SHIPMAN, SAMUEL (1883–). An American dramatist, born in New York City, and educated at Columbia University. He has written many popular plays, among the best-known being *East is West*, in collaboration with Aaron Hoffman, and *Friendly Enemies*. Others are: *Love and Art; A Social Outcast; A Spiritual Vulture; The Spell*, with Clara Lipman; *It Depends on the Woman; Royal Maid; Some Warriors; Elevating a Husband; Children of To-day; Flames and Embers; Head of the House; Sweethearts; The Good-for-nothing; Exemption*, with Clayton Hamilton; *The Kreutzer Sonata*, with Percival Wilde; *First is Last*, with John B. Hymer.

SHIPPING. The depressed financial condition of most European countries continued up to and through 1924 to affect adversely the shipping situation. During the last years of the War it was very generally expected that the great war losses and the small amount of construction in the first two years of the war period would bring about a shortage of shipping for several years after the close of hostilities. One of the principal arguments used by the German government to convince the Reichstag and the people at large of the desirability of the ruthless submarine campaign was based on this expectation, which would open new ways for German shipping. The anticipations in regard to shortage of shipping were not realized for two reasons: the reduced amount of maritime trade, and the heavy building of the United States, Great Britain, Germany, and Japan in the years 1917 to 1921, supplemented by the relatively large additions made to their merchant fleets by the less important countries during the same period. The United States added 11,000,000 tons to her overseas tonnage of 1914, and every one of the principal pre-war maritime nations, except Germany, Russia, and Austria-Hungary, added some thousands or millions of tons to their commercial fleets. The tonnages given in *Lloyd's Register* for July 1, 1914, and July 1, 1923, are shown in the Table A. Steam and motor vessels of less than 100 gross tons and sailing vessels of less than 100 net tons are excluded in all cases. For lack of satisfactory records all Japanese and most Greek (in 1923) sailing vessels are omitted: also wooden-hulled vessels of the United States engaged in trade in the Great Lakes.

TABLE A

SHOWING THE TOTAL TONNAGES OF VESSELS OF THE PRINCIPAL MARITIME COUNTRIES ON JULY 1, 1914, AND JULY 1, 1923

Nation	July 1, 1914	July 1, 1923
Great Britain and Dominions	21,045,049	22,058,112
United States	5,368,194	16,945,363
Germany	5,459,296	2,590,073
Norway	2,504,722	2,551,912
France	2,319,438	3,737,214
Japan	1,708,386	3,604,147
Italy	1,668,296	3,033,742
Netherlands	1,496,455	2,625,741
Sweden	1,118,086	1,207,727
Austria-Hungary	1,055,719	0
Russia	1,053,818	(†)
Spain	898,823	1,260,206
Greece	836,868	755,441
Denmark	820,181	996,862
Belgium	352,124	616,670
Other countries	1,384,097	3,182,993
Total, all countries	49,089,552	65,166,233

United States Merchant Marine, 1914–24. This was probably the most eventful decade in the history of American shipping. At its beginning, July 1, 1914, the tonnage in the foreign trade had declined to relative insignificance. This had been brought about by various antagonistic interests, foreign and domestic, by high wages in the shipping, shipbuilding, steel, and various other industries affecting the building and operation of ships, and by lack of interest in the question by Congress and the people at large. The combination of these numerous adverse factors was too great to be overcome without assistance by the government and by large commercial groups concerned in the foreign trade. Measured in dollars and cents it meant that the cost of operating a steamer under the American flag averaged about 6 per cent more than under the British and about 8 per cent more than under the Norwegian. The British freight lines, including steamers carrying passengers as a more or less subsidiary interest, were and in 1924 continued to be largely supported and controlled by great manufacturing, importing, exporting, and docking interests who found it advantageous to direct by their support the routes and terminals of transportation lines. By achieving this, the transportation lines became interested agents in finding and developing foreign markets for British goods and in securing foreign products for British import trade at the lowest rates, for the cheaper the goods the larger the volume of traffic. The Germans pursued similar methods and gave

BRITISH STEAMSHIP "MAJESTIC", WHITE STAR LINE

FORMER GERMAN "BISMARCK"

Gross Tonnage 56,551 Speed 26 knots

even more support and direction to their shipping, which was also carefully fostered by the government. The American merchant marine in the foreign trade had no such support as that given to the British and German fleets. Two-thirds of the exports up to 1914 were raw materials The American manufacturers have not made the same efforts as Great Britain and Germany to extend the sale of their products in foreign markets. Until they do so and take the same measures concerning the transportation of their wares, the maintenance of an extensive oversea merchant marine will be a difficult matter.

As early as 1913 the increasing export of manufactured articles and the reduction in cost of steel for shipbuilding began to have a favorable effect on the American shipping industry The outbreak of war gave a tremendous stimulus, which increased as the months rolled on. But in February, 1915, the Seamen's (La Follette) Act was a serious blow; in a few weeks it destroyed the American transpacific lines, which gave up attempting to continue their service, sold their vessels, and went out of business. (See UNITED STATES.) The demand for shipping began to increase soon after the outbreak of war At first, neutral shipping was preferred, but very soon the demand for tonnage swept everything into use, a result which German war methods would soon have achieved, for the danger to neutrals from mines and submarines was but little less than that to belligerents By the end of 1914, transatlantic freight rates had risen to four times pre-war figures, and they continued to advance in 1915 and 1916, in some instances to 15 times the pre-war normal. These conditions were brought about by (a) the internment, blockade, capture, and destruction of German, Austrian, Russian, Turkish, Rumanian, and Bulgarian shipping; (b) the diversion to naval use of a large percentage of Allied tonnage, the demand steadily increasing; (c) the loss of vessels from normal dangers of the sea and from submarine attack, submarine mines, etc.; (d) the transportation of food and munitions of war over long distances, from United States, Canada, the West Indies, South America, Australia, the East Indies, etc. Many American ship owners began at once to seize the opportunity to expand their holdings and to take advantage of the expected rise in freight rates. Many vessels were transferred from the coasting trade and enrolled for foreign service. A few shipping men took advantage of the already existing provision of the Panama Canal Act of 1912 which permitted the registry of foreign-built vessels not more than five years old American registry of such ships was still further facilitated by the Act of Congress of Aug. 18, 1914. In the fiscal year ending June 30, 1915, 147 vessels of 522,759 gross tons were thus transferred to the American flag and registered for the foreign trade

In many cases the transfers did not involve a change in the actual ownership, as they really belonged to American citizens or corporations but were operated under foreign flags for superior advantages thereby obtained Notwithstanding the enormous freight rates and the increasing demand for shipping, nowhere in the world was much new shipping laid down in the first year of the War. Germany, Austria, and Russia had no immediate use for shipping; England, France, and Italy, after May 23, 1915, were using their shipyards and their workmen chiefly in connection with war work, naval or military. The United States and Japan were the only other countries with extensive building yards and building facilities. New work was not undertaken in these countries until after June, 1915, because in the first year of hostilities it seemed to be the general opinion that the War could not last long on account of its enormous expense. By that time, however, it was seen that this war was as new in its methods of finance as in its size and its methods and that it might continue for years. The American and Japanese shipping interests began to order ships. At the same time British, Norwegian, and other foreign companies placed orders in the United States By the end of the year 700,000 tons of merchant shipping were under construction in American yards.

Shipping Act of 1916. Early in 1916 the Wilson administration proposed in Congress the creation of a great merchant marine under government control and operation. This was bitterly opposed by the great body of the Republicans and the more conservative Democrats. But as time went on and the need for shipping became more and more acute, it was seen that only by means of government assistance could the necessary vessels be supplied, so that on Sept. 7, 1916, after a long struggle in Congress, the so-called Shipping Act was passed and became a law. It is a much less comprehensive measure than the original bill. It established a Shipping Board of five members which was authorized to procure by purchase or construction cargo ships to the value of $50,000,000 and to set them at work, carrying American merchandise to foreign countries, and to regulate the rates and general business practices of the American merchant marine, much as is done by the Interstate Commerce Commission for land carriers Other powers of regulation and investigation were conferred.

Emergency Fleet Corporation. On Apr. 17, 1917, the Emergency Fleet Corporation was established under the provisions of the Shipping Board Act. This corporation was charged with the immediate duty of building up a large commercial marine of standard, fabricated, and other ships in the shortest possible space of time and under the most modern ideas of efficiency and economy in working, with speed of production as the primary object The first contract for new construction was let on Apr. 27, 1917. The demands of the Corporation were far beyond the capacity of the existing shipyards. In 1916 there were 66 yards, 27 of them for building wooden vessels only, in the United States; by the end of 1917 there were approximately 142 yards in which 1427 ships were building, of which more than 200 were wooden steamers of 2500 tons. The contracts for the wooden vessels were bitterly opposed and caused much friction between the members of the Shipping Board and those of the Fleet Corporation. As they were sold in 1922–23 for scrapping, the poor policy of their construction seemed proved

The Urgent Deficiency Bill, approved June 15, 1917, gave the President adequate power in placing orders for ships and ship materials and to take over for the use of the nation not only the output of the shipyards but the shipyards themselves. For several years the principal activities of the Shipping Board and Emergency Fleet Corporation were connected with the

building of ships. (See SHIPBUILDING AND NAVAL ARCHITECTURE.) After the close of the War, the Shipping Board endeavored to cancel all building contracts where cancellation could be effected without too great loss. Vessels were offered to American purchasers at low prices, and a considerable tonnage was sold Lines were established to various desirable points, and as far as possible these were subsequently turned over to commercial companies for operation.

The report of the United States Shipping Board, covering the activities of the board itself and of its subsidiary, the Emergency Fleet Corporation, shows that on June 30, 1923, the board owned 1325 steel vessels of 9,312,884 deadweight tons, of which 1187 vessels of 8,232,605 deadweight tons were cargo ships. In addition it owned 9 concrete vessels and 23 wooden vessels. On the same date there were 373 steamers of 3,172,498 deadweight tons in operation, handled by 42 managing agents and covering 78 services. There were laid up, therefore, 984 vessels of some 6,000,000 deadweight tons, or about 4,000,000 gross tons. The ships sold included 71 steel cargo ships aggregating 347,799 deadweight tons and realizing $8,725,372; 10 ships aggregating 64,911 deadweight tons were sold for conversion to Diesel motor ships and brought $564,500; and 44 steel tankers of 412,420 deadweight tons were sold for $18,875,004.90. In addition to these there were sold 8 old or damaged vessels, 13 ocean-going steel tugs, and 4 wooden tugs, while 233 wood and composite vessels, about 560,000 gross tons, were sold for scrapping.

The total merchant marine of the United States is analyzed in the following Table B showing the trade in which the ships were engaged, propulsive power, material of hull.

TABLE B

UNITED STATES MERCHANT MARINE, JUNE 30, 1923, SHOWING TRADE IN WHICH ENGAGED, TYPE OF VESSEL, MATERIAL OF HULL, ETC

UNITED STATES VESSELS AND TONNAGE ENGAGED IN THE FOREIGN TRADE, JUNE 30, 1914

Type	No	Gross tons
Steam	868	720,609
Sail	444	224,073
Barge	1,049	121,709
Total	2,361	1,066,391

In addition to the vessels added to American registry from other sources, the enemy vessels interned in 1914 in American harbors, including those of the Philippines, Porto Rico, and Hawaii, were seized and taken over by the United States government. The total tonnage of the 95 German vessels so acquired was 628,837. Among them were several of the largest and finest passenger steamers in the world, the *Leviathan*, formerly *Vaterland*, being actually the largest steamer then completed for service. There were 14 Austrian vessels interned in American ports in 1914, but 8 were sold to the Kerr Steamship Corporation before the United States declared war on Austria.

In Table D are shown the total tonnages of vessels, flying American and foreign flags, that entered and cleared in the foreign trade during the fiscal years 1914–23

TABLE D

	TOTAL TONNAGE		PER CENT	
	American	Foreign	American	Foreign
1914	27,470,703	79,101,283	26	74
1915	26,693,736	66,901,818	29	71

1923	61,293,398	72,196,133	45	55

Merchant Marine Act. For half a century attempts have been made by the various presidents, members of Congress, and others who saw the desirability of having a large merchant marine in the foreign trade under the American flag, to assist in building it up and maintaining it by means of subsidies. With the exception of obtaining special payments for certain classes of mail steamers for the carriage of the mails, all these attempts failed. At the end of the War in Europe, the United States found itself in possession of an adequate marine, but owing to the greater cost of operating vessels under the American flag than under foreign flags it seemed probable that the new ships must be laid up or sold to foreigners unless some form of government assistance was forthcoming. Subsidy bills were introduced but failed to receive Congressional sanction In the Merchant Marine Act of June 5, 1920, known as the Jones law, which provided for the continuance of the United States Shipping Board and for other matters connected with shipping, there was a partial recognition of the principle of giving subsidies for the building and operation of American shipping. In Section 24 of this Act, limitations on the rates and other conditions of mail subsidies were removed, leaving the matter of compensation to the United States Shipping Board and the Postmaster General, within the appropriations made by Congress. In Section 11 of the Act, it was provided that there would be lent to shipowners to build new ships an amount not to exceed $25,000,000 a year for 5 years, derived from funds obtained by the sale of government-owned ships and receipts from their operation. Provision was also made for the establishment of certain experimental steamship lines to be operated by the Shipping Board until it was shown that they could not be made self-supporting. Section 23 permitted the earnings of American vessels to be exempted from excess profits taxes up to one-third the

cost of approved types of new ships to be built in American yards. Section 34 of the Act sought to remove any restriction on the United States to impose discriminating duties against foreign ships by terminating any articles in treaties or conventions in contravention of such action and directed the President to give 90 days' notice of such intention President Wilson declined to issue such notices or to take steps toward the abrogation of existing commercial treaties, on the ground that Congress had no constitutional right to authorize or direct such action. Section 28 of the Act restricts preferential export and import railroad rates to goods consigned to or by American vessels. A large part of the Act deals with ship mortgages; the purpose was to popularize shipping bonds by making a vessel mortgage a prior lien to that of material-men. See SHIPBUILDING AND NAVAL ARCHITECTURE; WAR IN EUROPE, BLOCKADE, SUBMARINE.

SHIPPING BOARD. See SHIPBUILDING, *United States;* UNITED STATES, *History.*

SHIPSTEAD, HENRIK (1881–). United States Senator from Minnesota, born at Burbank, Kandiyohi Co, Minn. He was educated at the State Normal School at St. Cloud, Minn., and at the dental school of Northwestern University, Chicago. He practiced dentistry at Glenwood, Minn, for several years, acted as mayor of the town one year, and was elected to the State Legislature of Minnesota in 1917. In 1920, he moved to Minneapolis, and was elected to the United States Senate by the Farmer-Labor party on Nov 7, 1922.

SHOES. See LEATHER; LYNN; BOOTS AND SHOES.

SHOOTING. See OLYMPIC GAMES.

SHOWERMAN, GRANT (1870–). An American philologist. He was born in Wisconsin and studied at the State university. He was in Rome as fellow of the Archæological Institute of the American School of Classical Studies (1898–1900) and on his return to the United States in the latter year became professor of classics at the University of Wisconsin. He is the author of *With the Professor* (1910); *The Indian Stream Republic and Luther Parker* (1915); *A Country Chronicle* (1916); *A Country Child* (1917). He translated Ovid's *Heroides et Amores* for Loeb's Classical Library (1914).

SHULL, AARON FRANKLIN (1881–) An American zoölogist born at Miami County, Ohio. He was educated at the University of Michigan and at Columbia. He was assistant in zoology (1905–08) at the University of Michigan; instructor (1911–12), assistant professor (1912–14), associate professor (1914–21), and professor (1921–) of zoology at the University of Michigan. He did important work on sex determination in rotifers and in insects, and was joint author (with Ruthven and La Rue) of *Principles of Animal Biology* (1920).

SIAM. An independent kingdom of southeast Asia; area 195,000 square miles; population in 1921, 9,221,000 as compared with 8,266,408 in 1910. Bangkok, the capital, had 628,675 inhabitants in 1919 (200,000 Chinese). Chinese coolie immigration arriving at Bangkok in 1921–22, a typical year, numbered 75,242; those emigrating numbered 46,777.

Industry and Trade. The life of the population centred, for the most part, in the rice fields. In 1922, of the 6,770,000 acres under cultivation, 6,490,000 were given up to rice. Cotton, tobacco, maize, and pepper received a limited attention. The economic well-being of the country was dependent on forces beyond its control. Drought often played havoc with the rice crops, while rice demands from Japan and competition from Indo-China and Burma, for instance, affected either favorably or adversely the Siamese market Thus, exports of rice (in metric tons) reached 1,193,230 in 1913–14, 281,960 in 1920–21 (because of drought); 1,270,535 in 1921–22; 1,275,198 in 1922–23. Of the mineral resources of tin, tungsten, coal, iron, zinc, manganese, antimony, the first received the greatest attention Production of tin was 1918–19, 8834 tons; 1919–20, 8542; 1920–21, 6201; 1921–22, 6249. The advance in foreign trade over the period 1914–24 may be gauged from the following imports and exports for 1913–14, $32,593,000 and $42,742,000; 1920–21, $60,298,000 and $29,310,000; 1921–22, $60,173,000 and $74,022,000, 1922–23, $57,498,000 and $64,525,000. (Conversions from the tical made at average annual rates of exchange). Principal items of export, 1922–23, were rice, $54,218,000; teak, $2,441,880; stocklac, $882,000, wood, other than teak, $605,300; tobacco, $571,200; salt fish, $516,880. Principal items of import, 1922–23, were manufactured articles, largely cotton goods, $36,038,400; foodstuffs, $8,079,050. metal manufactures, $4,769,140; wines and opium, $2,570,145. Trade continued to be carried on largely with Hongkong, Singapore, China, India, the United Kingdom During the period after the War intercourse with the United States increased, imports in 1921 reaching $1,958,706, but dropping to $798,540 in 1923. Railway building was considerable during 1914–24, so that mileage increased from 976 in 1915 to 1485 in 1923. Work was under way on extensions out of Kovat, and from Petrin to Aran Pratet Through service from Bangkok to Penang was inaugurated in 1922, and a similar service to Chiengmai was planned. The whole railway system was being converted to the meter gauge. Wireless stations were erected at Bangkok and Senggora.

Government and History. There was no change in the structural form of government and the king remained the absolute ruler The revenues increased from $27,527,882 in 1913–14 to $31,508,990 in 1921–22; expenditures from $23,391,510 in 1913–14 to $33,223,200; extraordinary expenditures against capital account from $5,634,360 to $6,944,990. The national debt at the end of 1914 stood at $30,410,960, in March, 1923, it was $46,279,046. The rise in the price of silver compelled the government in 1919 to change the value of the tical from 13 to the pound ($0.37) to 12 to the pound ($0.405), but back again to the normal rate in January, 1923 In 1922, it was worth $0.47; from Jan. 3, 1923 on the bank selling rate on the United States remained at $0.406. Under King Rama VI progress was continuous, particularly in the fields of sanitation, law, municipal functions, etc. On July 22, 1917, Siam declared war on the Central Powers and sent an ambulance detachment to the western front late in 1918. As an Associated Power Siam had delegates at the Peace Conference and became a member of the League of Nations. Thus politically, but as well economically, with the passing of Germany the British influence became paramount in the country after the War.

SIBERIA AND FAR EASTERN REPUBLIC. Although commonly taken to embrace all of Russia in Asia, exclusive of the Central Asiatic provinces of Kirghizia and Turkestan, the geographical name Siberia properly applies only to the territory east of Lake Baikal and the Yakutsk territory of eastern Siberia, while the territory to the east of Yablonoi mountain ridge and to the south of Stanovoi mountain ridge, bordering on the Pacific Ocean, is known as the Far East. The territory of western Siberia comprises 2,209,660 square miles, with a population, according to the census of 1920, of 9,040,500 souls, as against 7,286,100 in 1914. The Yakutsk province, in Eastern Siberia, at present known as the Yakutsk Autonomous Socialist Soviet Republic, represents a vast expanse of practically uninhabited timber land and frozen marshes, covering 1,457,070 square miles, with a total population in 1920 of but 266,500 souls, as against 311,300 in 1914. The territory of the Far East, at present known as the Far Eastern Soviet Republic, including Sakhalin, has an area of 998,000 square miles, with a population of 1,624,700 souls, as against about 1,601,000 in 1914. Grand total: area, 4,664,730 square miles; population, 10,931,700.

Western Siberia, which is part of the Russian Socialist Soviet Republic, is bounded on the east by the Yukutsk Republic and Lake Baikal, on the south by the Kirghiz Republic and Tchungaria, on the west by the Ural Mountains, and on the north by the Arctic Ocean. It comprises the provinces of Altai, Yenisei, Irkutsk, Novo Nikolaevsk, Omsk, Tomsk, Tumen and the autonomous territory of Oyrat. With the density of population averaging only 2.23 souls per square mile (as against an average of 35 5 per square mile in the United States), it would appear that a great opportunity would exist for colonizing. The immense territory, however, was for the most part devoid of agricultural importance, and all the land suitable for habitation and settlement had practically been taken up. The agricultural zone of Siberia did not extend northward beyond the 58–59th parallel and represented a belt of about 450 miles in width and 1600 miles from east to west, constituting a continuation of the "black soil" belt of European Russia. The best and most thickly populated arable lands were situated along the path of the Trans-Siberian railroad, branching off through the valleys of the rivers and extending southward to the Chinese boundary. The total surveyed land area of western Siberia amounted to but 140,400,000 acres, or less than 10 per cent of the entire territory. The greater part of this surveyed territory was covered with forests, interspersed by vast expanses of marshes, and only 8,100,000 acres were estimated, according to the rural census of 1923, to be fit for settlement, of which area two-thirds would require heavy pioneer work. With the elimination of uninhabited territory, the density of Siberian population rises to about 9 per square mile, approaching that of Colorado (9.1), and North Dakota (9.2). The density of the population in the southern part of Siberia was estimated as high as 20 to 25 persons per square mile, or approximating that of Kansas (21.6), California (22), or Maine (25.7). If the territory is further reduced to the surveyed land only, which amounts, as above stated, to 140,400,000 acres in the six principal provinces, with a total population of 6,681,000 souls, an average of 30.4 persons per square mile would be arrived at. Of the above total acreage of surveyed lands, arable land, including prairies, amounted to 44.8 per cent; meadows, 8; pastures, 11.6; timber, 17.1; and under water, marshes, etc., 18.5.

According to the census of 1923 there were in western Siberia 3,010,000 head of horses, 3,641,074 head of large horned cattle, 6,200,800 sheep, 54,447,000 goats, and 877,107 swine. In 1917, the live stock of the average Siberian farmstead amounted to 2.5 draft horses, 3.2 of horned cattle, including 1.9 milch cows, 4.1 sheep and 1.5 swine. In 1922, the average equipment fell to 1.6 draft horses, 2.2 horned cattle, including 1.2 milch cows, 3.2 sheep and 0.5 swine. The Siberian horse, generally small, further deteriorated as a draft animal. The number of horses below 12 hands in height rose to 90 per cent of the total equine stock; the average weight of cattle on the hoof comparative with pre-war decreased from 578 pounds to 506 pounds, and the annual yield of milk per cow decreased by 20 per cent. Industrial enterprises under the jurisdiction of the (Soviet) Bureau of Siberian Industries numbered 695 and employed 44,236 workmen. Of this aggregate, 233 (33 per cent) were at a standstill. The majority of the bigger plants—299, or 43 per cent of the total number of establishments—were being operated by the state, employing 41,140 (93.2 per cent) of the total number of workmen. Leased enterprises represent 23.4 per cent of the total, with 4.3 per cent of the employees. Besides the coal and gold mining industries, the state operated 28 tanneries, 59 woodworking establishments (of which 28 were at a standstill), 5 heavy-woolen cloth mills, 1 flax-spinning mill, 1 cotton-wadding factory, 8 felt-boot factories, 23 alcohol distilleries (of which only 6 were included in the operating programme for 1923), 4 metallurgical plants, 20 metal-working shops, 4 glass factories, 1 porcelain factory, 3 match factories, 4 oilseed-crushing mills, etc. Of the state industries, 171 (57 per cent) were combined in "trusts," embracing chiefly the mining industries. Coal mining ranked first among the industries, employing 17,290 (39.1 per cent) of the labor. Gold mining stood second, with 6015 workmen, or 13.59 per cent of the total. Next in order followed the leather industry, with 3352 workmen (7.57 per cent); woodworking, with 3116 (5 94 per cent); and metal-working, with 2468 (3.75 per cent). The output of coal for the operating year 1922–23 amounted to 1,350,000 long tons, representing 96 per cent of pre-war production. The increase in coal production was attributed to the development of the "Kuzbas" region (Kuznetzki Basin), where the output exceeded that of 1914. It must be noted, however, that the development of the vast resources of the Kuznetzki Basin had hardly begun in 1914. Only surveying and preliminary excavation were carried out in that year, in the course of which there were mined about 3,000,000 poods of coal (about 48,000 long tons).

Far East. The Far Eastern Republic, which prior to 1922 was detached and politically independent of the Soviet régime, was gradually subjugated and absorbed by the latter. Soviet troops aided in the overpowering of the White government of the Maritime Republic in the fall of 1922, with the result that the Far Eastern Republic and the Maritime Republic were

consolidated into one and affiliated with the Union of Socialist Soviet Republics. As constituted in 1924, the Far Eastern Republic comprised Transbaikal, Amur, Maritime and Kamtchatka provinces, as well as Sakhalin. It was bounded by the Pacific Ocean and the Seas of Okhotsk and Japan on the east, the Arctic Ocean on the north, the Yakutsk Autonomous Republic on the west, Korea, China, Manchuria, and Mongolia on the south. Of the total area of 998,000 square miles, approximately 350,000 miles were covered by timber. The remaining territory was not yet thoroughly explored but roughly 54,000,000 acres were suitable for agriculture in one form or another, of which only 4,797,000 acres, or only 8.88 per cent of the total, constituted arable land. According to the rural census of 1923, the total population, including Kamtchatka, numbered 1,624,700, of vhich 1,284,800 were rural The area under cultivation reached its greatest extent in 1917, namely, 3,202,400 acres. By 1922 it fell, owing to disorganization and civil strife, to 1,711,000 acres. But, after annexation to Soviet Russia and political settlement, the sown area began increasing again, and in 1923 amounted to 2,001,000 acres. The total number of farmsteads registered was 214,461, with the following average personnel and equipment. number of mouths per farmstead, 5.45; field acreage, 15.8 acres; meadows, 6 67 acres; horses, 2.4 head; horned cattle, 3.6 head; sheep and goats, 2.5 head; swine, 1.37 head; machinery and equipment, 140 rubles' worth, at pre-war prices.

Agriculture throughout Siberia was characterized by the practical absence of winter sowings, all cereals being spring sown, and the prevalence of grain over other plants. In 1923, of the 2,001,000 acres planted in the Far East, 36.5 per cent was to spring wheat; 13.6 per cent to spring rye; 28.6 per cent to oats; and the balance of 21.3 per cent to other plants, chiefly soya beans, rice, flax and sunflower The soil and climatic conditions of this region favored the development of such technical plants as flax and oilseeds Average crops of cereals for the 10 years 1913–23 showed· wheat, 27 bushels; rye, 27.95 bushels; oats, 62 15 bushels Principal industries of the Far East were hunting fur animals, deep-sea fisheries, forestry and coal mining. According to the latest data of 1923, the total timber area of the Far East was about 222,450,300 acres. Of this territory, good timber stands were estimated at 123,357,600 acres, or 55 per cent of total. By comparison with pre-war data, which estimated the total area within the same boundaries at 116,000,000 dessiatines (313,200,000 acres) and of good timber stands at 83,000,000 dessiatines (224,100,000 acres), it was evident that the earlier figures were greatly exaggerated The distribution by administrative divisions of the 1923 data was given as follows:

Provinces	Total area	Total timber area (In acres)	Good forest land
Maritime	135,945,000	86,994,000	52,768,800
Sakhalin Island	8,496,900	6,750,000	4,212,000
Amur	99,079,200	57,304,800	30,601,800
Transbaikal ...	74,007,000	57,145,500	28,647,000
Kamtchatka ...	321,067,800	14,256,000	7,128,000
Total	638,595,900	222,450,300	123,357,600

The coastline of the Far Eastern Republic has a length of 11,930 miles, comprising the great fisheries of the Okhotsk, Japan, and Behring Seas. These waters were remarkable for the great variety of fish inhabiting them. Thus, in the Behring Sea 165 distinct species of fish were caught. The principal species of commercial value in the Far East were salmon, herring, codfish, sturgeon, and flounder. The whaling and seal-hunting industries were also largely developed, although whaling was not organized until 1923, when a whaling concession was, for the first time, granted by the Soviet government to a Norwegian, Mr. Christiansen. According to the data of a commission despatched to Commodore Islands in 1923, the seal herds of the Commodore Islands were estimated at 14,000 to 15,000 head, and of beavers at 250,000. In 1923, 269 fishing sectors had been leased by the Soviet government to Japanese concerns, for an aggregate rental of 1,162,000 rubles, in addition to payment on account of arrears of 1,000,000 rubles. The total catch of all kinds of fish in Far Eastern waters averaged about 193,550 tons, salmon amounting to about 100,000,000 pieces, or 160,000–170,000 tons and herring to 161,300 tons, of which western Kamtchatka yielded 54 per cent, eastern Kamtchatka 15 per cent, the Amur River 25 per cent, Okhotsk and Sakhalin district 10 per cent, and Sea of Japan 1 per cent. The Far East was rich in coal deposits, of which those of black coal were estimated at 2,305,000,000 tons, and lignite at 560,000,000 tons. At the end of 1923 six coal mining enterprises were exploited by the state and 14 were leased, chiefly in the Maritime province. The total production in 1923, exclusive of the Russian part of Sakhalin, which was occupied by Japan, by virtue of Japanese claims for the Nikolaevsk massacre, was represented as follows·

	Black coal	Brown coal (In tons)	Total
State coal mining enterprises ..	10,721,000	22,312,000	33,033,000
Leased coal mining enterprises . .	2,482,000	10,227,000	12,709,000
Total	13,203,000	32,539,000	45,742,000

History. Immediately after the Russo-Japanese War of 1904–05, a rapprochement took place between Russia and Japan. In a series of four secret treaties most of which were not made public until the time of the Washington Conference, the two powers allocated each other their respective zones of interest in the Far East and agreed on friendly coöperation in Far Eastern affairs The fourth and last of these treaties, which was first published by authority of Trotsky in 1917, was concluded on July 3, 1916, and provided for what amounted to an alliance between Russia and Japan. It was contemporary with an open agreement by which the two powers bound themselves to coöperate in the regions which hitherto had been the bone of contention between them. Thus the former enemies had in the darkness of secret diplomacy taken definite steps for the prevention of future conflict over eastern Siberia and for a joint imperialistic policy in China to the prejudice of the interests of all other powers But hardly had this policy matured when the Russian Revolution annulled the four secret treaties and provided Japan with a pretext and an opportunity to pursue a course of its own in the Far East.

A new chapter in the history of Siberia opened when the decision was reached in the summer of 1918 for Allied intervention in Siberia. The conclusion of peace between Soviet Russia and the Central Powers closed Russia proper to the Allies and thus there remained to them Vladivostok, the back door, as the only possible entrance to render aid to those Russian elements which were still eager to continue the war against the Central Powers. The Allies were also anxious to prevent the large military stores in Vladivostok and along the Siberian Railroad from falling into the hands of the enemy. An additional reason for the despatch of the Expeditionary Force was the desire to aid the Czecho-Slovak Legion which had been slowly and laboriously fighting its way to the Pacific in order to proceed to France, and which had come in conflict in Siberia with the Bolshevists and the armed German and Austrian prisoners. These were the reasons advanced by the United States in an official announcement of Aug. 3, 1918, for its participation in the venture, and there is no ground to doubt the sincerity of the American government. How far more selfish motives, and particularly the desire to crush Bolshevism, entered into the reasoning of the other participants is a different matter. At any rate, Japan, as became apparent from its subsequent action, aimed at the exclusion of Bolshevism and Russia from the Far East and at the extension of her own political and economic power to eastern Siberia, and had concluded already on May 16, 1918, a treaty with China to this effect, although officially it proclaimed to be actuated by the same motives as the United States.

Meanwhile a rather confused situation had arisen in the interior of Siberia. Early attempts on the part of the Bolshevists to spread their power to Siberia were only partially successful and were blocked during 1918 by the Czecho-Slovaks and the anti-Bolshevik organizations of various descriptions which sprang up during the course of the year. The confusion was still further increased by the independent action of the Japanese who landed troops at Vladivostok in the spring of 1918 and thereby began their policy of fishing in the troubled Siberian waters. During the summer the Allied Expeditionary Force arrived and at the same time the Japanese advanced along the Siberian Railway. Thus there were active over the vast extent of the Siberian territory an incoherent combination of forces and movements each one of which was, with the exception of the common opposition to the Soviet government, actuated by different motives. At the end of 1918, Admiral Kolchak succeeded in uniting the many counter-revolutionary groups into a rather loose organization which established its headquarters at Omsk in western Siberia. After the elimination of the moderate Socialists and the liberal elements through a coup d'état, the Omsk government adopted openly a policy of monarchist reaction. The reactionary and military character and the administrative inefficiency of the Kolchak government and particularly the predatory raids of such ruthless anti-Bolshevik condottieri as the Cossack Attamans Semenov, Ungern-Sternberg, and Kalmikoff, who recognized only nominally the authority of Kolchak, served to discredit the entire anti-Bolshevik movement with the mass of the Siberian people. The initial support which the counter-revolutionists received from the native population was further weakened by the fact that they were backed by foreign troops operating on Russian soil and especially by the Japanese, whose selfish aims became more and more evident. The number of Japanese troops in Siberia was temporarily reduced as a result of the protest of the American government on Nov 2, 1918. The United States, on the other hand, which was the only foreign government that in a measure held the confidence of the Siberian people, refused to enlarge its action into military support of the West Siberian government, in spite of urgent recommendations of the chief American representatives in Siberia in favor of such procedure. Also the Japanese, who acted from ulterior motives and who had no interests west of Lake Baikal, refused to make such a move and preferred to pursue a policy of their own by tightening their hold on Eastern Siberia The military position of Kolchak became in consequence more and more precarious and was further aggravated by the action of General Semenov, who sat astride the Trans-Siberian Railway at Chita and held up at will Kolchak's supply trains. At the same time the policy of reaction at Omsk went its course and succeeded in alienating completely the sympathies of the Siberian population. After initial military successes during 1919, the Kolchak All-Russian Movement succumbed to the Bolshevists at the end of the year, a victim of its own folly and of the lethargy or selfishness of the Allies who ostensibly had moved into Siberia to assist the Russians in the formation of a representative government This débâcle was followed in February, 1920, by the withdrawal of the American Expeditionary Force and the abandonment by the United States of a Siberian policy which had been a sterile adventure from the start. The Japanese, however, who were in Siberia for reasons of their own, remained and consolidated their powerful position. They issued a statement on Mar. 31, 1920, to the effect that "the presence of the Japanese forces in the Russian Far East does not imply any political designs against Russia and . . . as soon as the political situation in the Russian Far East has become normal to the extent that there will be no danger to Korea and Manchuria, and life and property of all our nationals protected and normal railway communications restored, that then, after the evacuation of the Czecho-Slovak forces has been completed, our troops will be withdrawn from Siberia as early as possible." This statement was followed in April of the same year by an attack of the Japanese troops on the local Russian forces and by the Japanese occupation of the entire Maritime Province. A weak anti-Bolshevik government led for a time in this region a precarious and ignominious existence as a tool of the Japanese.

After the fall of the All-Russian government Siberia lapsed once more into utter chaos, but the Bolshevists advancing from the line of the Trans-Siberian Railroad gradually established their authority in the greater part of the country. At Irkutsk the Western Siberian Revolutionary Committee sprang up, which assumed control and governed under direction from Moscow. Local opposition in Eastern Siberia to the Committee gave birth to the Far Eastern Republic which gradually took over control in practically the entire region east of Lake Baikal. The republic was nominally an independent state but in reality it maintained close connec-

tion with the Soviet government. In spite of this relationship, however, which existed primarily in the foreign policy of the two states, the Far Eastern Republic was not organized along Soviet lines, but on the basis of radical democracy. While private property was abolished the constitution of the new state contained a bill of rights and the Legislature was elected by the universal franchise of all the people. In short, the fundamental principle of the Soviet doctrine, namely the dictatorship of the proletariat, was not applied But it was obvious from the beginning that the Far Eastern Republic was merely a transitional organization and was created to serve as a "buffer" state between Soviet Russia and Japan. This became very evident from its strongly anti-Japanese policy and from its vigorous action against the counter-revolutionary elements, which were still operating within its territory or on its frontiers. In October, 1920, its forces expelled Semenov from Chita, whereupon that city became the capital of the new state.

In consequence of the successes of the Far Eastern Republic, the Japanese opened negotiations with representatives of this state and the Soviet government during 1920, which resulted in the definition of the frontiers between the territory of the Chita government and the Japanese zone Meanwhile new complications arose, because of the Japanese occupation of the northern half of Sakhalin and of parts of Kamchatka, ostensibly in reprisal for the massacre of Japanese troops at Nikolaevsk. In the early part of 1921 the Chita government called on Japan to withdraw from the remainder of the Siberian territory and pointed to the Japanese pledges in this respect. When this action produced no results more vigorous notes were directed to the Japanese government, while at the same time representations were made to the United States in which attention was drawn to the fact that the presence of Japanese troops in Siberia was a direct result of the invitation on the part of the United States to the Japanese government for intervention in Siberia and the claim was advanced that therefore the American government was morally responsible for the existing situation. This protest came simultaneously with a strong note from the Washington government to Japan. The United States had grown apprehensive as to the intentions of the Japanese in Siberia and gave warning that Japan's policy might lead to her isolation in Far Eastern affairs. Japan, however, evaded a direct settlement of the issue by inviting the Far Eastern Republic to a conference. Negotiations were begun in September, 1921, at the conference of Dairen, which dragged out till April, 1922, without producing any results. Meanwhile the Far Eastern Republic was unofficially represented at the Conference of Washington There the Siberian question came up, but was shelved after lengthy discussions. This Conference, however, had the indirect result of convincing the Japanese that a policy of closer adherence to international coöperation would be more productive than a policy dictated by national egotism. This consideration, together with reasons of domestic policy, induced the Japanese government, in the summer of 1922, following a proposal of the Far Eastern Republic for renewed negotiations, to express its willingness to evacuate the Siberian mainland by the end of October of the same year. A new conference took place in September, 1922, at Changchun in Manchuria, at which Soviet Russia was officially represented through Joffe, its envoy to China After some minor agreements the conference broke up because Japan was yet unwilling to deal directly with the Soviets. In conformity with its pledge, the Tokyo government withdrew its troops from the mainland in October, but the northern half of the island of Sakhalin remained under Japanese military occupation.

From the very start, the connection between the Far Eastern Republic and the Soviet government had been close and this intimate relationship grew in proportion to the consolidation of the position of the Chita government, to the freeing of Siberian soil from foreign troops and from counter-revolutionists, and to the crystallization of a Soviet Far Eastern policy, especially with regard to China. In December, 1920, a treaty had been signed between the Far Eastern Republic and Soviet Russia whereby Kamchatka was ceded to Moscow. At the same time Communism came more and more to the fore in the inner political life of the Far Eastern Republic and tended to submerge the original democratic principles. The Communists obtained gradually a majority in the National Assembly at Chita and the Far Eastern Republic became for all practical purposes a part of the great Soviet organization. With the evacuation of the Maritime Province by Japan, all of the former Asiatic domains of the Czar were in the hands of revolutionary Russia and there was no raison d'être for the Chita "buffer" state. The Far Eastern Republic having fulfilled its purpose was liquidated on Nov. 13, 1922, when the Chita National Assembly voted to turn over all power to a Revolutionary Committee which operated as part of the Soviet government. The undisputed authority of the Moscow government stretched now, as far as governmental authority goes in the vast, thinly populated, and undeveloped territory of Siberia, from the Ural Mountains to the Pacific Coast.

The history of Siberia became thereafter wholly part of the history of Soviet Russia. Soviet Far Eastern policy included in the succeeding years primarily negotiations with China concerning Mongolia and Manchuria and with Japan concerning the northern half of Sakhalin In the case of China steady progress was made in the course of lengthy and arduous negotiations toward a closer relationship. As for relations with Japan, there was also a turn rather satisfactory to Moscow. While still continuing her occupation of northern Sakhalin, Japan gave a definite pledge for the early evacuation of that territory. In the summer of 1924, more or less authentic reports were current to the effect that Soviet Russia and Japan had reached or were approaching an agreement for closer cooperation of the two states in Far Eastern affairs to the exclusion of all other powers. If sufficiently substantiated, these reports would mean that Moscow and Tokyo had reached that point of alliance and joint action in opposition to the interests of the Western Powers which was attained by the governments of the Czar and the Mikado at the time when the Revolution occurred and threw Far Eastern affairs into complete turmoil.

SIDIS, Boris. See Psychology, Abnormal.

SIERRA LEONE. A British colony and protectorate on the west coast of Africa between

French Guinea and Liberia. Area of colony, about 4000 square miles; population in 1921, 85,-163 of whom 1161 were Europeans. In 1911, the population was 75,572, of whom 702 were Europeans. Freetown, the chief town, had 44,-142 inhabitants in 1921, as compared with 34,-090 in 1911. The protectorate has an area of 27,000 square miles and a population (1921) of 1,456,148. The colony and protectorate continued to depend upon the export of palm kernels and kola nuts, which formed 87 per cent of the domestic exports. Other exports were palm oil, piassava, and rice. Exports in 1913 totaled £1,731,252; in 1920, £2,949,380; in 1922, £1,372,862. Imports, consisting of manufactured goods, food, drink, tobacco, and coal, totaled £1,750,303 in 1913; in 1920, £3,548,478; in 1922, £1,511,496. Of total imports in 1922, the United Kingdom furnished 71 per cent; United States, 11 per cent; West African possessions, 6 per cent. Of total exports in 1922, the United Kingdom received 69 per cent; the United States, 1.5 per cent; West African countries, the remainder. The important place that Germany occupied in the colony's export trade —it took most of the palm kernels—was taken by the United Kingdom and the United States. That the colony's position in 1922 was not much better than that of 1913, was reflected in the tonnage figures. In 1913, 2,931,085 entered and cleared; in 1922, 2,474,226 tons. Revenues and expenditures showed some increase over 1913–23. Revenues for 1913 and 1923 were £618,383 and £845,319; expenditures for the same years were £622,439 and £727,661. The public debt on Jan. 1, 1923, amounted to £1,729,-848. After 1912, the railway from Boia Junction was extended to Kamabai (104 miles). The natives gave excellent assistance to Great Britain during the War and aided in the reduction of Kamerun. Their dependence for foodstuffs completely upon importations led to want after the War because of prevailing high prices.

SILESIA. See CZECHO-SLOVAKIA.

SILESIA, UPPER. This region (area 3230 square miles) was the seat of a bitter conflict in the years 1919–21. The population is mixed, according to the German census of 1910, there being 1,258,186 inhabitants of Polish extraction and 884,045 Germans. Because of this preponderance of Polish nationals, the Poles, championed by the French, strongly pressed before the Peace Conference their claims for annexation of the whole region. There was an economic factor, however, not to be disregarded. The region was responsible for one-fifth of Germany's total coal production. The vast coal basin, stretching from Oppeln south and east into Teschen and Galicia, by 1913 had produced 45,000,000 tons of coal. Besides, great iron fields, as well as zinc and lead deposits, contributed to make the section one of the most important industrial centres of central Europe. Here were located the important towns of Beuthen, Gleiwitz, Oppeln, Konigshütte and Ratibor, in which Polish laborers found plentiful employment. By the decision of the Peace Conference the region was constituted a plebiscite area and an inter-Allied commission was provided for and granted police powers. From February, 1920, until the final disposition of the region (October, 1921), the whole of Upper Silesia was in a ferment. The importance of the territory for both contestants and the bitterness that characterized every insignificant move attracted international attention. By the French and Poles Germans were accused of colonizing the area; the Allied Commission, on the other hand, was charged by Germans with showing partiality toward the Poles and permitting them to intimidate inhabitants in the southern and eastern districts. A course of terrorization during 1920 was systematically pursued by the Poles; voters were kept from balloting, were beaten, and sometimes killed. Non-residents were refused passage across the frontier. On Mar. 20, 1921, the plebiscite was taken. The count showed 717,122 votes for Germany and 483,514 for Poland. In the chief industrial centres the vote was preponderantly German. As the division of the territory came up for consideration before the inter-Allied Commission, the disorders increased. The French representative, who had consistently championed the Polish cause, favored the cession of the whole of the southern and eastern sections, i.e. the industrial areas, to Poland. This the representatives of Great Britain and Italy refused to countenance, with the result that affairs dragged as protracted negotiations were carried on by the home governments. Polish patriots aware of this dissension collected a large force and virtually possessed the districts under dispute. Meanwhile, Germans had rushed to the defense of their compatriots, with the result that fighting took place around Ratibor and Cross-Strehlitz. In May, 1921, M. Korfanty, Polish high commissioner, erected a government in the southeast. Not until Allied troops were despatched in June, 1921, did some semblance of order appear. On June 26, a truce was established, though the Polish troops shook off control, turned brigands, and terrorized the German populations.

The impasse caused by the irreconcilability of the rival demands finally prompted the Supreme Council to turn over adjudication to the League of Nations, August 12. A commission made up of representatives of Japan, Brazil, China, Spain, and Belgium, reported on October 20. The report, as accepted by the League Council, virtually conceded all of Poland's claims. The southern and eastern districts, constituting an area of 1240 square miles, with a population of 891,669, were turned over to Poland. The new boundary, running from Oderberg in the south along the Oder River northwest to a point a little below Ratibor, thence northeast to Beuthen, thence northwest to a point west of Lublinitz and finally northeast again to Lissau, gave to Poland the greater share of the so-called Industrial Triangle containing four-fifths of the coal production and nearly all the metallurgical plants, viz., half of the county of Zabrze, all of the county of Kattowitz, and a little more than half of the counties of Beuthen and Königshütte. Something of the nature of the division may be seen in the fact that of the 67 collieries in operation in Upper Silesia, 47 were allocated to Poland. These mines, in 1920, had produced 31,-750,000 metric tons, of which the 47 mines falling to Poland were credited with a production of 23,763,740 metric tons. In the territory allotted to Poland, 510,000 votes had been cast in the plebiscite, of which 285,000 had been for Poland and 222,000 for Germany. As a rule, German votes had been in a majority in the cities. Because the industrial life of the whole region would be dislocated if boundary lines were drawn immediately, the League Council provided

a body of administrative regulations. All of Upper Silesia, for 15 years, was to be under the supervision of a mixed commission of Poles and Germans. Railways were to continue in operation under their old concessions and rates were to be uniform. The existing systems of water supply were to be continued. The German mark was to remain the legal tender in the plebiscite area over the whole 15-year period. Though the German and Polish customs laws were to apply forthwith at the new frontier, natural products coming from one of the two zones and destined for consumption in the other were to cross the frontier duty-free. The same was to be true for unfinished products needing completion. For 15 years Poland was to permit exportation into Germany of any of the mineral products in the Polish zone, and Germany was to reciprocate. Property rights were to be respected as well as the rights of minorities. On Oct 27, 1921, the German government informed the Council of Ambassadors of its willingness to accept the League's decision, though it protested against the unfairness of the division of territory. During June and July, 1922, the inter-Allied forces evacuated the region, and were replaced by Poles and Germans. The Germans proceeded in September, in their zone, to hold an election on the question of home rule as against continuance as a province in the Prussian state. By a vote of almost ten to one, the decision favored the erection of a self-governing state. The Poles, on their part, divided Polish Upper Silesia, together with Teschen, into three electoral districts for elections to the Polish parliament. Silesia having received local autonomy, elections were held on September 24 for the new county council and the first session was opened on October 11

SILICA GELS. See CHEMISTRY.

SILK. By 1924 the United States had become the largest and most important silk-consuming and silk-manufacturing country in the world, taking approximately three-quarter's of the world's production However, it was dependent entirely upon foreign countries for raw materials. Japan was the leading producer of raw silk (see tables), so that the greater part of the United States' silk imports came from Japan, with China and Italy ranking second and third respectively. In 1923, the raw silk imported into the United States amounted to 49,505,581 pounds, valued at $391,942,417. The countries from which it was imported were as follows·

	Pounds	
France	516,080	$4,564,702
Italy	2,449,688	20,726,043
China	12,261,561	83,395,432
Japan	33,377,971	275,908,398
Other countries	900,281	7,347,842

The total imports of silk and manufactured silk during the year 1923 were valued at $446,210,331. That most of this material is consumed in the United States is indicated by the fact that in 1923 the total manufactures of silk exported were valued at $11,136,578.

The condition of the silk manufactures industry in 1914 and 1921 is shown by the following census figures:

SILK MANUFACTURES INDUSTRY [a]

Years	Number of establishments [b]	Persons engaged	Salaries and wages
1914	856	115,571	$57,615,000
1921	1,565	131,697	134,095,000

Years	Cost of materials	Value added by manufacture [c]	Value of products
1914	$144,442,000	$109,569,000	$254,011,000
1921	337,559,000	245,860,000	583,419,000

[a] Bureau of the Census Report on Silk Manufactures, 1921.

[b] Statistics for establishments with products valued at less than $5000 are not included in the figures for 1921; there were 109 establishments of this class which reported 225 wage earners and products valued at $365,500 For 1914, however, data for such establishments are included in the figures, with the exception of the item "Number of establishments"

[c] Value of products less cost of materials

[a] Compiled by the Statistical Bureau of The Silk Association of America.

[b] The production of raw silk in China and India is unknown. The Japan crop is approximately 47,000,000 pounds.

[c] Excludes Tussah silk.

[d] In the absence of statistics from Austria and the Levant, 1915 production is used as an estimate.

The crop years from 1913–14 to 1916 showed a total production as follows: 1916–17, 59,800,000 pounds; 1915–16, 53,090,000; 1914–15, 48,468,000; 1913–14, 59,972,000. The distribution followed very much the same proportions as for the years 1918 to 1923 given more completely in the table, taking into consideration, of course, the effect of the War in Europe and Asia Minor.

SILK, ARTIFICIAL. The artificial silk industry began in the United States about 1910 and by 1920 had reached an annual production of 10,000,000 pounds. After that time the production of the artificial silk increased even more rapidly, so that in 1923 the six larger companies engaged in this manufacturing reported a production of 35,490,000 pounds, as

IMPORTS OF RAW SILK AT ALL PORTS OF THE UNITED STATES [a]

[c] Except pile fabrics.

compared with 26,000,000 pounds in 1922, and estimated that in 1924 they would turn out 41,600,000 pounds. The Viscose Company alone which started production in 1911 had not only a main plant at Marcus Hook, Pa., but other factories at Lewistown, Pa., and Roanoke, Va., and had an output for 1923 of approximately 27,500,000 pounds. It was extending its facilities so that in 1924 it was able to turn out more than 32,000,000 pounds. As showing the distribution of this industry in the United States the accompanying table from the *Textile World* is of interest.

Firm	1923 Production Pounds
Visase Company	27,500,000
Du Pont Fibresilk Co.	2,750,000
Tubize Artificial Silk Co.	3,500,000
Industrial Fibre Corp.	1,200,000
Cupra, Inc.	40,000
Lustron Co.	500,000
Total	35,490,000

The United States is fast becoming the most important producer of artificial silk in the world, and while there were no accurate statistics available, it was estimated that the world total for 1922 was about 80,000,000 pounds and for 1923 about 90,000,000 pounds, or about 50 per cent more than the production of real silk. Artificial silk was being used in the United States for hosiery, dress goods, shirtings, and in combination with real silk for crêpes and ribbons. Not only was there an increased production of artificial silk in the United States in 1923, but also increased imports, the total "yarns, threads, and filaments" arriving in the United States during the calendar year 1923, amounting to 3,906,037 pounds valued at $6,738,031 as compared with 2,087,775 pounds valued at $3,908,710 during 1922. The exports of artificial silk products during 1923 included 1,113,218 dozen pairs of hosiery valued at $4,906,408, as against 1,439,056 dozen pairs valued at $6,172,550 during the corresponding period in 1922, and other manufactures of artificial silk amounting to 571,718 pounds, valued at $1,690,044

SILVER. On June 30, 1917, it was estimated that the silver dollars in the United States Treasury and their circulation totaled $568,000,000, of which $497,000,000 were in the Treasury and $71,000,000 in circulation and in the banks. It was proposed to melt these coins and to sell as bullion a quantity not in excess of $350,000,000, and to replenish the deficiency so produced by the purchase from time to time of an equivalent amount of bullion at the fixed price of one dollar per ounce, 1000 fine. This was done under the terms of the so-called Pittman Act, approved Apr. 23, 1918, and the immediate effect was to remove the free market in the United States and in London, and make the quotations at the former market in the neighborhood of one dollar per ounce for the life of the Act. The Pittman Act was considered the most important in the history of silver since the repeal of free coinage in France and India, and its effect was to render more profitable the mining and production of silver in the refining of the baser ores under the terms of the Pittman Act which expired in 1913.

Purchases of silver were made by the United States government as follows:

PURCHASES OF SILVER UNDER THE PITTMAN ACT

	Ounces
1920	29,907,361
1921	58,662,527
1922	62,181,024
1923 [a]	49,834,123
Total	200,585,035

[a] Last purchases in June.

Up to June 30, 1923, 222,146,473 silver dollars had been recoined.

In 1923 the exports of silver from the United States were valued at $72,463,780 while the imports were valued at $74,453,530.

[a] Estimates of the Bureau of the Mint with the cooperation of the United States Geological Survey.

[b] Average to Pittman Act price ($1 per ounce) January to June, and of New York price July to December, inclusive.

It will be noted that in 1923 the State of Utah produced 20,275,700 ounces or nearly 28 per cent of the United States production and the record silver production of any single State for any year. This was derived mostly from the refining of lead ores.

SIMMEL, GEORG (1858-1918). German philosopher and historian (see VOL. XXI). One of the clearest and internationally most respected thinkers before the War, Simmel took to heart the European catastrophe. He sought refuge in the philosophy of art and composed an appreciation of *Rembrandt* (1917). Shortly before his death he wrote his philosophic testament in the form of a *Lebensanschauung* (1918). A number of studies on Simmel and the various phases of his philosophy were published in Germany after the master's death; among these may be mentioned Max Adler's *Georg Simmels Bedeutung für die Geistesgeschichte* (1919).

SIMMONS COLLEGE. A nonsectarian technical institution for women at Boston, Mass., founded in 1899. The student enrollment increased from 1083 in 1915 to 1253 in 1920, and dropped again to 1197 in 1923–24. During the same time the faculty was increased from 118 to 121 members, and the library from 22,000 to 36,000 volumes. An endowment campaign was begun in 1921. Certain changes in the requirements were instituted in 1920; three years instead of two of language were required, "free margin" subjects were accepted with limitations, and no conditions were allowed. President, Henry Lefavour, Ph.D., LL.D.

SIMONDS, FRANK H(ERBERT) (1878–). An American journalist (see VOL. XXI). In 1914 he became military editor of *The Review of Reviews*, and was an associate editor of the *New York Tribune* from March, 1915, to December, 1918. He wrote: *They Shall Not Pass—Verdun* (1916), and a *History of the World War* (5 vols.).

SIMONS, GEORGE ALBERT (1874–). An American clergyman, born at LaPorte, Ind., and educated at Drew Theological Seminary. He entered the ministry of the Methodist Episcopal Church in 1899 and preached in Brooklyn and New York City. In 1907 he became superintendent of the Finland and St. Petersburg Mission Conference and later held several similar positions. He founded two publications, *Methodism in Russia*, and *Christiansky Pobornik*, in Petrograd. During the War he was chairman of the Red Cross Committee in Russia, and in February, 1919, he testified before the United States Senate in regard the Bolshevik rule in Russia. In the winter of 1920 he had charge of the distribution of relief supplies sent by the Methodists to Finland, Russia, etc. He was manager of the Russia Methodist Book Concern

SIMPLON TUNNEL. See TUNNELS.

SIMS, WILLIAM SOWDEN (1858–). An American naval officer (see VOL. XXI). He was president of the Naval War College in 1917, became an admiral in 1918, was again appointed president of the War College in 1919, and retired in the same year with the rank of rear-admiral. In 1920, in an extensive report to the United States Senate subcommittee, he alleged grave errors in the management of United States naval operations during the War.

SINCLAIR, HARRY FORD (1876–). American oil producer, born at Wheeling, W. Va. He was educated at public schools in Kansas, and studied pharmacy at the University of Kansas. After spending some years in the drug business, he turned his attention to oil and became president of the Sinclair Oil and Refining Corporation and the Sinclair Gulf Corporation which in 1919 were consolidated as the Sinclair Consolidated Oil Corporation, of which he became chairman. During 1923–24, the leasing from the government of certain oil properties by this corporation led to a Congressional investigation and a demand for the annulment of the leases. In 1917, he was appointed a member of the committees on oil, raw materials, minerals, and metals of the National Research Council. In addition to his oil interests, he held office or directorships in various fiduciary corporations in Oklahoma and Pittsburgh, Pa.

SINGAPORE. See STRAITS SETTLEMENTS.

SINGMASTER, Elsie (Mrs. Harold Lewars) (1879–). An American author, born at Schuylkill Haven, Pa., and educated at Radcliffe College. She wrote: *When Sarah Saved the Day* (1909); *When Sarah Went to School* (1910); *Gettysburg—Stories of the Red Harvest and the Aftermath* (1913); *Katy Gaumer* (1914); *Emmeline* (1916); *The Long Journey* (1917); *Life of Martin Luther* (1917); *History of Lutheran Missions* (1917); *Basil Everman* (1920); *John Baring's House* (1920); *Ellen Lewis* (1921); *Bennett Malin* (1922); *The Hidden Road* (1923). She also contributed short stories to magazines.

SIN-KIANG. A Chinese outer territory, consisting of Chinese Turkestan, Kulja, and Kashgaria, thus comprising all Chinese dependencies lying between Mongolia and Tibet. Area, 550,580 square miles; estimated population, (2,500,000). The whole was regarded as a separate province and the capital, Urumchi, was the seat of the Chinese civil governor. A more assiduous cultivation of the soil, in which irrigation helped greatly, accounted for an increasing prosperity during 1914–24 Leading products included cereals, fruits, vegetables, wool, cotton, silk, jade, and gold. Principal imports from China proper were tea, silks, and cotton piece goods. Imports from India were cotton piece goods, indigo, leather, paints, silk piece goods, spices, etc. Principal centres for Chinese trade were Urumchi and Kucheng while the principal centres of British trade were Yarkand, Kashgar, and Khotan Before the War, the Russian interest in the country was keen and through political agents and traders from Russian Turkestan its influence was spreading through the population. This penetration for a time ceased as a result of the Revolution so that in 1924 it was not yet evident whether the Soviet meant to win over Chinese Turkestan's Turanian population.

SINN FEIN. See Ireland.

SINO-JAPANESE AGREEMENT. See Japan, *History.*

SISSON, Edgar Grant (1875–). An American editor, born at Alto, Wis. He studied at the Northwestern University from 1894 to 1897 and was a member of the staffs of several papers in Chicago as reporter and editor, until 1911, when he became managing editor of *Collier's Weekly.* He was editor of the *Cosmopolitan Magazine,* 1914–17, and associate chairman of the Committee on Public Information (1917–19), with general direction of the foreign section. He organized the publication and distribution of President Wilson's speeches throughout Russia in 1917–18, and made to President Wilson the first report published by the government (1919), under the title *The German-Bolshevik Conspiracy.* He became news editor of the New York *World* in 1921.

SLADEN, Fred Winchester (1867–). An American army officer, born in Massachusetts, and graduated from the United States Military Academy in 1890. He was on duty in Oregon, Washington, Idaho, and the Philippines. He engaged in relief work in San Francisco after the earthquake and fire in 1906 and was in China during 1914 and 1916 and on the Mexican border in 1916–17. He was secretary of the War Department General Staff in 1917 and 1918. He was commander of the 5th Infantry Brigade of the 3rd Regular Division in France and Germany in 1918 and 1919 and was active in the Aisne, Château-Thierry, Marne, St. Mihiel, and Meuse-Argonne defensives He was appointed superintendent and Commandant of the United States Military Academy in July, 1922

SLAVONIC LITERATURE. In 1914, the literature of all the Slavonic peoples was feeling the influence of the various movements which were agitating France and western Europe. Realism was giving place to symbolism and to modernism of various kinds and schools. Then came the War, which radically changed the external life of the different peoples. Poland became a battle ground; Czecho-Slovakia and the Jugo-Slavs saw themselves forced into a war in which their sympathies were on the side of their official enemies, and their hatred was for their superiors. With the end of the War came the restoration of independence to these different peoples and a complete change in the future which they saw before them. The great changes in the literature accompanying this great political and social upheaval had hardly yet taken place and it was still too soon in 1924 to define with certainty the definite results that would be produced.

In Poland, the death of the greatest of her authors, Sienkiewicz, in 1916, removed the one man who had secured a recognized place in the international world of letters. The other men of the younger generations—men like Wladyslaw St. Reymont, author of *The Peasants* and several historical novels; Stefan Zeromski, author of several historical novels, notably *The Wind from the Sea;* and Andrzej Strug, author of *Tomb of the Unknown Soldier,* a psychological study—continued the tradition of the Polish novel. Jozef Weyssenhof was perhaps one of the foremost short-story writers, although these were very numerous and among them were several women of considerable ability. In poetry, Leopold Staff, Jan Kasprowicz, Tuwim and others wrote lyric poetry and lyric dramas which are worth attention. The spirit of the new Poland with its promise for the future, which was first indicated by the poet-artist Stanislaw Wyspianski, is shown in its modern form in the collection of stories by Eugeniusz Malaczewski, *The Horse on the Hill,* in which amid the scenes of the Polish-Bolshevik war we see the vision of the new country and of the new spirit, as we do also in many of the war songs of the people. Perhaps we should include here also the account of the Mongolian adventures of the Polish professor Ferdinand Ossendowski, which attained wide circulation in its English translation as *Beasts, Men and Gods.* Amid all its changes, Polish literature still maintained on the whole its chivalrous and knightly air which is one of the chief features of the Polish genius.

The Czecho-Slovak situation was quite different. The people were struggling whole-heartedly to break the bonds which bound them to Austria-Hungary and this gave to much of their poetry a cryptic and enigmatic character. As it was, many of the leading poets, as Machar and Dyk, were arrested and kept in prison for their opposition to Austria. Among the other poets who pleaded the cause of the people more or less openly, we may mention Sova and Theer and also Křička, the author of the first of the war songs. Langer and Medek sang of the ex-

ploits of the Czecho-Slovak legions in Siberia and described in verse the heroic exploits of these wandering soldiers After the War, Czecho-Slovak poetry was optimistic and the authors ranged from free verse to the conservative forms, as in Otokar Fischer and Josef Chaloupka. Among those who progressed the furthest toward the left we may mention Stanislav K. Neumann, a brilliant and talented poet. The mystic Otokar Březina had written little and his influence was still inconsiderable. Among the novelists of prominence were A. Jirásek, K. M. Čapek and Anna Marie Tilschová. When we seek for the national inspiration we find it in the writings and speeches of President Thomas G. Masaryk who himself summed up and exemplified much if not most of the modern intellectual life of his people. The usual optimistic mood of the nation, however, had not been expressed in the drama, where Karel Čapek (q.v.) with his two plays *R. U. R.* and *The Insect Comedy* gave a pessimistic and satirical view of life which won for them presentation not merely in his own country but also in England and America. Finally we may mention that Hviezdoslav (Pavol Országh), the foremost singer of the Slovaks, died in 1921.

In the Kingdom of the Serbs, Croats and Slovenes, the same tendencies predominated The older authors, as Anton Tresić Pavičić, a poet and novelist of Dalmatia had largely withdrawn from publication and had left the field to the younger representatives of the modernists and symbolists, e.g. the novelists Tsankar, Kosor and Nazor and the poets Jovan Dušic, Milan Rakić and Miličić. In addition to the struggle of generations there was also continuing an interesting process of fusion. The Serbs and the Croats published their works indifferently in the Cyrillic of the Serb and the Latin of the Croatian but there was still a certain difference in spirit coming from the long centuries of isolation and subjection to different cultures, the Byzantine of the East and the Latin of the West, and the complete merging of these two streams of poetry and thought was expected to produce some interesting and valuable works in the near future. We must mention also Nikolaj Velimirović, Orthodox Bishop of Ochrida, a distinguished preacher and writer whose books have often been translated and who did much to carry the knowledge of his people outside his country. During the War he won a name for himself as one of the great preachers of England, where he went in connection with the education of Serb refugees and where he was frequently invited to preach in St. Paul's Cathedral, London

Among the poets and novelists of the Slovenes, may be mentioned Ivan Cankar, whose novel *Pictures of Dreams* reflects the unreal and terrible experiences of the War. Other authors are Oton Zupančič, Dragotin Kette, Josip Murn, and Ivan Pregelj.

Bulgaria also lost, immediately after the War, her greatest poet, Ivan Vazov, who died in 1921. He had been associated with the Bulgarian movement for independence from its very beginning, and his prose and verse describe almost every phase of the life of the people. In 1920, the nation gave him a jubilee on the fiftieth anniversary of the commencement of his writing and it was a fitting prelude for the manifestation of national sorrow which accompanied his death. The younger Bulgarian authors followed the usual schools of western Europe and of Russia.

SLEEPING SICKNESS. The popular name of this affection, known to the medical profession as epidemic encephalitis, is unfortunate, because this title is preëmpted by a chronic affection which is endemic among the African blacks. (The last named disease is known technically as trypanomiasis.) Although the acute form of sleeping sickness is by no means new, having flourished in different localities under various names in the past, it was not recognized as a separate morbid entity until about 1916 and since that period it has become familiar to medical men throughout the temperate zones. Nothing is known of its intimate nature, but it stands in some vague relation to infantile paralysis and epidemic meningitis. It has a high mortality and is apt to leave its victims badly damaged. It occurs in epidemic incidence but attacks only a relatively small proportion of the community. The severity of its nature is due to the fact that it attacks some of the most important portions of the central nervous system. From another viewpoint, it suggests an affinity with influenza, which affection in rare cases attacks the brain and causes a condition very similar to sleeping sickness. A certain number of cases of the latter have occurred in individuals recovering from the grippe.

Epidemic encephalitis is characterized by a great variety of symptoms and a number of clinical types have been isolated, some of which may appear in abortive form. Hence diagnosis may be difficult in the individual case for somnolence may be absent and be replaced by excitement and constant muscular twitching. In some localities, this form may predominate, and may be recognized in a disease which prevailed in Italy 80 years ago. This persisted for some years and at no time was drowsiness mentioned as a characteristic symptom. This is an additional reason against the use of the term "sleeping sickness."

SLEMP, C(AMPBELL) BASCOM (1870–). An American Congressman, born at Turkey Cove, Lee Co., Va., and educated at the University of Virginia. He taught mathematics at the Virginia Military Institute and later practiced law in Virginia, at the same time acting as an officer in several business concerns. He was elected to Congress first in 1907 and served continuously thereafter until he was appointed secretary to President Coolidge in 1924.

SLESVIG. See SCHLESWIG.

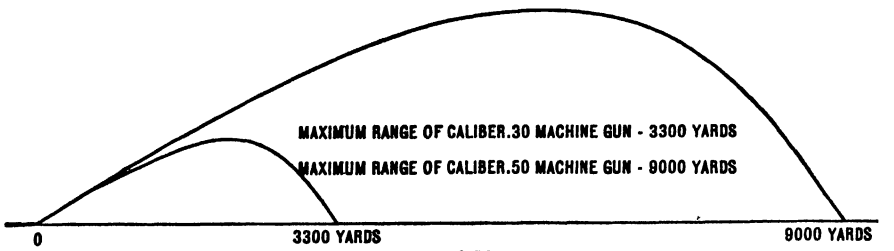
SLOAN, JOHN (1871–). An American artist, born at Lock Haven, Pa. He received his art education in evening classes in the Pennsylvania Academy of Fine Arts under the late Thomas P. Anschutz. He was particularly noted for his scenes of city life. His lithographs are humorous and vivid, as for example, that of a workingman, pipe in mouth, hands in pockets, sitting on the roof with his back against a chimney and his stockinged feet stretched out before him, enjoying solid Sunday peace and freedom. Mr. Sloan has made many drawings for magazines, and his work as an illustrator included designs for Paul de Kock's novels. For his painting "The Coffee Line," at the Carnegie Institute, Pittsburgh, Pa., he received honorable mention in 1905. "The Dust Storm" is in the Metropolitan Museum, New York City, and examples of his work

are included in the print collection at the New York Public Library. He was an instructor at the Art Students' League in New York City and director of the Society of Independent Artists.

SLOVAKIA. See CZECHO-SLOVAKIA.

SLOVENES. See JUGO-SLAVIA, *History*.

SMALL ARMS AND MACHINE GUNS. If we include under the heading "Small Arms" (see also ORDNANCE), shoulder rifles, pistols, machine guns, ammunition and accessories, the decade between 1914 and 1924 was marked principally by developments in machine guns. Prior to the War, practically all machine guns used the same caliber ammunition as the shoulder rifles with which the infantry was equipped, and were employed as a means by which a given number of individual soldiers could deliver a greater volume of fire at the enemy than if equipped with shoulder rifles. Under stress of actual combat, machine guns were soon divided into different types especially suited for particular uses. The lighter weight types were adapted to firing short concentrated bursts of fire and the heavier types were developed for playing the continuous leaden stream of the machine gun barrage. Special types were developed for mounting in tanks and in airplanes and special mounts were developed for employing machine guns in anti-aircraft work.



The special-type guns necessitated the development of special types of ammunition; for instance, armor piercing for use against tanks and armored airplanes, tracer and incendiary ammunition for use against observation balloons and gasoline tanks of airplanes. The need for larger cavities to contain the special composition required in tracer and incendiary ammunition led to the development of larger caliber bullets for which heavier and heavier machine guns became necessary, with the result that the sphere of employment of the machine gun was enormously increased and its range of action multiplied two and one-half to three times.

Shoulder Rifles. Prior to the outbreak of the War, the United States Army adopted the Springfield rifle, Caliber 0.30, Model of 1903, as standard equipment for infantry and cavalry troops This rifle and the standard ammunition for it easily led the world, as was repeatedly demonstrated in international rifle matches. Its nearest competitor was the German Mauser, the shoulder rifles in use by other armies being relatively much inferior. Under battle conditions, the Springfield maintained its supremacy and even by 1924 was susceptible of further improvement only in minor particulars, such as providing a large aperture sight to be located on the receiver near the eye, telescopic sights for issue to individual sharpshooters, and possibly a change in the stock to provide a pistol grip.

Unfortunately, due to difficulty of production, it was impossible to manufacture enough Springfield rifles to completely equip the United States troops or to provide any for troops of the Allied armies, much as they desired this superior weapon. The greater number of the United States troops were equipped with the modified Enfield rifle of British design rechambered for rimless 0.30 caliber United States ammunition instead of the older type British 0.303 cartridges with projecting rim which tended to increase the danger of jams. Incidentally the United States ammunition had a much higher velocity than the British cartridge and was much more effective at all ranges at which rifle fire is employed.

Pistols. The Colt automatic pistol, caliber 0.45, was beyond question the most effective weapon of its kind in use prior to the outbreak of the War and no improvements in it were found necessary as the result of battle experience. Unfortunately the difficulty of manufacturing this weapon necessitated the issue of a considerable number of 0.45 caliber revolvers to United States troops which, even at that, were much better equipped in this respect than the troops of any other nation engaged in the War.

Automatic Rifles. The second type of weapon using standard small arms ammunition is intended to be a portable arm for front-line troops, capable of being fired from the hip if necessary, and to some extent even while proceeding forward to the attack. Its normal employment, however, is from the ground supported by a light biped at the muzzle, the gunner taking the prone position. For this purpose the British army used the Lewis gun, the Germans the Maxim 08–15, and the French, the Chauchat, the United States troops being armed to a considerable extent with the latter weapon prior to the issue of the standard Browning automatic rifle developed contemporaneously with the entrance of the United States into the world conflict. The Browning was probably the most successful weapon of its type in use at the end of the War, but mature reflection on the relative merits of the type led to a conclusion that it was a misfit, being too light for sustained automatic fire and too heavy to be fired from the shoulder. Later tendencies were toward providing a much heavier barrel in order that it may be fired for a greater length of time without putting it out of action by overheating. Provided in addition with a substantial biped mount, it comes under the classification of machine rifles to which the French Chauchat, the British Lewis and the German Maxim more nearly belong than to the class of strictly automatic rifles.

DIAGRAMMATIC COMPARISON OF TRAJECTORIES; 0.50 CALIBER AND 0.30 CALIBER BROWNING MACHINE GUNS

Machine Guns. In 1914, the principal types of machine guns were the Benet-Mercie, the Colt, the Maxim, the Vickers, the Lewis and the

Hotchkiss. In May, 1917, the Browning (heavy) machine gun received its initial test and was at once adopted as standard for the United States Army. The new gun demonstrated its superiority to all other types of machine guns then in use by the armies of the world. Although the maximum range of this gun was found to be less than some types of French and also German machine guns, the fault lay in the ammunition used and not in the gun itself. With improved ammunition this gun, which is recoil-operated and water-cooled, is a most effective weapon for delivering a sustained fire of great volume.

Aircraft Machine Guns. The machine gun found a new field of employment in connection with aircraft, two general types of mounting being developed as the result of combat experience in the clouds. For the use of the pilot, two or more guns are rigidly mounted on the airplane structure and fired directly to the front, the bullets being fired between the rapidly revolving blades of the propeller by means of a synchronizing mechanism connecting the motor and the gun. For the use of the observer, a free gun is so mounted as to permit of fire in any direction. Vickers aircraft machine guns were used to a considerable extent for the pilot and Lewis guns for the observers. Marlin aircraft guns were later adopted when Vickers became unavailable, due to great care necessary in the manufacture of ammunition for this gun. Browning machine guns were modified for aircraft use but were not entirely satisfactory, due to the haste in which they were developed. Several attempts to improve this gun have been made recently but up to 1924 none has been entirely satisfactory.

Anti-Aircraft Machine Guns. At first it was thought that anti-aircraft machine gunnery involved merely providing a simple mount which would permit all-around-traverse and elevation of 85 or 90 degrees. The usual type of mount used by anti-aircraft machine gunners during the War consisted of an adapter head with a pintle at the lower part of the bracket which revolved freely on the head of a tripod. The upper part of the bracket was provided with a U-shaped opening in which the machine gun was mounted, thus making it possible to elevate the gun about its transverse axis and to traverse it by rotating the entire mount adapter about the pintle. The anti-aircraft machine gun made a place for itself in the equipment of all armies, and considerable effort has been expended in the development of more satisfactory mounts for this type of weapon. In order to increase the volume of fire, it is probable that more than one gun will be mounted on each tripod. A semi-ball mount adapter has been manufactured and tested since the Armistice and future design was tending toward this type.

The effective range of 0.30 caliber ammunition limits the employment of the ordinary machine gun to attack upon the personnel of aircraft or upon the structure of low-flying unarmored planes. The development of the super-machine gun of 0.50 caliber bids fair, however, to displace the earlier 0.30 caliber gun not only on account of its greater range but because its much larger bullet permits the development of more satisfactory armor-piercing, incendiary and tracer varieties.

Super-Machine Guns. The Browning 0.30 caliber machine gun was brought out contemporaneously with the entrance of the United States into the world conflict. It proved so successful from its first tests that early effort was made to apply its principles to the design of a machine gun to fire 0.50 caliber ammunition. The first design fired a bullet of 600 grains at a muzzle velocity of 2450 feet per second. About this time several German anti-tank guns were captured. Inasmuch as the 13-mm. ammunition for these guns fired an 800-grain bullet at a muzzle velocity of 2500 feet, a second design of 0.50 caliber machine gun was brought out firing an 812-grain bullet at a muzzle velocity of 6200 feet per second.

A water-cooled 0.50 caliber machine gun has been designed for ground use by infantry troops, but it develops so much energy in firing that it is impossible to hold it steady for horizontal fire, using a tripod of such light weight as can be conveniently transported by infantry. An air-cooled type for mounting on aircraft has proved very successful and bids fair to be universally adopted as a synchronized weapon. A water-cooled type has also been developed for anti-aircraft use. This gun has a maximum range of approximately 9000 yards, its armor-piercing bullet will penetrate one inch of armorplate at short ranges, and the tracer bullet will give a brightly illuminated trace for approximately 2500 yards.

Small Arms Ammunition. The War vastly increased the ranges at which small arms ammunition was expected to be used effectively. In order to meet insistent demands for greater range, extensive test firings were continually held in all armies and every effort made to improve the shape of the bullet and increase the effectiveness of the powder charge. In general, it has been found desirable to further sharpen the nose of the bullet in order to reduce the effect of air resistance and also to "boat-tail" or taper the base, in order to eliminate or greatly reduce the drag caused by the vacuum at the base. The improved contour of the bullet has permitted an increase in weight, and with the increased remaining velocity at any given range, a considerable increase in hitting power has been obtained. See STRATEGY AND TACTICS.

SMALLPOX. During the 10 years 1914–24, much information was gained about this affection. The conviction is growing that there are different strains of the disease, one of which is naturally mild and the other severe. Should this dualistic view obtain a permanent foothold many peculiarities of the disease may be explained. A severe type of disease may, of course, have its virulence modified and appear alternately in mild or severe form; but there may be a mild form which is never severe under any circumstances. This appears to be the case with the alastrim of the West Indies, which is believed to be the same as the mild smallpox of western Africa, from which it was originally derived. The latter has long been regarded as distinct from the severe smallpox of eastern Africa. The severity of the latter, as of other virulent strains of the disease in the tropics, makes it difficult to control by vaccination, to which must be added the great difficulty of obtaining fresh virus, and the difficulty in enforcing vaccination decrees in primitive communities.

The alleged failure of vaccination in the Philippines was readily shown to have been due to lax enforcement of the laws, the turning in of bogus returns and other irregularities. The unvaccinated were the sufferers and the country

later was properly revaccinated, with resulting return of immunity. During the War, there were numerous striking examples both of immunity of vaccinated troops exposed to virulent disease and the spread of the disease among the unvaccinated.

Paul Test. A new diagnostic test was in force in some localities which will prevent the long quarantine of suspects. This consists in the inoculation with the suspicious matter of the rabbit's cornea, cock's wattles, etc Smallpox pus provokes a peculiar reaction not obtained with the use of any other substance. This is known as the Paul test.

SMALLWOOD, WILLIAM MARTIN (1873–). An American zoölogist born at Warsaw, N. Y He was educated at Syracuse University and at Harvard. He was instructor in biology at Syracuse (1896–98), professor of biology and geology at Allegheny College (1898–1902), and associate professor of zoölogy (1903–07), and professor of comparative anatomy (1907–) at Syracuse University. He published papers on the embryology of mollusca, and *A Text Book of Biology* (1913; 2d ed., 1920), *Practical Biology* (1916), *Biology for High Schools* (1920); *Man the Animal* (1921).

SMELL. See PSYCHOLOGY, EXPERIMENTAL

SMILLIE, ROBERT (1859–). A British labor leader, born at Belfast, of Scottish parents. At 14 years of age he went to work in a shipyard at Govan, and two years later went to Lanarkshire where he worked in the mines for 16 years. He was an active trade unionist, and through his efforts the Lanarkshire Miners' Union reached a membership of 30,000 He possessed so much organizing ability that he was promoted steadily until in 1912 he was elected to the presidency of the Miners' Federation of Great Britain. In March, 1921, ill health compelled him to resign from the Federation.

SMITH, ALFRED EMANUEL (1873–). An American public official, born in New York City. He was educated in the parochial schools of the city and from 1895 to 1903 was clerk in the office of the Commission of Jurors in New York City. He was a member of the Democratic organization and served in the New York Assembly from 1903 to 1915 In 1911, he was Democratic leader and, in 1913, Speaker in that body. From 1915 to 1917, he was sheriff of New York County In the latter year he was elected president of the Board of Aldermen and in 1919, governor of New York State He was reelected to this office in 1922, defeating Charles S. Whitman, Republican candidate. Governor "Al" Smith was one of the most conspicuous candidates for the Democratic nomination for the Presidency in 1924. See UNITED STATES, *History.*

SMITH, ALFRED H(OLLAND) (1864–1924) An American railway president (see VOL. XXI). During the War he was appointed assistant director-general of railroads in charge of transportation in trunk-line territory east of Chicago and north of Ohio and the Potomac Rivers, and regional director of the Eastern District On June 1, 1919, he was reappointed president of the New York Central lines It was generally conceded that he was one of America's most progressive and far-sighted captains of industry.

SMITH, DAVID STANLEY (1877–). An American composer, born at Toledo, O. While pursuing his regular academic studies at Yale, he also took the course in composition there under Professor Parker. When he graduated in 1900, his *Commencement Ode* for baritone, male chorus and orchestra was produced as part of the commencement exercises From 1901 to 1903, he was in Europe, continuing his studies under Thuille in Munich and Widor in Paris In 1903, he was appointed instructor in the theory of music at Yale; in 1909, assistant professor; in 1910, full professor; and in 1920, dean of the Department of Music, succeeding Prof. Horatio Parker. For many years he was also organist at various churches in New Haven In 1917, he became conductor of the Horatio Parker Choir; in 1918, conductor of the Choral Art Club; and in 1919 he succeeded Parker as conductor of the Oratorio Society and the New Haven Symphony Orchestra. His works consist of: two symphonies; a symphonic poem, *Darkness and Dawn;* the overtures, *Joyeuse, Sérieuse,* and *Prince Hal; Symphonic Ballad, Allegro giocoso, Commemoration March, L'Allegero, Il Pensieroso,* and *Impressions; Prelude, Chorale and Fugue* for organ and orchestra; the choral works with orchestra, *The Windswept Wheat, The Fallen Star, The Dark, Pan,* and *Rhapsody of St. Bernard;* two string quartets; a piano trio, anthems; and part-songs and songs

SMITH, FREDERICK EDWIN, first VISCOUNT BIRKENHEAD (1872–). An English lawyer and statesman (see VOL. XXI). He was a member of Parliament from 1906 to 1919. In 1915, he served as solicitor-general and from 1915 to 1919 as attorney-general. During the War he served with the Indian Corps in France In 1919, he was appointed Lord High Chancellor of Great Britain but later resigned that office. He was created Baron in 1919 and Viscount in 1921. He visited the United States in 1916 and again in 1923. His later books include *Destruction of Merchant Ships* (1917); *My American Visit* (1918), and *The Indian Corps in France* (1919).

SMITH, HERBERT BOOTH (1883–). An American clergyman, born at St Louis, Mo., and educated at Princeton Theological Seminary. He was ordained to the Presbyterian ministry in 1909 and held pastorates in Rochester, N. Y, Knoxville, Tenn., and Los Angeles, Cal In the last-named city he ministered to a congregation of 3000. He wrote *Five Sermons on Democracy* (1918) and *The New Earth and Other Sermons* (1920)

SMITH, HUGH MCCORMICK (1865–). An American ichthyologist born at Washington, D. C. He was educated at Georgetown University (M.D., 1888) He was assistant in the United States Fish Commission (1886–92), in charge of the division of fisheries (1892–96), in charge of scientific inquiry (1897–03), Deputy United States Commissioner of Fisheries (1903–13); and Commissioner of Fisheries (1913–22). As deputy commissioner and commissioner of fisheries he directed the activities of the Bureau of Fisheries and published various papers on the commercial fisheries and aquatic resources of the United States

SMITH, JOHN MERLIN POWIS (1866–). An English educator. He was born in London, came to America, and studied at the University of Chicago He was graduate student and fellow of the university (1895–99) and literary secretary to President Wm R Harper (1899–1906). After 1915, he was professor of Semitic languages and literature He is the author of *Biblical Ideas of Atonement,* with E. D. Burton

and G. B. Smith (1909); *Commentaries on Micah, Zephaniah, Nachum and Malachi* (1911–12); *Commentaries on Amos, Hosea and Micah* (1914); *The Prophet and his Problems* (1914); *A Guide to the Study of the Christian Religion*, with G. B. Smith (1916); *Religion of the Psalms* (1922); and has collaborated on Harper-Smith's *Hebrew Method and Manual* (1921) and Harper-Smith's *Elements of Hebrew* (1921).

SMITH COLLEGE. A nonsectarian institution for women at Northampton, Mass., founded in 1871. The enrollment of the college increased from 1638 in 1914 to 2153 in the year 1923–24, the faculty was increased from 146 to 208 members, and the library from 50,000 to 107,000 volumes. Largely through an endowment campaign conducted in 1920, the productive funds of the college were increased from $1,695,892 to $4,264,567. In 1918, a School of Social Work was established, and in 1921 an Experimental School for the Training of Teachers of Retarded Children. Entrance examinations for all students were required, beginning with the fall of 1919. Marion LeRoy Burton was succeeded by William Allan Neilson, Ph.D., LL.D., as president in 1917.

SMITH-LEVER ACT. See AGRICULTURAL EXTENSION WORK; EDUCATION IN THE UNITED STATES.

SMITHSONIAN INSTITUTION. An institution in Washington, D. C., created in 1846 for the increase and diffusion of knowledge among men. Throughout the decade 1914–24, geological explorations were carried on in the Canadian Rocky Mountains by the secretary of the Institution, Charles D. Walcott. He investigated the Lower, Middle and Upper Cambrian formations at Wonder Pass, the great interval of non-deposition of sedimentary rock-forming material along the front range of the mountains west of Calgary, Alberta, and the pre-Devonian strata of Sawback Range as far as the headwaters of the North Fork of the Saskatchewan River. Dr. R. S. Bassler, curator of palæontology, carried on explorations between 1914 and 1921 to determine the geological history of the Appalachian, Ohio, and Mississippi valleys. Frank Springer made collections of fossil echinoderms along the new Erie Canal in western New York State and also in the Ohio valley. Fragmentary remains of a fossil bird related to *Hesperonis* in the Judith River formation were discovered in Montana. Dr. Wherry completed the areal mapping of various formations in Pennsylvania, and a geological survey was made of the Canal Zone in 1914.

Arthur Sowerby went on a zoölogical exploration trip in China and Manchuria in 1917, and was again in that region at the close of 1923. H. C. Raven collected zoölogical specimens in Borneo and in Celebes, Dutch East Indies; collections of corals, birds, cacti, and invertebrates were gathered in the Danish West Indies, east Cuba and Haiti. Two expeditions were sent to Africa. The Collins-Garner Congo Expedition collected many specimens of apes and about 2500 mammals, birds, reptiles, fishes and invertebrates for the National Museum in 1917. The Smithsonian African Expedition, organized under the direction of Edmund Heller, spent 1919–21 in the interior of the continent collecting specimens for use in comparison in working up the collections made in Africa by Theodore Roosevelt, Paul Rainey, and others. Charles M. Hoy directed an expedition to Australia in 1920 and 1921 to study the fauna, which was rapidly being exterminated.

Dr. A. S. Hitchcock made botanical explorations in the Hawaiian Islands in 1917; studied the grasses of the Adirondacks and White Mountains in 1918; conducted an expedition to British Guiana in 1920; and spent several months in the Orient in botanical work under the Department of Agriculture. Dr. J. N. Rose, with the coöperation of the Carnegie Institution, made explorations in South America. Botanical collections were also made in Santo Domingo and Haiti by Dr. W. L. Abbott and Emery C. Leonard, and in Jamaica by William R. Maxon.

The chief of the Bureau of American Ethnology, Dr. J. Walter Fewkes, was engaged during the decade in the excavation and repair of the large prehistoric Indian ruins in Mesa Verde National Park and of ruins in neighboring valleys. Aleš Hrdlička was sent in 1920 to the Far East to pursue his researches on the origin of the American Indian and the peopling of eastern Asia. Anthropological expeditions were sent also to Africa and to Siberia in 1915 and in 1923 to the Paleolithic regions of France and Spain. The American School of Archæology was organized in China in 1914. Prof. W. H. Holmes participated in an exploration by the Carnegie Institution in 1916 of the ancient Maya cities in Guatemala and Honduras, and in 1919 archæological investigations were begun by Philip A. Means in Peru and Bolivia.

The Langley Aërodynamical Laboratory was opened in 1914 for the study of the principles of aerodromics, especially those of aërodynamics, and for research to increase the safety and effectiveness of aerial locomotion. In the astrophysical laboratory a balloon pyrheliometer was designed in 1916 to measure the heat of the sun at high altitudes, and during the 10-year period, great advances were made in the methods of observing the solar radiation, including the establishment of two new observing stations, one in Arizona, the other in Chile. In 1917, F. G. Cottrell invented a method of electrical precipitation of suspended particles which was used commercially by smelting and refining companies.

The Institution continued to publish the results of its investigations, distributing 1,600,000 publications during the 10 years to libraries, educational institutions and individuals. A Congressional appropriation in 1920 made possible the establishment of the National Gallery of Art as an independent bureau under the administration of the Smithsonian Institution The Freer Gallery of Art was established under the administration of the Smithsonian Institution in the year succeeding, under the provisions of the will of Charles L. Freer, who gave it his large and varied collection. The National Museum made great progress during the 10-year period, large additions being made to its collections through gifts, bequests, and transfers from the Federal agencies. Many of the objects in its collections, new to science, were studied and described by the members of its technical staff, and the results were made known through the Museum *Proceedings* and *Bulletins*. See EXPLORATION.

SMOKELESS POWDER. See EXPLOSIVES.

SMOKE SCREEN. See WAR IN EUROPE, *Naval Operations*.

SMOOT, REED (1862–). An American legislator (see VOL. XXI), United States Senator from Utah. He was first elected in 1909 and was reëlected in 1914 and in 1920. He was a member of the Public Lands and Service, the Appropriations, Finance and the Pensions Committees in the Senate. He was conceded to be the first authority on finance and governmental expenditures, and had much to do with the preparation of the various tariff bills passed during his time of service.

SMUTS, JAN CHRISTIAN (1870–). A South African statesman (see VOL. XXI). As commander-in-chief of all the British Imperial forces in German East Africa, he showed great vigor and before the end of 1916 had entirely broken the German power there. He was then summoned to London by Lloyd George for the deliberations of the Imperial War Cabinet, of which he became the only permanent Dominion member. He represented South Africa at the Peace Conference. In 1919, he became prime minister of the South African Union and was faced by the Nationalist agitation led by General Hertzog. At the general election of 1920 he failed to obtain a majority for his party in Parliament. Faced with the necessity of a union with either the Nationalists or the Unionists, he turned to the Unionists, as the Nationalists were unwilling to give up their hopes of a republic. With the Unionists' help, his party, called the South African party, obtained a good majority in the election of 1921. The Labor party and the Nationalists joined forces against him, however, and on June 23, 1924, he was forced to resign and a coalition of the Nationalist-Labor party came into power with General Hertzog as prime minister.

SMYRNA. By the Treaty of Sèvres (Aug. 10, 1920), Greek diplomacy, largely the work of Venizelos, achieved a triumph when this important region of Anatolia (Asiatic Turkey) was assigned to Greece. But it was won only to be lost again, and by the definitive Treaty of Lausanne (July 24, 1923) it reverted again to Turkey. The artificial nature of the earlier settlement, the defeat at home of Venizelos (December, 1920) and the triumph of Nationalist Turkey (1921–22), all contributed toward hastening the downfall of Greek power in Asia. Venizelos, in his memorandum of Dec. 31, 1918 to the Peace Conference, had asked for the creation of an autonomous Smyrna, made up of the Turkish vilayets of Aidin and Brusa; this region, he claimed, was inhabited by Greek majorities and was set off topographically from eastern Asia Minor. But earlier Allied commitments, notably those to France and Italy, prevented the erection of such a territory, with the result that the Smyrna region awarded to Greece by the Treaty of Sèvres was indefensible on ethnographic, economic, and geographical grounds. The Smyrna of the Treaty of Sèvres was made up of the entire sanjak of Smyrna and certain districts of the sanjaks of Manisa and Akhissar. On the north, its frontier went to the Bay of Adramyti, on the south, to Kemer. The zone possessed a population, according to the best 1914 figures, of 1,057,000 divided into 509,000 Greeks, 470,000 Moslems, and 78,000 others. The city of Smyrna, in which the whole region centred, had ranked before the War as the second largest part of the Ottoman Empire and in exports, its trade had surpassed even that of Constantinople. It served a vast hinterland extending east as far as the Ushak and Karahissar uplands, north to the Dardanelles, and south to Adalia. Its railway communications were the best in Turkey, for the Smyrna-Kassaba line connected with Afiun Karahissar on the Bagdad system, and branches ran north and south. This region was, in 1920, created an autonomous Turkish province under Greek administration The treaty required Greece to establish a local parliament in Smyrna with an electoral law to be approved by the Council of the League of Nations. After five years, this local parliament was to have the right, if it desired, to petition the League for the absolute and definitive incorporation of the Smyrna area into the Greek kingdom, but no provision was made for a petition in favor of reunion with Turkey. Practically, the treaty clauses meant that Smyrna was to be under the provisional Greek administration for five years, as a transitional stage, and then to be annexed to Greece. The settlement was attacked, ethnographically, on the following grounds. It did not solve the Greek problem in Anatolia for at least 66 per cent of the Greeks lived outside the zone. Again, it would be impossible to move the other Greeks to this enclave for they consisted largely of traders and the like, and therefore had fixed economic interests in their places of residence. From the economic point of view, the settlement was a poor one because Smyrna was not essentially a Greek city but a great entrepôt of trade linking the West with Anatolia, and seating a commercial class that included French, Dutch, and British merchants and capitalists as well as Greek. As for geography, it was at once recognized that the frontiers, as created, cut across rivers, valleys, and railways, and only in the south followed a natural line of division. The hostility of the Turks to the cynical *Realpolitik* of the Allies in the whole matter of the Greek programme requires no further explanation. Smyrna, originally, had been promised to Italy by the secret agreement of St. Jean de Maurienne (April, 1917); but the reluctance of the Italian people to countenance a costly imperialistic adventure accounted largely for the failure of the Italian government to push its claims or stand in the way of the Greek aspirations. Therefore the Greek occupation of Smyrna at the invitation of the "Big Three" proceeded unopposed (May 15, 1919). But not unopposed by Turkey, for the occupation was attended by dramatic results. Spurred on by Greek excesses in the Smyrna zone and their deep-seated hatred of the Greeks, whom they regarded as inferiors, Turks throughout the whole of Anatolia sprang to their nation's defense, and gave support to the newly organized Nationalist government located at Angora. Both sides mobilized for war, until by 1921 there were 200,000 Turks and as many Greeks under arms. The Powers made little effort to interfere except for an attempt at the London Conference of Mar. 11, 1921, to rewrite the Sèvres clauses respecting Smyrna. Military interference was out of the question, and in May, 1921, the Powers declared their neutrality, and as was at once evident, abandoned the Greeks to their fate. The war in Anatolia was waged during 1921–22 with varying fortunes (see GREECE), and suddenly terminated in September, 1922, when the Greeks fleeing to the coast entered the city of Smyrna to make for their ships. The Allies took over the city on September 8,

the Turks entered September 11, and on September 14 a fire broke out that almost gutted the city and accounted for the loss of thousands of lives. The course of the war had been marked by an unusual ferocity during which the atrocities of the Greeks matched if they did not surpass those of the Turks. In fact, it was even contended that Smyrna had been fired by the Greeks to shake the West out of its apathy. But Europe had looked on the whole Greek adventure askance: the Greeks in Anatolia had complicated the problem of a Turkish peace and had made possible the resurgence of a Nationalist Turkey. Italy had naturally enough disapproved the Greek adventure from the outset, and had made separate amicable bargains with the Turkish Nationalists in 1921–22; France, after the Peace Conference, had looked on Greek aims with unfriendly eye, and had likewise made terms with Nationalist Turkey; while the British government, though at first willing enough to utilize Greece as a pawn in Near Eastern politics had lost enthusiasm after the overthrow of the ingratiating Venizelos, and, in view of French and Italian coolness, was willing enough to see the pawn swept off the board The Greeks were out of Anatolia in 1922, and the strength of Turkey as against the impotence of Greece, made the question of Smyrna's disposition now relatively simple. The ultimate character of the settlement was foreshadowed in the Armistice of Mudania (Oct 10, 1922) between Turkey and Great Britain, France and Italy, which among other things assured Turkey of complete sovereignty over Anatolia. A preliminary step was taken in the Lausanne Agreement (May, 1923) between the Turks and Greeks by which the question of Greek damages in Smyrna was amicably settled on the basis of compensation in Thrace (q.v.). Finally, in the Treaty of Lausanne (July 24, 1923), the Greek loss of Smyrna was confirmed. One of the most brutal, and yet possibly necessary elements rising out of the Greek defeat was the arrangement made for the exchange of Greek and Turkish populations. From August, 1922, when the flood of Greek refugees from Asia Minor began to pour into Greece, into 1924, the process of colonizing Greeks (some 500,000) in the home lands went on steadily. But for the aid rendered by the Refugee Commission which was created by the League of Nations Council and headed by Mr. Henry Morgenthau of New York, the task might well have been insuperable

SNEDDEN, DAVID (1868–) An American educator, born at Havilah, Cal He was graduated from St Vincent's College in 1889 and took postgraduate courses at Stanford and Columbia Universities. For several years he served as principal of schools in California and from 1901 to 1905 was assistant professor of education at Stanford University In the latter year he was appointed adjunct professor of education at Columbia, serving until 1909, when he became State Commissioner of Education in Massachusetts In 1916, he became professor of education in Columbia. Professor Snedden was a member of many learned societies and published, among other works: *Administration of Education for Juvenile Delinquents* (1906); *Educational Administration in the United States* (1908); *Problems of Vocational Education* (1911); *Problems of Secondary Education* (1917); *Vocational Education* (1920); *Sociological Determination of Objectives in Education* (1921). From 1918 to 1920, he was president of the National Society for Vocational Education.

SNOWDEN, PHILIP (1864–). An English public official (see VOL. XXI). During the War he was a member of the Liquor Control Board, and in 1924 he was appointed Chancellor of the Exchequer in Ramsay Macdonald's cabinet. His first budget reduced the customs on sugar, tea, cocoa, etc., and abolished the duties on automobiles. He wrote *Through Bolshevik Russia* (1920) and *A Political Pilgrim in Europe* (1921).

SNOW REMOVAL. See ROADS AND PAVEMENTS.

SNYDER, VIRGIL (1869–). An American mathematician, born at Dixon, Iowa. He studied at Iowa State University, and then held a fellowship at Cornell, after which he studied abroad, receiving his Ph.D at Gottingen in 1894. He returned to Cornell as instructor of mathematics and in 1910 became professor His original investigations include studies on the geometry of the line and sphere, configurations of ruled surfaces, and birational transformations, the results of which he published He became editor of the *Bulletin* of the American Mathematical Society in 1903. Besides various scientific papers, he wrote *Differential Calculus*, with James McMahon (1898); *Differential and Integral Calculus* (1902); *Elementary Text-book on the Calculus* (1912); *Analytic Geometry of Space* (1913). He also edited *Plane Geometry* (1910), and *Solid Geometry* (1912).

SOCIAL INSURANCE. An increasingly important phase of social legislation was the application of the insurance principle to various classes of misfortunes that handicap workingmen, to afford relief in case of unemployment, accident during employment, occupational disease, sickness, and invalidity and old age. See WORKMEN'S COMPENSATION; OLD AGE PENSIONS, and MOTHERS' PENSIONS.

The problem of unemployment, in its relation to the worker's welfare, was first attacked on a national scale in Great Britain in 1911, when a compulsory unemployment insurance act was passed, affecting 2,225,000 people in specified trades, and encouraging voluntary insurance in other trades. This scheme was extended to affect 3,725,000 people in 1918; in 1920, to include all over 16 years of age, with certain exceptions In 1922, a compromise plan was under consideration, combining the State plan with one providing for insurance by industry. Administrative cooperation with the labor exchanges greatly minimized the genuine problem of detecting those unemployed because of laziness. In other countries, the measures taken had provided generally either for voluntary funds managed by societies or unions, and compulsory or voluntary municipal funds, subsidized by the state, provincial or municipal governments. The municipal unemployment fund plan was adopted in Italy (1910), Germany and Holland; insurance through subsidized societies was more general in France, Norway, Denmark, Spain (1919), and Switzerland. Switzerland in 1919 adopted a temporary Federal measure providing for unemployment insurance; and in 1920

Italy established a compulsory system. See UNEMPLOYMENT.

Compulsory insurance against sickness and accidents had been established for several decades in Germany, Austria and Hungary. It covered a wide range of occupations. The National Health Insurance Act passed by Great Britain in 1911, which was compulsory, and universal with a few specified exceptions, and provided for sickness, disablement, maternity, medical and sanatorium benefits, was amended several times during and after the War, changing the amounts both of weekly contributions and benefits. In 1912, Switzerland adopted an insurance law covering sickness and accidents, for the latter compulsory, for the former generally voluntary. Italy's compulsory insurance law of 1920 (see OLD AGE PENSIONS) also provided against sickness or accident. Health insurance legislation had been adopted in Poland; and in 1922 such protection was legislated in Latvia and Jugo-Slavia. The question of health insurance received considerable attention in the United States in 1916–18, when commissions were appointed by a number of States to investigate the need and possibilities of such legislation, but the movement met with considerable opposition on the ground that compulsory payment was an infringement of personal liberty, and that sufficient means for health insurance were already available in various friendly orders, unions, corporations, and commercial insurance companies.

SOCIALISM. The history of socialism after 1914 did not bring forth any noticeable change in principle. The great struggle in the socialist ranks during 1914–24 was concerned primarily with tactics, for throughout these years the socialist principle retained its solid Marxian basis. While there was much debate among the three foremost groups, the communists under Lenin, the orthodox socialists under Kautsky, and the "revisionists" under Bernstein, none of these groups ever seriously questioned the fundamental Marxian doctrine. In regard to procedure two distinct camps appeared, the one favoring the attainment of the socialist aim through the dictatorship of the proletariat, and the other striving for the same end by utilizing the existing political and economic institutions. In addition socialism came to lean more and more on organized labor and adopted under the influence of syndicalism, industrial unionism, and guild socialism, tactics of a more strictly industrial character. Tactics, the disruption of international socialism, and the final reconstitution of the International mark the years from 1914 to 1924.

The Socialist International. Early in 1914 plans had been made to hold an International Congress on Aug. 23, 1914, in Vienna for the commemoration of the founding of the International Workingmen's Association 50 years before. This congress was never held because with the outbreak of the War international socialism broke up into its component national parts. The general strike against war was not called in spite of all previous plans for such action, and the War swept international socialism away regardless of individual mass meetings and protests against war in various countries. Most socialists placed their country's needs ahead of their socialistic principles. The Belgian, the French, many of the British, and most of the German socialists supported their respective governments. Only the Russian, some of the British, and a small minority of the German socialists remained passive. During 1915 more or less determined efforts were made to reconstruct the disrupted International, and toward this end a conference was held at the instance of the Scandinavian socialists during January, 1915, in Copenhagen. Only the Scandinavians and the Dutch, 16 delegates in all, attended. In February of the same year the socialists of the Allied countries held a conference in London, which, however, concerned itself with victory rather than with peace and criticized the imperialism of all the warring countries only perfunctorily. More important than either of these two was the conference held at Zimmerwald, Switzerland, in September, 1915, at the invitation of the Italian socialists, at which were present representatives of all the important socialist parties, exclusive of the British to whom passports had been refused This conference emphasized the international solidarity of all socialists and issued a manifesto condemning the War. Nothing definite, however, was accomplished, and the efforts at welding together the broken up International proved equally unsuccessful in 1916. The International Socialist Bureau, which had been removed at the outbreak of the War from Brussels to the Hague and which was now under the direction of the Dutch socialists, held a conference at its seat July 30–Aug. 2, 1916, which was attended by representatives from Sweden, Denmark, Holland, the United States, and Argentina and at which resolutions were adopted placing the responsibility for the War on the capitalist system. The socialists of belligerent and neutral countries, who had convened during the previous year at Zimmerwald, met again in August, 1916 at Kienthal, Switzerland. The majority of the 40 delegates at this conference represented the Italian Official Socialist party, and the Swiss and Russian socialists. Only two Germans and three Frenchmen attended, and hence the conference accomplished very little. Renewed efforts at international unity brought about the so-called Peace Conference of Stockholm in June, 1917 The plan initiated with the Russian Workmen's and Soldiers' Council and found response among the Germans and Austrian socialists who drew up an elaborate peace programme on the basis of "no annexations and no indemnities" Of all the important socialist parties, only the Germans attended, and the conference was therefore an utter failure. More concrete results were produced by the Inter-Allied Labor and Socialist Conference of Feb. 21–23, 1917, at London. It voted a declaration of war aims, commonly called the London Memorandum, which endorsed President Wilson's four principles essential to peace and the British Labor party's programme as to war aims, and advocated a League of Nations. On that basis, however, unity with the enemy socialists was hardly possible at that time. Another Inter-Allied Socialist Congress met in London during September, 1918. A majority resolution approved efforts to aid revolutionary Russia against Germany, while a minority, which wished to go much further in support of the Soviet government, was condemned as pro-Bolshevik. Amid continued attempts during 1919 to revive the disrupted Second International, 12 radical socialist parties met at the instance of the Rus-

sian Soviet government at Moscow, Mar. 2–6, 1919, and formed the Third International, a strictly communist organization. The International Socialist Bureau, the only remnant left of the Second International, summoned the Berne Conference of February, 1919, at which 26 countries were represented. The Conference settled a number of points of conflict and expressed its opposition to the Communist International. In the following August the committee for the reconstruction of the Second International held a session at Lucerne, at which further progress was made and a congress for the following year was decided on. At the Congress of Genoa, August, 1920, international socialism was finally reconstituted after six years of discord. The organization was, however, by no means complete, for many socialist units remained outside its fold. The Congress declared emphatically against the acts and programme of Lenin and Soviet Russia and adopted in the main British Labor party features and principles. A score of socialist parties attended the Conference and affiliated with the new international body. Amsterdam was chosen as the permanent seat. The Third International held a Congress at Moscow in 1921 which was attended by several hundred delegates from 42 countries. The result of this meeting was the maintenance of the Soviet doctrine in all its purity Socialist groups that were opposed both to the nationalist tendencies of the Second International and the centralism and exclusive communist character of the Third International organized in Vienna, Feb. 2, 1921, the International Working Union of Socialist Parties, or, as it was commonly termed, the Second and a Half International The chief adherents of this body were the Independent Labor party, the German Independent socialists, the Socialist party of France, the Austrian, Swiss, and Rumanian socialists, and the Russian Mensheviks. This intermediary organization soon manifested a desire, however, to coöperate with the other Internationals, and at its instance a conference of the three Internationals was held in the Reichstag building in Berlin, Apr. 2–5, 1922, at which a basis for common procedure was discussed While the Conference and the subsequent meeting of its Committee of Nine, Berlin, May 23, 1922, ended in failure as far as the Moscow International was concerned, it succeeded in bringing the other two organizations closer together. This rapprochement continued during the remainder of the year and at the meeting of the executives of the two bodies at The Hague, Dec. 10, 1922, it was decided to call a congress at Hamburg for May 20 of the following year, in order to bring about united socialist action. At this congress 424 delegates from 30 countries, representing 43 socialist parties or groups, were present. The Vienna International and the Second International merged and formed the Labor and Socialist International with its permanent seat in London. Thus the socialist parties of the world, with the exception of the communist groups, were united for the first time since August, 1914. The new organization and the Third International continued their hostility to each other.

France. The elections of 1914 increased the number of seats of the socialists in the French Chamber to 101. The outbreak of the War found the French socialists giving uniform support to their government. They regarded the War as a war of defense on the part of France and dropped the antimilitarist plank from their platform. During 1915 and the greater part of 1916 they continued this solid indorsement of the government, but late in 1916 a steadily growing minority element sprang up which opposed the War At the Socialist Congress of Bordeaux, October, 1917, it became apparent that the majority had swung over to the minority viewpoint; but a fusion of the two groups did not take place, since no agreement could be reached on the question of war credits. In April, 1919, the French Socialist party voted to remain in the Second International, protested against the Peace Treaty of Versailles, and condemned the League of Nations. At the elections of 1919 it polled 1,750,000 votes, a gain of 40 per cent, but its representation in the Chamber was reduced to 55 seats. In 1921 the communist element seceded from the Socialist party and founded an independent organization, which polled 321,444 votes against 578,466 for the socialists, in the elections of May, 1922. At its national congress at Lille, 1923, the French Socialist party rejected a proposal from the communists for united action against the occupation of the Ruhr and the danger of an imperialist war. On the same occasion it voted for recognition of Russia. In the May elections of 1924, it increased its membership in the Chamber from 55 to 101 seats. With the secession of the communist element, the party became more moderate, this being manifested by its apparent willingness to support a Radical Socialist government, without, however, actually participating therein. See COMMUNISM.

Germany. While the War was still imminent, the German socialists voiced their protest against it in organized mass meetings, but once war was declared the Social Democratic party in the Reichstag, with a few exceptions, supported the government and voted the war credits. As the War progressed, dissatisfaction with the party's attitude toward the government and the War appeared in the Reichstag group and, although few in numbers during 1914 and 1915, the dissenters were strong enough in 1916 to break with the party and form a new organization, the Socialist Union of Labor, which mustered 20 members in the Reichstag and adopted a programme uncompromisingly opposed to the War. Thus the conflict between internationalism and nationalism had split the great German Social Democratic party. During 1917, the new organization grew in strength and called itself the Independent Social Democratic party. It demanded immediate peace and branded the War as capitalistic throughout, while the adherents of the old party, now called the Majority Socialists, supported the government and sought internal economic and political reforms and a peace honorable to Germany. With the disastrous close of the War, and the revolution, the Majority Socialists took over the government. When the Independent Socialists seemed to be willing to support them, a minority among them, which had been most outspoken in its hostility to the War, seceded and expressed sympathy with the Soviets. The Spartacists, as these ultraradicals called themselves, began an uprising in January, 1919, which was forcibly suppressed by the Majority Socialist government. As a result of the elections of 1919, the government passed completely into the hands of the Majority Socialists, but

the Independents made also considerable gains. Of the three socialist groups which thus existed in Germany, the Majority and Independent Socialists favored the Second International and the Spartacists the Third International. In October, 1920, however, the Independents pronounced their adherence to the Moscow body. At their annual national congress at Goerlitz in September, 1921, the Majority Socialists decided to coöperate with the bourgeois parties. In September, 1922, in the Convention of Nüremberg, the Majority Socialists and the Independents combined into the United Social Democratic party. A small minority of the Independents held aloof and joined ultimately the communists. The Reichstag group of the communists joined in 1923 the Reichstag group of the United Socialists and formed with some of the former Independents the left wing of that party, but in the Reich the socialists lost many members to the communists. This leftward trend within the socialist rank and file became clearly apparent in the elections of May, 1924, when the seats in the Reichstag of the United Socialists were reduced from 166 to 100, while the communists obtained 60 seats against 15 in the old Reichstag. As a result of this leftward movement and of the great Nationalist gains, the active or passive participation of the socialists in the government was doubtful in the summer of 1924.

Great Britain. Early in 1914, the three outstanding British socialist societies, the British Socialist party, the Independent Labor party, and the Fabian Society, drew up a plan for closer coöperation, but here, as elsewhere, socialist progress was checked by the advent of the War. In England, as in Germany, there was at first organized socialist protest against the War. This changed once the conflict had become a reality. The Labor party, only partially socialist in character and composition, gave full support to the government while the Independent Labor party remained aloof. Thus, on the whole, British socialism and the Labor party remained loyal to the government throughout the War (except for a group of British socialists) and in the closing years of the struggle socialist members of the Labor party accepted posts in Lloyd George's War Cabinet. After the War, in 1919, unsuccessful attempts were made to bring together the British Socialist party, the Independent Labor party, and the Fabian Society. There had been a fourth group, the former Social Democratic Federation, now called the National Socialist party, which in 1920 assumed its old name and joined the Labor party. The latter, still only partially a reflection of socialist views and principles, became in the post-war period increasingly socialist in character and its gains in the elections of 1919 were regarded as socialist gains. In 1920, it expressed itself as opposed to the Third International. At the same time the radical British Socialist party became the British Communist party (see COMMUNISM) and was joined by the Socialist Labor party, an offshoot of the American Socialist Labor party. Towards the end of the War, guild socialism (q.v.) and syndicalism, (q.v.), two nonpolitical and strongly industrial movements, began to exert an ever increasing influence on British socialism and in the post-Armistice years these movements became even more powerful. The elections of 1922 made the Labor party, with 142 members in the Commons, the chief party of opposition and after the elections of 1923, which increased its strength to 191 seats, the Labor party took over the government with the passive support of the Liberals. The Labor party was affiliated with the Labor and Socialist International of which it was the leading spirit.

The United States. The American Socialist party lost rather than gained during 1914. Although it elected Meyer London to Congress, it polled at the November elections over 200,000 votes less than in 1912. During 1915, there was a great deal of strife in the party over the nonparticipation of the American socialists in the Copenhagen Conference. The party was rather successful in that year in electing candidates to State and local offices. At the presidential election of 1916, however, it polled over 150,000 votes less than in 1912. America's entrance into the War in 1917 had the same disrupting effect on the American Socialist party that the War had had on the socialist parties of other countries. After endeavoring in vain to have the party repeal its expression of opposition to the War, a patriotic group seceded and formed the Social Democratic League in 1918. During the same year the American government suppressed many antiwar activities of the socialists by imprisoning a number of them, including Eugene Debs. New factional disputes arose in 1919 after the Chicago Convention, at which the party declared in favor of the Third International. The radical elements left the party and formed the groups subsequently known as the Communist party and the Communist Labor party (see COMMUNISM) Thus the American Socialist party lost considerable influence due to its middle-course policy. On the one hand it alienated the more conservative elements, while on the other hand it lost those who were communist in sympathy and wished to stand squarely on the Moscow programme. In 1920, the American socialists took a definite stand against Moscow by insisting on using their own judgment as to their principles and tactics. That year was also marked by the suspension of the five socialists elected to the New York State Assembly. When these were reelected, three of them were again suspended in December of the same year. At the national elections in 1920, the party polled about one million votes. In 1921, the sentences of Debs and a number of other socialists, imprisoned during the War under the Espionage Act and other war-time measures, were commuted. At the Convention of 1922, the Socialist party voted for affiliation with the Vienna International and for unreserved recognition of Russia. In Wisconsin the Socialists sent Victor Berger to Congress in the elections of 1922, while Daniel W. Hoan became mayor of Milwaukee for a third term. In New York City the Socialist party joined in the elections with The Farmer-Labor party to form the American Labor party. An invitation from the Workers' party, the successor of the Communist party, for coöperation in various matters was rejected unanimously at the annual convention, May 19–23, 1923. In the elections of the same year the Socialist party in New York City cooperated again with the Farmer-Labor party. The American Socialist party was represented at the Unity Conference of the Vienna and London Internationals and affiliated subsequently with the Labor and Socialist International.

Italy. The Italian Socialists were opposed to

the War and voiced their protest against it in various ways, making plain their hostility even after Italy's entry and throughout the duration of the War. The post-war period saw the same internal dissension in the Italian party, communists and reformists forming separate organizations. The growth of Fascism weakened the socialist movement, the elections of May, 1924, indicating a marked retrogression.

Russia. The Russian socialists were almost uniformly opposed to the War and suffered severe persecution from the Russian government. For further details see COMMUNISM.

SOCIAL PSYCHOLOGY. Like all the new sciences, social psychology had to struggle against the tendency to conceive science on the literal model of mathematical physics It is hard for the human mind to escape the fascination of rigid laws and absolute predictability, even when such a prospect destroys the very purpose of the scientific research If social psychology were reducible to a mechanical system, it would be a monstrosity, and no one would be interested to study it. And yet because the scientific intelligence, in its ordinary workings, divides and classifies into pigeonholes, more than one social psychologist found himself embarking on vain constructions until he was awakened by the complexity of the subject matter.

In this connection, a short regression into the history of social psychology is instructive The new science was called into being to supplement the science of individual psychology The latter science, being investigated on an experimental, physiological basis, was powerless to bring together the complex facts and tendencies of human life, and it was therefore necessary to add a new member to the intellectual encyclopædia. But no sooner was this member added than the problem came up of finding a specific method for it By scientific method most persons understand positive method, a method that gives results that anybody can understand without the necessity of a cultural initiation or direct sympathy. But it was the insistence upon such a positive and objective method that had impoverished the science of individual psychology and had robbed it of all the hopes aroused by the literary psychologists and the authors of the naturalistic novel. A similar insistence was bound to bring about an analogous disappointment with social psychology.

The best illustration of this development is to be found in the writings of Wilhelm Wundt For nearly half a century, the director of the Leipzig laboratory dominated the science of psychology in Germany. In his later years he turned from individual psychology to *Volkpsychologie*, but he continued to apply the same "structural" formula—the search for elements and laws. He defined the social mind as an individual synthesis possessing actuality, although in his physiological psychology actuality was regarded as immediacy of experience and was therefore personal. Moreover, in dealing with the group mind as a synthesis, Wundt entangled himself in the same difficulty as in his apperceptive synthesis of the individual mind. The apperceptive synthesis was a union of psychophysical sensations, and yet it had a reality over and above its component atoms.

So, too, the group mind was a synthesis of individual minds and seemed to have a substantial existence of its own. Wundt held that the attributes of the group mind were to be determined by the analysis of its products; thus the attributes of the German mind were to be formulated by an analysis of the collective acts of the German people, those of the French mind by an analysis of French acts, etc But in practice Wundt's laws of folk psychology were but applications of individual psychology; just as in practice his analysis of immediate psychological experience tended to be degraded more and more into mere physiology.

In Germany, Wundt's folk psychology met the opposition of those who approached collective phenomena from the study of history and the evolutionary development of peoples. Krüger was the leader of this group—the school of *Entwicklungspsychologie* or developmental psychology of groups. The conflict paralleled the historic quarrel in France between the objective sociologists and psychologists like Gabriel Tarde who hoped to explain all social phenomena through the mechanism of the instinct of imitation.

In the United States and in England, the issues were never so sharply drawn; for one reason, because no rigorous discipline was developed for the study of social facts McDougall's *Social Psychology* served for many years as a model for all students of the subject. Its method was thoroughly empirical—empirical, that is, in the British sense, without being objective. Inspired largely by the *Dynamic Sociology* of Ward, Professor McDougall had undertaken to put into relief the component individual motivations which go to make up the movement of life which we call society. Because this system of motivations was elaborated in the form of a textbook treatise instead of a novel, as Thackeray's *Vanity Fair*, both the author and his critics tried to judge the work as objective science in the manner of physics. Professors disagreed as to the number of instincts and inherited dispositions man possessed at birth; whether these instincts were immutable or could be propitiated by a favorable environment; and finally as to the relation of these instincts to ethics and religion. Some even attempted to verify the existence of the instincts by the aid of a physiological microscope and discovered only simple and conditioned reflexes.

It is significant that in setting about to study the same social phenomena from another angle, Professor McDougall arrived at the conception of a *group mind.* Such a conception is, after all, another way of expressing the literary notion of a national genius, or a national spirit, with fairly definite characteristics. The difficulty comes in the attempt to put such conceptions on the level of objective visibility and precision, and the difficulty is involved in the very notion of objectivity. We may, in this connection, qualify as objective any judgment which remains true or is capable of becoming true for all men regardless of their psychological motivation, or their personal or moral caprice. Such a definition, it is obvious, applies only to the world of matter and the world of numbers. When we step outside of these relatively simple fields, we are compelled to rely on metaphors—metaphors which are more or less adequate to the artistic task of expression. A recognition of this fundamental relationship between the objective and the nonobjective at once clarifies

the task of the social sciences, and indicates a natural division between social psychology, sociology, and practical ethics.

The simplest field of the three is sociology, or the study of social statics. This science deals with facts and figures which do not lie but which are quite misleading when they are regarded as the whole story. The function of social psychology, on the other hand, is to organize a marionette show capable of explaining and interpreting any set of objective statistics that we may pick. Social psychology, then, cannot be a rigorous science that can be added to, brick by brick. It is rather an imaginative conception of a hypothetical structure, and gives as it were the local color setting to the drama of practical action Whether we call this action applied sociology or applied social psychology, or social ethics, does not really matter, so long as we do not presume by any theoretical or imaginative schematism to close the system of experience and shut out the necessity or the possibility of practical action. Of the two theoretical sciences, sociology is the more objective, the more universally true; but for that very reason, the practical applications of sociology are less deducible from the data and more dependent upon what Prof Roscoe Pound calls "the prerogatives of the expert" But in the case of social psychology, its imaginative schematism is something already interpretative and subjective, something already foreshadowing a practical goal. Thus Professor McDougall's *Social Psychology* contains within it a morality; as does also the more daring and imaginative treatise of Mr. Trotter Professor Dewey's *Human Nature and Conduct* is frankly couched in terms of a pragmatic idealism, and for that reason the analysis and discussions are instructive even to those who do not accept all the premises of that philosophy.

If our characterization of the essence of social psychology is correct, it follows that it cannot be taught in the dogmatic manner of textbooks. And yet because of the insistent demand for positive principles, more textbooks were written during the decade under consideration than works of a stimulating intellectual character. The behavioristic revolt in general psychology led to a similar manifestation in our field, and there was more than one attempt to simplify the complexities of social life to the mechanism of stimulus and response. Such a scheme gives only an imitation of knowledge and does not bite into the actual movement of things. M. Bergson has said that the human intelligence, as it comes out of the hands of nature, is capable of dealing only with the unorganized solid. Such a judgment goes far to explain the naïve constructions produced by some of the students of the youthful science of social psychology. They went at the science with heavy marching boots and failed to understand the subtleties involved in human culture.

It should be remembered that the social sciences all took their rise as part of a reaction against polite literary culture, with its conventional phrases and moral homilies. This reaction was born of an excessive faith in the methods of physical science, which was set up in opposition to humanism. The social sciences were to replace cultural studies and were to give a positive solution to the problems which cultural tradition had been able to pose only in vague terms. Now despite the exaggerated tendencies of the new sciences, they have had a salutary effect in toughening our cultural values. In teaching us to resort to conscious reflection and analysis instead of to react passively to the suggestion of traditions, they have done their task well. Where they have failed is in not always applying the artistic finesse necessary to the subject. This is the future task of social psychology.

SOCIETY ISLANDS. See PACIFIC OCEAN ISLANDS.

SOCIOLOGY. See SOCIAL PSYCHOLOGY.

SOIL. The highly important rôle which colloids play in soils was emphasized by investigations, and much new light was thus thrown on the physical and chemical properties of soils. The colloids, which appear to be not a group of substances but matter reduced to a certain degree of fineness, have been shown to occur in soils in larger proportions than was formerly realized, and to modify profoundly their absorptive power for water and other constituents, flocculation and deflocculation, and solution and precipitation of soil constituents. The soil survey of the United States now covers over 750,000,000 acres, as compared with 489,000,000 acres in 1914. It furnishes in large measure the fundamental data necessary for classifying the tillable lands with reference to fertility and crop adaptation.

Bibliography. The following books on soil cover recent investigations and new material. T. L Lyon and H. O. Buckman, *The Nature and Properties of Soils* (New York, 1922); Sir A. D Hall, *The Soil*, 3d ed (London, 1920); M. Fleischer, *Die Bodenkunde*, 5th ed. (Berlin, 1922); Edward J Russell, *Soil Conditions and Plant Growth*, 4th ed (London and New York, 1921); Sir John Russell, *Farm Soil and Its Improvement* (London, 1923); F. E. Bear, *Soil Management* (New York, 1924); H H. Bennett, *The Soils and Agriculture of the Southern States* (New York, 1921); F. V. Coville, *The Agricultural Utilization of Acid Lands by Means of Acid-Tolerant Crops* (U S Dept of Agr *Bul. 6*, 1913); Sir E. John Russell, *The Micro-organisms of the Soil* (London, 1923); Edmond Kayser, *Microbes et Fertilité du Sol* (Paris, 1923); P. Ehrenberg, *Die Bodenkolloide*, 3d ed (Dresden and Leipzig, 1922); F. S. Harris, *Soil Alkali* (New York, 1920). There are two scientific periodicals devoted entirely to soils; viz, *Soil Science* and *Internationale Mitteilungen fur Bodenkunde*, and certain aspects of the subject are dealt with extensively in *Journal of Ecology*, as well as in the older agricultural periodicals

SOISSONS. See WAR IN EUROPE, *Western Front*.

SOKOLOV, NIKOLAI (1886–). An American violinist and conductor, born at Kiev, Russia. Having received his first instruction from his father, he entered the Yale University School of Music in 1899, studying the violin under C. M. Loeffler. In 1903, he became a violinist in the Boston Symphony Orchestra. His career as a virtuoso began in 1911 with a tour of England and France. For a time he lived in San Francisco, where he organized a string quartet in 1916 and made his début as conductor with the Philharmonic Orchestra there, which he conducted during the summer of 1916. In 1918, he became conductor of the Cleveland Symphony Orchestra, which he brought to a high degree of efficiency. He also

appeared as guest conductor with several of the great American orchestras and with the London Symphony Orchestra. In 1919, he formed a string quartet with Edlin, Kalodkin and de Gomez, members of the Cleveland orchestra.

SOLAR CONSTANT. See ASTRONOMY; METEOROLOGY.

SOLAR SYSTEM. See ASTRONOMY.

SOLF, WILHELM (1862–). A German public official, born in Berlin. He was much interested in the Oriental languages, studied Sanskrit, and lived a long while in Calcutta. Returning to Germany, he studied political science and was appointed governor of German Samoa in 1900 and German colonial secretary in 1911. He achieved much success in the reform of German colonial administration. He was appointed secretary of state for foreign affairs in October, 1918, and in this capacity conducted the negotiations for the Armistice. He continued to hold this office under the revolutionary Socialist government until December, 1918, when he resigned. Later he was appointed ambassador to Tokyo. He wrote *Weltpolitik und Kolonialpolitik* (1918) and *Kolonialpolitik, Mein Politisches Vermachtniss* (1919).

SOLOMON ISLANDS. See PACIFIC OCEAN ISLANDS.

SOLS. See CHEMISTRY, PHYSICAL.

SOMALILAND. A British African protectorate comprising the Somali Coast on the Gulf of Aden, extending from Labadu to Bandar Ziyada. Its area is 68,000 square miles; its population about 300,000, for the most part Mohammedan and nomadic in character. The chief towns had, by the 1921 census, the following populations: Berbera, 30,000; Zeyla, 7000; Bulhar, 7300. The exports were largely pastoral in nature, i.e. skins and hides, cattle and sheep. The imports were foodstuffs and textiles. Exports for 1921 were £317,659 as compared with £216,596 in 1913–14. Imports for 1921 and 1913–14 were £349,003 and £238,218. Expenditures still continued in excess of revenues and imperial grants-in-aid were necessary to make up deficits. Revenues for 1921–22 were £120,405 (largely from customs); expenditures, £263,128. In 1921–22, a grant of £100,000 was made in the form of a loan. Transport still depended for the most part on the camel. In 1920, the Mullah Mahommed, who for 20 years dominated the interior and consistently fought off the attempts at British penetration, was completely broken when an attack from the air by British aëroplanes wrecked his camp and killed great numbers of his followers. He himself died in hiding soon afterward, and with him passed the power of the dervishes. British rule was thus triumphant.

French Somali Coast. A French colony lying between Italian Eritrea and British Somaliland on the Gulf of Aden. Area, 5790 square miles; population (estimate of 1921) 208,000. Jibuti, the largest town in 1921 had 8366 inhabitants of whom 354 were Europeans. Chief exports included hides and skins, ivory, salt, and fish; total in 1921, 109,361,080 francs. Chief imports were cotton goods and foodstuffs; total in 1921, 129,840,325 francs. A large share of the trade was in transit to and from Abyssinia via the railway from Jibuti to Addis-Abeba (590 miles). The influence of the railway (completed in 1917) on trade was seen in the increased tonnage entering Jibuti. In 1912, 247 ships of 737,748 tons entered; in 1921, 484 ships (307 French) of 1,529,989 tons. The local budget for 1922 balanced at 4,595,000 francs. As a result of the enlightened colonial policy the natives continued orderly.

Italian Somaliland. A colony and three protectorates of Italy extending along the east coast of Africa from British Somaliland to the Juba. Area, 139,430 square miles; population about 450,000. Mogadiscio, the capital of the colony, had 16,000. Attempts were made in the south, in the colony, to turn the native Somali from pastoral pursuits toward agriculture. In 1922, under the Duke of Abruzzi, 7500 acres were put under cotton. In the north, however, the native products continued to be cattle, sheep and skins. Exports for 1921 were 12,130,000 lire; imports, 71,112,000 Leading imports were cotton goods, sugar, rice, petroleum, yarn. Leading exports were hides (from 75 to 80 per cent), dura, maize, gum, butter, cotton The budget for 1922–23 called for revenues of 19,664,000 lire of which 8,422,000 lire was to be an imperial contribution. The military expenditure was to be 3,281,700 lire to maintain an armed force of about 3000 men. There were no railways. Mileage of roads in 1922 was 1135 miles Communications were maintained by 13 wireless stations. A wireless station at Mogadiscio was in touch with Italy via Massawa By the secret treaty of 1915, to facilitate Italy's entry into the War, Great Britain promised to augment Italy's territories to the right of the Juba River in order to assure Italian control of this important watercourse. By 1924, however, no settlement had been reached because of Italy's excessive demands. See AFRICA, *History.*

SOMME, BATTLES OF THE. See WAR IN EUROPE, *Western Front.*

SONIC SOUNDING. See NAVIGATION.

SONNINO, SIDNEY, BARON (1847–1921). An Italian statesman (see VOL. XXI). He was asked by Premier Salandra in 1914 to take charge of the foreign office. His conduct of the office showed wide knowledge of international affairs, patriotism, and high principles. He also acted as foreign minister under Orlando during the Peace Conference, which he attended as second Italian delegate from January 18 to June 19, 1919, when he retired on the Orlando cabinet's going out of office. Sonnino was blamed in some quarters for the Allies' policy toward Italy at the Peace Conference. He was later made a senator.

SOREL, GEORGES (1847–1922). A French engineer and social philosopher (see VOL. XXI) During the War he temporarily left the syndicalist ranks and seemed to accept the ultranationalistic philosophy of Maurras. The Russian Revolution, however, brought back his faith in social reform through violence, and in a new edition (1920) of his celebrated *Réflexions sur la Violence* he included a brilliant plea for the Russian dictator Lenin. Among his writings published since the War is a collection of essays under the general title *De l'Utilité du Pragmatisme* (1919).

SOROLLA Y BASTIDA, JOAQUIN (1863–1923). A Spanish painter (see VOL. XXI). His work for the Hispanic Society of America, which included a series of portraits of Spanish writers and a "Panorama of the Forty-Nine Provinces of Spain," was finished in 1920, and was the last work done before he became paralyzed.

SOSMAN, ROBERT BROWNING (1881–). An American physicist, born at Chillicothe, Ohio. He studied at Ohio State University and received his Ph.D. (1907) at the Massachusetts Institute of Technology. During 1906–08 he was at the laboratory of the A. D. Little Company of Boston, but in 1908 entered the service of the Geophysical Laboratory of the Carnegie Institution in Washington as assistant physicist; he was physicist (1911–18) and acting director (1918–20). He was consulting chemist of the nitrate division of the Ordnance Bureau of the United States Army during the War. His special investigations included studies of the electromotive force of solutions, conductivity and ionizations of aqueous solutions 0°–300°, specific volume of minerals at fusion temperatures, and other similar topics pertaining to mineral chemistry and physics.

SOUTH, UNIVERSITY OF THE. An institution founded at Sewanee, Tenn., in 1857, under the auspices of the Protestant Episcopal Church. The student enrollment increased from about 160 in 1914 to 272 in the year 1923–24 and 44 in the summer session of 1923, the members of the faculty increased from 20 to 25, and the library from 35,000 to 40,134 volumes. The productive funds were increased from $400,000 in 1914 to $1,368,639 in 1923, largely through an endowment campaign carried on in 1919, and the income from $125,000 in 1915 to $279,650 in 1923. A new stone dormitory was opened in 1921, and courses in forestry were added to the curriculum in 1923. Benjamin Ficklin Finney succeeded Albion Williamson Knight, D.D., as president in 1922.

SOUTH AFRICA, UNION OF. A self-governing British Dominion, constituted by the South African Act of September, 1909, as a legislative union, comprising the provinces: The Cape of Good Hope, Natal, Transvaal, and the Orange Free State. Total area: 473,089 square miles. Total population, in 1921, was 6,928,580 as compared with 5,973,394 in 1911, a gain of 15.99 per cent Whites increased from 1,276,242 to 1,519,488, a gain of 19.06 per cent. In 1921, Europeans included 21.93 per cent of the total population. Of the white population (1921), 847,508 were classed as urban and 671,980 as rural; urban colored numbered 888,177 and rural 4,520,915. The provincial censuses showed:

	Area Square miles	Total population 1911	Total population 1921	Increase per cent	European population 1911	European population 1921	Increase per cent
Cape of Good Hope ..	276,966	2,564,965	2,782,719	8.49	528,377	650,609	11 72
Natal	35,284	1,194,043	1,429,398	19.71	98,114	136,838	39 47
Transvaal	110,450	1,686,212	2,087,636	23.81	420,562	543,485	29.23
Orange Free State ..	50,389	528,174	628,827	19.06	175,189	188,556	7.63
Total	473,089	5,973,394	6,928,580	15.99	1,276,242	1,519,488	19.06

There were 115.92 white males to 100 white females in 1911 and 106.05 to 100 in 1921. The following record the marriage, birth, and death rates of whites, per 1000 of the white population for 1913 and 1921: marriage rate, 9.08 and 8.48; birth rate, 31.68 and 28.42; death rate, 10.27 and 10.41. Principal towns in 1921 were: Johannesburg, Transvaal, 288,131 of which 151,836 were white; Cape Town, Cape of Good Hope, 207,404 of which 113,302 were white; Durban, Natal, 146,310 of which 57,095 were white; Pretoria, Transvaal, 74,052 of which 45,361 were white; Port Elizabeth, Cape, 46,094 of which 25,982 were white; East London, Cape, 34,673 of which 20,374 were white.

Religion and Education. In 1918, whites professed the following faiths: Dutch churches, 800,178; Anglicans, 265,149; other Protestants, 200,673; Catholics, 55,552; Jews, 58,741. In 1913 there were 4286 schools for whites with 203,421 pupils which increased by 1920 to 4746 schools with 303,255 pupils; in 1913 there were 2363 schools for colored pupils with 167,708 pupils which increased by 1920 to 3129 schools with 238,137 pupils. Expenditure for education increased from £2,268,026 to £5,940,037. Primary and secondary education were controlled by the four Provincial Administrations. In 1921 there were nine institutions of higher learning with 3292 students and 378 instructors. In 1918, the University of the Cape of Good Hope was divided into three universities, viz., University of Cape Town, University of Stellenbosch, University of South Africa. The other six institutions became constituent colleges.

Agriculture. This industry made great advances during the decade 1911–21, partly as a result of the stimulus of high prices during the War, but as much because of the enlightened interest manifested by the Union agriculture department which coordinated the activities in all four provinces. The maize crop increased from 863,252 tons in 1911 to 1,334,724 tons in 1921. Similarly wheat increased from 181,032 tons in 1911 to 228,401 tons in 1921. The 1918 crops were 304,485 tons wheat and 1,264,009 tons maize. Other crops included oats, barley, kaffir corn, potatoes, citrus and deciduous fruits, and tobacco. Droughts and locusts were frequent, those of 1919 having been particularly severe. Cotton culture gained in popularity. In 1910, 22 bales were produced; in 1920–21, 7153 bales (500 pounds each). In 1920–21, Transvaal's cotton acreage was 16,144, yield 5405 bales; Natal, acreage 2764, yield 1725 bales. In Natal the growing was concentrated in the Pongola Valley (250 miles from Durban) and was thriving because of the abundance of cheap native labor. Sugar, in Natal and the native reserves, yielded 1,627,403 tons in 1920–21. Tea and tobacco showed little or no advances. The pastoral industries ranked high in importance. Stocks increased from 1911 to 1921 as follows: sheep, 30,656,000 to 31,729,512; cattle, 5,796,000 to 8,557,089. In 1921, there were 920,468 horses, 261,828 ostriches, 7,836,696 goats, 914,769 pigs. Wool production, measured in exports, showed gains. In 1913, 176,971,000 pounds were exported; in 1922, 209,783,144 pounds. Mohair (derived from the Angora goat) maintained its important position. In 1922, 25,792,749 pounds were exported. Prices fluctuated wildly, dependent on the demand in England, and the competition with Turkey. In

1921, the value of the mohair exported was £583,643; in 1922, £1,152,470. By 1921, the Union was self-sufficing as regards its meat and dairy supplies and was even beginning to export considerable quantities of both Ostrich-farming, which had been hard hit during the War, recovered to some extent after the Armistice. The great yield of 1913 of 1,023,000 pounds of ostrich feathers glutted the market so that production during the ensuing years dropped. By 1922, only 303,692 pounds were exported. The number of ostriches dropped off almost two-thirds Irrigation projects from 1912 on became the interest of the government In 1921–22, a total of £1,010,000 was spent. In 1922, the works in the Lake Mentz region along the lower course of the Sundays River were opened. These serve 4900 acres. The project aimed ultimately to reach 40,000 acres. In 1921, the total area under irrigation was 808,899 acres.

Manufacturing. The War gave an impetus to local industries The number of establishments increased from 3998 in 1916 to 7005 in 1921. Leather tanning extract, tobacco, cement showed the greatest advances. Value added to products by manufacture in 1921 was £40,343,000, gross value of manufactured products, £98,308,000 Average number of persons employed was 179,819 of which 62,962 were whites. Local industries were encouraged by tariffs and rebate during 1914–19, and from 1921 on the government applied itself to aiding industrial developments. Bounties were offered for pig iron manufactured, for steel produced from native ores, and for meat exported

Mining. The gold-mining industry was the dominating factor in the economic life of the Union of South Africa. The 40 large-scale producing mines had an output of 9,133,060 fine ounces in 1923, a figure which was only reached once before in the history of the industry—in 1916, when it was 100,000 ounces greater—although in the three years of 1912, 1915 and 1917, the total was slightly more than 9,000,000 ounces. The official valuation of the gold output as declared by the Transvaal Chamber of Mines for 1923 was £40,178,170, which represented an increase of £8,000,000, or 26 per cent, over 1922. The £40,000,000 level was exceeded in only two previous years—1920, when the total value was £44,705,384 and 1921, when it was £42,529,396 A large measure of the prosperity of the gold-mining industry prior to 1923 was due to the gold premium, which amounted to £1,383,397 in 1923; £2,069,031 in 1922; £8,323,954 in 1921; and £10,080,009 in 1920 Owing to the fact that the United States was in 1924 the only free gold market, the rate of exchange on New York was the measure of the premium which gold commanded over British and South African currency. Early in 1922, the diamond mines resumed production, after nearly two years of idleness. In the first six months of 1923, 755,200 metric carats were produced, or more than in the entire year of 1922. The coal mines were making a slow recovery, and copper mines were again operating. The total value of the principal minerals produced in the Union from the earliest dates of existing records to Dec 31, 1922, was £1,060,602,350 Of this, gold represented 71 per cent, diamonds 21 per cent, coal 5.4 per cent For 1922, the total mineral output was valued at £38,614,081 as compared with £52,025,840 in 1912, and £68,332,127 in 1920. The fall in value was due to the drop in diamond output caused by the world-wide depression following 1920. In 1919, £11,734,495 in diamonds was mined; in 1921, £3,103,448; in 1922, £2,266,631. Coal production increased from 7,594,944 tons in 1911 to 11,396,905 tons in 1921. In 1922, coal mined was 9,725,479 tons. Most of this was used in the gold and diamond mines, but a considerable quantity was being exported via Delagoa Bay, mainly for bunkering purposes (1,477,654 tons in 1922). Diamonds were found principally in the Cape Province and in the Transvaal; gold in the Transvaal; coal in Natal and the Transvaal; copper in the Cape Province; tin in the Transvaal. Other minerals of importance besides those mentioned were: asbestos, coke, lime, salt, silver, cement, etc.

Commerce. The following are total import and export figures for selected years:

	1911	1919	1922
Imports ...	£38,035,000	£50,791,000	£51,557,371
Exports . .	£57,308,000	£104,561,000	£60,333,755

The depression of 1921 and 1922 is reflected in the above. Leading imports were, in 1922, by order of value: foodstuffs, cotton piece goods, machinery, oils, wood, hardware, iron and steel manufactures, leather goods Leading exports were, in order: gold, wool, diamonds, hides and skins, corn, mohair, coal. Proportions of the merchandise import trade by countries of origin, for 1910 and 1922, were: Great Britain, 70 and 53 5 per cent; United States, 8 and 11.8 per cent In 1920, American imports were 18.2 per cent and in 1921, 15.6. In 1922, German imports were 6.1 per cent (9 per cent in 1913). Proportions of export trade by countries of destination, for 1910 and 1922, were: Great Britain, 81 and 78.2 per cent; United States, 17 and 3.9 per cent Exports to Germany for 1922 were 4 7 per cent. Imports into the Union during the first six months of 1923 totaled £25,343,417; exports were £36,398,591, an increase of £11,000,000 over the first half of 1922. Principal imports from the United States were oils, automobiles, cotton piece goods, hardware and cutlery, lumber and agricultural and mining machinery The leading ports were Cape Town, Durban, Port Elizabeth, and East London. In 1912, 4106 vessels of 12,205,300 tons entered, and 4080 vessels of 12,163,081 tons cleared the ports. In 1921, these were entered, 3567 vessels of 10,210,000 tons, cleared, 3532 of 10,217,000 tons A drydock at Durban, said to be the largest south of the equator, was begun in 1919. Its length was 1150 feet.

Transportation. In May, 1910, the provincial railways were amalgamated into a single system denominated the South African Railways under the control of the Union. To this were added the railways of Southwest Africa in April, 1922. On Dec. 31, 1913, the total government mileage was 8282; in March, 1923, this was 10,987 miles (Cape—4254 miles, Orange Free State—1342 miles, Transvaal—2644 miles, Natal—1415 miles, Southwest Africa—1331 miles) New lines built were from Prieska to Kalkfontein, for military purposes; Krugersdorp to Mafeking; the completion in the Cape Province of the Mossel-George-Oudtshoorn line connecting Cape Town and Port Elizabeth. In 1923 projects were under way for the addition of 853 miles, and for electrification of 250 miles of track, principally between the Natal coal fields

and Maritzburg. The first section of the electrical railway was opened in May, 1924. In 1913, earnings of the railways were £13,214,000; in 1922–23 they were £20,146,797. The operating ratio, i.e. expenditures over earnings, was 77 per cent in 1922–23 as compared with 54 per cent in 1910. The railways were running behind, as was evinced by the fact that the end of the fiscal year 1922–23 saw an accumulated deficit of £2,220,511.

Finance. Revenues and expenditures for 1911–12 were £17,369,030 and £13,234,505 and for 1922–23 (estimates) £28,695,000 and £24,827,940. To the last figure must be added £10,763,000 charged to the loan account. These figures excluded the railway and harbor accounts which were managed separately. Chief sources of revenue were income, super excess profits, and dividend taxes, customs and excise, interest, posts, telegraphs and telephones. Native taxes were hut and poll taxes. The public debt in 1912 was £117,260,534; in 1922, £191,784,936. Expenditures for war purposes raised by loans during 1915–22 totaled £23,173,985 After 1913 the provinces were made to depend for their finances upon assigned revenues made to them by the Union together with annual subsidies limited to 50 per cent of their normal expenditures. Expenditures were primarily for education. For 1913–14 and 1920–21, the subsidies to the provinces were as follows: Cape, £862,000 and £1,701,000; Natal, £361,000 and £621,999; Transvaal, £629,000 and £1,539,000; Orange Free State, £341,000 and £615,999. In June, 1921, a central Reserve Bank was established at Pretoria with branches at Cape Town and other important centres. The subscribed capital was £1,000,000 and on Oct. 31, 1923, the Bank had issued £10,644,613 in notes. On June 30, 1922, the note issuing powers of the Joint Stock Banks had come to an end. In addition to its functions as a bank of issue, and the principal holder of the gold reserves of the country, the Reserve Bank operated as a bank of discount. The rate of exchange of the pound fluctuated as follows over the period discussed: average, 1914, $5.14; 1920, $3.66; 1922, $4.43; 1923, $4.57. Wholesale prices were (1910 = 100): 1914, 109; 1919, 185.4; 1920, 251.2; 1922, 144.5; October, 1923, 125.3 Retail (cost of living) prices (1914 = 100): 1921, 162; 1922, 135, October, 1923, 132.

History. The generation of Boers who had fought against Great Britain in 1902 was alive when the War broke out in Europe. Many of the Boers still entertained nationalistic aspirations and saw in the War an opportunity to gain release from the domination of the British Empire. However, the more important Boer leaders like Botha and Smuts were true to the British purpose and by the weight of their example gained the Union for the Allies and gave material assistance in subjugating the German African colonies The Dutch nationalistic cause was, nevertheless, real, and in 1914 assumed serious proportions. The immediate reason for the disaffection was the decision of the government to send a force against German Southwest Africa. In October, 1914, a serious rebellion was launched by Boer irreconcilables most of whom sought to further their own aims rather than the purposes of Germany. The leaders were General de Wet and General Beyers, while the man to whom all looked for inspiration was General De La Rey. Unfortunately for the rebels, General De La Rey was shot and killed by a police patrol on Sept. 15, 1914, while on his way to join the insurgent camp. The rebellion broke out actively, however, under de Wet and Beyers, and General Botha was obliged to take the field against his erstwhile companions in arms. After some desultory fighting the Boers were dispersed and de Wet surrendered (Dec. 1, 1914) while Beyers was drowned in the Vaal river while trying to evade capture (Dec. 9, 1914). The losses were not heavy although the forces engaged were considerable. In all 10,000 rebels had taken up arms. Only one of the leaders, Fourie, was sentenced to death for his part in the insurrection. Clemency was shown to the others in the way of light prison sentences, so that by December, 1915, de Wet was free. With active opposition gone the move on German Southwest Africa went through successfully, with the result that by July, 1915, the colony was subjugated. Considerable aid was also rendered by Briton and Boer alike in the European and East African campaigns, 150,000 South Africans seeing service. Throughout the war period the Dutch nationalists, led by General Hertzog, continued in opposition and a coalition of the South African party (Botha-Smuts) and the Unionists was necessary to carry on the government. Republican propaganda became more and more virulent and by 1917 the Nationalists were outspoken in favor of a republic. They appealed to President Wilson to intercede; in fact General Hertzog made a trip to Paris via New York to lay the matter before the President, but without success. At Versailles, Botha and Smuts signed the treaty for the Union. Botha having died in 1919, Smuts became prime minister. The election of 1920 indicated that the Nationalists had gained ground rather than lost. The poll showed: Nationalists, 45; South Africans, 40; Unionists, 25; Labor, 21. The only hope for a strong government was a permanent alliance between the two pro-British parties, and this Smuts was able to effect after many pourparlers in 1920. The election of 1921 could therefore be held on the frank issue of republicanism. The result gave Smuts a clear majority, the poll showing returned 76 of the enlarged South African party, 47 Nationalists, 10 Labor. In 1922, the Nationalists and Laborites came to an understanding by which the urban districts were to be contested exclusively by Labor candidates and the rural districts by Nationalists, the condition being, however, that the Republican agitation was to cease for the life of the existing parliament. However, the Nationalists openly set forth their secessionist principles the following year with the result that two of the most important Labor leaders, Colonel Creswell and Mr. Barlow, were estranged. Inherently weak as the Labor-Nationalist alliance was, it harried the government during three uneasy years, reduced the government's parliamentary majority, little by little, until it was finally only four, and eventually provoked General Smuts to dissolve the Union Parliament on Apr. 7, 1924 and appeal to the electorate in a general election. From 1921 on the government had been steadily losing ground, for a variety of reasons. The Nationalists still smarted under the defeat of 1914; the Laborites resented the severity with which strikes had been suppressed; there was general complaint over the fact that Smuts had

consistently neglected dominion affairs because of his international interests. The result was, in the elections of June, 1924, a decisive defeat for the government party and the return of the Labor-Nationalist alliance. Even Smuts himself lost his seat. General Smuts resigned on June 23 and was succeeded by a Labor-Nationalist coalition headed by General Hertzog. Colonel Creswell, leader of the Laborites, joined the cabinet with the portfolio of Minister of Defense and Labor. Particularly significant was the pact of April 21 between the two government groups which was to serve as the basis of the coalition. By it, the Nationalists promised to relinquish their secessionist agitation for five years while the Laborites, for the same period, pledged themselves to refrain from socialist propaganda.

The vexatious problem of the status of immigrants from India was very acute on the eve of the War, but was allowed to rest during the world conflict, partly for the sake of patriotic solidarity, and partly because of the agreement which had been reached in 1914 between General Smuts and Mohandas K. G. Ghandi (whose leadership of the passive resistance movement among the Indians of South Africa before the War served as training for his subsequent and more prominent career in India). By this agreement, the government promised that the existing laws relative to the rights of Indians in the Union would be enforced in a just manner and with due regard to vested rights; this was generally understood to mean that the rights of Indian residents would not be further curtailed by legislation or by administrative interpretation of the laws. During the war period, however, this interpretation was challenged. In the Transvaal, where by a state law Indians were forbidden to purchase land, as individuals, the Indian merchants evaded this restriction by forming joint stock companies to acquire real estate. The frequency of their purchases alarmed the white community, who insisted on the prohibition of this practice by new legislation, and accordingly an act of the Union Parliament in 1919 forbade corporations of Asiatics to acquire realty. Once more race hatred burst into flames. Curiously enough, the most frenzied agitation against the "Asiatic peril" was not in Natal, where about four-fifths of the 150,000 Indians in the Union were concentrated, outnumbering the whites, but in Transvaal, where the number was relatively small. The explanation of the seeming paradox is that in Natal the greater number of the Indians were coolie laborers on sugar and tea plantations, whereas in Transvaal the Indians were merchants and traders, often prosperous and aggressive businessmen whose competition was feared, perhaps in an exaggerated degree. The Union government in 1920 appointed an Asiatic Inquiry Commission to go into the whole matter. The Commission's report, dated March, 1921, sustained the 1919 law and recommended that in Natal Asiatic landownership for agricultural purposes should be confined to the coastal zone, while elsewhere a policy of voluntary segregation should be pursued. This expression of anti-Indian sentiment, though couched in the most restrained terms, was sufficiently pointed to evoke a protest from the Government of India, which, by the way, was at this time manifesting grave concern regarding the rights of Indians in Kenya Colony (see KENYA). When, in the summer of 1921, the problem was aired in the British Imperial Conference at London, the determined efforts of the Indian government to secure the adoption of a general principle of equal rights for natives of India were met by an even more determined, and successful, opposition by the South African delegates, General Smuts and Sir Thomas Smartt. There the matter rested. In 1924, a fresh outburst of racial antipathy was caused by agitation for and against a Class Areas Bill, which proposed to impose drastic restrictions, amounting almost to prohibition, on the holding of property, leases, and trading licenses by Asiatics, outside of designated areas.

Internal problems that provoked the most attention during the period 1914–24 were the status of the natives and the growing articulateness of labor. The pressing demand for citizenship and equality of treatment of the native Bantus, many of whom were in the professions and had been under the tutelage of native aggressive churches, was a point of serious consequence. Around the question of segregation of natives in restricted areas, the whole contention crystallized. The Nationalists and South Africans favored the proposal, the Unionists were opposed. In 1920, a segregation act was passed, applicable to the rural districts It stood frankly for the policy of white supremacy over the blacks and though it granted the natives some autonomy, it held out no hope for the possible fusion, politically, of the two races. In 1923, an act was passed allowing natives to settle in urban districts. During the War period, native outbreaks were frequent. Strikes occurred on the Rand and elsewhere during 1917–20, and blood was spilled at Port Elizabeth in 1920. On May 24, 1921, at Bulhoek, a body of natives calling themselves Israelites, on refusing to disperse and leave for their homes, were fired upon and 400 casualties were the result. Labor unrest, due to the closing of the diamond mines after the depression of 1921, was equally acute. In 1922, a strike in the gold, coal, and diamond mines took on serious proportions and led to open warfare A general strike was called on one hand, and martial law was declared on the other; Fordsburg, one of the strongholds of the strikers, was shelled and finally taken. Though hostilities were brief, the losses on both sides were 183 killed and 524 wounded. Financial losses were placed at $25,000,000. The miners contended that the owners were attempting to introduce wholesale native labor and cut wages radically; the owners and the government charged the outbreaks to the extremists who had communistic leanings.

The governor general of South Africa for 1914–20 was Lord Buxton; he was succeeded by Prince Arthur of Connaught.

SOUTH AMERICA, EARLY CIVILIZATION OF. See ETHNOGRAPHY.

SOUTH AUSTRALIA. A state of the Australian Commonwealth occupying the central and southern part of the continent. Area, 380,070 square miles; population (excluding aborigines) in 1911, 408,558; in 1922, 505,069; average annual increase, 2.45 per cent. Adelaide, the largest city, including suburbs, had 260,542 inhabitants in 1921 (200,117 in 1913). The area under cultivation continued to increase, wheat in particular showing gains. From 16,938,988 bushels of wheat in 1913–14, production mounted to 34,258,914 bushels in 1920–21. Other crops

were barley, oats, hay, and vines. Pastoral activities continued to occupy a prominent rôle. Mineral production in 1921 amounted to £944,052 (£634,318 in 1913); copper, the most important, was valued at £106,370 in 1921. Value of production for 1920–21: agricultural, £19,981,471; pastoral, £5,624,217; manufacturing, £7,837,340; mining, £1,154,742; dairying, £3,498,101; total, £39,054,203. Imports and exports for 1913 were £7,348,340 and £9,809,763; for 1921–22, £9,047,242 and £14,761,915. Government accounts showed: revenues and expenditures for 1913–14, £4,822,766 and £4,604,129; for 1921–22, £7,771,752 and £7,826,241. The public debt, from £33,564,332 in 1914 mounted to £62,496,585 in 1923.

SOUTH CAROLINA. South Carolina is the thirty-ninth State in size (30,989 square miles), and the twenty-sixth in population; capital, Columbia. The population increased from 1,515,400 in 1910 to 1,683,724 in 1920, a gain of 11 1 per cent. The white population increased from 679,161 to 818,538; the Negro (which, it will be noted, considerably surpasses the white), from 835,843 to 864,719; native white, from 673,107 to 812,137; foreign-born white, from 6054 to 6401. Both urban and rural populations rose during the decade; the former from 224,832 to 293,987, the latter from 1,290,568 to 1,389,737. The growth of the principal cities was as follows: Charleston, 58,833 in 1910 to 67,957 in 1920; Columbia, 26,319 to 37,524; Greenville, 15,741 to 23,127.

Agriculture. As South Carolina is one of the most important cotton-producing States, agricultural conditions in the decade 1910–20 reflected, as in the case of other cotton-producing States, the ravages of the boll weevil which reached the State in 1918 or 1919. This is indicated by a comparison of the acreage and production of cotton for the various years: 1913, acreage 2,790,000, production 1,378,000 bales; 1915, acreage 2,516,000, 1,134,000 bales; 1917, 2,837,000 and 1,237,000 bales; 1920, 2,964,000 and 1,623,000 bales. The acreage in 1922 was 2,058,000; and the production fell to 530,000 bales. The estimated production of 1923 was 783,000 bales For a discussion of conditions resulting from the ravages of the boll weevil, and of general conditions relating to cotton-growing in the decade, see BOLL WEEVIL and COTTON. While the population of the State increased 11.1 per cent in the decade, the number of farms increased 9.2 per cent (from 176,434 in 1910 to 192,693 in 1920). The total acreage in farms decreased from 13,512,028 to 12,426,675, or 8 per cent; but the improved land in farms increased from 6,097,999 to 6,184,159 acres. While the percentage of total land area used for agricultural purposes decreased from 69.2 to 63.7, the percentage of land improved increased from 45.1 to 49.8 per cent. The total value of farm property showed an apparent increase, from $392,128,314 in 1910 to $953,064,742 in 1920, or 143 per cent; the average value per farm, from $2223 to $4946, or 122.5 per cent. In interpreting these values and all comparative values in the decade 1914–24, the inflation of currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 192,693 farms in 1920, 67,724 were operated by owners, 738 by managers, and 124,231 by tenants. The comparative figures for 1910 were 64,350,863, and 11,221. White farmers in 1920 numbered 83,683, of whom 83,542 were native; the Negro farmers numbered 109,005. White farmers in 1910 numbered 79,636 and the Negro farmers 96,772. Farms free from mortgage in 1920 numbered 42,847, compared with 47,535 in 1910; those under mortgage 14,299, compared with 15,020. Dairy cows in 1920 numbered 228,569; 180,842 in 1910. The number of hogs also increased from 665,211 to 844,981. "Beef cows" decreased to 64,949, from 65,319; sheep from 27,926 to 23,581. The estimated production of the principal farm crops in 1923 was as follows: corn, 32,432,000 bushels; wheat, 1,925,000 bushels; oats, 10,192,000 bushels; potatoes, 2,882,000 bushels; sweet potatoes, 9,050,000 bushels; tobacco, 66,730,000 pounds; hay, 362,000 tons; peanuts, 32,832,000 bushels. Comparative figures, for 1913, are: corn, 38,512,000 bushels; wheat, 972,000; oats, 8,460,000; potatoes, 800,000; hay, 244,000 tons; and tobacco, 33,288,000 pounds.

Manufactures. The industrial development of South Carolina has been slow but steady. The chief increase in recent years was in the various phases of cotton manufacturing. In 1920, there were, in the State, six cities with more than 10,000 inhabitants, having 10.3 per cent of the total population of the State. These cities, in 1919, reported 21.3 per cent of the value of the State's manufactured products. There were in the State, 1854 manufacturing establishments in 1909; 1885 in 1914; and 2004 in 1919. Persons engaged in manufacture numbered 78,040, 77,603, and 86,360; and the capital invested amounted to $173,220,870, $203,210,875, and $374,537,636 in those years The value of the products in 1909 was $113,235,945; in 1914, $138,891,202; and in 1919, $381,452,984. The abnormal increase in value of products being to a great extent due to the change in industrial conditions produced by the War, statistics of this item cannot be used as an exact measurement of the growth of manufactures between the industrial censuses of 1914 to 1919, but a comparison of the number of establishments and persons engaged in those years, shows a considerable increase in the manufacturing activities of the State. The first industry in point of value of product is the manufacture of cotton goods, valued in 1909 at $65,930,000; in 1914, at $78,446,000; and in 1919, at $228,440,000 The manufacture of cotton-seed oil and cake is second in this respect, with a product valued in 1909 at $10,903,000; in 1914, $16,380,000; and in 1919, $38,675,000. Fertilizers, ranking third, in 1909 were valued at $9,025,000; in 1914, $13,824,000; and in 1919, $30,412,000. The production of mineral and soda waters was next in order: in 1909, $740,000; in 1914, $1,541,000; and in 1919, $5,351,000. The chief manufacturing cities of the State are Charleston and Columbia.

Education. South Carolina has undoubtedly a more difficult educational problem than most of the other States, due to the extremely large Negro population and to the large rural population. In spite of these difficulties, great progress was made in the decade 1913–23. This is indicated by the fact that while South Carolina still has the largest percentage of illiteracy of any of the States, it also showed the largest decrease in the decade 1910–20. The Legislature, during the period, passed many important

laws designed to improve educational conditions. Among these were the compulsory educational law passed in 1918 and revised in 1920, which proved a great stimulus and incentive to school attendance and added thousands of pupils to the enrollment list. The general assembly of 1922 made unusually liberal appropriations for public education. The State has an excellent rural graded-school Act, supplemented by an equalizing Act guaranteeing the seven-months term. Great progress was made in vocational education, especially in agriculture, textiles, home economics, and training of teachers. Coöperation is given by Clemson College, Winthrop College and the State Colored College. The total enrollment in town schools for whites in 1922 was 115,769; in country schools for whites, 120,844; in Negro town schools were enrolled 64,379; and in Negro country schools 161,888, making a total white enrollment of 236,613 and a Negro enrollment of 226,267, or a total enrollment in the State of 462,880. In 1913, the total enrollment was 361,161; 167,914 white, 193,247 colored. The enrollment in the high schools in 1922 was 113,461 Expenditures for schools in 1922 was $9,517,968. The percentage of illiteracy in the State decreased from 29.6 per cent in 1910 to 23 per cent in 1920 Among the native whites it decreased from 11.4 to 8.5 per cent; among the colored population, from 46.9 to 38.7. Among the foreign-born whites, it remained for both periods 6.5.

Finance. For finance, see STATE FINANCES.

Political and Other Events. South Carolina, consistently Democratic since the Civil War, remained so in the decade 1914–24. Elections were held in 1914 for governor, State officers, representatives to Congress and U. S. senator. Ellison D. Smith was a candidate for reelection to the Senate and was opposed for the nomination by Governor Cole I. Blease Senator Smith was elected and Richard I. Manning was elected governor. Governor Blease, whose term was a sensational one, brought it to a close by wholesale pardon of State prisoners. At the expiration of his term he had freed more than 3000 prisoners as a protest against the prison laws of the State. In January, 1915, prior to his leaving office, he disbanded the organized militia of the State, as a result of a difference with the Federal War Department over its administration. Mr. Manning took the office of governor on January 11. He at once revised the order disbanding the militia. Statewide prohibition was adopted by a majority of the people, to go into effect Jan. 1, 1916. Governor Manning was reëlected in 1916, defeating former Governor Blease for the nomination. It was necessary to hold two primaries, as under the South Carolina primary system, a nominee must receive a majority of all the votes cast, otherwise a second primary must follow. In the first primary, Blease led by more than 20,000 votes but lacked 500 of the majority. In the second primary, however, Governor Manning received the majority of the votes and later was elected. In the presidential voting of that year, President Wilson received 61,846 votes and Charles E. Hughes, 1550. As a result of the death of Senator Tillman, in 1918, Christie Benet was appointed by the Governor to fill out the unexpired term. In November, N. B. Dial was elected as successor. R. E. Cooper was elected governor. On May 20, 1922, he was appointed a member of the Federal Farm Loan Board, and was succeeded by Lieutenant-Governor Wilson G. Harvey. In 1922, Thomas G. McLeod defeated Governor Blease in the Democratic nomination for governor and was elected. He was inaugurated in January, 1923. In his inaugural address he favored efficiency and economy in the government and the enforcement of the prohibition law.

Legislation. The most important acts of the Legislature in the decade 1914–24 are indicated below. In 1915, several important measures relating to the regulation of the liquor traffic were enacted. The Legislature in 1916 passed a measure creating a State system of rural credits. Liquor laws were amended, as were the laws relating to insurance and public utilities. The Legislature of 1919 put further restrictions on child labor. It also passed a law requiring compulsory school attendance of children under 14. The Legislature of 1921 provided for a State Board of Fisheries and passed an act regulating the storage, grading and marketing of cotton and other nonperishable farm products. It also amended the laws of 1912 relating to exemption from jury duty, by including female electors in the exempt class. The Legislature of 1923 passed a measure under which cities with populations between 20,000 and 50,000 are permitted to adopt the manager plan of city government. A bill prohibiting the public wearing of masks was defeated.

SOUTH CAROLINA, UNIVERSITY OF. A nonsectarian coeducational State institution at Columbia, S. C., founded in 1801. The enrollment of students increased from 540 in 1915 to 909, of whom 192 were women, for the scholastic year 1923–24. The faculty consisted of 50 professors and 27 instructors and assistants. New dormitories for men and a new dormitory for women were completed during the year 1923–24, besides other improvements and additions. There were approximately 90,000 volumes in the main library in 1924 and about 12,000 in the library of the School of Law of the university. Wm. Davis Melton, LL.D., succeeded Wm. S. Currell, LL.D, as president in 1922

SOUTH DAKOTA. South Dakota is the fourteenth State in size (77,615 square miles), and the thirty-seventh in population; capital, Pierre. The population increased from 583,888 in 1910 to 636,547 in 1920, a gain of about 9 per cent. The white population increased from 563,771 (1910) to 619,147 (1920); and the native white, from 463,143 to 536,756. The Indian population decreased from 19,137 to 16,384 and the foreign-born white from 100,628 to 82,391. The urban population rose from 76,673 to 101,872, and the rural from 507,215 to 534,675. There are only two important cities in the State, Sioux Falls and Aberdeen. The former increased from 14,094 in 1910 to 25,202 in 1920, and the latter, from 10,753 to 14,537.

Agriculture. As South Dakota is almost entirely an agricultural State, it was greatly affected by conditions which prevailed during and after the War. From 1917 to 1920 there was a period of prosperity due to the world-wide demand for wheat and other grains which are the chief agricultural products of the State. This period was succeeded by one of depression caused apparently by financial conditions, but more especially by overproduction of wheat, which resulted in a lowering of the price to an extent which made it unprofitable to farmers. These conditions prevailed in 1921–23. While the

population of the State increased 9 per cent in the decade 1910–20, the number of farms decreased 3.9 per cent (from 77,644 to 74,637). The acreage, however, increased from 26,016,892 to 34,636,491, or 33.1 per cent; and the improved land in farms increased 15 per cent, or from 15,827,208 to 18,199,250 acres. The percentage of the total land in farms rose from 52.9 per cent in 1910 to 70.4 per cent in 1920, but the percentage of improved land in farms decreased from 60.8 per cent to 52.5. The total value of farm property increased 142.2 per cent in the decade, or from $1,166,096,980 to $2,823,870,212; the average value of farm property from $15,018 to $37,835. It must be borne in mind, however, that these values do not represent the actual increase; there must be taken into consideration the decreased purchasing power of money and other economic and financial conditions following the War. Of the total of 74,637 farmers in 1920, 47,815 owned their own farms, 781 were managers and 26,041 were tenants. In 1910, the owners numbered 57,984, the managers 431 and the tenants 19,231. It will be noted that there was a considerable decrease in the number of owners in the decade, while the number of both managers and tenants showed an increase. The white farmers in the State in 1920 numbered 73,025, compared with 74,836 in 1910; in 1920, there were 16,037 farms free from mortgage, and 27,262 mortgaged; in 1910, 35,101 farms were free and 21,691 mortgaged. The acreage, production and value of the principal crops, in 1923, was as shown in the table.

Crop	1923 Acres	1923 Bushels	1923 Value	1913 Acres	1913 Bushels	1913 Value
Corn	4,208,000	145,176,000	$75,492,000	2,640,000	67,320,000	$37,699,000
Spring wheat	2,735,000	25,982,000	21,045,000	3,775,000 [b]	33,975,000	24,122,000
Winter wheat	77,000	924,000	748,000			
Barley	890,000	20,025,000	8,010,000	958,000	16,765,000	7,712,000
Flaxseed	284,000	2,414,000	5,021,000			
Oats	2,304,000	78,336,000	24,284,000	1,590,000	42,135,000	14,326,000
Rye	304,000	3,496,000	1,713,000	50,000	660,000	330,000
Potatoes	88,000	7,744,000	3,872,000	60,000	4,680,000	2,948,000
Hay	1,050,000	1,732,000 [a]	14,029,000	460,000	552,000 [a]	3,588,000

[a] Tons instead of bushels.
[b] Given as wheat only, not differentiated into spring and winter.

Manufactures. See UNITED STATES, *Manufactures.*

Education. Educational progress in South Dakota in the decade 1913–23 was steady and consistent. Not only was the number of teachers increased at a more rapid rate than in many States, but large sums were spent in a State-wide building programme for fine rural and city schools. Teaching requirements were considerably raised and general teaching conditions vastly improved. Among the specific accomplishments was the establishment of a high-school division with a director in charge. In 1919, there were only 112 accredited high schools in the State; in 1923 there were 249, with much more rigid requirements. Another feature was the establishment of Americanization work. The total enrollment in the evening schools after the introduction of that work exceeded 3000. Home economics and agricultural courses were established in high schools under the Smith-Hughes Act, and the rehabilitation of disabled civilians was also undertaken. A "Better School Drive" in 1919 produced excellent results, including the erection of dozens of fine consolidated schools and hundreds of modern one-teacher schools. The Legislature passed a law providing State aid to consolidated standard and rural schools, and State inspection of rural and consolidated schools was also established. A new compulsory attendance law was enacted, and legislation provided for State supervision of its enforcement, as a result of which the average attendance per rural pupil enrolled increased from 102 to 127 days per year. The law provides for at least an eight-month term in every school in the State. The total enrollment below the grade of high school in 1912 was 90,389; in 1921 it was 133,343. In the high schools, in 1921, there were 16,584 pupils enrolled. Total expenditures for schools in the latter year were $15,054,924. The percentage of illiteracy in the State decreased from 3.7 in 1910 to 2.2 in 1920; in the native white population it remained at 0.4 per cent. among the foreign-born white it decreased from 5 per cent to 4.9; among the colored, from 6.8 to 6.7.

Finance. For finance, see STATE FINANCES

Political and Other Events. Political events in South Dakota in the decade 1914–24 were marked in the latter part of the period by the influence of the Non-Partisan League, which gained considerable strength in the State, although lacking the power which marked its growth in North Dakota. The Republicans in 1914 reelected Governor Byrne, but Senator Crawford was defeated for reëlection by E. S. Johnson, Democrat. The Republicans elected representatives in all three districts of the State. In 1916, Peter Norbeck, Republican candidate, was elected governor. At this election a constitutional amendment prohibiting liquor traffic and a woman suffrage amendment were defeated. The State celebrated the anniversary of its settlement in July, 1916. In the presidential voting of this year, Charles E. Hughes received 64,261 votes; President Wilson, 59,191 Governor Norbeck was reëlected in 1918. In this year the so-called Non-Partisan League acquired great political strength and cast over 25,000 votes for a candidate for governor. Thomas Sterling, Republican, was elected to the Senate. In the elections of 1920, the Republican candidate for governor, W. H. McMaster, was elected, and Peter Norbeck, former governor, was elected to the Senate. In the presidential voting of this year, Warren G. Harding received 109,874 votes; James M. Cox, 35,938. T. P. Christiansen, the Farmer-Labor and Non-Partisan candidate for the presidency, received over 34,000 votes. Governor McMaster was reëlected in 1922, together with the entire State ticket and three members of Congress. The State was seriously affected during this year by a bituminous coal strike and by a strike of railroad shopmen, which continued from July 1 until the autumn. As a result, elevators and granaries were for a long period congested with crops, while the impossibility of

moving the crops broke down the market to such an extent that much of the produce was sold at a loss. Various amendments proposed were defeated in 1922. Governor McMaster was inaugurated on Jan. 2, 1923. In his inaugural address he dealt chiefly with the agricultural problems of the State. Presidential primary elections were held in April, 1924. Hiram Johnson was endorsed as the Republican candidate. Senator Sterling was defeated for reëlection to the Senate by Governor McMaster.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature of 1915 passed a bill abolishing the death penalty. The Supreme Court of the State in this year declared the so-called "blue sky" law of the State unconstitutional. In 1917 a budget system was created. A new primary law was enacted, and a prohibition law was passed, to become effective in February, 1918. The Legislature also passed a workmen's compensation law and amended the banking laws of the State. A special commission was appointed to make a survey of the educational system. The Legislature of 1919 passed measures forbidding the display of the red flag calculated to excite hostility or violence to the government. It also passed a measure providing for a land settlement commission to encourage and to assist former soldiers and sailors to build homes and to own farms. Provision was made in 1921 for the loan of money for urban home building under the Rural Credits Board. The primary law was simplified and bills were initiated for the establishment of a State bank and for the development of hydroelectric power Amendments providing for the two latter were defeated in the election of 1922. The Legislature of 1923 passed a measure prohibiting expenditures in excess of appropriations. It also made provision for a constitutional convention, passed a uniform flag act, and enacted a measure to facilitate the cooperative marketing of agricultural products. Provision was made for the creating of associations for this purpose.

SOUTH DAKOTA, UNIVERSITY OF. A coeducational State institution at Vermillion, S Dak, founded in 1882. During the decade 1914–24, the university increased 200 per cent in the number of students, added 200 courses to its curriculum, and completed three buildings. The student enrollment in 1913–14 was 421 as compared with 1239 in 1922–23, the faculty numbered 50 members as compared with 90, and the library contained 20,500 volumes as compared with 45,000 volumes The women's building, engineering shops and observatory, and the chemistry building were completed, and the stadium and administration building were begun. Departments in journalism and commerce were opened in 1915. Robert L. Slagle, Ph D., LL.D., succeeded Franklin P. Gault, Ph.D., as president in February, 1914.

SOUTHERN CALIFORNIA, UNIVERSITY OF. A coeducational institution at Los Angeles, Cal., founded in 1879. The student enrollment increased from 2649 in 1913–14 to 7846 in 1922–23 and 6862 in the first semester of 1923–24. The teaching staff increased correspondingly from 207 to 403 members and the library from 21,000 to 55,000 volumes. The productive funds rose from $412,548 to $2,614,792, and the total yearly income from $106,766 to $860,000. The School of Commerce and Business Administration was organized in 1920, and in the first three years of its existence increased more than 200 per cent in enrollment; an extension division was organized in 1922, and in 1923, the School of Social Welfare under the direction of Dr. Emory S. Bogardus. One building of the science unit, for the College of Pharmacy and the department of chemistry, was expected to be begun in 1924, and the cornerstone of the first unit of the women's building was to be laid. This first unit was to be a residence hall; the other buildings were to be a women's gymnasium and a home economics building. President, Rufus B. von Kleinsmid, A.M., Sc.D., J.D., D M.C.P., Ph. et Litt.D.

SOUTH POLE. See POLAR RESEARCH.

SOUTHWEST AFRICA PROTECTORATE. Formerly German Southwest Africa (q.v.) but since 1920 a mandate territory of the British Empire administered by the Union of South Africa. It has an area of 322,400 square miles, and an estimated native population of 208,307. The European population, according to the 1921 census, was 19,432 of which 7855 were Germans and the remainder South Africans. The capital, Windhoek, had 3460 Europeans and 4399 natives. Only the German soldiers (about 6000) were repatriated, the civilians being permitted the possession of their holdings. Many of the British soldiers settled on the land and took up stock raising and farming, with the result that the British population was soon considerable. The Germans, however, after the conclusion of the War, maintained their efforts to gain autonomy and remained hostile to the British-Dutch penetration which not only extended to administration but to currency, schools and the like. The Germans continued to support their own schools in disregard of the tenders of the government. Diamond mining, exploited by British capital, continued the most important activity and was the largest factor in the protectorate's foreign trade. In 1922, £343,930 in diamonds were exported to the United Kingdom. Other exports were live stock, copper ore, vanadium, lead and tin. In 1913, exports were valued at £3,446,220; in 1919, £1,679,534; in 1920, £5,401,385 (of which £4,265,294 were diamonds); in 1922, £1,247,229. Countries of destination of 1922 exports by proportions were: United Kingdom, 28 per cent, South Africa, 34 per cent; Belgium, 26 per cent; Germany, 6 per cent; United States, 1.2 per cent. Leading imports in 1922 were foodstuffs, apparel, cotton goods, mineral oils, etc. Under the Germans, in 1913, imports were valued at £2,171,230; in 1919, £1,135,116; in 1920, £2,180,183; in 1922, £1,147,637. Countries participating were: Union of South Africa, domestic produce, 32 per cent; foreign produce, Union of South Africa, 32.6 per cent; Germany, 18.6 per cent; United Kingdom, 2.8 per cent; United States, 2 per cent. In 1922, there were 968 miles of railway of 3-foot 6-inch gauge and 475 miles of 2-foot gauge. The most important port, Walvis Bay, was opened up when the British built a 22-mile line from Walvis Bay to Swakopmund, the western terminus of the territory's most important railway. The Union of South Africa was linked to the protectorate when a line was built for military purposes from Prieska to Kalkfontein. In 1922, a line of 132 miles was in the course of construction from Windhoek to Gobabis.

In October, 1915, after the military forces

had occupied the country, a civil administration was established, though martial law was maintained until 1921. Germany, in the Treaty of Versailles, renounced her sovereignty, with the result that Southwest Africa was assigned to the Union of South Africa as a mandate territory in May, 1919. The mandate was approved by the League of Nations Council on Dec. 17, 1920. The governor general delegated his powers to a local administrator who was to be assisted by a nominated council of nine made up of four Germans, four South Africans, and one official. For the fiscal year 1922–23, revenues amounted to £870,930 (in 1917–18 they were £650,000). The principal source of revenue was the tax on diamonds, while £75,000 was paid annually as revenue from customs by the Union Customs Department. The laws of the Union were gradually being introduced into the country.

SOVIET REPUBLICS, UNION OF SOCIALIST. See RUSSIA.

SOVIETS, ALL-RUSSIAN CONGRESS OF. See COMMUNISM.

SOWERBY, LEO (1895–). An American composer, born at Grand Rapids, Mich. He received his entire musical education in Chicago, studying with C. F. Lampert, P. Grainger (piano), E. Delamarter (organ) and A. O. Anderson (composition). In 1918–21, he taught theory at the American Conservatory there, and was also organist at the South Congregational Church and critic for the *Inter-Ocean* In 1921, he was awarded a special fellowship by the American Academy in Rome, where he spent the following two years. He appeared as soloist in his own works. As a composer he is a decided futurist, although he himself claims affinity with the neoclassicists (Franck-d'Indy). His works comprise: a symphony; a symphonic sketch, *The Sorrow of Mydath;* an overture, *Comes Autumn Time; Suite in the Old Style; Rhapsody on British Folk-Tunes; The Ballad of King Estmere* for two pianos and orchestra; a violin concerto, a cello concerto and a piano concerto; a quintet for wind instruments; besides other chamber music, piano pieces, and choruses.

SPA CONFERENCE. See PEACE CONFERENCE AND TREATIES; REPARATIONS.

SPAETH, (JOHN) DUNCAN ERNEST (1868–). An American philologist. He was born in Philadelphia, Pa., and studied at the University of Pennsylvania and at Leipzig, then in Italy and France. He was professor of English at several colleges and lecturer on the University Extension Course of the New York Board of Public Education. After 1911, he was professor at Princeton. He is the author of *Christian Theology in Browning's Poetry* (1916) and *Old English Poetry* (1921); and editor, with Henry S. Pancoast, of *Early English Poetry* (1921). During the War, he was educational director of Camp Wheeler and Camp Jackson and edited a *Camp Reader for American Soldiers,* adopted by the War Department for the American Expeditionary Forces.

SPAIN. A constitutional monarchy of southwestern Europe. Continental Spain has an area of 190,050 square miles; Greater Spain (including the Balearic and Canary Islands and the Spanish possessions in the north and west coast of Africa) has 194,800 square miles. Population in 1910 was 19,950,817: in 1920, 21,347,335; average annual increase, 0.65 per cent; density of population in 1920, 109.5 per square mile; maximum density in province of Biscay, 490.1 per square mile; minimum density in province of Soria, 38 per square mile. Principal cities with population in 1920, were: Madrid, 751,352; Barcelona, 710,335; Valencia, 243,783; Sevilla, 205,527; Malaga, 150,584; Murcia, 141,175; Saragossa, 141,350. For the period under discussion, vital statistics were as follows (per 1000 inhabitants): marriages, 1914 and 1921, 6.5 and 7.8; births, 30 and 30.5; deaths, 22.2 and 21.5. Emigration, after the War, took on large proportions once more, 101,980 Spaniards quitting the country in 1919; 185,918 in 1920; 92,504 in 1921; 93,591 in 1922; and 123,804 in 1923, as compared with 129,576 in 1914. Their destinations were for the most part the Argentine, Cuba, Brazil, Uruguay, and Mexico. It should be noted, however, that these emigrations were largely seasonal, covering the period of the harvest only, and that most of the emigrants returned immediately after. In 1910, 59.3 per cent of the population was illiterate. Education in the primary grades made slow progress, though institutions for higher education were fairly well attended. On Dec. 31, 1921, there were 27,429 primary schools in Spain. In 1920–21, 215 secondary schools had 52,288 pupils, and the 11 universities in the country with the university section of Canary Islands, 23,508 students. In 1920–21, the total expenditure on education and the fine arts was 143,180,762 pesetas as compared with 62,584,378 in 1914.

Industry. Agriculture continued the mainstay of the country. Areas under cereal crops increased little: wheat, 9,676,879 acres in 1914 and 10,488,800 in 1923; rye, 1,886,206 in 1914 and 1,801,500 in 1923; barley, 3,402,553 and 4,539,600. The acreage under vines remained about the same (3,315,400 in 1923) though production in gallons was 582,801,120 in 1923 to the 432,617,000 in 1913. Similarly, the production of olive oil was 265,422 tons in 1913 and 298,859 metric tons in 1923. Other important products were rice, beans, peas, lentils, tares, vetches, flax, hemp, pulse, esparto, oranges, hazel nuts, onions, almonds. The sugar industry received attention, there being 26 cane sugar factories and 44 beet sugar factories in 1921. Production of cane sugar fell off between 1913 and 1920, for in 1913, 13,231 metric tons of cane sugar were produced as compared with 6760 tons in 1920; in 1921 there was a revival to 12,033 tons. Production of beet sugar was slightly higher than before the War and was increasing; in 1913 there was an exceptionally large production of 148,394 tons, and during the War production slumped, reaching a minimum of 101,258 tons in 1915; after then the increase was steady and gradual, and production reached 159,722 tons in 1921. Pastoral activities were once more on the increase, sheep increasing in number from 14,500,000 in 1913 to 20,522,000 in 1921; goats, 3,394,000 to 4,298,000; horses, 540,000 to 722,000; mules and asses, 1,824,000 to 2,432,900; cattle, 2,878,000 to 3,718,000; hogs, 2,750,000 to 5,152,000. The fishing industry likewise advanced over the period, for 89,000 fishermen were engaged and brought in a catch valued at about 60,000,000 pesetas in 1913, while in 1920 the number of fishermen was 148,700 and the value of the catch, 374,080,000 pesetas. Some 689 factories prepared sardines and fish preserves for the home and export markets. During the War interest in mining was stimu-

lated, but except for coal, soon flagged. All the principal minerals in 1921 showed smaller yields than those of 1912. Iron dropped from 9,139,000 tons to 2,602,000 tons in 1921. Total values of mineral products at the mine mouths were, for typical years: 1910, 453,000,000 pesetas; 1917, 1,323,000,000; 1921, 402,608,000. The number of workers likewise dropped from 149,812 in 1912 to 102,452 in 1921. The War had a heightening influence on the manufactures of the country, which, because of the dearth of capital and Spain's inexperience, was also only temporary. There were 2,614,500 spindles in the cotton establishments in 1910 and only 1,252,900 in 1922; 340,410 spindles in the wool factories in 1922 as compared with 662,000 in 1910. Cork production and paper increased slightly.

Trade. The years 1913 and 1914 saw an excess of imports over exports, but with the beginning of the war period and the heavy demands made on Spain for her products, the balance turned favorable and continued so through 1919. From thence on, imports once more exceeded exports The figures for typical years in thousands of dollars at the prevailing rates of exchange are (excluding treasure):

	1913	1918	1921	1922
Imports	252,067	109,773	382,449	470,143
Exports	204,123	170,626	211,488	224,622

Leading exports were, of course, alimentary substances, including grain, sugar, and wine, metals and their manufactures, wool, timber, and cotton. Imports were machinery, drugs, metals, foodstuffs, etc. The following indicates the distribution of the foreign trade by countries. Imports for 1913 and 1920 (in thousand pesetas): Great Britain, 244,669 and 213,815; France, 204,268 and 219,229; United States, 167,486 and 331,346; Germany, 185,370 and 86,160 Exports for 1913 and 1920: France, 327,744 and 280,078; Great Britain, 231,571 and 218,704; United States, 72,195 and 77,952; Germany, 74,419 and 15,883; Cuba, 64,539 and 81,024 While the figures indicate a healthy state of affairs in the post-war year, it should be remembered that the peseta was worth only 15.9 cents in 1920, and 19.3 cents in 1913, and that wholesale prices in 1920 were more than twice those of the earlier year. The following analysis of Spain's trade with the United States will serve as key to the situation. Figures are in millions of dollars. The index figures are based on the value of the average imports and exports for 1910–14.

	IMPORTS FROM THE UNITED STATES		EXPORTS TO THE UNITED STATES	
	Millions of dollars	Index number	Millions of dollars	Index number
Average 1910–14	26	100	22	100
1920	151	577	42	197
1921	69	264	26	121
1922	71	271	29	133

In 1914, 18,915 vessels of 22,229,159 tons entered and 16,482 of 19,265,265 tons cleared Spanish ports. In 1918, the figures were: entered, 12,475 of 6,745,084 tons; cleared, 13,936 of 7,204,843 tons. In 1921: entered, 19,121 of 20,107,592 tons; cleared, 16,688 of 15,979,977 tons. The Spanish merchant marine consisted of 628 steamers of 844,322 tons and 236 sailing vessels of 32,000 tons in 1914; in 1922, there were 621 steamers of 912,817 tons and 581 sailing vessels of 101,285 tons. There was therefore a substantial increase in spite of the war losses by submarine and mine. Through the middle of 1918, 51 vessels of 123,176 tons were torpedoed and 6 vessels of 16,731 tons were sunk by mines. (These figures exclude boats of less than 250 tons.)

Railways. In 1913, total length of railways open was 9310 miles; in 1920, 9504 miles. The railway service was severely taxed during the War because of the increased traffic caused by the cessation of the coasting trade The continued depreciation of equipment, the higher wages, and only the slight rate increase of 15 per cent allowed, put the railroads in a sorry condition. It was incumbent on the government to increase annually the state subsidies, so that 168,000,000 pesetas had to be paid over during 1922 In 1923, rumors to the effect that the government planned to discontinue the subsidies served to disorganize completely railroad finances. Schemes for the greater use of water power and the electrification of railways were considered during the period. In 1919, the first Spanish subway, that of the Madrid tubes covering a length of 3 miles, was opened.

Finance and Economic Conditions. The revenue in 1914 was 1,343,000,000 pesetas and the expenditure 1,430,000,000. By 1922–23, the revenue had mounted to 2,453,000,000 pesetas (exclusive of loans) and the expenditure to 3,375,090,000. Estimates for 1923–24 were: expenditure, 3,048,386,000 pesetas, and revenue, 2,617,000,000. Deficits thus steadily rose, for the most part because of the refusal of the government to increase the burden of direct taxation. Whereas in 1915, direct taxes were 38.3 per cent of the total revenues and indirect taxes 33 per cent, in 1922–23, direct taxes were 36 per cent and indirect taxes, 40 per cent. For 1921–22, the final deficit was put at 1,101,000,000 pesetas; the deficit of 1922–23 was 922,000,000; and the initial budget estimates of 1923–24 carried a deficit of 431,386,000. In 1922–23 alone, the interest on loans contracted to meet current expenses was 47,000,000 pesetas The national debt over the period showed: External debt, 1915, 1,028,070,000 pesetas; 1923, 910,000,000 pesetas. (This last was merely nominal, however, for about 800,000,000 pesetas of the external debt was held by Spaniards.) Internal debt, 1915, 8,118,263,000 pesetas; 1923, 14,659,000,000. In 1914, there were 1,985,847,000 paper notes in circulation, by June, 1923, these had increased to 4,134,000,000 However, the metallic reserves of the Bank of Spain were 2,525,000,000 pesetas. The period of the War saw a quickening of interest in internal affairs and an increased prosperity. Many joint stock companies, particularly during 1916–17, were formed for industrial enterprises and the government aided by the creation of a commission for the promotion of industry. Also, the external loan placed abroad was taken up by Spaniards so that the great majority of the bonds were held at home. The

application to the domestic coal fields saw a doubling of pre-war production in anthracite and lignite, and though the coal was of an inferior quality, it served very well for the use of the electrified railways which were being extended. The demands for raw materials and foodstuffs from belligerents caused home stringencies and necessitated strict governmental regulation. From 1914 on, the government applied itself to the regulation of cereal exports, the control of domestic prices, the removal of import duties from foodstuffs, the stimulation of agriculture by bounties, etc. In 1917, a general agricultural law was passed for the encouragement of the industry through the creation of a central agricultural loan bank. In 1918, after the failure of local boards of supply to control the traffic in provisions adequately, full powers were given to a commissary general. The rise of prices, the growing intransigency of labor, profiteering, etc., all contributed to a general industrial unrest that took on a revolutionary character. Based on the wholesale prices of 1913 as an index of 100, prices averaged 221 in 1920 and then fell to 190 for 1921, 176 for 1922, and 172 for 1923; for December, 1923, the index was 176. The period of rising prices was therefore accompanied by strikes, many very bitter in character. In 1916 a general strike proclaimed in Valencia by the railroad workers necessitated the calling out of the soldiery; in 1917, the prevailing food shortage led to another general strike with the result that constitutional guarantees were suspended and many labor centres ordered closed. In 1919 some 100,000 workers downed tools in Barcelona, not only in industrial plants but in all public services as well. Terrorism was resorted to and syndicalist agitation was particularly prevalent. The government declared martial law and attempted to mobilize the strikers, but so threatening was the situation that a hasty compromise was agreed on which in effect granted all the workers' demands. In retaliation, the employers declared a lockout in the year which threw out of work some 1,000,000 employees including professional workers and teachers. In subsequent years, with Barcelona as the centre, strikes were sporadic in Saragossa, Bilbao, and Corunna, and even reached the agricultural workers in Andalusia and other regions. In 1922, the postal workers went on strike; in 1923 the transport workers went out in Barcelona for 66 days, and even bank clerks in Madrid left their desks. After 1920, economic conditions took a turn for the worse; the balance of trade became unfavorable; the costs of the unhappy Moroccan campaign were severely felt. The threatening aspect of labor in this year foreshadowed the coup d'état of 1923. The economic condition was reflected in the falling rate of exchange: par value, $.193; 1919 average, $.198; 1920, $.159; 1921, $.135; 1922, $.155; June, 1923, $.146. A tendency for the better was to be seen in the formation of the Catholic Syndicates, a group of coöperative associations, in 1918. By 1921, in 4000 local syndicates, some 600,000 workers were enrolled.

History. The outbreak of the War strongly divided Spanish opinion into two groups: the pro-French Spaniards, who were largely liberal in their tendencies, as well as antimonarchical and anticlerical; and the conservatives, who, because of French expansion in Morocco and the separation of church and state in France, were pro-German in their sympathies. This cleavage and the fact that Spain could not possibly gain anything from war led to the decision to remain aloof from hostilities. The Cortes, meeting in October, 1914, endorsed the general policy, with the result that the country settled down, first to a state of uncertainty because of the fear of suspended food imports, and then to one of complacency as orders for materials began to pour in from France. A steady stream of metals, clothing, and pack-animals, crossing the frontier during the whole period 1914–18, brought, in return, increased prosperity to certain classes. Shipbuilding flourished as well as trading with Allied ports, with the inevitable increase of vessels lost by torpedoing and mines. In 1915 the Dato ministry, in power since 1913, fell and was succeeded by a cabinet made up of the liberal elements headed by Count Romanones. The new government was generally characterized by a pro-Allied attitude, although it took no active steps to lead Germany to a war declaration. On Apr. 20, 1917, Count Romanones resigned, to be followed by Garcia Prieto, leader of another wing of the Liberals, who was more nearly neutral in his tone. The Liberal stay in power was, however, very brief. The demands for a more aggressive policy toward Germany, because of the intensification of its submarine campaign and the unsuccessful attempt on the part of the Spanish government to cause the dissolution of the military juntas which had rapidly spread among the infantry officers, hastened the crisis In June, 1917, Dato (Conservative) was once more called to head a cabinet, and he immediately acceded to the revolutionary demands of the military cliques. Their agitation, fed by the inefficiency of the bureaucracy on the one hand and the increasing arrogance of the military on the other, was to culminate in the events of 1923 Three movements were to march side by side in the subsequent years: the increasing distemper of the laboring classes, manifesting itself in industrial struggles of growing bitterness; the larger part in affairs that the military juntas assumed; and the regionalist movement, centring in Catalonia, whose purpose was a greater measure of local autonomy. From all this agitation it was to be expected that the parties of the Left should adopt an uncompromising attitude. An extensive programme was announced, including greater decentralization, popular election of senators, elimination of the right of the government to suspend the constitutional guarantees and to prorogue Parliament at will, annual meetings of parliament, etc. Labor troubles were frequent throughout 1917, and the demands of the Catalans took on more insistency. Most of the Catalan members of the Cortes met in an assembly at Barcelona on July 19, 1917, to press for reforms. The general strike that followed (July–August) and the forced resignation of the war minister as a result of the intrigues of the Military Committee hastened the fall of the government. Prieto again formed a cabinet of Maurists (extreme Conservatives), Liberals, and Catalanists. A general election took place early in 1918; the government fell at the first meeting of the Cortes on March 18. The high-handed conduct of the war department under La Cierva had precipitated the crisis. Only through the personal influence of the King could a new cabinet be formed. This was made

up of the strongest men in public affairs: Maura (Premier), Dato (Foreign Office), Marina (War), Besada (Finances), Alba (Education), Romanones (Justice). It, too, fell (November 6); it was followed by a short-lived Prieto ministry which in turn was succeeded by a Romanones government on December 3.

The end of the War and the popularity of the democratic doctrines which reverberated around the world were reechoed significantly in Spain. The ministry of public works announced an extensive programme of economic reconstruction. In December, 1918, a Catalan parliamentary delegation issued a manifesto demanding home rule. A general strike broke out in Barcelona early in 1919, hastened on by syndicalist propaganda. The attempt to mobilize the strikers on the one hand, and the desire to propitiate them, on the other, by the appointment of liberal civil authorities at Barcelona, brought the civil and military officials into conflict. The government therefore resigned and a cabinet formed by Maura (Apr 15, 1919) effected a dissolution of the Cortes and a new general election. But Maura was compelled to retire soon after, and the following ministries could maintain only a brief tenure. The machinations of the juntas and the continued industrial conflicts made any permanent civil government an impossibility. In April, 1920, Dato once more headed a ministry His attempt to conciliate the extreme conservatives of his party, i.e. Maura and La Cierva, and the Liberals by a programme of social reform including arbitration, insurance, and land measures, was unavailing, for as a result of the December elections he was left without a majority in the Cortes. His endeavors to reconcile all Conservative elements were occupying him when he was assassinated on Mar. 8, 1921.

From 1921 on, the conduct of the war in Morocco (q.v.) became the leading question in Spain. The increasing taxation and the intolerable censorship, together with reports of disasters that began to drift in, served to antagonize further all classes of opinion against the ruling political leaders. Cabinets continued to change with lightning rapidity. The Maura ministry, embarrassed by the juntas in its handling of the Moroccan War, attempted to force their dissolution and was compelled to resign when the King refused to sign the decree (Jan. 11, 1922). Maura was called back, to last only another two months, and was followed by a Liberal coalition under Guerra The latter immediately became popular by restoring the constitutional guarantees, suspended three years earlier, and by moving against the military juntas On Nov. 14, 1922, a decree was promulgated, ordering their abolition. A prolonged discussion over the responsibility for the disasters of 1921 in Morocco (q.v.), an attempt to impeach the Allende-Salazar ministry under which they had taken place, and demands for such reform of the constitution as would end the suspension of the guarantees, caused the overthrow of the ministry. After great difficulty a new Liberal government was formed under Prieto on December 7. In December a sensation was caused when the former high commissioner of Morocco, General Berenguer, assumed full responsibility and demanded a trial in order that the whole matter might be aired. His charges of inefficient equipment and a general lack of foresight on the part of the administration stirred a country which had already been aroused over the great loss of life and the expenditure of 500,000,000 pesetas. By the middle of 1923 parliamentary commissions investigating the conduct of the campaign were prepared to bring charges against the ministry and the high officers in command as concessions to public opinion. The fear of a coup d'état forced the government to prorogue the Cortes, for the leaders of the hostile movement were military men generally. The further reverses of September, 1923, brought the matter to a head. This, together with the continued labor troubles and the increasing Catalan agitation and the success of Mussolini's dictatorship in Italy, paved the way for a military revolution On September 13, Capt-Gen. Ferdinando Primo de Rivera, in charge of the military at Barcelona, seized the civil administration of the city and forced the resignation of two cabinet ministers offensive to him, and eventually that of the whole Prieto government. It was evident at once that the revolution was not directed at the throne but at the prevailing political methods. The King accepted the situation in this light, for on his arrival in Madrid he requested General Rivera to head the military directorate and form a government. Parliament was dissolved by decree on September 16; the ministerial departments were placed under the permanent undersecretaries; the separatist movement was denounced in a royal decree; trial by jury was suspended, and a strict censorship imposed. The military directorate headed by General Rivera and made up of Generals Adolfo Espasno, Luis Navarro, Luis Hermoso, Dalmacio Rodriguez, Antonio Mayenda, Gomez Jordana, Ruiz Portal, and Mario Muslera, with Admiral Marquis Mavez, exercised the real functions of government First measures were characteristically severe. All local officials were dismissed and new elections ordered. Decrees were promulgated abolishing the salaries of life senators, amending judicial procedure, and establishing a commission for the review of railway administrative methods. The support of the middle classes was demanded under a veiled threat of compulsion The result was the oversubscription on November 5 of 350,000,000 pesetas of treasury bonds That the dictatorship did not contemplate a brief stay in power was indicated when Count Romanones and Don Alvarez, speakers respectively of the Senate and the late Chamber of Deputies, were removed from their posts for petitioning the King to convoke the new Cortes. The lot of the dictatorship was not an easy one. Hostility was evoked by the dissolution of the provincial legislatures, the exile of the popular Professor Unamuno to the Canary Islands, and the failure of the directorate to cope with the repeated Moroccan disasters. By the summer of 1924 it became increasingly evident that de Rivera had neither the ability nor the resources to effect the long-hoped-for restoration of his country. In fact, that a démarche was contemplated was hinted at in the royal decree of July 4 which demilitarized the directorate and modified the dictatorial powers of de Rivera.

Catalan Question. The Catalan question, which had agitated Spain to a greater or less degree for 50 years, came to a head, as indicated above, in the years 1917–19. At first purely sentimental and literary, the movement for home rule had taken on a political and eco-

nomic character. The Catalan language was revived, and the particularistic tone of the agitation became more pronounced. An assembly met in Barcelona in 1917 in defiance of the government and voted resolutions asking for drastic reforms in the constitution. In spite of the arrest of the members attending, the agitation continued. In 1918 a parliamentary delegation of Catalans presented to the Madrid government a full statement of demands. This included delimitation of Catalan territory, to take in the existing four Catalan provinces; definition of the respective limits of the powers of the central government and those of the Catalan and the calling of a Catalan constituent assembly; political, economic, and financial autonomy through the organization of a Catalan government with two chambers; regional control of taxes on mines, forests, railways, and water courses; a court of arbitration for the settlement of disputes between the central and regional authorities. An attempt was made to place this manifesto before President Wilson and the Peace Conference, but the nation-wide hostility which it aroused, together with the threats of the military to apply force and of the middle class to declare an economic boycott, softened the ardor of the intransigeants. Incidentally a large mass of the supporters of the movement fell away when the workers lost interest and became absorbed in the trade union movement. Yet the undercurrent continued to be felt from time to time. From 1921 to 1924 it appeared from the disorders and propaganda prevalent that the movement had lost none of its vitality. Even the decree of Sept. 18, 1923, which at the instance of the military dictatorship inveighed against the separatist movement, had no real effect Whether the Rivera administration meant to apply more forceful measures was not plain in 1924, but it was known that the flamboyant nationalism which it represented did not look kindly on anything but a diffuse localism. At any rate, Catalans were openly hostile to the directorate, going so far, in April, 1924, as to appeal to the League of Nations for intervention.

Foreign Affairs. Domestic concerns during 1914–18 distracted attention from foreign affairs. The result was that the tone of the negotiations carried on with Germany over submarine sinkings never became obstreperous. In 1918 an agreement was reached with Germany for a ton-for-ton indemnity to cover all losses. In 1919 Count Romanones attended the Peace Conference and succeeded in obtaining for Spain a place in the Council of the League of Nations. All talk of a Franco-Spanish alliance, which was current rumor in 1919 and 1920 and was quickened by Count Romanones's presence at the Peace Conference and the King's visit to Paris in 1919, came to naught because of the Spanish pretensions in Tangiers. Spain's desire to assume an important place in foreign affairs and in the Mediterranean in particular was not to be frustrated, for with the assumption of the reins of government by the Directorate, pourparlers were at once commenced with Italy. In November, 1923, the Queen and King, accompanied by General Rivera, were entertained by Italian royalty. A commercial treaty was at once effected, and it appeared certain that Mussolini and Rivera meant to hasten a rapprochement of the two powers for the maintenance of an equilibrium in the Mediterranean. Another question discussed over the period was the negotiation of commercial treaties with France, Germany, Switzerland, Portugal, and the United States. Considerable hard feeling was engendered by the fact that France in 1920 increased all tariffs considerably. The matter was debated in 1921 and 1922 and seemed on the way to solution in 1923 when the government was authorized to negotiate a treaty, but the coup d'état ended all discussion for the time. The same was true of the German and United States treaties which had lapsed in 1922 and 1923 respectively. For Spain's part in the Tangier discussions, see TANGIER CONTROVERSY. See also MOROCCO; ITALY; NAVIES OF THE WORLD.

SPANISH LITERATURE. Spanish literature in the nineteenth century had a veritable renaissance in the drama, the novel, and in lyric poetry, three fields in which Spain had been supreme in the heyday of her Golden Age. To these she added an excellent school of criticism. In all four of these forms of literary activity Spain continued to shine during the first quarter of the twentieth century. The "generation of 1898" was the name applied to the forward-looking group which, while preserving all that was best in their native inheritance, wished to profit by all that was best beyond the borders of their own land. Keen observers saw the lessons to be learned from foreign experience, and patriotic hearts and minds adapted those lessons to the native needs, so that Spanish literature of the first quarter of the century was racially Spanish and typical.

In the novel, two old favorites went into new fields: Blasco Ibáñez gave a series of novels about the War, one of which, *Los Cuatro Ginetes del Apocalipsis*, is remarkable for its grasp of the extent of the racial problems involved; and Pío Baroja gave a series of novels that tend to show the development of liberal ideas in Spain in the nineteenth century. These have been compared, *mutatis mutandis* with the *Episodios Nacionales* of Pérez Galdós.

The novel appears in several attractive fields: the historical novel, the regional novel, the realistic novel, the latter sometimes showing keen analysis of modern problems Ramón María del Valle-Inclán wrote about 30 *cuentos*, and three historical novels dealing with the Carlist War in Galicia. Alejandro Pérez Lugín made a great furore with his *La Casa de la Troya* (Fastenrath prize), which portrays the life of Santiago de Compostela. His subsequent novels *Currito de la Cruz* and *La Corredoira y la Rua* also deal with Galicia, as do those of Francisco Camba, whose *Revolución de Laíño* won the Fastenrath prize (1922). Mauricio López Roberts won the Fastenrath prize (1917) with his *El Verdadero Hogar*, and his *El Ave Blanca* (1922) deals attractively with a strange Basque legend. Guillermo Díaz-Caneja won the Fastenrath prize (1918) with his *El Sobre en Blanco*, while his later novel, *La Virgen Paleta*, was considered his most beautiful work up to that time. Without intending to be so he is a moralist. The Pueyo prize (1922) was awarded to M. D. Benavides, whose *Lamestación* revealed a young author of great promise. Ricardo León was considered by many as being stylistically the author most nearly entitled to be considered the successor of Juan Valera. In subject matter and in manner of treatment he continued the traditions of Alarcón and Pereda. His *El Amor de los*

Amores is a kind of reve sal of *Pepita Jiménez.* Among his latest novels were *Amor de Caridad, Cuentos de Antaño y de Hogaño,* and *Humos de Rey.* Beatriz Galindo (Mrs. Isabel O. de Palencia) wrote one of the most effective books of the year 1923, *El Sembrador Sembró su Semilla . . .*, a fascinating novel and a medically sound study of eugenics. Concha Espina de la Serna, after winning the Fastenrath prize for 1914 with her *La Esfinge Naragata,* was forging rapidly to the front, with *La Rosa de los Vientos, Ruecas de Márfil, El Metal de los Muertos, Despertar para Morir, Dulce Nombre,* and *El Caliz Rojo.* In 1923, the Royal Spanish Academy awarded her the Castillo de Chirel prize, and she was already being spoken of for the Nobel prize.

During the period under consideration, poetry gave us not only the editions of the complete works of such poets as José María Gabriel y Galán, Vincente Medina, and Antonio Machado y Ruiz, but new works of very real worth and inspiration, which drink deep from the fountain of the national life. Francisco Villaespesa gave us *Andalucía, La Maja de Goya,* and *Paz.* J. M. Bello's *Cantigas de Juglaría* exhibit a surprising variety of rhymes and meters; and the polished verse and beautiful thoughts of E. Carballo's *Cancionero de Amor* met with favor. The *Ruta de Ensueño* (1917) of F. Pérez Menéndez Maturana was deemed better than any of his previous work. The *Poemas* (1918) of A. Torre-Ruiz caused him to be hailed as a new poet of real inspiration. Juan de Contreras, Marqués de Lozoya, showed himself to be a graceful versifier with a real inspiration in *Poemas de Añoranzas* (1915), *Sonetos Espirituales* (1918), and *Poemas Castellanos* (1920), the last of which, treating of Segovian legends, won the Fastenrath prize. The great poetic event of 1922 was the discovery of a real poet in the person of an authentic shepherd of Castile, Julián Sánchez Prieto, whose book *En el Chozo* was written in the fields among his sheep.

The drama flourished as one would expect, and some of the best work was done in verse, verse whose charm yields in no respect to the verse of earlier periods. Francisco Villaespesa produced *La Leona de Castilla* (1915), *Abenhumeya, El Rey Galaor, La Maja de Goya,* and *Judith,* the last a Biblical subject which has been fairly popular in Spanish literature. Eduardo Marquina gave us *El Gran Capitán, La Morisca, La Extraña* (1921), *El Pavo Real* (the most beautiful production of the year 1922, and dealing with an exquisitely dainty legend of British India), and in 1923, *Una Noche en Venecia* (a happy combination of profound love and sound thinking, set to verse that needs no musical accompaniment). Antonio Rey Soto, although a churchman, ranks well as a poetic dramatist, as shown by his *Amor que Vence al Amor* (1917) and his mystic tragedy *Cuento del Lar* (1918). Next to Eduardo Marquina, the most graceful dramatic poet was probably Luis Fernández Ardavín, whose works *La Drama del Armiño* (1921), *El Doncel Romántico* (1922), and *Romance de Doña Blanca* (1923), were all very well received. In the nonpoetic drama there is also much excellent work to record. Despite his great age Benito Pérez Galdós won a triumph with his tragicomedy *Santa Juana de Castilla* (1918), as had in 1917 the almost equally aged Catalan dramatist Angel Guimerá with his peace play *Jesús que Vuelve.*

The Alvarez Quintero brothers continue to keep the Spanish stage supplied with their clean, witty light comedies and with occasional pieces of a more serious nature such as *Malvaloca* (crowned by the Academy), *La Calumniada, Ramo de Locura, La Prisa,* and *Cristalina,* all of which, without losing any of the usual charm of the authors, deal with serious questions. Two other authors of note belong to this lighter school, Carlos Arniches (whose *La Tragedia de Marichu* and *La Mala Hora* were very successful), and Pedro Múñoz Seca, who keeps his public in gales of laughter by his unexpected quips and flashes of repartee (for example, in *El Conflicto de Mercedes*), but who can also write for children, as shown by his beautiful *La Muerte del Dragón.*

There still remain four great names connected with the drama in the quarter-century. Jacinto Benavente, from the nature of his work, has been called the Spanish Shakespeare. After 1916 (when he produced *La Ciudad Alegre y Confiada,* which is an exquisite allegory treating the question of national civic preparedness as against personal selfishness) he gave us *La Inmaculada de Dolores, Mefistófela, Los Cachorros, La Ley de los Hijos, La Vestal de Occidente,* and *Por ser con Todos Leal ser para Todos Traidor.* He was awarded the Nobel prize for 1922. Manuel Linares Rivas won a succession of triumphs with his careful studies of vital problems: *Cobardías* (1918, attacking all kinds of moral cowardice), *El Caballero Lobo* (1919), *Almas Brujas, Lo Pasado, Como Dios nos Hizo, Frente a la Vida* (problem of educating middle-class girls to economic efficiency so as to avoid necessity of loveless marriages), and his success of 1923, *La Ma la Ley,* which is a piercing study of a bad inheritance law. In the later years, Gregorio Martínez Sierra was devoting a great deal of his time and talent (and he was ably seconded therein by his talented wife) to staging with exquisite taste the plays of others (e.g. *El Pavo Real* and *Una Noche en Venecia* by Marquina, and *El Conflicto de Mercedes* by Múñoz Seca); but that did not prevent him from doing some creative work, as witness *El Corazón Ciego, Don Juan de España* (a new treatment of an old legend), and *El Grillo del Hogar,* which is a dramatization, with delicate touches, of Dickens's *Cricket on the Hearth.* J. López Pinillos, who wrote under the pen name of Parmeno, worked indefatigably during his last years, as witness *Los Senderos del Mal,* and *Esclavitad* (Piquer prize for 1918), *El Condenado, La Red* (1919, Academy prize in 1921), *Como el Humo, La Tierra,* and *El Caudal de los Hijos* (all produced in 1921, all studying serious problems and the last one treating honor as a spiritual inheritance that parents must hand down unsullied to their children); and then went to his reward, leaving behind him two works for posthumous production: *Los Malcasados* and *Enbrujamiento,* which latter was a tremendous success.

The school of criticism following in the footsteps of Clarín, Menéndez y Pelayo and Valera shows such names as Azorín, Blanca de los Ríos de Lampérez, Carmen de Burgos, E. Díez Canedo, Miguel de Unamuno, Ramón Pérez de Ayala, Ricardo León, Luis Astrana Marín, and the two special followers of Menéndez y Pelayo: Ramón Menéndez Pidal and Adolfo Bonilla y San Martín, each of whom had in turn developed a following.

SPARTACISTS. See COMMUNISM; GERMANY.

SPAULDING, EDWARD GLEASON (1873–). An American philosopher, born at Burlington, Vt., and educated at the University of Vermont and at Bonn in Germany. He taught philosophy in the College of the City of New York from 1900 to 1914 and then became a member of the faculty of Princeton University. For several years he lectured at Woods Hole, Mass. He collaborated with six others in *The New Realism* in 1912 and also wrote *The New Rationalism* in 1918. He served in the Engineers Corps of the United States Army during the War.

SPECTROHELIOGRAPH. See ASTRONOMY.

SPELLACY, THOMAS JOSEPH (1880–). An American lawyer, born at Hartford, Conn. He was graduated from the Law Department of Georgetown University in 1901, and from 1903 practiced law in Hartford. He was active in Democratic politics and from 1915 to 1919 was United States District Attorney. He was Democratic candidate for governor in 1918, and in 1919 served as legal adviser in Europe in the settlement of naval affairs growing out of the War. From 1919 to 1921, he was Assistant Attorney General of the United States. In the election of 1924, he was one of John W. Davis's managers.

SPENCER, ARTHUR COE (1871–). An American geologist, born at Carmel, N. Y. He studied at the Case School of Applied Science, and in 1896 received his Ph.D. at Johns Hopkins. Later entering the service of the United States Geological Survey as assistant geologist, he attained the rank of geologist in 1902. In his official capacity he studied the general geology and ore deposits of Virginia, Colorado, Wyoming, Alaska, and Cuba, and more particularly the zinc and iron deposits in the pre-Cambrian rocks of New Jersey, as well as those of Texas, including the iron ores, and the Triassic iron ores of Pennsylvania. Later he was given charge of the investigation of lands in the Appalachian and White Mountains to determine whether Federal control of lands would promote navigability of dependent streams.

SPENCER, ROBERT (1879–). An American landscape painter, born at Harvard, Neb., and educated at The National Academy of Design in New York and at the New York School of Art. He studied under Chase, DuMond, Henri, Garber, Francis Jones, and F. Luis Mora. Among his numerous awards were the George Innes gold medal of the National Academy of Design (1914), the gold medal of the Boston Art Club (1915), and the gold medal of the Panama-Pacific Exposition (1915). His paintings are permanently hung in the Metropolitan Museum of Art in New York City and in the most important collections of the United States, including those of Chicago, Washington, Pittsburgh, Detroit, and Buffalo. He became a National Academician in 1920.

SPENGLER, OSWALD (1880–). A German scholar and writer on philosophical topics. He received international notoriety through the publication of his *Untergang des Abendlandes, Umrisse einer Morphologie der Weltgeschichte* (2 vols., 1920–22). In this work he attempted to trace a philosophy of history and to predict, on the basis of the postbellum disorganization of Europe, the eclipse of western civilization. His other works include a study of the philosophy of Heraclitus (1904) and a sociological tract on *Preussentum und Sozialismus* (1922).

SPINDEN, HERBERT JOSEPH (1879–). An American anthropologist who was born in Huron, S. D. He did field work for the Peabody Museum of Harvard University in the western States, Mexico, Central America, etc., and was a member of the American Museum of Natural History in New York. He specialized on ancient art and was in charge of the exhibit of industrial art in 1919. He conducted an archæological expedition to Venezuela, which was financed by the Museum of Natural History, in 1915, and published a work on *Ancient Civilizations of Mexico and Central America* (1917).

SPIRE, ANDRÉ (1868–). A French writer of Jewish extraction. He was the leader of a group of Franco-Jewish poets and writers in Paris, who wanted to carry forward the Jewish tradition regardless of language. This school included such men as Henri Franck (died in 1912) and Edmond Fleg, the author of *Ecoute, Israel.* Spire's published works include. *Et J'ai Voulu la Paix, Fournisseurs* (war poems); *Versets: Et Vous Riez, Poèmes Juifs; Les Juifs et la Guerre* and *Quelques Juifs* (critical essays). As a poet Spire reflects a restless and powerful lyricism best characterized in his own words as of a man who "does not know how to love in a dry manner—like a priest."

SPIRITUALIST ASSOCIATION, NATIONAL. An association incorporated in 1893 for the union of local spiritualist societies of the United States into an organization for mutual help and coöperation in charitable, educational, religious, and missionary activity relating to the objects and phenomena of spiritualism. Annual conventions are held in which matters relating to spiritualism are discussed. The Association made progress in membership and financially in the decade 1914–24. Many local churches were built, and a vigorous propaganda was carried on. Ministers to a large extent took the place of the itinerant system in local societies and churches At the annual meeting in 1919, legislation in all States for the protection of the spiritualists as a religious denomination was strongly urged. An advance toward securing a national temple in Washington was made in 1921 by payment in full for a prominent building site. The Association maintains a Spiritualist school, the Morris Pratt Institute, at Whitewater, Wis. Its periodicals include *The Progressive Thinker, The Weekly Banner of Life,* and *The National Spiritualist* (a monthly). It has a membership about 600,000, with some 600 affiliated churches. Its ministers number about 500 and its mediums about 1200. The president is Dr. George B. Warne. The general offices of the Association are in Washington, D. C.

SPITZBERGEN. An Arctic archipelago with a total area of 25,000 square miles, belonging to Norway since 1919. The summer population (1921) was 1315; the winter population (1921–22), 895. The permanent population was made up of inhabitants of five mining camps engaged in the collieries. The interest in the exploitation of the resources of the islands led to considerable scientific research, mainly geological and topographical. As a result of the activities of Norwegian explorers, the mapping of the country was rapidly pushed, while oceanographic research was aided by the interest of the Prince of Monaco. A wireless station was established by the Norwegian gov-

ernment at Green Harbor in 1911; the Germans established a meteorological station near Cross Bay in 1910. Other wireless stations were erected by the English and Swedes in the period 1914–24. The discovery of coal on the archipelago was the initial stimulus to an active interest in the region on the part of British, American, Swedish, Norwegian, and Russian nationals. Further reconnaissances showed the presence of deposits of iron ore, asbestos, alluvial gold, gypsum, colored marble, phosphates, and platinum. Up to 1924 coal, the only mineral regularly worked, had five mines, located at Braganza Bay, Green Harbor, Coles Bay, and Advent Bay (two mines). Prior to the annexation to Norway, the output mined and exported averaged 26,000 tons; in 1922, 297,000 tons were mined. Coal areas preëmpted and claimed by the various nationals were approximately as follows: British companies, 4000 square miles; Norwegian, 900; Swedish, 350; Russian, 100; Dutch, 10. The large American interests had been sold to European companies, and the German holdings, seized by the British during the War, were added to the British estates. Settlements were being regularly laid out; the latest census (1920) showed seven principal towns with the following summer populations: Longyear City, 400; Hiorthavn, 70; Coles Bay, 21; Green Harbor, 209; Cape Boheman, 90; Ny Aalesund, King's Bay, 321; Bell Sound, 240. A postal service was maintained by Norway, and Scandinavian and German tourist boats touched at the harbors during the summer season, June to September.

Partly as a result of Norwegian agitation, the political status of Spitzbergen came frequently before the attention of Europe. Conferences were held in 1910, 1912, and 1916, but without result. Finally, in 1919, Spitzbergen, together with Bear Island, was granted to Norway by the Supreme Council, but under a series of guarantees in the interests of other nationals holding property. The archipelago was not to be used for any military purpose. The ships of all signatories to the treaty, Great Britain, the United States, France, Italy, Japan, Holland, Denmark, Norway, and Sweden, were to enjoy fishing and hunting privileges in territorial waters as well as the right to touch at Norway en route to and from Spitzbergen. A Danish commissioner was to examine claims with regard to disputed estates, and a tribunal of the interested powers was to make final settlements.

SPITZKA, EDWARD ANTHONY (1876–). An American physician, anatomist and psychiatrist, son of Edward C. Spitzka. Born in New York City, he was educated at the College of the City of New York and received his medical degree from Columbia University in 1902. His early years after graduation were devoted to anatomy and especially to brain study. He was connected with the anatomical department of Jefferson Medical College from 1904 and was director of the Daniel Baugh Institute of Anatomy from 1911 to 1914, when he removed to New York to enter upon the practice of neurology and psychiatry. He was for many years identified with brain study in general, with especial reference to comparative anatomy of the brain, including research into the brains of distinguished and abnormal individuals such as Czolgosz, the assassin. He studied especially the action of high-voltage currents on the brain, the effects of electrocution, of reanimation after electric shock, etc., and wrote many papers on these and allied subjects. During the War, he was very active both abroad and at home and was appointed lieutenant-colonel of the Medical Corps and Medical Reserve Corps. His only large contribution is an American edition of *Gray's Anatomy* with notes (1908).

SPLEEN. DISEASES OF THE. See ANÆMIA.

SPOKANE. A city of Washington. The population increased slightly from 104,402 in 1910 to 104,437 in 1920 and to 127,000 for the metropolitan area by the estimate of the Bureau of Census in 1921. A comprehensive industrial expansion took place during the 10 years 1914–24, bringing the number of manufacturing plants up to 325 with an estimated output value of $100,000,000. Building permits and values rose from 687 with a value of $982,227 in 1914 to 2508 with a value of $2,486,568 in 1924. Bank clearings increased from $202,665,546 in 1914 to $578,855,533 in 1923 and deposits increased during the same period from $31,655,855 to $51,844,945. Postal receipts rose from $539,500.98 to $1,116,046.17. In 1914 the jobbing output of Spokane was less than $50,000,000; in 1923 the estimate was placed at $181,000,000.

SPONDYLOTHERAPY. See ABRAMS, ALBERT.

SPORTS. The major sports such as athletics, baseball, football, golf, tennis, etc., will be found treated under their separate heads. This article will confine itself to a brief review of the more important minor sports with special reference to their progress during the 10 years ending with 1924.

Billiards. Every type shared in the general sport "advance." William F. Hoppe remained at the top in the 18.2 balkline game, successfully defending his championship honors against Jacob Schaefer in a challenge match following the international tournament held in 1923 at New York City which resulted in a tie. Ralph Greenleaf retained his title in pocket billiards but in 1923 Cliff Denton wrested the three-cushion championship from Johnny Layton. Edgar T. Appleby was the international amateur 18.2 balkline title holder. It will be noted that all these leading billiard players are Americans. France, Germany and Belgium were all represented in recent tournaments but failed to make impressive showings.

Chess. Dr. Emanuel Lasker of Germany regained his title as champion of the world from José R. Capablanca in an international tournament held in New York City early in 1924. This marked the first time in many years that so representative a gathering of chess masters had been held in the United States and served to stimulate interest in the game The usual intercollegiate chess tourneys in the United States and the customary cable matches between the universities of Oxford and Cambridge in England and Yale and Harvard in America continued to be held annually.

Cricket. Great Britain remained the centre for this game, although it seemed to be growing in popularity in the United States, particularly in New York and Philadelphia. The Free Foresters from England visited the United States and Canada in 1923, winning seven games, drawing two and losing none.

Cycling. As a recreation, cycling apparently is regaining its former hold on public favor despite the advent of the automobile. Cycle racing attracts thousands of spectators especially

in the larger cities of the United States. Velodromes devoted to bicycle competitions of various sorts with seating capacities of from 15,000 to 20,000 have been constructed in recent years in New York City and Newark, N. J.

Fencing and Gymnastics. Fencing is making slow progress, the sport being chiefly confined to a few American colleges and athletic clubs although it has become an attractive feature of the Olympic Games (q.v.). The United States leads in gymnastics, colleges and athletic clubs featuring this sport during the winter months.

Hockey. Hockey is popular in many countries, notably Great Britain, Switzerland, Canada and the United States. Several women's teams have been organized since 1920 and in 1924 American women players made a tour through Great Britain and France, meeting various teams in those countries. Professional hockey flourishes in Canada and in 1924 steps were taken to establish a professional hockey league in the United States, with teams in New York City, Boston and other large centres in the Eastern States.

Skating. Both as a recreation and sport, skating showed growth in popularity and in a sense handicapped the advance of hockey inasmuch as the rinks in the larger cities have such a large patronage that they have proved more profitable for skating alone than for hockey.

Rowing. College rowing in the United States retains its grip, the annual regattas on the Hudson and the Thames attracting throngs of 50,000 spectators The victories scored at Poughkeepsie in 1923 and 1924 by the oarsmen from the University of Washington served to produce nation-wide interest in the sport Rowing contests afford one of the most entertaining features of the Olympic Games (q.v.)

Shooting. The United States, Switzerland, France and Argentina all pay considerable attention to shooting, the team from the United States being victorious in the international championships held in 1924, prior to the Olympic Games of that year.

Wrestling. This had a large following of college men and amateurs in the United States but the professional "game" appears to be losing in popularity. Ed "Strangler" Lewis holds the professional world's championship.

Yachting. The last races in this period for the America's Cup, emblematic of the world's yachting championship, were held in July, 1920, off Sandy Hook The defending yacht was the *Resolute*, owned by members of the New York Yacht Club, and the challenger was the *Shamrock IV*, owned by Sir Thomas Lipton of the Royal Ulster Yacht Club of Belfast, Ireland. Five races were sailed, of which the *Resolute* captured three and the *Shamrock* two. The six-meter team race regatta between British and United States teams of four boats each was held off the Isle of Wight during August, 1923, the British craft triumphing by a score of 120 points to 86.

SPRINGFIELD. A manufacturing city of Massachusetts. The population rose from 88,926 in 1910 to 129,614 in 1920 and to 145,000 by local estimate in 1924. A zoning ordinance dividing the city into distinct use districts was adopted in 1921. In 1922, a new concrete bridge across the Connecticut River was completed at a cost of approximately $6,000,000, including the site; the following year a steel bridge was erected at a cost of $873,000 on the site of the North End bridge, destroyed by fire. The annual Eastern States Agricultural and Industrial Exposition was established at Springfield in 1916. The number of industries increased from 280 in 1914 to 540 in 1924, and the value of output from $31,773,000 to $228,000,000

SPROUL, WILLIAM CAMERON (1870–). An American public official, born at Lancaster, Pa. He was graduated from Swarthmore College in 1891 and for several years was engaged in farming. He afterwards organized several important iron and steel plants and developed numerous railroads, mining, traction and power enterprises in West Virginia. In 1896, he was elected to the Pennsylvania Senate. He was five times re-elected. In 1919, he was elected governor of Pennsylvania, serving until 1923. He took special interest in the development of highways and was known as "the father of good roads in Pennsylvania." Governor Sproul built and endowed the Sproul Observatory at Swarthmore College and restored, at his own expense, the ancient Chester Courthouse, the oldest public building in Pennsylvania.

SPROULE, WILLIAM (?–) An American railway president. He began in the railroad business with the Southern Pacific in 1882, and after holding various positions in the freight department of the Pacific system, became general traffic manager in 1898 In 1910 he became president of Wells Fargo and Company and from September, 1911, to July, 1918, he was director and president of the Southern Pacific Company. During the War the government commandeered his services, and he was put in charge of western railways This work occupied him until December, 1919. In 1920 he resumed the office of director and president of the Southern Pacific Company.

SPURR, JOSIAH EDWARD (1870–). An American geologist, born at Gloucester, Mass. He was graduated from Harvard University and also studied in Berlin During 1893, he was an assistant geologist on the Minnesota Geological and Natural History Survey, and later was connected with the United States Geological Survey as assistant geologist until 1897; thereafter as geologist During 1906–11, he was in consulting practice and in the latter year became vice-president and consulting engineer of the Tonopah Mining Company of Nevada. During the War he served on the committee of mineral imports with the United States Shipping and the War Trade Boards, after which he was chief engineer of War Minerals Investigations for the United States Bureau of Mines. In 1919, he became editor-in-chief of the *Engineering and Mining Journal*. In 1897, he was a delegate to the International Congress of Geology held in St. Petersburg and in 1921 was president of the Mining and Metallurgical Society of America. He is the editor of *Political and Commercial Geology* (1921), and the author of: *The Iron-Bearing Rocks of the Mesabi Range in Minnesota* (1894); *Through the Yukon Gold Diggings* (1900); *Geology Applied to Mining* (1904).

SQUIER, GEORGE OWEN (1865–). An American military engineer, born at Dryden, Mich. He studied at the United States Military Academy and entered the Army as second lieutenant of the 3d Artillery, continuing in the military service until his retirement on Dec. 23, 1923. Meanwhile having shown a decided interest in electromagnetic phenomena, especially as applied to its uses in telegraphy and teleph-

ony, he studied at Johns Hopkins University. Among his military assignments were an appointment as instructor of electricity and mines at the United States Artillery School at Fort Monroe (1895–98); command of the United States cable-ship *Burnside* during the laying of the Philippine cable telegraph system (1900–02); service as chief signal officer, department of California (1902), as chief of signal corps with rank of brigadier-general (1917); and charge of army air service with rank of major-general (1916–18). General Squier's own researches and inventions included studies on the sine waves systems of telegraphy, multiplex telephony and telegraphy over open bare wires laid in the earth or air, tree telephony and telegraphy, and the absorption of electromagnetic waves by living organisms. His attainments were recognized by the John Scott gold medal (1896) and the Elliott Cresson gold medal (1912) of the Franklin Institute For his services in the War he received the Distinguished Service Medal from the United States and was made a Knight Commander of St. Michael and St. George by Great Britain He has written a number of books on aëronautics, including *Military Aeronautics* (1908), and *Aeronautics in the United States* (1918).

STAFF, GENERAL. See ARMIES AND ARMY ORGANIZATION

STAMBULISKY, ALEXANDER (1879–1923). A Bulgarian statesman, born at Slavovitsa, Bulgaria, and educated at Sofia and Halle He became a journalist and in 1902 edited a newspaper of the Agrarian League Later he became a member of the Bulgarian Assembly, and soon acquired great influence in the Agrarian party. He strongly opposed most of King Ferdinand's policies. For this and for his public statement that if King Ferdinand led the country into war again he would lose his throne, Stambulisky was sentenced to prison for life He was released in 1918, however, helped subdue a revolutionary movement among the Bulgarian troops, and later became minister of foreign affairs, although his party did not then have a majority in the cabinet In April, 1920, he headed a cabinet consisting entirely of his own followers, and immediately began putting into effect his plans for solving the economic and financial problems that confronted the government. In October, 1921, under a law enacted by the Stambulisky government, the trial of the war ministers charged with responsibility for Bulgaria's participation in the War as Germany's ally was started. The trial dragged through most of 1922 and resulted in the conviction of 22 ministers. Stambulisky's government announced that the constitution would be revised in such a way as to curtail royal privileges. This aroused the leaders of all the parties, except the Agrarian, and they combined with the army, and with the help of the King, overthrew the government. Stambulisky escaped arrest only by hurried flight, at first being accompanied by a guard of 2000 men, but later being obliged to proceed almost alone He was shot and killed as he was crossing an open field on June 15, 1923.

STANFORD UNIVERSITY. A nonsectarian, coeducational institution at Stanford University, Cal., founded in 1891. The university grew with great rapidity during the decade 1914–24, both in the size of its student body and in its physical equipment and resources. The enrollment rose from 1879 at the beginning of the period to 3564 at the close, and the faculty from 229 to 468 members. The library increased from 239,122 to 350,000 volumes; Herbert Hoover presented to the university, in 1919, a collection of material on the War, including the official records of the American Relief Association, the Commission for Relief in Belgium and other great relief organizations headed by him; to these were added government documents and publications and archives and collections made for the Food Research Institute. By the beginning of 1924, the Hoover War Library, as it was called, contained over 125,000 titles, and the work of cataloguing the material was progressing rapidly.

The Food Research Institute was founded at Stanford in 1920–21 on endowment from the Carnegie Corporation of New York of approximately $700,000 to be given in annual installments for the succeeding 10 years. Its purpose was the intensive scientific study of the problems of the production, distribution and consumption of food from the wide national and international viewpoint. Three new schools and three new departments also were established and the system of undergraduate instruction was reorganized. The School of Biology was organized in 1922–23 from the departments of anatomy, bacteriology and experimental pathology, biochemistry, botany, entomology, palæontology, psychology, physiology and zoology, and the Food Research Institute and the Hopkins Marine Station. The School of Education was established in 1917 and the School of Nursing was opened in 1922. The department of mining and metallurgy was separated from the department of geology and mining, and the department of political science was established in 1918–19 The departments of Greek and Latin were combined in 1922 to form the department of classical literature.

Many buildings were put up during the decade, including the Thomas Welton Stanford Art Gallery, the new building on the new site of the Hopkins Marine Station, and the Stanford Hospital, costing $500,000, in 1917; a laboratory building for aircraft investigation, and Roble Hall, a dormitory for women, in 1918; a library with capacity of about 700,000 volumes forming the central structure of a new quadrangle, in 1919; the stadium in 1921; the Stanford Union and the basketball pavilion in 1922; and in 1923 a series of dining halls for Encina Hall and two dormitories for men, Toyon Hall, and Branner Hall, which was erected by the board of athletic control from the earnings of the stadium. In 1919, the Stanford Home for Convalescent Children was installed in the old Stanford residence, and an endowment of $100,000 was subscribed in memory of Mrs Stanford. Through the gift of $40,000 of Mrs. Henry Crocker, another unit for 20 beds was in process of construction at the close of 1923.

During the War, the Stanford Naval Base Hospital saw active service in France. In 1915, Dr. John Casper Branner became president suc-

ceeding Dr. David Starr Jordan, who was made chancellor. Dr. Branner was retired in 1916 and was succeeded by Ray Lyman Wilbur, M.D.

STANGE, CARL (1870–). A German Protestant theologian and author (see VOL. XXI.) Among his later works are: *Der Weg zu Gott* (1915); *Wunder- und Heiligengeschichten* (1917); *Die Religion als Erfahrung* (1919); *Luther und das Sittliche Ideal* (1919); *Zum Verstandniss des Christentums* (1920); *Die Ethik Kants* (1920).

STARCH. See CHEMISTRY, ORGANIC.

STARR, FREDERICK (1858–). An American anthropologist (see VOL. XXI). He edited many scientific works and is the author of *Mexico and the United States* (1914); *Dictionary of the Choctaw Language* (1917); *An Early Account of the Choctaw Indian* (1918); *The First Man* (1919); *The Origin of Religion* (1919); *Korean Buddhism: History, Condition, Art* (1919).

STARS. See ASTRONOMY.

STATE FINANCES. The subject of State finances occupied much attention in the decade 1914–24, especially during the latter part of that period. The immense increase in the expenditures of the State governments and their constantly expanding debt were among the most striking features of the financial history of the country. The passage of the Income Tax Law by the provisions of which State and municipal bonds were exempted from taxation (see TAXATION) resulted in a demand for these bonds for the investment of money which met with a ready response by the creation of an immense body of bonded indebtedness on the part of the States. In addition to this, legitimate expenses and expenditures increased during the period. Expansion in educational and social directions called for large additional sums, and the increasing use of automobiles, both as pleasure and commercial vehicles, demanded great expenditures for the construction of highways. For these and other purposes, many of the States greatly increased their bonded indebtedness during the decade.

Comparison is made below of the financial condition of the States in two representative years of the period, 1916 and 1922. The former date is chosen because it reflects the condition that prevailed before the causes that produced the greatly increased expenditures went into effect, and 1922 represents the latest year for which complete figures are available. Both sets of figures are from reports of the Bureau of the Census. The assessed valuation of property subject to general property tax increased from $70,056,003,286 in 1916 to $106,878,258,410 in 1922. This includes real property, personal property and other property subject to taxation.

State	Year	Total Receipts	Total Expenditures	Net Debt	Per Capita
For all States	1916	$783,775,905	$780,550,560	$459,661,269	$4 59

STEAM. See BOILERS.

STEAM AUTOMOBILES. See MOTOR VEHICLES.

STEAM ENGINES AND STEAM TURBINES. In the interval between 1914 and 1924, it was conclusively demonstrated that the reciprocating steam engine, at least in its larger sizes, practically had been supplanted by the steam turbine and the internal-combustion engine (q.v.), especially for central-station work where the increased capacity per unit demanded made it unsuitable for such work under modern conditions. There were, however, notable exceptions to this rather broad statement as to the passing of the steam engine, as will appear in the consideration of the power plants considered later and of such uses as when direct-connected to the rolls in a steel mill, a large reciprocating engine being so installed as late as 1922. The building of a 4200 horse-power twin tandem compound drop-valve engine with a Corliss detached valve gear for a corn-syrup factory, however, was noted in 1922 as the largest direct-connected engine-generator unit that had been built for some time in the United States and this was not exceeded up to 1924.

Furthermore, there were important developments and applications in connection with the type of steam engine known as the Uniflow or Unaflow engine devised in Germany by Professor Stumpf and introduced into the United States in 1914. This engine was distinguished by a cylinder of special design where the flow of steam masses into it on admission and out of it on exhaust with minimum changes of direction. In this way much of the initial condensation of the steam is obviated, as considerable of the moisture in the expanded steam is eliminated at the end of the working stroke and before compression begins. The steam passes out through terminal exhaust slots, and with the piston acting as a valve almost full vacuum can be obtained with the least possible back pressure, so that especially in the case of a condensing engine, there results a substantial economy. In other words, the steam can be compressed to boiler pressure with a minimum amount of work expended during such compression.

In units of less than 1000 kilowatts, the uniflow engine often showed greater economy than a steam turbine, and for capacities of less than 8000 kilowatts it usually was preferable. These engines, both in Europe and America, found wide range of application, from compressors in refrigerating plants, pumps, and electric generators to iron and steel mills. In the year 1920 alone, 40,000 horse power in such engines was said to have been sold in the United States. In 1922, a 2500 horse power uniflow engine was installed in a steel plant, while textile mills and other plants were being similarly equipped. In Germany, Professor Stumpf made a number of successful experiments with locomotives to which he had fitted uniflow engines.

Growth of the Steam Turbine in the United States. In 1907, the total rating of steam engines in the central electric light and power stations in the United States was 1,810,040 horse power, while but 798,025 horse power was credited to steam turbines. In 1917 according to the United States Census, out of a total rating of 8,449,076 horse power in central-station equipment, 1,701,677 horse power was credited to steam engines and 6,747,399 horse power to steam turbines. In 1920, out of an estimated total installation of 11,476,000 horse power, 1,781,100 horse power or 15 5 per cent was credited to steam engines and 9,695,500 horse power or 84.5 per cent to steam turbines.

During this period there was also a marked

increase in the size of the individual units, while there was a corresponding decline in the capacity as well as the number of reciprocating engines. Thus in the 1917 census report referred to, it was stated that practically all the steam engines in both commercial and municipal central stations were to be found in the lowest grouping, namely "500 horse power or under," and the average size of these machines was well under 200 horse power

The statistics quoted above apply only to central stations, but 9,000,000 horse power capacity of the various industries in the super power zone, exclusive of steam and electric railways and central lighting station loads, was analyzed in the Superpower Survey report of the United States Geological Survey in 1921. It was found that of this total two-thirds was privately generated and one-third was purchased. Excluding the central stations from consideration, 68 per cent were steam engines, 19 per cent steam turbines, 8.5 per cent water wheels, and 4.5 per cent internal-combustion engines.

In 1914, the 30,000 kilowatt steam turbine had become recognized practice for central-station installations and the record unit at that time was a 35,000-kilowatt machine for the Philadelphia Electric Company. This was a 13-stage horizontal Curtis turbine, 63 feet 2 inches long, 21 feet 7 inches wide and 15 feet 10 inches high, weighing 600 tons, and taking steam at 215 pounds pressure and 150° super heat, exhausting against an absolute pressure of 1.5 inches of mercury. At that time, however, it was clearly realized that steam turbines of as large capacity as 50,000 kilowatts were feasible and designers then or soon after were working on such units. Even then it was apparent that steam turbines could be used with reduction gearings on land as well as on steamships, and in 1915 a low-pressure turbine was employed as a source of power for a rolling mill by the use of a helical involute gear.

The steam turbine at that time had demonstrated its economy but aside from gaining wider applications the main features now were the constant increase in capacity of the units as built and the tendency to use ever higher pressure, 300 to 350 pounds being the prevailing practice for turbines installed in 1916 and pressures of 500 to 1000 being considered for new designs. This was accompanied by the tendency to use steam at higher temperatures. By 1918, two triple-cylinder compound units of 60,000-kilowatts normal rating and 70,000-kilowatts maximum output, were built, one for the 74th Street Station of the Interborough Rapid Transit Company in New York City, and the other for the Muscle Shoals plant of the Air Nitrates Company. At this time it is interesting to note that on account of the War all orders for steam turbines rated at 700 horse power and over required the approval and supervision of the War Industries Board, the military departments of the government and the munition industries receiving preference.

The War, however, interfered but slightly with the development of the steam turbine, and by 1924 a number of interesting forms of steam-turbine units were developed. Higher pressures and temperatures were used in the effort to secure maximum efficiency. Changes were made in the arrangement of the blading so that machines of greater capacity, more efficient and more rigid, would be secured, also the arrangements for bleeding were standardized and the emergency-governing devices were improved. A recent development was the increased use of the cross-compound type, which, while originally brought out in the United States, had been rather more employed in Europe. In fact, by 1924, there were under construction cross-compound units of both reaction and impulse types of approximately 40,000 to 50,000-kilowatt capacity. With steam being used at 1200 pounds pressure, it was found feasible to design an impulse high-pressure unit on the cross-compound principle, where the exhaust at 350 pounds pressure was supplied to the other units of the station. A notable installation was a 50,000-kilowatt reaction unit in the form of a three-cylinder machine where the high-pressure and intermediate-pressure elements were connected in tandem to a generator, while the low-pressure element was a double-flow unit operating at 1800 revolutions per minute and drove a generator, being really a separate element cross-compound with the other two. Here twin vertical surface condensers were installed on either side of the turbine with their upper waterboxes above the engine room floor. There was reheating of the steam to 700 degrees Fahrenheit after it left the high-pressure turbine, this process taking place in the boiler. With such an arrangement special governing arrangements are employed to prevent overspeeding where the load is reduced suddenly.

For use with steam pressures of 1000 to 1200 pounds the General Electric Company had built two turbines of novel design of 2600 and 4000 kilowatts respectively, where the exhaust was used to supply other turbines at from 250 to 300 pounds. These machines, while simple in design and lending themselves to ready use, required special boiler equipment.

Small auxiliary turbines were developed so as to employ higher steam pressures and temperatures. There was a tendency to employ steel casings in place of those of cast iron, so supporting them that expansion would have comparatively less effect in changing alignments with changing temperatures. These smaller turbines were also given improved speed regulation.

Reference has been made elsewhere to the mercury boiler developed by the General Electric Company and installed at the plant of the Hartford Electric Light Co. (see BOILERS). In this connection, a mercury-vapor turbine was devised as an essential element of this arrangement. See SHIPBUILDING, *Propelling Machinery.*

STEAMSHIP. See SHIPPING; SHIPBUILDING; etc.

STEBBINS, JOEL (1878–). An American astronomer, born at Omaha, Neb. He studied at the University of Nebraska, and while holding a fellowship at Lick Observatory, obtained his Ph.D. at the University of California in 1903. He was assistant in astronomy at the Washburn Observatory of Wisconsin, but in 1903 accepted a call to Illinois, where in 1913 he became professor. He made a specialty of stellar photometry, publishing the results of his investigations in various astronomical journals. The American Academy of Arts and Sciences honored him with the Rumford medals in 1913 and he received the Draper medal of the National Academy of Sciences in 1915. Dr. Stebbins served on the Lick Observatory eclipse expedi-

tion to Labrador in 1905 and also with the similar expedition to Wyoming in 1918.

STEELE, RUFUS (MILAS) (1877–). An American author, born at Hope, Ark., and educated at Pacific Methodist College, Santa Rosa, Cal. He edited various newspapers on the Pacific coast, among them the *San Francisco Call* and the *San Francisco Chronicle.* During the War he was appointed editor of the division of films of the United States Committee on Public Information (1918–19). He has written many motion picture scenarios and has been associated in producing the pictures. He wrote *The City That Is* (1909); *The Fall of Ug—A Masque of Fear,* produced in the Bohemian Grove in California (1913); *Rule G* (1915); *Aces for Industry* (1919).

STEELE, WILBUR DANIEL (1886–). An American author, born at Greensboro, N. C., and educated at the University of Denver, the Museum of Fine Arts in Boston, and the Académie Julien in Paris. He published many short stories in magazines, and in 1914 *Storm* appeared, followed by *Land's End* in 1918. The O. Henry Award Committee awarded him the second prize in 1919 for *They Know Not What They Do,* and in 1921 he received a special award from the same committee for "maintaining highest level of merit for three years among American short story writers."

STEFANSSON, VILHJALMUR (1879–). An Arctic explorer (see VOL. XXI). In 1914 he made a 600-mile sled journey over broken and moving ice from Martin Point, Alaska, to Banks Island, and in 1915 discovered new land north of Prince Patrick Island. The next year he discovered new islands west of Heiberg Island, and in 1917 found that the polar ocean is shallow in the region northwest of Cape Isachsen. He wrote: *The Friendly Arctic* (1921); *Go North, Young Man* (1922); *The Northward Course of Empire* (1922); *Hunters of the Great North* (1922), etc.

STEINACH, EUGEN (1862–). An Austrian physiologist who became famous in connection with the possibility of rejuvenating elderly animals and men through grafting the sexual glands of young animals and latterly through simple division or ligation of the efferent duct. Born at Hohen Ems, Vorarlberg, Steinach was educated at the University of Vienna (M.D. 1886) and in 1895 was appointed professor of physiology in the German University of Prague. He fitted up a laboratory for the study of comparative physiology—the first of its type in the German-speaking countries. Building on a foundation laid by the labors of two French scientists, Ancel and Bouin, he performed many experiments on rats with extraordinary results. When made professor of physiology in Vienna he was placed at the head of a special biological research institute and continued his labors. Steinach is not himself a surgeon, and gland operations on men were performed by Viennese surgeons who also reported the cases. Steinach's only book is his small manual dealing with experiments on rats only, *Verjungung durch Experimentelle Neubelebung der Aelternden Pubertatsdrusen* (1920). Books on Steinach's work have been written by several authors. See SECRETIONS, INTERNAL.

STEINER, EDWARD ALFRED (1866–). An American sociologist, born at Vienna, Austria. He was educated in the public schools of that city and at Heidelberg University. He also took postgraduate courses at other German universities and at Oberlin College. In 1891, he was ordained to the Congregational ministry and was pastor of several churches in Ohio and Minnesota. In 1903, he became professor of applied Christianity at Grinnell College, Iowa. Professor Steiner wrote: *Tolstoy the Man* (1903); *On the Trail of the Immigrant* (1906); *Against the Current* (1910); *From Alien to Citizen* (1914); *Nationalizing America* (1916); *Old Trails and New Borders* (1921).

STEINER, RUDOLPH (1861–1925) German social philosopher. He was born at Krajevic, Jugo-Slavia. He was a commentator and editor of Goethe and an enthusiast for Hindu philosophy and mysticism. He became the German exponent of what is popularly known as theosophy but what he preferred to call anthroposophy. He founded several centres for the spread of this learning, of which the most important is the Goetheanum in South Germany, and a periodical, *Lucifer-Gnosis.* Like the French philosopher Comte, he sought to make humanity an emotional object of worship, in imitation of the established religions. His followers were subject to mild persecution. After the War, Steiner was one of the leaders of the democratic intellectuals. He preached international reconciliation and the renunciation on Germany's part of any attempt at world dominion. Steiner's works included: *Goethe als Vater einer Neuen Aesthetik* (1889); *Wahrheit und Wissen* (1892); *Philosophie der Freiheit* (1894); *Friedrich Nietzsche* (1895); *Goethes Weltanschauung* (1897); *Haeckel und Seine Gegner* (1908); *Lyrik der Gegenwart* (1900); *Welt und Lebensanschauung der 19en Jahrunderts* (1900); *Die Mystik* (1904); *Theosophie* (1904); *Die Kernpunkte der Sozialen Frage in den Lebensnotwendigkeiten der Gegenwart und Zukunft* (1921); *Die Hetze gegen das Goetheanum* (1921). Two volumes of *Mystery Plays* were published in English (1920).

STEINMAN, DAVID BARNARD (1886–). An American civil engineer, born in New York City. He studied at the College of the City of New York and at Columbia University. During 1910–14, he was professor of civil engineering at the University of Idaho, then had charge of the department of civil and mechanical engineering at the College of the City of New York (1917–20). In 1921, he identified himself with consulting practice in New York City, and made a specialty of constructing bridges. Among his notable works are the continuous bridge of 1550 feet at Sciotoville, Ohio, the Hell Gate arch bridge over the East River, New York City, and the suspension bridge at Florianopolis, Brazil. He was also the engineer in charge of the Detroit-Windsor suspension bridge. He was awarded the gold medal (1920) of the American Society of Civil Engineers. In addition to numerous articles contributed to the journals of his profession, he is the author of *Suspension Bridges and Cantilevers* (1911); *Theory of Arches and Suspension Bridges* (1914); *Plain and Reinforced Concrete Arches* (1915); *Design and Construction of Suspension Bridges* (1922).

STEINMETZ, CHARLES PROTEUS (1865–1923). An American electrical engineer (see VOL. XXI). Among his later publications are *America and the New Epoch* (1916); *Theory and Calculation of Electric Circuits* (1917); *Theory and Calculation of Electrical Apparatus* (1917).

STEKEL, WILHELM (1868–). An Austrian psychiatrist and psychoanalyst, one of the best known of Freud's disciples. Born at Bojan, Bukowina, he received his medical degree from the University of Vienna. Since 1908, he has shown almost unparalleled literary activity and announced several years ago that he had subjected over 10,000 individuals to psychoanalysis. Of his numerous writings, the majority have been translated into English although with more or less change in title. Most of the following are numbers in a series of volumes still incomplete: *Nervose Aengstzustände und ihre Behandlung* (1908); *Die Sprache der Traume* (1911); *Die Traume der Dichter* (1912); *Der Will zum Schlaf* (1915); *Onanie und Homosexualitat* (1917); *Die Geschlechtskalte der Frau* (1920); *Die Impotenz des Mannes* (1920); *Psychosexuelle Infantilismus* (1922). These volumes are part of a great system which deals with all disorders of affective and impulsive life.

STELLAR EVOLUTION. See ASTRONOMY; PHYSICS.

STEPHENS, JAMES (1882–). An Irish poet and novelist, born in County Dublin. He became a solicitor's clerk in London. In his spare time he wrote verse and fiction and showed marked ability in both. His writings include: *Insurrections* (1909); *The Hill of Visions* (1912); *The Charwoman's Daughter* (1912); *Here Are Ladies* (1913); *The Rocky Road to Dublin* (1915), *Songs from the Clay* (1915); *Reincarnation* (1918), etc.

STEREOCHEMISTRY. See CHEMISTRY, ORGANIC.

STERN, L. WILLIAM (1871–). A German psychologist (see VOL. XXI). His work after the War was devoted chiefly to mental testing and to the psychology and philosophy of personality. Both of these interests, though largely ignored by the Wundtian psychology of the last generation, were quite popular in postwar Germany. Stern's works after 1914 include: *Vorgedanke zu Weltanschauung* (1915); *Die Psychologie und das Personalismus* (1917); *Grundgedanke der Personalistische Philosophie* (1918); *Die Intelligenz der Kinder und Jugendliche* (1920).

STERNE, ELAINE (1894–). An American photoplay writer, born in New York City, and educated at Columbia University She wrote more than 60 photoplays, among them the *Sunny Jim* series and *The Gang.* Her photoplay *The Sins of the Mothers* brought her a prize of $1000 in 1914, and *Without Hope* a second prize of $500. In the Collier short-story contest of 1914 she won a prize of $250. She is the author of: *Sunny Jim* (1916); *The Road of Ambition,* a novel (1917); and *Over the Seas for Uncle Sam* (1918).

STEVENS, EDWARD FLETCHER (1860–). An American architect, born at Dunstable, Mass. He studied design at the Massachusetts Institute of Technology and in several offices in Boston and New York. After practicing in Rome for several years he became a member of the firm of Stevens and Lee of Boston and Toronto. He planned over one hundred hospitals and institutions in various cities and designed also overseas hospitals during the War and was a member of the special committee appointed to revise the plans of army hospitals. He was a member of the American Institute of Architects, and other organizations, and was the author of *The American Hospital of the Twentieth Century* (rev. ed., 1921).

STEVENS, GORHAM PHILLIPS (1876–). An American architect, born in Staten Island. He studied architecture at the Massachusetts Institute of Technology and in Europe. After a year's service with McKim, Mead and White, he was Carnegie fellow in architecture at the American School of Classical Studies in Athens (1903–05). In 1911 and again in 1918 he was director of the American Academy in Rome, and from 1912 to 1918 was director of the School of Fine Arts at that institution. From the latter year he was professor in charge. Besides being a member of many societies, he was the author of *Life of Charles F. McKim,* and of contributions on Greek architecture to various scientific journals

STEVENS INSTITUTE OF TECHNOLOGY. A nonsectarian institution for men at Castle Point, Hoboken, N. J., founded in 1870. The enrollment of the institute increased from 453 in 1915 to 614 in 1922, and dropped again to 530 in 1923; the faculty was increased from 37 to 55, and the library from 11,000 to 16,000 volumes, all on technical subjects A United States Navy Steam Engineering School was established in 1918; the department of electrical engineering was moved in 1921 to the larger of the two barracks buildings bought from the government, and the space so vacated in the main laboratory building was given to the department of physics; comprehensive examinations in elementary and advanced mathematics were made requirements for entrance for applicants offering certificate credits for admission. Four scholarships were endowed for $40,000 by the alumni in memory of Stevens men who had died in the service during the War, and an endowment campaign for increase of salaries was begun. A new gymnasium was built, and two acres adjoining the main buildings bought in 1915, making in all about 22 acres and including the original "Stevens Castle." President, Alexander Crombie Humphreys, E.D., M.E., Sc. D., LL D.

STEWART, DONALD OGDEN (1894–). An American humorist, born at Columbus, Ohio, and educated at Yale University According to his own story, he was so well equipped for a business career that he turned to literature, and wrote: *Parody Outline of History; Perfect Behavior* (1922); *Aunt Polly's Story of Mankind* (1923) During the War he served as chief quartermaster in the United States Navy

STEWART, JULIUS L (1855–1919). An American painter, born in Philadelphia. He studied under Gerome and Madrazo in Paris, where he lived the greater part of his life. He was known as a figure and genre painter, his style being decidedly French in finish, but his characterizations of American types were excellent, particularly his studies of members of the American colony in Paris. He was a member of the executive and advisory committee of the St. Louis Exposition in 1904, and his work won several awards.

STIDGER, WILLIAM LEROY (1885–). An American clergyman and author, born at Moundsville, W. Va., and educated at Brown University and Boston University. He was ordained in the Methodist Episcopal ministry in 1914 and went to San Francisco, where he preached till 1916. After three years at San José, he went to the Far East under the auspices of the Methodist

Centenary. He served during the War as a truck driver in France for the Y. M. C. A. His writings include: *Giant Hours with Poet Preachers* (1918); *Soldier Silhouettes* (1919); *Star Dust from the Dugouts* (1919); *Outdoor Men and Minds* (1920); *Standing Room Only* (1921); *Flash Lights of the Seven Seas* (1921); *Flames of Faith* (1922); *There are Sermons in Books* (1922); *Henry Ford, the Man and His Motives* (1923); *The Symphonic Sermon* (1923).

STILLMAN, JOHN MAXSON (1850–1923). An American chemist, born in New York City. After graduating from the University of California, he studied at Strassburg and Würzburg, and later received a higher degree in California (Ph.D., 1885). He was instructor in chemistry at the University of California (1876–82), chemist of the Boston Sugar Refining Company (1882–87), and with the Standard Sugar Refining Company (1887–91). In 1891, he became a member of the first faculty of Stanford University, and in 1913 was made vice president, an appointment which he held until his retirement under the age limit as emeritus in 1917. His original investigations included researches in both organic chemistry and mineral chemistry, but his most important work was on the history of chemistry and included a life of *Paracelsus, as Physician, Chemist, and Reformer* (1920), and a manuscript volume on *The Story of Early Chemistry* (1924).

STINNES, HUGO (1870–1924). A German industrialist and financier, born at Mülheim, Germany. At 19 years of age, he entered the mining company owned by his father in Westphalia, where he remained two years. He then organized his own company, called Hugo Stinnes, Ltd, the whole original share capital being 50,000 marks (about $12,000). His first important success was the creating of the German-Luxemburger Mining and Foundry Corporation —the first exemplification of his famous "vertical trust" building. The company owned its own coal, its own ore, and its foundries for the manufacture of its product through all its stages. He extended his holdings to ships and became the most important shipping man in Germany. He organized great companies for making iron and steel, he bought forests, chateaus, hotels, railroads. He owned the largest oil concession in the Argentine, the great electrical plants that are the power centre of Rhenish-Westphalian industry, lime kilns, tanneries, sugar refineries, moving-picture concerns, and vast lands in South America. When the War came, Stinnes grasped the tremendous opportunity to add to his power. He was partially responsible for the ruthless industrial exploitation of occupied Belgium. He supplied war materials of all kinds. Then he began to make his influence felt in the political field. He was elected to the Reichstag in 1920, and about the same time bought many of the leading German newspapers, and large interests in paper-manufacturing establishments. In 1921, he was busy with a scheme for a supertrust that would control every industry in Germany and regulate production, transportation, and the supply of the German markets as well as those of the whole world. His financial manœuvres were made possible only by the steady depreciation of the German currency, deliberately bringing that about by preventing the stabilization of the German mark and repeatedly borrowing money only to pay it back in inflated paper.

STOCKER, HARRY EMILIUS (1876–). An American clergyman and author, born at Nazareth, Pa., and educated at the Moravian College at Bethlehem, Pa. He was a teacher in the public schools of Pennsylvania for a time and was ordained to the Moravian ministry in 1902. After holding several pastorates, he taught in the Moravian College in Bethlehem for a year, and then became pastor of the First Church in New York City in 1919. He was a member of the administrative committee of the Federal Council of Churches and held offices in many Moravian church organizations. His writings include: *History of the White River Indian Mission in Indiana* (1917); *Moravian Customs and Other Matters of Interest* (1918); *History of the Moravian Church in New York City* (1921), etc.

STODDARD, (THEODORE) LOTHROP (1883–). An American author, born at Brookline, Mass., and educated at Harvard University. He was admitted to the bar in Massachusetts in 1908. His writings include: *The French Revolution in San Domingo* (1914); *Present-Day Europe—Its National States of Mind* (1917); *The Stakes of the War* (1918); *Harper's Pictorial Library of the World War,* Vol. VI; *The World at War* (1919); *The Rising Tide of Color Against White World-Supremacy* (1920); *The New World of Islam* (1921); *The Revolt against Civilization* (1922).

STOESSEL, ALBERT FREDERICK (1894–). An American violinist and conductor, born at St. Louis, Mo. From 1910–1913, he studied the violin under W. Hess and E. Wirth at the Hochschule für Musik in Berlin, where he made his début in 1913. After the outbreak of the War he returned to the United States, making his American début with the St. Louis Symphony Orchestra (1915). In 1917, he enlisted in the army and was appointed director of the School for Bandmasters. After his return, in 1919, he became assistant conductor of the New York Oratorio Society, and in 1921 was elected regular conductor. In 1923, he was appointed head of the newly established Department of Music at New York University. His compositions include a string quintet and smaller pieces for violin and piano.

STOKES, ANSON PHELPS (1874–). An American educator, born at New Brighton, Staten Island, N. Y. He was graduated from Yale in 1896 and from the Episcopal Theological Seminary in 1900. After spending several years in travel he was appointed secretary of Yale University in 1899, where he remained until 1921. He was ordained in the Protestant Episcopal Church in 1900 and from that year to 1918 was assistant minister of St. Paul's Church, New Haven. From 1917 to 1919, he was chairman of the trustees of the American University Union in Europe, and was secretary and chairman of the educational commission of the Phelps Stokes Foundation. He was also a member of the General Education Board and was a trustee of many educational and missionary societies. He organized the Army Educational Commission and was founder of the National Commission for Mental Hygiene. He was decorated by several foreign governments for his work. He is the author of: *Memorials of Eminent Yale Men; What Jesus Christ Thought of Himself; Historic Universities in a Democracy; A Visit to Yale in China;* and *Yale and New Haven.*

STOKES, HAROLD PHELPS (1887–). An American newspaper writer, born in New York City. After graduating from Yale in 1909, he spent several years in travel in Europe and the Far East, then began newspaper work in New York with the *Evening Post.* He was Albany and Washington correspondent for that paper and was also its representative at the Peace Conference in Paris. During the War he served with the field artillery and took part in several of the most important campaigns in France. In 1919, he became Washington correspondent of the *Evening Post.*

STONE. Between 1914 and 1924 there was a considerable increase in the amount of stone produced by the quarries of the United States, though the output varied considerably with building conditions, especially during the War.

In 1923, about 107,200,000 tons of stone valued at $161,600,000 were produced in the United States, an increase of nearly 17 per cent from the largest recorded output, namely, that of 1916, and a total value greater than that for 1920, which was $133,541,960. The distribution of the various kinds of stone produced in 1923 as regards quantity and values is shown in the accompanying tabulation. Each of these items varies with special conditions Thus the sale of crushed stone, which represents more than half the stone quarried, depends in large measure upon its use as railway ballast, for road metal and for concrete, and in all of these fields there was an increase in 1923. Likewise, the demand for building stone, which includes granite, sandstone and marble, is closely related to the building situation, and here there was an improvement at the end of the 10-year period. During this interval there had been a decrease in the amount of stone sold for flagging, but a tendency was noted to use flagstone more and more for its decorative value.

STONE SOLD IN THE UNITED STATES IN 1923

Use	Estimate for 1923 Quantity	Value
Building stone, cubic ft.	29,600,000	$34,150,000
Approx. equiv. in short tons	2,340,000	.....
Monumental stone, cubic ft.	4,863,000	17,670,000
Approx equiv. in short tons	407,000	.....
Paving blocks, number	46,070,000	33,980,000
Approx. equiv in short tons	481,000	.....
Curbing, cubic ft	4,138,000	2,856,000
Approx. equiv. in short tons	340,000	.....
Flagging, cubic ft.	628,000	476,000
Approx equiv. in short tons	52,000	.....
Rubble, short tons	800,000	1,200,000
Riprap, short tons	2,200,000	1,800,000
Crushed stone, short tons	66,000,000	67,000,000
Furnace flux (limestone and marble), long tons	24,400,000	22,700,000
Equivalent in short tons	27,730,000	.....
Refractory stone (ganister, mica schist, and dolomite), short tons	1,131,000	1,548,000
Manufacturing industries (limestone and marble), short tons		
Other uses, short tons	5,720,000	8,500,000
Total (quantities approximate, in short tons)	107,200,000	161,600,000

STONE, HARLAN FISKE (1872–). An American educator and public official (see VOL. XXI). From 1910 to 1924, he was dean of the School of Law at Columbia University. He was a member of the Legislative Drafting Research Fund and frequently acted as adviser before legislative committees in both the State and national governments. Amherst College conferred a degree (LL.D.) upon him in 1913. He was appointed, by President Coolidge, in March, 1924, Attorney-General of the United States to succeed H. M. Daugherty.

STONER, WINIFRED SACKVILLE, JR. (MRS. CHARLES P. DE BRUCHE) (1902–). An American author, born at Norfolk, Va., and educated by her mother, who founded the "National Education System." With her mother, Miss Stoner demonstrated this system throughout the United States. When but seven years of age she published a book of verses and in the next year an Esperanto version of Mother Goose. She has written a dozen books, among them being: *Journeys with Fairy Christmas* (1911); *Facts in Jingles* (1914); *Valuable Fur-bearing Animals* (1916); *Sweetest Songs of the Air Kingdom* (1917); *History of the United States* (1919); *Giants of Old* (1919), etc. She has also written scenarios, plays, and songs.

STORAGE BATTERIES. See MOTOR VEHICLES.

STORRS, LUCIUS SEYMOUR (1869–). An American railway official, born at Buffalo, N. Y., and educated at the University of Nebraska. After holding various important positions with several railway organizations, he became the vice president of the New York, New Haven, and Hartford Railroad in 1914. He was president of the American Electric Railway Association in 1917 and chairman of the committee on national defense of that association, controlling coöperation of electric railways through the National Council of Defense.

STOVALL, PLEASANT ALEXANDER (1857–). An American diplomat, born at Augusta, Ga., and educated at the University of Georgia. He edited the *Athens Georgian, Augusta Chronicle,* and *Savannah Press,* and became the owner of the last-named. He was elected to the Georgia House of Representatives in 1902 and again in 1912–13. He was appointed to represent the United States in Switzerland from 1913 to 1920. In 1891 he wrote a *Life of Robert Toombs.*

STRAITS SETTLEMENTS. A British colony comprising the island of Singapore, the island of Penang (with the land settlements of Province Wellesley), and Malacca, on the western coast of the Malay peninsula. Total area, 1600 square miles; total population in 1911, 714,069. In 1921 the population was 881,939, divided as follows: Singapore, 423,768; Penang, 304,572; Malacca, 153,599. Males numbered 557,838; females, 324,101. In 1918 there were in the Settlements 274,574 Malays, 432,764 Chinese, and 94,213 British Indians. Immigrants in 1921 were 191,043 Chinese and 45,673 Indians. In the period 1914–22, deaths outnumbered births.

Industry and Trade. The increasing attention which the natives gave to rubber cultivation to the exclusion of food crops, particularly rice, led to the dependence on imports for consumption needs. Difficulties ensued when the United States restricted its importation of rubber in 1918 and when neighboring countries, because of crop shortages, failed to send sufficient quantities of rice. Other industries declining in the face of the growing rubber culture were coconut, clove, nutmeg, and gambier. The leading activity continued to be commerce, for the Settlements are one of the most important transshipment and trading points in the world. Imports and exports for typical years, inclusive of treasure and trade with Federated Malay States, were: for 1913, £55,936,472 and £45,-

375,132; for 1920, £148,187,421 and £119,471,984; for 1921, £68,126,020 and £58,025,105; for 1922, £68,584,002 and £63,360,888. Fifty per cent of the total trade came from or went to the British Empire. Of the 1922 trade, 75 per cent was handled through Singapore, 22 per cent through Penang, and 2 per cent through Malacca. Principal imports in 1922, in order of value, were rice and other grains, tin ore, cotton goods, tobacco, cigars and cigarettes, fish, sugar, petroleum, and coal. Principal exports were rubber and gums, tin, copra, spices and pepper, tapioca, pineapples, and rattans Trade with the United States in 1922, imports from the United States, $5,623,206; exports to the United States, $93,350,441; in 1923, imports, $7,352,567; exports, $153,790,206. In 1913 shipping entered and cleared, exclusive of native craft, was 27,125,000 tons, of which 15,251,000 were British. In 1921 25,056,000 tons entered and cleared the ports of the territory. In 1923 a causeway was completed across the Johore Straits to connect Singapore with the mainland. This made through train service between Bangkok, Siam, and Singapore possible.

Government finances showed increases over the period Revenues for 1913 and 1921 were £1,446,403 and £4,613,669; expenditures, £1,221,338 and £4,133,604. The debt totaled, on Jan 1, 1922, £18,658,000. An important source of revenue was the government monopoly of opium The governor of the Settlements was also high commissioner for the Federated Malay States (q.v.), as well as for Brunei, and was the British agent for North Borneo and Sarawak.

British North Borneo. A British protectorate on the island of Borneo under the jurisdiction of the British North Borneo Company. Area, 31,106 square miles; population (1911), 208,183, mainly Mohammedan settlers and native aborigines Europeans numbered 355; Chinese, 26,002. Revenues for 1913 were £210,197 and for 1921, £372,119; expenditures for the same years were £259,494 and £440,058. Imports for the years 1913, 1920, and 1921 were £634,538, £1,284,438, and £900,668. Exports for the same years were £863,115, £1,405,771, and £923,616 Rubber, tobacco, and timber, shipped to Singapore and Hongkong, were the most important exports. Opium, an official monopoly, was one of the leading sources of revenue.

Brunei. A British protectorate southwest of British North Borneo. Area, 4000 square miles; population (1921), 24,454, of whom 35 were Europeans and 1434 Chinese. Exports were cutch (mangrove extract), coal, rubber, and sago. Oil was discovered, but not in paying quantities. There was a wireless station at Brunei.

Sarawak. A British protectorate southwest of Brunei. Area, 42,000 square miles; population (estimated), 600,000. Imports in 1921, £1,501,000; exports, £1,788,000. Chief exports were sago, pepper, rubber, liquid fuel, and gold. Trade was with Singapore. Revenues in 1921 were £331,000 (from customs, opium, gambling, arrack, and pawn farm taxes); expenditures, £272,000.

History. In March, 1924, the British government announced the abandonment, in the interests of economy, of the projected naval base at Singapore. The scheme first was originated in 1922 and was a direct outcome of the Washington Conference at which Great Britain guaranteed not to increase her naval base of Hongkong and to give up Wei-hai-wei, looked on as a potential base. To protect, therefore, communications with Australia and New Zealand, and to defend the right flank of her Indian possessions, the fortification of Singapore was regarded favorably by the Imperial Conference of 1923 and was written into the naval schemes of the Law and Baldwin governments. Macdonald's decision was received with misgivings by the Australian and New Zealand governments, which expressed great concern over their safety.

STRATEGY AND TACTICS, MILITARY. Military strategy is the science and art of projecting and directing important military movements and operations with the object of securing advantageous positions of supply, attack, defense or retreat, and deals in general with large forces not engaged in battle Military tactics is the science and art of leading and manœuvring troops on the battlefield or its immediate vicinity. The goal of both is the same, the defeat of the enemy by the delivery of the most powerful blow possible at his weakest point, or, when acting on the defense, to prevent or successfully resist such an attempt by the enemy.

Changes in Tactics Developed in the War. The basic principles of strategy were little affected by the test of the War. Although on a far greater scale than ever before, the mobilization of the armies and their movement into position for attack or defense did not differ essentially from the methods that had been employed in previous wars The tactics employed, however, underwent some modification, owing to the increase in fire power of weapons in use at the outbreak of the War, and the introduction of new weapons and other novel war material

In early days, before the invention of firearms, shock action was almost entirely depended upon for the decision, which required tactics utilizing the troops in masses or columns. The introduction of firearms and their gradual improvement resulted in fire power and movement becoming the predominant factors, and brought about deployment of troops on a wide front in order to secure them. Experience teaches that under present conditions neither shock action nor fire power alone can win, the two must be used in combination, and modern tactics endeavors to provide means whereby fire power may be utilized to open the way for shock action to strike the decisive blow This blow should be directed at the enemy's weakest point, if it can be determined in the initial deployment, otherwise a mobile force must be held in readiness to launch an attack against the weak point when it is revealed.

During the first phase of the War, before the lines became stabilized, the tactics used in combat were those which had been inculcated in peace-time training, the deployment of infantry being made with considerable strength in the skirmish line in order to secure fire superiority and the advance being made by successive rushes of assaulting units, the attack being supported by artillery fire. The increase in rapidity and precision of artillery fire and the effective use of machine guns caused a thinning of the assault line and the organization of the attacking force in greater depth, in order to minimize losses. This change in formation also gave greater power of manœuvre.

In defense the tactics were similarly modified. After the first phase when the lines became stabilized on the Western front, both sides occupied nearly continuous front-line trenches extending from Switzerland to the Channel, strongly garrisoned, dependence being placed on the fire power of this line supported by an artillery barrage to repel the enemy's attack. The heavy losses and almost complete destruction of the front-line trenches due to the artillery preparatory fire of the attacking troops led to the adoption of a modified organization of the terrain whereby the front line was held weakly by outposts with a main line of resistance at the rear so located that the attacking forces would be more or less disrupted when it was reached and would be beyond effective support by their artillery and consequently more easily repulsed by counterattack.

Therefore organization in depth was adopted for defense as well as for offense. The conditions which brought about these changes were those due to the introduction of new weapons and devices and a supply of ammunition in greater quantity than ever before.

Airplanes and tanks and the utilization of gas were the major influences, to which should be added improved machine guns, automatic rifles, light mortars and the 37-millimeter gun as integral parts of the fighting equipment of the infantry.

Airplanes. At the beginning of the War, airplanes were few in number and were used practically entirely for reconnoissance. Very rapidly, however, their use was extended to include observation and direction of artillery fire, location of front-line units, photographing the enemy positions and transmitting orders and, in certain cases, the carrying of supplies to isolated units. Then machine guns were mounted on them and combat planes were developed which fought aërial battles to decide the supremacy of the air and deny to the enemy the aërial observation which had become so important. It was also found that bombs could be dropped from them and that by such means strategic points in the enemy's rear could be effectively attacked. As these various uses developed to a greater and greater extent, it was found even practicable to attack the enemy troops on the battlefield with machine-gun fire and bombs. See AËRONAUTICS.

The use of anti-aircraft guns and of machine guns to prevent observation and destroy the airplanes did not prove of great value. Very few airplanes were destroyed by such means, although well-directed fire forced the airplanes to heights where observation was imperfect, and it was found that the most effective way to keep the enemy airplanes in check was to fight them in the air by combat planes in superior force. The control of artillery fire by aërial observation was a tactical change of signal value.

Captive Balloons. These were also effectively used for observation and control of artillery fire, although, to avoid destruction by enemy artillery and airplanes, they had to be kept well in the rear. However, under favorable weather conditions, observation was good and the advantages of a stationary position and direct wire communication were great.

Dirigibles. The great cost, long time of construction, large target offered and special landing arrangements required prevented dirigibles from successful employment and extended use during the War, even though they could carry large quantities of explosives and supplies. Their principal use and success was in naval warfare.

Tanks. Armored motor cars with machine guns mounted were developed before the War and under certain conditions were effective in reconnoissance and for courier service, but they could operate effectively only on roads in fair condition. The invention of the tank produced a machine that could operate across country, destroy wire entanglements, cross trenches, break down light walls and which, armed with one-pounders or machine guns proved a very useful aid to the infantry in attack, heavy tanks usually preceding the infantry to open ways through obstacles and cover the infantry during the cleaning up of a captured position, light tanks usually accompanying the infantry to support them in their attack, and destroy machine-gun nests.

Gas. The introduction of gas also had an influence on tactics. The cloud attack in which gas was first used, and later the concentration of gas on certain areas by means of gas shells, assisted an attacking force by compelling the enemy to remain in shelters during the advance or fight when handicapped by wearing masks Many kinds of gas were used during the War, from the early irritating and suffocating types such as chlorine and phosgene to lachrymal and blistering types, as benzyl bromide and mustard gas. The most effective were phosgene and mustard gas, although tear gas and other types were of value under certain conditions.

As a development from the introduction of gas came the use of smoke clouds to screen the advance of an attacking line or to cut off observation by the enemy. See CHEMICAL WARFARE.

Infantry Weapons. *The automatic rifle*, introduced during the War, provided means for maintaining the fire power of the thinner skirmish line and enabled concentrated fire to be delivered on appropriate targets. Its value in holding attacks, and in covering weak points in defensive positions, has been proved.

Machine Guns. At the beginning of the War, machine guns had not been perfected, were comparatively few in number and the technic of their employment was in an experimental stage. At that time the German Army was greatly superior both in number of machine guns and in trained gunners. The improvements developed as the War progressed increased their reliability of functioning, and experience led to methods of use which rendered them tremendously effective both in offensive and defensive action, in the former case assisting the attacking skirmish line to achieve and maintain fire superiority as well as at times supporting the advance by indirect barrage fire over the heads of the advancing troops, and in the latter case delaying and disrupting the attacking forces by concentrations from concealed positions and by flanking fire delivered along the belts of wire in front of strong points and centres of resistance. In open warfare they proved most valuable in delaying rear-guard actions. See SMALL ARMS AND MACHINE GUNS.

Hand Grenades. The position warfare, which lasted so long on the Western front, called for weapons that could deliver high angle fire in order to reach narrow trenches at short range.

To fill this need was developed the hand grenade, at first a crude can filled with explosive and fired by a time fuse. From this beginning came the offensive grenade, with a thin metal case whose fragments could not injure the thrower but which produced the desired effect on the enemy by the shock of the explosion; and the defensive grenade, thrown from a protected position, with a heavy metal case which, when the grenade burst, broke into fragments and added the effect of the flying pieces to the shock of the explosion Later improvements resulted in grenades filled with various gases and chemicals for special uses. The invention of the method of discharging grenades by rifle fire from a cup placed on the muzzle of the rifle increased very greatly the range and accuracy of fire.

Trench Mortars and One-Pounder Guns. Another weapon developed for high angle fire was the trench mortar varying from the 3-inch light Stokes mortar capable for brief intervals of firing 40 or more 12-pound shells a minute up to 6-inch, 8-inch and larger mortars firing heavier shells at a lesser rate of fire with greater range and more destructive effect. These mortars, especially the light ones, which could be fired from concealed positions close up to the skirmish line of an attacking force, proved very effective against machine-gun nests.

The 37-mm. or one-pounder gun was introduced and also proved effective against machine-gun nests and, when supplied with special ammunition, was useful against light tanks

Infantry Equipment. In consequence of the successful development of the weapons above described, the equipment of a rifle squad in the United States Army in 1924 included one automatic rifle and one grenade discharger A howitzer company was assigned to each infantry regiment equipped with three light mortars and three 37-mm guns.

Tactical Value of Tanks. The value of tanks as an auxiliary arm of the infantry was demonstrated during the War. In the organization of the United States Army in 1924, one light tank company was an integral part of an Infantry Division. The company included a headquarters section with one signal tank and nine reserve tanks, and three platoons each with five tanks, two armed with 37-mm. guns and three with machine guns. Light tanks are transported on trucks as close as possible to the battle front.

Other Changes in Tactics. The changes in infantry tactics were accompanied by some changes in artillery tactics, indirect firing being developed to a high degree of perfection. The interdependence of the infantry and the artillery was emphasized and close liaison between the two arms was found most important. In order to conceal battery positions from aerial observation, effective methods of camouflage were developed. The rolling barrage to precede the leading infantry waves in an attack was perfected and was made possible by a supply of ammunition such as never had been available before.

In defensive positions the importance of field guns which could be rapidly advanced to bring direct fire on tanks was recognized, as was the desirability of accompanying guns to advance with the infantry to assist in reducing enemy strong points too heavily fortified to be destroyed by the infantry weapons.

Cavalry tactics were hardly affected by the War, as the conditions of warfare after the battle of the Marne did not permit the utilization of cavalry to any important degree. It seems apparent that the future use of cavalry will be in open warfare largely as a screen for the movements of the armies and for reconnoissance in conjunction with the air service. Cavalry patrols can secure information by contact with enemy patrols and from captured prisoners which airplanes cannot obtain, while airplanes can quickly relay to headquarters the information picked up by the cavalry as well as that which they can obtain by direct observation and aërial photographs.

The tactical value of leadership and morale, of training and discipline, of accurate, well-aimed rifle and machine-gun fire, of team work by adjacent units and of effective and reliable intercommunication was impressively revealed in the War. See ARMIES AND ARMY ORGANIZATION; ARTILLERY; ORDNANCE; CHEMICAL WARFARE; WAR IN EUROPE; etc.

STRATON, JOHN ROACH (1875–). An American clergyman, born at Evansville, Ind., and educated at Southern Baptist Theological Seminary at Louisville, Ky. After being ordained to the Baptist ministry in 1900, he held pastorates in Chicago and Baltimore; in 1918 he came to the Calvary Church in New York City. He won the $1000 prize offered by the Commercial Club of Portland, Ore., for an essay on *Portland and the Northwest*, and a $500 prize offered by the Anti-Saloon League. During 1923 he assailed Dr. C Woelfkin on proposed abrogation of immersion, vainly attempted to prevent Dr. W. H. P. Faunce (whom he denounced as a heretic) from addressing the Northern Baptist Convention, and asserted that the Union Theological Seminary was a breeder of revolutionary ideas in religion. He attracted considerable attention in the spring of 1924 by a series of debates with Dr. Charles Francis Potter, Unitarian and modernist. His writings include: *The Menace of Immorality in Church and State* (1920); *The Heavenly Home* (1920); *The Gardens of Life* (1921); *Church vs. Stage* (1921); *Our Relapse Into Paganism* (1921); *Dance of Death* (1922).

STRATTON, SAMUEL WESLEY (1861–). An American physicist, born at Litchfield, Ill. He was graduated at the University of Illinois in 1884, where in 1886 he became instructor of mathematics and physics and in 1889 professor of physics and electrical engineering. He was later called to the University of Chicago where he attained the full professorship of physics in 1898, and continued in that capacity until 1901 when he organized the United States Bureau of Standards at Washington; he was director of the Bureau until 1923. In that year, he accepted the presidency of the Massachusetts Institute of Technology. In 1895, he joined the Naval Militia of Illinois, of which he became lieutenant-commander; he served during the Spanish-American War in the United States Navy with the rank of lieutenant. During 1904–12, he commanded the District of Columbia Naval Militia. He was secretary of the committee for aëronautics and a member of the Executive Board of the National Research Council during the War. The Elliott Cresson medal of the Franklin Institute was conferred on him in 1912 and in 1917 he received the Public Welfare medal of the National Academy

of Sciences. Dr. Stratton became a member of the International Commission on Weights and Measures and in 1923 was a member of the United States Assay Commission.

STRAUSS, RICHARD (1864–). A German composer (see VOL. XXI). After his *Alpensymphonie* (1915) he wrote very little, and none of the later works fulfilled the hope that he would again reach the high level of the masterpieces of his second period. While he preserves his strong individuality, uninfluenced by either Impressionism or Futurism, as well as his marvelous command of all technical resources, the irresistible melodious sweep and flaming passion of his earlier works are missing. His powers of thematic invention have declined. His latest works are: a revised version of *Ariadne auf Naxos* (Vienna, 1916); a new opera, *Die Frau ohne Schatten* (Vienna, 1919); a second ballet, *Schlagobers* (Vienna, 1924); a suite for small orchestra, *Der Burger als Edelmann* (arranged from *Ariadne auf Naxos*); and some songs. Neither the revised nor the new opera had much success, while the ballet was received with favor. The suite, however, is exquisite The songs cannot bear comparison with his earlier masterpieces in the same field. In November and December of 1921, he visited the United States for the second time, producing his own works exclusively With several of the great orchestras he conducted his orchestral masterpieces, and in conjunction with other artists appeared as pianist in his chamber music and songs. It is significant that the programmes he offered contained practically nothing written after 1900.

STREETS. See ROADS AND PAVEMENTS.

STRESEMANN, GUSTAV (1878–). A German statesman, educated at the universities of Berlin and Leipzig. When he entered the Reichstag in 1907, he was general-manager of an important union of manufacturers, and was identified with the great industrial leaders, such as Hugo Stinnes, who were the mainstay of the German People's party. He was at one time chairman of the Foreign Relations Committee. In August, 1923, he was asked to form a ministry During the time he was in office the Bavarian revolt occurred, and there was much disorder throughout Germany. He announced that the distress of the German people might be alleviated by a cessation of resistance in the Ruhr and the return of the Crown Prince. His views caused the downfall of his government in November, 1923, and Dr. Wilhelm Marx was asked to form a new cabinet. Dr. Stresemann was given the post of Minister of Defense in the new government. See GERMANY, *History*; REPARATIONS.

STREUVELS, STIJN (FRANK LATEUR) (1871–). A Flemish author, born in Heule, West Flanders. He was a baker at Avelghem until 1905. He wrote in the West Flanders dialect and was said to be the most distinguished Low Dutch author of his time. His writings include: *Het glornerijke Licht* (*The Glorious Light*) (1912); *Openlucht* (1905); *De Vlaschaard* (1908). The last two books were translated into English by A. Teixeira de Mattos and published in 1915 under the title *The Path of Life.* He also wrote many short stories.

STRIKES AND LOCKOUTS. A survey of labor disputes during the decade 1913–23 brings out two sharply contrasted periods: the war years, when efforts to promote patriotic coöperation between capital and labor reduced the number of strikes to a markedly low level; and the post-war period, when, with generally unsettled conditions and a diminished effort for arbitration, the number of strikes and the number of persons affected rose quickly, in many countries to a hitherto unprecedented figure. An interesting experiment during the period was the effort of the Australian states to prohibit strikes and lockouts, although the original act did not prove satisfactory and was replaced in 1918 by a new measure which made strikes illegal only in certain specified industries and public agencies and where walkouts occur within 14 days after notice of intention to strike. Another interesting movement was the step taken by employers in Germany and the Scandinavian countries to insure themselves against strikes, as an offset, they claimed, to the protection that the worker had in his strike benefits. See PICKETING, SABOTAGE, and INJUNCTION.

United States. A strike marked by much violence occurred in 1913–14 among the Colorado coal miners, giving rise to several sanguinary conflicts and the burning of a tent colony in which two women and 11 children were suffocated. While the objects of this strike—better working conditions, eight-hour day, higher wages, and recognition of the union—were not gained after more than a year of struggle, a Federal investigation of the situation uncovered conditions at the mines which were obviously in need of remedy and the operators were threatened with Federal intervention if outbreaks continued to occur. In the same year there were serious disorders in connection with a strike among the coal miners of West Virginia and the silk workers of Paterson. During the period immediately preceding the entrance of the United States into the War, strikes became numerous, partly because the workers sought to secure for themselves a share of the large war profits, in part because it seemed opportune to demand the betterment of conditions, and perhaps to some small extent because of the activities of foreign agents. In 1916, four railroad brotherhoods and the railway representatives came to a deadlock. In the arbitrations that followed, President Wilson's plan, which was accepted by the men, was rejected by the railroads, this situation bringing about the passage of the Adamson law, fixing the legal standard of a day's work at eight hours, and forcing the railroads to acceptance. During the War, in an organized effort to substitute mediation for the strike and lockout, thus obviating loss of time in that emergency, a Committee on Labor of the Advisory Commission of the Council of National Defense was formed, in 1917, with Samuel Gompers, president of the American Federation of Labor, as chairman, and with subcommittees on various phases of the question, such as wages and hours, mediation and conciliation, welfare work, cost of living, and domestic economy. A Labor Adjustment Committee, consisting of three representatives each of the government, employers, and employees, was created, and immediately made itself felt in preventing threatened strikes in the west coast shipyards and among the

east coast longshoremen; it finally effected a settlement of the strike in the copper mines of the Southwest. In connection with the latter strike, a wholesale, unauthorized deportation of miners—some of them members of the I. W. W. (q.v.)—from Jerome and Bisbee, Ariz., caused a great stir. About this time a general disorganization of the lumber industry in the Northwest by strikes gained for the workers the eight-hour day. An outbreak among machinists engaged on war work at Bridgeport was, in spite of concessions to the workers, finally quieted only by an ultimatum threatening blacklisting of the men from all war work. This period, which had been one of comparative quietude, was broken by the Armistice. In 1919, in Seattle, 25,000 shipyard workers went out, bringing on a general strike in that city which affected about 60,000 workmen. It was unsuccessful. When the Boston policemen in that year went out on strike to secure recognition of their union, their posts were filled by other men. Another unsuccessful attempt to compel recognition of a union was that of the steel workers, about 300,000 of whom walked out in September, 1919. Judge Gary refused to confer with the union leaders on the grounds that they were not representative of a large number of the workers. Federal troops were finally called in before the men returned to work. In New York City, in 1919, there was an actors' and a longshoremen's strike, and a printers' lockout. In that year a strike among bituminous coal miners, affecting about 425,000 men, was called off after two weeks, and the difficulties settled after six weeks upon the terms proposed by President Wilson. There were 125 unauthorized strikes, in 1919, affecting 1,053,256 men. Of the 4,154,733 workers who were involved in all strike movements in that year (1919), not less than 400,000 were in the clothing trades, 178,000 in textile work in New Jersey and New England, 330,000 in shipyards, 430,000 in the building trades A serious strike, in 1922, tied up practically the entire coal industry. For the first time, anthracite and bituminous mines were simultaneously affected. The walkout, following attempts to reduce wages, began on March 31. The bituminous strike ended August 15; the anthracite miners did not return until the beginning of September (see COAL). In August, 610,000 men were out. There was an outbreak of violence at Herrin, Ill., following the shooting of two union pickets by armed guards; 19 nonunion miners were killed and 30 wounded by an armed mob. Both bituminous and anthracite strikes were terminated by an extension of previous contracts from Mar. 31, 1922, to a date in 1923, and by agreements for further conference. As a result of this situation, and fulfilling one of the conditions on which the men went back to work, in September, 1922, Congress created the United States Coal Commission for the purpose of investigating all phases of the production, transportation and distribution of coal, and relationships between operator and worker, with a view to recommending remedial legislation. This year was notable also for the nation-wide strike among railway shopmen, involving 400,000 men and seriously tying up the entire transportation system. Beginning July 1 as a protest against reduction in wages, it finally resolved itself into a fight for the restoration of seniority rights to those who had gone on strike. On September 11, 16 railways came to terms with their workers, both agreeing to abide by the decisions of the Railroad Labor Board. Those railroads which refused to settle had so far succeeded in building up their shop forces as to be beyond the necessity of dealing with the strikers, although some of these roads were under the necessity of guarding their employees for some time thereafter. A strike of 155,000 anthracite miners in Pennsylvania in 1923 lasted only 10 days, the workers gaining a 10 per cent increase of wages but being denied the check-off and the closed shop. The pressmen's strike in New York City, September 18–26 of that year, was significant from the point of view of union discipline: the local union having defied the authority of the main

RELATION OF WORKERS TO LABOR UNIONS, 1916 TO 1923

Relations of workers to unions	Number of disputes

The approximate total duration of 2116 disputes ending in 1916 for which duration was reported as 49,680 days, or an average duration of 23 days each.
In 1917 the total duration of 1435 such disputes was 26,981 days, or an average duration of 19 days each. In 1918 the total duration of 1709 disputes was 29,895 days, or an average of 17 days each. In 1919 the total duration of 1855 disputes was 62,930 days, or an average of 34 days each. In 1920 the total duration of 1321 disputes was 51,893 days, or an average duration of 39 days each. In 1921 the total duration of 1258 disputes was 64,231 days, or an average duration of 51 days each In 1922 the total duration of 552 disputes was 21,017 days, or an average of 38 days each. In 1923 the total duration of 917 disputes was 21,406 days, or an average of 23 days each.

body, its charter was canceled, and the international organization supplied pressmen to fill the strikers' places.

The accompanying table and paragraph summarizing the labor disputes during the years 1916–23 are from the *Monthly Labor Review* of the Department of Labor, June, 1924. See TRADE UNIONISM, LABOR ARBITRATION, COAL, and RAILWAYS.

Other Countries. The figures for disputes in the United Kingdom from 1907 to 1920 show a tendency toward gradual increase, with a temporary falling off during the War. In 1913, there were 1497 disputes, affecting directly and indirectly 689,000 working people, with an aggregate duration of 11,631,000 working days. In 1916, these figures had fallen to 578, 281,000 and 2,581,000, respectively. In 1919, there were 1413 disputes, involving 2,515,000 people, with a duration of 34,903,000 days; in 1920, 1715 disputes, 1,932,000 workers, 27,011,000 days. The latter two years, due to the industrial unrest in 1919 and the great coal strikes in 1920, were practically peak years, except in point of aggregate duration, the record for which was reached during the coal strike of 1912. Among the more important strikes of the period was the Dublin strike in 1913–14, to uphold the principle of the sympathetic strike, or practical boycott of offending employers by other trades. This was noteworthy as the nearest approach to a general strike in British history; it involved even agriculture. The Munitions Act in 1915 made many strikes illegal, and this, together with public opinion, restricted for some time the extent of strikes and their duration. Even well into 1919, in spite of prevalent disturbance, there was no strike of great importance, until the railway strike beginning in September. The wage question which caused this difficulty was referred to a conference, the strike coming to an end after nine days. There was a national coal strike in 1920, followed by a more serious strike in 1921 that lasted for four months, and was terminated only by a government grant subsidizing wages in the industry, for three months, up to a maximum of £10,000,000. This strike also led to the passage of an act enabling exceptional measures to be taken in an emergency to protect the public from being deprived of the essentials of life. Among the other more important strikes abroad during this period, the following may be mentioned: 1914, London building trade, Yorkshire coal miners, railway employees in South Africa; 1915, miners in South Wales, and the Silesian coal miners and Berlin tool makers in Germany; 1916, Great Britain, jute workers of Dundee; Norway, a general strike protesting against compulsory arbitration of disputes; Spain, a railroad and general strike; 1917, an unprecedented number of short strikes in Japan, many as protest against the high cost of food; 1918, Great Britain, engineering trades, colliery examiners in South Wales, cotton trade, London metropolitan police force; 1919, coal miners, iron workers, shipbuilders; Italy, general strike in Naples; Spain, lockouts and strikes in all the chief industries; Sweden, printers, match makers, and a lockout in the woodworking trades; 1920, Great Britain, cotton textile strike.

STRONG, WILLIAM WALKER (1883–). An American physicist, born at Good Hope, Pa. He studied at Dickinson College, and at Johns Hopkins. He was a Carnegie assistant in physics at Johns Hopkins and during 1911–13, professor of electric theory at the University of Pittsburgh. In 1913, he became president of the Scientific Instrument and Electric Machine Company. During the War he developed a fume mask for poisonous gases, and in 1921, discovered the effect of magnetic psychoanalysis. In addition to many papers contributed to scientific journals, he wrote *The Absorption Spectra of Solutions* (2 vols., 1910, 1911), *The New Science of Fundamental Physics* (1918), and *The New Philosophy of Modern Science* (1920).

STRUCTURAL GEOLOGY. See GEOLOGY.

STRUCTURALISM. See CONSCIOUSNESS AND THE UNCONSCIOUS.

STURTEVANT, ALFRED HENRY (1891–). An American zoölogist, born at Jacksonville, Ill. He was educated at Columbia University. In 1915, he became research associate of the Carnegie Institution of Washington. He collaborated with Morgan in extensive researches on genetics, especially of the fruit fly, and published a number of papers dealing with the taxonomy and genetics of this animal. He was joint author (with Muller, Bridges and Morgan) of *The Mechanism of Mendelian Heredity* (2d ed., 1923).

STYRIA. A province of the Republic of Austria. Its area in 1910 was 8658.4 square miles; in 1923, 6323 square miles. Its population in 1910 was 1,444,157; in 1923, 977,350. See AUSTRIAN REPUBLIC.

SUBLIMATION. See CONSCIOUSNESS AND THE UNCONSCIOUS.

SUBMARINES AND THEIR WAR ACTIVITIES. The use of the submarine boat as a commerce destroyer was not a part of Germany's original plans for the War. The U-boats which had been completed and tested before the outbreak of the war were so unsatisfactory that Admiral von Tirpitz, the German naval chief, was highly skeptical as to their usefulness. Their first cruises against the British forces, in which 2 out of 10 were lost without inflicting any damage on their adversaries, seemed to confirm his views. Few new boats were ordered, and no special effort was made to hasten their construction. But on Sept. 22, 1914, Lieutenant Weddigen in the *U-9* sank in one hour a whole division of three 12,000-ton armored cruisers (*Aboukir*, *Hogue*, and *Cressy*), with a loss of 1400 men. The effect of this achievement was instantaneous, both in England and Germany. The British navy had made no definite plans to combat submarine activity. Extremists like Admiral Sir Percy Scott declared that no adequate measures were possible; extremists of the opposite view considered the submarine too ineffective to require such plans. Von Tirpitz was converted at once; not only was he converted, but he soon became the leading advocate of submarines in Germany. New boats in great numbers were ordered, and the earlier ones were taken in hand to remove their defects, as far as that could be done.

While this work was going on, the idea of using sumbarines against shipping was quickly conceived and developed. It was estimated that by Feb. 1, 1915, the repairs to the old boats would be completed and a number of the smaller new ones would be ready for service. On February 4 the Germans declared that the waters surrounding Great Britain and Ireland

would be a war zone in which enemy merchant ships would be destroyed, and that it would not always be possible to avoid danger to passengers and crew and even to neutral ships. Owing to a sharp protest from the United States, the declaration was modified in regard to neutral ships, their neutral character to be judged by all circumstances and not simply by the flag carried. As thus changed, it was put into effect on February 18.

After the sinking of a number of cargo and fishing vessels, the British passenger steamer *Falaba*, bound to Sierra Leone, was torpedoed on March 27 with the loss of 100 lives. On May 7, before the storm of protests which this evoked had died down, the great passenger liner *Lusitania* was torpedoed without warning and sank in 20 minutes with a loss of life at first reported as 1396 but afterward thought to be about 1200. Nearly 300 Americans were on board, and many were drowned. The protests over the *Falaba* affair were as nothing compared to those now aroused. The United States was deeply stirred and came near to declaring war against Germany, but the country was unprepared for war and did not even start to prepare for it until 1917, after war was admitted to be inevitable

The American protests were met by the usual German promises, though even the Chancellor was convinced of the danger of making an active enemy of the United States, and on June 15 an imperial order was issued, forbidding the sinking of large passenger vessels Von Tirpitz and the naval staff fought the order so furiously as to somewhat weaken imperial support of it. Encouraged by this, the naval instructions to submarines were apparently relaxed; for on August 19 the large British passenger steamer *Arabic*, outward bound, was sunk off the Irish Coast with the loss of 44 lives. The United States again protested strongly, and the German government apologized, quoting the statement of the submarine commander that the *Arabic* was apparently trying to ram him, and also repeating (September 2) their previous assurance that liners would not be sunk without warning and without safety of the lives of noncombatants, provided that the liners did not try to escape or offer resistance. Two days later, September 4, the liner *Hesperian* was sunk with the loss of 32 lives. The German government denied that she was destroyed by a submarine, but the proof seemed clear.

During the year the Germans sank various American cargo vessels for which they agreed to pay, but up to 1924 had never done so. The Chancellor now forced Von Tirpitz to stop sinking liners, and on September 20, further orders were issued, suspending operations except in the North Sea. This condition of affairs remained unchanged until after the close of 1915, notwithstanding the arguments and protests of Von Tirpitz and the naval staff. But on Feb. 12, 1916, the German government issued a memorandum declaring that after February 29, merchant vessels armed with guns would be treated as belligerents On March 24, the channel steamer *Sussex*, with 325 passengers, about 25 of them Americans, was torpedoed. Though it was not sunk, 80 persons were killed and injured. Following this, President Wilson threatened to break off diplomatic relations altogether, "unless the German government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight carrying vessels." The German reply concluded with the statement that German naval forces had received an order that vessels would not be sunk without warning and the saving of life unless they should attempt to escape or offer resistance; but if the United States failed to secure the "freedom of the seas" from Great Britain, the "German Government would then be facing a new situation in which it must reserve to itself complete liberty of decision." Although this proviso made the promise as to methods of warfare absolutely valueless except for the brief interval before Germany would decide that the United States had not obtained from Great Britain the "freedom of the seas"—an impossible absurdity—it was accepted by the President, who said he would "rely on a scrupulous execution henceforth of the now altered policy."

Fear of American hostility, or doubt of its success, held Germany back from unrestricted submarine warfare until the beginning of 1917, when the naval staff persuaded the government that it would be so effective as to starve the British people until they demanded peace. Fears of the United States were declared groundless. That country had evidently no warlike intentions, for it was wholly unprepared for war, and nothing of importance was being done to remedy this situation. The political campaign of 1916 had been won on an anti-war platform by the aid of pacifists and pro-Germans, and as late as December the President had made a speech in which he told the people not to lose their heads over talk of preparedness. "Moreover," the naval staff said, "the submarines would stop any attempts to transport troops to Europe before Great Britain was brought to her knees." A note to the Allies on December 12, proposing negotiations for peace, was rejected by them; and on Jan. 9, 1917, it was decided to commence unrestricted warfare on February 1. The new decision was publicly announced on January 31. While other areas were added later, the rough outlines of the war zone, as defined by the announcement, within which submarine warfare was to be unrestricted, included all north European waters between the meridians of 4° E. and 20° W. longitude, and between the latitudes of the Faroe Islands and Cape Finisterre, except over narrow lanes along the coasts of Holland and Spain, the Zone also included all the Mediterranean except areas along the Spanish coast and a lane 20 miles wide leading to Greece. The last phase of the blockade was now reached. The United States at once broke off diplomatic relations with Germany. On February 3, the American Ambassador left Berlin and on the same date the German Ambassador at Washington was handed his passports; but the declaration of war was deferred until April 6 in the futile hope that Germany would rescind her decree.

Germany had now about 140 submarines ready for service and many more building; 269 were ordered in 1917, and the construction work on submarines and destroyers was pushed to the limits of the shipyard capacity The total tonnage of Allied and neutral merchant vessels sunk during each month increased from 291,000 in January to 464,000 in February; 507,000 in March; and 834,000 in April. The tonnage sunk

in May dropped to 549,000; in June, it was 631,000; in July, 492,000; in August, 480,000; in September, 315,000; in October, 429,000; in November, 259,000; and in December, 350,000. During 1918, it steadily decreased, with slight fluctuations, to 106,000 in October. Sixty-six German submarines were sunk in 1917 and 74 in 1918. In the early days of unrestricted warfare, the antisubmarine forces were inadequate in number either for patrol or convoy, but this number grew steadily, and the system of patrol and convoy was soon vastly improved. Depth bombs were supplied in constantly increasing quantities, and methods for their discharge were perfected. Aircraft became more and more valuable, especially for sighting submarines when submerged Allied submarines increased in number and gained in effectiveness Decoy vessels (Q-ships), P-boats, sub-chasers, sloops, trawlers, mine-sweepers, booms, mine-fields, paravanes, camouflage, and zigzag steering played their parts. But the most important vessels in the antisubmarine service were the destroyers, and the most effective system of protection was the convoy. The first division (six boats) of American destroyers arrived at Queenstown on May 4, 1917, and, within the next 30 days, three similar divisions joined them. Not only did they greatly help to relieve the strain on the British forces, but news of their appearance on the blockade 28 days after the declaration of war was most inspiring to the Allies and more than equally depressing to the Germans. Before American troopships began to reach the danger zone in great numbers, many more American destroyers, together with patrol vessels, submarines, and cruisers, had joined the Allied forces, so that the rush of troops during the spring and summer of 1918 was so effectively guarded as to surprise not only the United States and its Allies but also the Germans, who had confidently expected to prevent absolutely the transport of any great number of troops and their supplies, and who were chagrined and alarmed by their complete failure. See NAVIES; BOMB, DEPTH; HYDROPHONE; PARAVANE; VESSEL, NAVAL, *Submarine;* WAR IN EUROPE, *Naval Operations;* BLOCKADE, ALLIED; WAR, DIPLOMACY OF THE.

SUDAN, ANGLO-EGYPTIAN. An African territory under the joint administration of Great Britain and Egypt, lying between Egypt and Uganda and the Belgian Congo, and extending from the Red Sea to the limits of Wadai in Central Africa. Area, 1,014 000 square miles; population, estimated in 1922, 5,850,000. The chief towns are· Khartum, the capital (30,600), Omdurman (78,000), Khartum North (34,000). Gum arabic continued the product of greatest economic value. In 1913, 33,353,393 pounds were exported (value, £E371,528); in 1923, 50,200,640 pounds were exported (value, £E1,006,223). Cotton ranked second with 5,103,750 pounds, valued at £E152,110, and 11,228,000, valued at £E458,188. Fluctuations were great, as may be seen by the 1915 output of 9,794,000 pounds and the 1921 output of 11,068,000 pounds. This was occasioned by the inability to regulate the water supply, a condition dependent on the completion of the great irrigation projects in the Tokar district of the Red Sea province. Other products included: durra (millet), with an estimated yield of 90,000 tons and an export of 43,900 tons (£E240,150) in 1922 and 37,351 tons (£E212,185) in 1923 as compared with an export of 2080 tons in 1913 and 85,000 tons in 1917; sesame (value of export in 1923, £E190,505); cattle (value of export in 1923, £E103,747); ivory (value of export in 1923, £E56,512 for 41 tons; the 1913 output was 138 tons). In 1913, total exports were £E1,185,186; in 1920, £E4,712,652; in 1923, £E2,562,091. Reexports for 1913, 1920, 1923, were £E93,055, £E363,319, £E190,334. Imports for 1913, 1920, 1923, were £E2,109,476, £E7,006,865, £E4,669,004. Imports, by order of value in 1923, included cotton fabrics, iron and steel manufactures, sugar, coal, machinery, flour, etc Exports were sent to the following in order of value in 1923: United Kingdom, Egypt, United States (£E305,218), Germany, Italy. Imports in 1923 were from Egypt, United Kingdom, India and Aden, Japan, Abyssinia, United States (£E95,208). The rapid development of cotton and cereal growing enhanced greatly the importance of Port Sudan.

It was seen by the Sudan government that only great irrigation projects could open up the country for economic exploitation. The two areas which received attention in the period 1912-23 were the Gezira district, between the White and Blue Niles, and the Tokar district in the Red Sea province. In the former a project was commenced in 1914 for the opening up of about 300,000 acres by the construction of a dam on the Blue Nile, at an estimated cost of about £6,000,000. At the same time, the Egyptian government proposed to construct a dam on the White Nile below Khartum, for the use of its own lands. Work was commenced on this scheme in 1919 but was discontinued for lack of funds in 1921. The work on the Makwar (Blue Nile) dam continued, by 1922, it had cost £4,000,000 In 1922, there were 1500 miles of railway in operation. In 1923, construction was under way on a railroad from Thamian to Kassala for the tapping of the great Tokar cotton district. To facilitate communications, the British erected 11 wireless stations in the Sudan. The cost of government consistently increased. For 1913 and 1922, revenues were £E1,568,352 and £E3,880,000; expenditures for the same years were £E1,533,065 and £E3,880,000. Surpluses from revenue were accumulated in a reserve and expended on public works.

The Sudan enjoyed the period of prosperity that was prevalent in all noncombatant countries during the War. The rise in prices, the demand for cotton and gum, and the presence of large British forces in Egypt, accounted for the economic well-being. This state of affairs was reflected in the comparative peace that attended the British occupation. In 1916, the confines of the territory were extended to take in the whole of Darfur, which was incorporated as the fifteenth province of the Sudan. This was occasioned by the rebellion of the Sultan Ali Dinar who, working with the insurgent Senussi, contemplated an invasion of the Sudan. As a result of the conquest, Great Britain and France were able to settle the troublesome frontier question of Wadai and Darfur (1919) During the period of the War, military forces were in continual operation in the southern provinces, notably Mongalla and Nuba, because of local uprisings. The Sudan was little affected by Egyptian troubles (1919–23) and though Egyptian nationalism sought to include the

Sudan in its aspirations, there was very little positive sympathy displayed by native Sudanese. The British government steadily refused to permit the new Egyptian state to absorb the Sudan (see EGYPT). In August, 1924, a crisis in Anglo-Egyptian relations was precipitated when Egyptian agitations led to outbreaks in Khartum, Boha, and Port Sudan. Planes and troops were rushed to the affected areas and for a time fears were entertained that the revolt might become general

SUEZ CANAL. During the War the Suez Canal became an important strategic and military consideration, and it was determined that its waterway should be deepened and enlarged so as to take care of greater vessels. By 1921, a depth of 39.4 feet, which was fixed as the minimum, obtained for the distance of 80.8 miles, leaving but 18.6 miles which was 34 feet deep. This shallow portion was toward the Suez end where there was a tide of 3.28 to 5.91 feet, so that at certain stages of the tide there was full depth through the canal, there being practically no tide at the Mediterranean end. The minimum width at the bottom was 147.6 feet, while the ordinary width of 197 to 246 feet was increased to 325–360 feet at curves or special places

Much of the canal bank was lined with stone to prevent washing, and this wall was set at the full standard width which later was obtained by dredging to give the projected cross-section of water at all points At Port Said the breakwater was extended to prevent much of the slipping up of the entrances. From 1921 on, there was practically 40 feet of water available for the entire length of the canal. Previous to the War the traffic through the canal was about 21,000,000 tons annually During the War it declined to 13,000,000 to 14,000,000 tons, and in 1923 it increased to 22,730,162 tons, as indicated in the accompanying table.

SUEZ CANAL TONNAGE AND RECEIPTS, 1913, 1919–1923

Year	Ships		Other vessels [a]		Total cargo, in metric tons	Total receipts, in francs
	Number	Net tons	Number	Net tons		
1913	5,085	20,034 000	..	..	25,776,000	127,303,000
1919	3,986	16 013,802	2,406	431,536	13,973,000	144,984,000
1920	4,009	17,574,657	3,133	230,594	17,047,000	151,868,000
1921	3,975	18,118,999	3,257	155,820	17,509,000	149,251 000
1922	4,345	20,743,245	3,044	94,009	21,361,000	166,857,000
1923	4,621	22,730,162	2,901	91,970	22,777,000	175,791,000

[a] Includes small craft and local traffic.

By 1923, traffic through the Suez Canal had surpassed all previous records, amounting, as stated, to 22,730,162 net tons, or an amount greater by 2,455,000 tons than the record of 1912, which, until 1922, had been the highest previous year's record. As will appear from the table, the increased tonnage corresponds with the decrease in the number of ships, the total for 1923 (4621) being 752 less than in 1912, but the average net tonnage per vessel rose from 3773 in 1912 to 4919 in 1923.

While there was a tonnage recovery of cargo movement through the canal after 1919, the totals were less than before the War. For example, the total southbound cargoes in 1923 amounted to 7,704,000 metric tons, as compared with 11,320,000 metric tons in 1913, while the northbound cargoes showed a slight increase, being 15,073,000 metric tons, as compared with 14,456,000 in 1913.

SUGAR. See CHEMISTRY, ORGANIC.

SULPHUR. Few discoveries in the field of chemical engineering were of greater significance than that of the Frasch process by which sulphur deposits of Louisiana and Texas could be exploited in an efficient and economical way. In 1900 the domestic output of sulphur in the United States was valued at only about $500,000, and the demands of the industry were met by imports of sulphur and pyrite, or by native supplies of the latter substance. In 1902, came the successful development of the new process, and by 1920 the output had grown to such an extent that it was valued at $30,000,000, and the three companies working in this field not only were able to supply the domestic demand but to export sulphur to the extent of about $9,000,000 Before the War, quantities of pyrite were produced in the United States and were used in the manufacture of sulphuric acid, but during the War sulphur was substituted by many manufacturers of sulphuric acid and the output of the plants was increased As a result, in 1920 the production of pyrite, which comes mainly from California and Virginia, with small imports from Spain and Canada, was the smallest since 1911. The amount of sulphur mined and shipped, together with its value in the interval from 1914 to 1924, is given in the accompanying table.

U. S. SULPHUR PRODUCTION

Year	Sulphur mined Long tons	Sulphur shipped Long tons	Value
1914	417,690	341,985	$6,214,000
1915	520,582	293,803	3,955,000
1916	649,683	766,835	12,247 000
1917	1,134,412	1,120,378	23,987,000
1918	1,353,525	1,266,709	27,868,000
1919	1 190,575	678,257	10,252 000
1920	1,255 249	1,517,625	30,000 000
1921	1,879,150	954,434	18,000,000
1922	1,830,942	1,343,624	24,000,000

The output in 1922 came from two mines in Texas, and from one each in Louisiana, Nevada, and Utah, more than 99.9 per cent being produced by the three mines in Texas and Louisiana which regularly contribute the bulk of the annual output of the United States. An agreement between the American and Sicilian sulphur producers regulating the world's unrefined sulphur market was concluded early in the spring of 1923. Prices were to be regulated in relation to the demands for consumption, with an intention of gradually regaining the pre-war levels based on a gold standard, and to be increased by $1 a ton over those temporarily put into effect in October, 1922. North America was to be supplied by the American producers, Italy by the Sicilian producers, and the remainder of the world proportionately by the two groups, with the provision that Sicilian producers might sell to any country a maximum of 65,000 tons for the manufacture of sulphuric acid. This agreement permitted Sicily to export annually 210,000 tons, including 65,000 tons for sulphuric acid, a quantity largely in excess of Sicilian exports in recent years.

The development of the American sulphur in-

dustry not only had peculiar significance in the United States but it was a very vital matter for Italy. In 1906, the Sicilian production was 475,553 metric tons, and with the development of the American mines it was realized that the Italian industry was seriously threatened by the United States, as Italy was the only serious competitor of that country.

The Sicilian production, together with that of all Italy, is indicated in the accompanying table.

Year	Sicilian Production	Total Italian Production
1914	334,974	377,843
1917	177,453	211,847
1918	194,585	234,296
1919	181,744	226,126
1920	224,247	263,603
1921	240,089	273,872
1922	137,640	191,600

SUMATRA. See DUTCH EAST INDIES.

SUMNER, FRANCIS BERTODY (1874–). An American zoölogist, born at Pomfret, Conn. He was educated at the University of Minnesota and at Columbia University. He was instructor at the College of the City of New York (1899–1906); director of the biological laboratory of the United States Bureau of Fisheries at Woods Hole (1903–13); as well as biologist at the Scripps Institute for Biological Research (1913–19); and associate professor of zoölogy (1919–) at the University of California. He published extensively on the development of the bony fishes, on the fauna of the Woods Hole region, and more recently on the influence of environment on, and heredity of, the coat color of various mammals.

SUNDAY SCHOOL UNION, AMERICAN. A corporate organization, having annual and life members, established in 1817 as the Sunday and Adult School Union; seven years later its name was changed to that given above. Its object was to establish and maintain Sunday schools and to publish and circulate moral and religious publications. The affairs of the society were conducted by a board of officers and managers—prominent laymen of the different denominations. In the years between 1915 and 1924, 11,423 Sunday schools were established and 6782 were reorganized; over 200 missionaries were commissioned yearly; 68,385 Bibles, 165,156 New Testaments, and 103,491 Gospels of John were distributed; 497 churches were organized, 193 churches built; 3039 prayer meetings established, and over 1000 young people's societies organized. In carrying on their work the missionaries made 1,942,747 visits to families, traveled 11,957,141 miles, delivered 213,434 sermons and addresses, and reported professed conversions of 64,218 persons. The work of the Union was chiefly in the rural districts of the country, in places where there were no religious services. It was to these otherwise unreached communities its missionaries carried the Gospel message and started a religious work. Work among the Negroes of the South was also undertaken. The society published books of reference, Bible dictionaries, maps, and other helps to the study of the Bible, many of which were used as textbooks in theological seminaries and colleges. It published 11 periodicals and lesson helps for Sunday school teachers and scholars—evangelical and undenominational in character—of which over 19,000,000 copies were distributed between 1914 and 1924. National headquarters were maintained at Philadelphia. President, Martin Luther Finckel.

SUN YAT-SEN (1867–). A Chinese revolutionary leader, born in Kuangtung province, the son of a native Christian. He was educated at the College of Medicine in Hongkong and practiced his profession in Macao and Canton. Believing that the Manchus were responsible for Japan's aggressions in China, he headed a revolt against the government in 1895, but failing in his purpose, he was obliged to leave the country. He collected funds from the United States, Hawaii, and the Straits Settlements to help the antidynastic movement and also organized propaganda work in China. In Japan he founded a society called the Tung Men-hui, which later played an important part in Chinese politics The "western learning" section of young China looked on him as their leader. When the revolution broke out prematurely at Wuchang, he was in England, but he returned to China in time to be elected provisional president When on Feb. 12, 1912, the Emperor abdicated, Yuan Shih-K'ai was made head of the new government, Dr. Sun resigning the presidency. Later Dr. Sun was appointed director of national railways at Shanghai. When Yuan died in 1916, Dr Sun headed a group of Cantonese who fought against the party in power at Canton, and in 1921 he was elected president of the Chinese Republic, although the southern part of the country would not recognize his authority. A prolonged struggle between the sections ensued, during which his prestige throughout the world decreased, while his power in China remained indeterminable.

SURFACE, FRANK MACY (1882–). An American zoölogist and statistician, born at Eaton, Ohio. He was educated at the State University of Ohio (A.M., 1905) and at the University of Pennsylvania (Ph.D., 1907). He was associate biologist at the Maine State Experiment Station (1907–10 and 1913–17); biologist at the Kentucky Experiment Station (1910–13); assistant chief statistician of the Division of Food Inquiry (1917–19), and chief statistician of the American Relief Administration (1919–20).

SURGERY. See ABORTION; ANÆMIA; ANGINA PECTORIS; CANCER; GALLSTONE DISEASE; WOUNDS

SURGERY, RECONSTRUCTIVE. As a result of the War, there was a certain amount of reversion to first principles in postbellum surgery. Whether such reversion has been beneficial is another matter. Surgery in 1924 might be an improvement in some ways over surgery in 1914, but was such improvement due necessarily to military experiences? There were still thousands of crippled children and adults due large-

ly to lack of organization and equipment, special hospitals and vocational training schools. It should be possible after ordinary traumatism and infantile paralysis—to go no further—in the interest of salvage, to save 10 per cent of the victims if the requisite apparatus could be guaranteed. As a result of war experience we know that proper first aid often prevents crippling. One of the chief lessons from the War has to do with splints and splinting, the latter requiring team work among the surgeons. In all locations in which accidents have a cumulative incidence, splints are now kept on hand in sufficient amount while attempts at standardization of splints and splinting have been patterned successfully upon military surgery. In routine surgery, splints are adjusted with the principal object of prevention of deformity yet this must at times antagonize the principle of wound treatment.

The Carrel-Dakin solution which proved of such value in war wounds, as well as the other methods in vogue for wound treatment, are naturally antagonistic to the principle of fixed dressings intended to avert deformity; and until the two forms of treatment can be brought in harmony with each other the status of wound treatment will be unsatisfactory. Some form of compromise must be forthcoming; permanent splinting must not be allowed to interfere with wound drainage. Stiffness of joints after immobilization will not be due to the treatment but to the original injury. The extremely radical methods of cleansing infected war wounds are not required in peace surgery and would be unnecessarily drastic.

SUTHERLAND, GEORGE (1862–) An American jurist and legislator (see VOL. XXI). He served as United States Senator from 1905 to 1917, but was defeated for reelection in 1916. He was appointed to the United States Supreme Court in 1922

SWARTHMORE COLLEGE. A nonsectarian, coeducational institution at Swarthmore, Pa., founded in 1864. The student enrollment increased 25 per cent during the decade between 1914 and 1923–24, from 434 to 537 students. The board of managers voted to limit attendance to approximately 500 students. To the college library of 57,000 volumes there was added the Friends' Historical Library The Sproul Astronomical Observatory was completed in 1915 and two swimming pools were added to the gymnasium, and in 1920 Hicks Hall of Engineering was built. The Cloisters, a group of six fraternity and nonfraternity club houses, was under construction in 1923–24, and Worth Dormitory for girls was completed in the same year. A million dollar endowment campaign was completed in 1921, bringing the productive funds of the college to more than $3,000,000. Joseph Swain, LL.D., resigned from the presidency in 1920 and was succeeded in 1921 by Dr. Frank Aydelotte.

SWAZILAND. A British native protectorate in South Africa under the control of the British Colonial Office and administered by a resident commissioner under the direction of the high commissioner for South Africa. It has an area of 6678 square miles and a population of 112,951, of which 2205 were Europeans, by the census of 1921. The main concern of the administration was the expropriation of monopolies and concessions which had been granted to whites by the Swazi chief, Mbandeni. During 1904–22, £117,412 was spent on this work. The public debt still amounted to £92,500. Swazis were settled on land reserves which amounted to about one-third of the total acreage in the protectorate. The costs of administration increased from £63,967 in 1913–14 to £89,674 in 1922. Native taxes, customs, sales, leases, concession rents, and licenses furnished the revenues. The people were largely a pastoral folk and exported oxen and hides to the Cape. Live stock in 1921 numbered: cattle, 210,391; horses, 1449; and goats, 118,790. Recent experiments with tobacco and cotton by white farmers were meeting with success. Tin mining was important, the yield in 1915–21 being worth £376,000. Gold was fast declining, the yield in 1922 being only 427 ounces.

SWEDEN. A kingdom in northern Europe with an area of 410,581 square kilometers. Its population (1922 and 1913) was 5,987,520 and 5,638,583, of which the urban population comprised 1,813,177 and 1,485,840 The chief cities and their population were (1922 and 1912): Stockholm, 424,944 and 350,955; Gothenburg, 228,258 and 173,875; Malmø, 144,796 and 92,338; Norrkøping, 58,353 and 146,674; and Helsingborg, 48,390 and 33,863.

Agriculture. Total area of agricultural land under cultivation (1921) was 3,794,711 hectares; natural meadow, 922,824 hectares; forest areas, 24,583,721 hectares The area and production of various crops was as follows:

	Hectares 1913	Metric tons 1913	1923
Wheat	146,712	254,000	317,000
Rye	351,824	566,000	644,000
Barley	165,836	368,000	255,000
Oats	728,639	1 449,000	969,000
Mixed grains	265,169	381,000	430,000
Leguminous crops	46 785	54 000	61,000
Potatoes	158 658	2,051,000	1,667,000
Root crops	135,757	3,127,000	4,060,000
Hay	1,682,304	4 472,000	4,750,000
Total value of 1923 crops (kronor).		1,116,000,000	crowns
Total value of 1913 crops		887,700,000	crowns

Sweden imported heavily of grain and flour, imports during 1923 amounting to 108,755,000 crowns (1913, 54,692,000) as against exports of 6,515,000 crowns (1913, 3,987,000). Sweden's chief exports were lumber, wood pulp, paper, and iron ore.

Mining and Industry. In 1922, there were 1757 lumber mills (1248 in 1912) employing 50,217 workers (37,908 in 1912). Wood-pulp production (1922): mechanical, 581,700 metric tons, chemical 1,158,553 tons. The coal supply was very small and insufficient for the requirements, production during 1922 being 378,861 metric tons. Sweden was, however, very highly developed electrically, utilizing its waterfalls for the production of motive power. Sweden disposed of approximately 1,150,000 developed turbine horse power. Figures for the iron and steel industry were as follows: (1922) iron mines, concentrating, and briquetting works, 98; workmen, 8348; production of iron ore, 6,201,244 metric tons; number of iron and steel smelting furnaces, 453; production of pig iron, (1922) 264,259 metric tons, (1923) 277,000 tons.

Transportation and Communication. The length of railways was 15,401 kilometers in 1922 and 14,171 in 1912, of which for the former, 5625 kilometers were state owned (4610 in 1912). Traffic (1923) on state railways: passengers carried, 25,282,000; freight, 13,149,000 metric tons. Similarly for private railways: passengers carried, 38,300,000; freight hauled, approximately 19,000,000 metric tons. On Dec. 31, 1923, Sweden's merchant marine totaled 1,220,077 gross tons (ships over 100 gross tons only), of which the 1181 steamers and motorships weighed 1,152,912 gross tons, and the 238 sailing vessels 67,165 gross tons. Total earnings of merchant marine (1922) reached 185,400,000 Kr. Vessels entered (1921) with cargoes were 17,431, with net tonnage of 6,443,157 tons; while in ballast 6790 vessels with net tonnage of 1,879,416 entered. Vessels cleared with cargoes numbered 10,334 with a net tonnage 6,676,802 tons; in ballast 7778, with net tonnage of 1,612,375. In 1922, the length of telegraph wires was 80,000 kilometers; the number of stations 3480; the number of messages, 7,001,472. Length of telephone wires: state, 679,452 kilometers; private, 10,625 kilometers.

Commerce. Swedish exports (1923 and 1913) were valued at 1,136,000,000 and 817,347,000 crowns; imports, 1,342,000,000 and 846,538,000 crowns. Exports and imports, by groups of commodities, for 1913 and 1923 are shown in the table.

IMPORTS AND EXPORTS, BY GROUPS OF COMMODITIES

	1923		1913	
	Imports	Exports	Imports	Exports
Textile manufactures	140,749,000	16,661,000	62,062,000	5,692,000
Spinning raw materials	87,395,000	2,724,000	60,138,000	2,374,000
Tallow, oils, tar, rubber, etc.	80,058,000	10,085,000	67,061,000	5,404,000
Minerals, raw, etc	181,562,000	92,819,000	148,847,000	91,142,000
Metals, unfinished	64,237,000	62,167,000	48,796,000	78,623,000
Metals, wrought	57,105,000	45,059,000	40,845,000	29,543,000
Vessels, autos, carriages, machinery	117,250,000	114,053,000	51,267,000	62,966,000
Grains, flour, etc	108,755,000	6,515,000	65,290,000	11,031,000
Timber products, sawn, etc	8,141,000	276,551,000	15,355,000	247,883,000
Pulp, cardboard, paper, etc.	15,365,000	311,609,000	4,919,000	112,784,000
Animal foodstuffs	48,275,000	45,595,000	28,827,000	73,152,000
Groceries	97,432,000	659,000	60,086,000	686,000

CHIEF COUNTRIES OF ORIGIN AND DESTINATION, 1922

	Imports Crowns	Exports Crowns
Germany	314,100,000	103,220,000
Great Britain and Ireland	268,310,000	284,970,000
United States	167,370,000	137,990,000
Denmark	84,620,000	83,380,000
France	32,370,000	104,930,000
Norway	35,270,000	80,050,000
Netherlands	39,120,000	55,070,000
Russia	3,560,000	68,180,000

Finance. On Dec. 31, 1923, the state debt stood at 1,643,055,870 crowns of which 1,596,949,617 were funded. Notes in circulation totaled 559,000,000; gold reserve, 271,800,000 crowns. The budget proposal for 1924–25 provided for total income of 644,429,500 crowns of which actual state revenue amounted to 492,496,500. Paper currency outstanding Mar. 1, 1924, 530,000,000 crowns. The exchange rate was generally around par during the period (26.8 cents). The cost of living, which, in July, 1920, reached 270 (as based on the 1914 prices at 100), dropped to 236 in July, 1921, and 195 in April, 1922.

History. The outbreak of the War occasioned an immediate declaration of neutrality by Sweden, in company with the other Scandinavian countries, and in this she persisted to the end. Her position was a difficult one, and the Swedish people displayed extraordinarily good sense in circumventing the vexing problems which arose. In the beginning of the War, it appeared that Sweden's economic stability would be little deranged, for she at once became the go-between for Germany and America. For a time this trade flourished, but as the submarine campaign intensified and the British blockade became tighter, Sweden began to feel the pinch of necessity. From 1916 on, coal imports from Great Britain began to drop off seriously. The blockade was thrown, not about Germany, but about the Scandinavian countries, for there were no means of ascertaining whether imports to Sweden were not designed for transshipment to the Central Powers. The result was that the suffering of the population was often acute. Measures had to be taken for the regulation of industry and conservation of what little food and raw material stocks Sweden had or was able to get. All exports were closely scrutinized and those of the more important domestic products prohibited; a financial moratorium was imposed; the government was empowered to fix prices, hold up the sale of shipping, take in hand the whole matter of insurance, and resort to rationing. On this last score the life of the greater part of the population was, of course, intimately touched. A food commission was set up to supervise the importation of foodstuffs and in 1915 price-fixing was resorted to. In 1916 and 1917, sugar cards and bread cards were first employed, the bread allowance being generally 250 grammes per person per day. Other articles rationed were potatoes, milk, and coffee. All such regulations were finally lifted in August, 1919. Industry likewise suffered. In the activities dependent on the use of foreign raw materials, it was necessary to form import associations for the distribution of stocks. Before the end of the War, rationing was the rule in almost every industry. In the matter of fuel, for which Sweden depended on outside sources, the people were hard hit. It was necessary, therefore, to create a fuel commission, which undertook the exploitation of the country's forests on a grand scale. Mines and railways were kept going, but because prices charged were less than the cost of cutting, the government had to assume a deficit of 100,000,000 crowns.

Sentiment regarding the War at first gravitated toward the Central Powers. The rigors of the British blockade had seriously interfered with the course of Swedish life, perhaps more profoundly than with those of the other Scandinavian peoples, and the Swedes adopted a more bellicose attitude toward the Entente. In 1916, debate in the Riksdag was very bitter,

the Russian decision to fortify the Aland Islands particularly giving offense. Under the prompting of the military or Activist party, the Riksdag passed a military appropriation of 104,000,000 crowns. But from 1917 on, the general attitude changed. A cabinet crisis on Mar. 5, 1917, precipitated the fall of the Hammarskjöld ministry, and the succeeding cabinets concerned themselves more and more with the problem of reaching an agreement with the Entente The question became more pressing as food became scarcer and rioting more frequent. Throughout 1917, pillaging of bakeshops was the rule Finally, in February and in June, 1918, understandings were effected with Great Britain whereby Sweden was permitted to import stocks of food and such raw materials as phosphates, oils, coal, cotton, wool, rubber. In return Sweden turned over part of her merchant marine to the Entente and guaranteed the export of her iron ores.

The unsettled economic conditions and the spread of democratic doctrines immediately after the War left their mark on the progress of Swedish events in the years 1919–24 By laws in 1919 and 1921, the Riksdag made the right of suffrage universal, women being given the franchise on May 26, 1919 In 1921, a national referendum law was passed. A question of greatest national interest was the discussion over the legalization of the eight-hour day in 1919. After a prolonged debate, the measure was defeated in the Riksdag with the result that the Chamber was dissolved and a new election held. The new chamber proved more amenable to the government's wishes and the law for an eight-hour day was carried. The prevalence of radical ideas was further indicated when the King was compelled to summon Herr Branting, leader of the Social Democrats, to form a government in 1920. An ambitious programme for the inauguration of inquiries into socialization of industry, expropriation of large estates, disestablishment of the State Church, and disarmament, was announced, but the government went down to defeat in the autumn elections, as a result of heavy polls for the Right, and was compelled to resign. No temporary expedients or brave gestures could act as stop-gaps. The depression of 1920-21 which gripped the world was felt in Sweden, too, for in the general stagnation about 150,000 men were out of work at the end of 1921. Politics again became the barometer. In the elections of 1921, the Social Democrats were heavily supported, with the result that Herr Branting formed a Socialist government for the second time The Branting ministry continued in power until Apr. 6, 1923, when it fell on the question of unemployment doles. It had maintained its position of course only on sufferance, representing merely a minority party. The continued disorganization of industry had manifested itself in a growing turbulence, so that 1922–23 saw the country gripped by strikes in the sawmills, wood-pulp factories, and iron works. In the face of such internal storms, and lacking the power to force through remedial measures, the Branting ministry went down and was followed by a Right government headed by Herr Trygger

In foreign affairs, Sweden's rôle was a more complex one than that of the other Scandinavian countries, for her proximity to Finland and Russia involved her in questions of importance. The establishment of the republic of Finland in 1917 divided Swedish counsels. There was a large body of opinion favorable to an immediate recognition; another group, concerned over the disposition of the Aland Islands, was in favor of a more circumspect policy. In 1918, Finland was recognized, though Sweden refused to take sides in the internecine war between the Reds and the Whites which broke out in that year. The Aland Islands question continued to agitate political circles, though, in 1920, Sweden decided to submit the whole matter to the League of Nations, which it had joined that year, the grant of the islands to Finland in May, 1921, was received with much disfavor (see ÅLAND ISLANDS). While Russia did not receive formal recognition, a commercial delegate was permitted to establish his residence in Sweden, and though in 1919 the unpopularity of the Bolsheviks forced his departure, commercial relations were once more resumed in 1920. To the credit of Sweden was the government's refusal to join in the Allied blockade of Russia in 1919 In May, 1924, *de jure* recognition was accorded Russia. Subsequent European events were viewed with hostility rather than the usual indifference. Protests were frequent against the Ruhr occupation for in this fact lay the explanation of the disorganization of the Swedish iron industry and the adverse trade balance of 1923. Herr Trygger expressed the Swedish temper in the spring of 1924 when he declared a lack of confidence in the League of Nations' ability to guarantee international justice and peace. His government's concern with an increased defense budget and a scheme for longer military service as well as for the creation of an independent air-force board was of a piece with the prevailing uneasiness. SWEET BRIAR COLLEGE. A college for women founded at Sweet Briar, Va., in 1906. The number of college students increased from 74 in 1914 to 373 in 1924, and the faculty members from 20 to 32. The academy was discontinued during the period. The library increased from 4100 to 10,450 volumes during the decade, and the annual income from $125,957 to $224,726. An endowment of $302,110 was raised by the college. Emelie Watts McVea, Litt D., LL D., succeeded Mary K Benedict, Ph.D., as president.

SWIMMING. See SPORTS

SWINNERTON, FRANK ARTHUR (1884–). An English novelist and critic, born at Wood Green. His writings include: *The Merry Heart* (1909); *The Young Idea* (1910); *The Casement* (1911); *The Happy Family* (1912); *George Gissing: A Critical Study* (1912); *On the Staircase* (1914); *R L. Stevenson: A Critical Study* (1914); *The Chaste Wife* (1916); *Nocturne* (1917); *Shops and Houses* (1918); *September* (1919); *Coquette* (1921); *The Three Lovers* (1922); *Young Felix* (1923).

SWITZERLAND. A country of south central Europe. Its area is 15,945 square miles, of which 507 square miles are lakes of more than 25 acres in area, and 3072 square miles

otherwise unproductive. Of the productive land, 3576 square miles were forests in 1921, 69 square miles in vines, and 8721 square miles in agriculture and mountain pasturage. According to the 1920 census, the population was 3,886,090, compared with 3,765,123 in 1910. The largest cities were Zurich, 207,161, Basel, 135,976, Geneva, 135,059, Berne, 104,626, and St. Gall, 70,437. The population of Zurich was declining; for 1921 was estimated at only 203,840, reacting from an abnormal increase during the War; the population of the other cities did not change materially. The percentages of the population engaged in various pursuits in 1910 (statistics for 1920 not yet published) were as follows: extraction and production of raw materials, 28 per cent (of which 96 per cent was agricultural); industries, arts and trades, 43 per cent; commerce, 10 per cent; transportation, 6 per cent; domestic service, 1 per cent; living on income or on another's bounty, 3 per cent; without profession, in foreign families or establishments, 3 per cent. In 1910, the number of German-speaking persons in Switzerland was 2,594,184; French-speaking, 793,264; Italian-speaking, 302,578; Romansch-speaking, 40,234; and speaking other languages, 23,031. In 1913, emigration for overseas countries was 5787, considerably less than in 1920 and 1921, when those kept in by the War migrated in great numbers, the minimum of 304 having been reached in 1918. The 1922 figure (6191) represented a practical return to prewar conditions. Switzerland is largely a Protestant country, although in certain cantons, especially St. Gall, Lucerne, Fribourg, Tessin and Valois, Catholics are considerably in the majority. There is, however, no Federal church, all denominations being supported by voluntary contributions, not by state taxes. In 1910, there were 2,107,814 Protestants, 1,593,538 Catholics, and 18,462 Jews.

Education. In the school year 1921–22 there were 646 kindergartens, with 831 teachers and 19,380 pupils; 4253 primary schools, with 16,829 teachers and 531,009 pupils; 524 secondary schools, with 2623 teachers and 54,604 pupils; and 156 intermediate schools, with 1880 teachers and 27,280 pupils. There were also supplementary professional, industrial, commercial, agricultural, and domestic science schools, numbering 1069 with 72,875 students and 4713 teachers. The higher professional schools (including also normal and arts and crafts schools) numbered 48, with over 32,000 students The seven Swiss universities were located at Basel, Zurich, Berne, Geneva, Lausanne, Fribourg and Neuchâtel, with 5879 students and 1134 hearers At Lucerne was a theological faculty with 45 students, and at St. Gall a commercial academy with 390 students and hearers.

Agriculture. Agricultural production in Switzerland was as follows: wheat (including spelt and meslin), 154,020 metric tons in 1913 and 148,403 metric tons in 1923; rye, 45,054 and 41,799 metric tons; barley, 9936 and 22,401 metric tons; oats, 75,324 and 44,403 metric tons; corn, 2976 and 4200 metric tons; potatoes, 725,000 and 634,000 metric tons. Beef cattle in 1911 numbered 1,443,483, of which 796,909 were cows; after reaching a low point of 1,382,116 cattle, of which 729,999 were cows, in 1920, the number increased to 1,425,341 and 747,138 respectively in 1921, the latest available year. Horses numbered 144,128 in 1911 and 134,147 in 1921.

Industry. Switzerland is an industrial country in spite of a lack of raw materials; the chief natural resource is water power. The total water power available was estimated at 2,699,336 horse power in 1914, of which 526,098, or 19.5 per cent was already utilized; water power was used principally by hydro-electric stations and by the chemical and textile industries. At the end of 1913 there were 8101 factories in operation in Switzerland, but no figure for the number of workmen was available; in 1916 there were 8433 factories with 360,506 workmen; and in 1922, 8055 factories with 304,339 workmen. The principal industries in 1922 were machinery and appliances, with 49,918 workmen; cotton textiles, with 32,265; clothing and outfitting, with 31,391; silk textiles, with 27,500; watch and jewelry manufacture, with 27,496; metallurgy, with 23,314; and foodstuffs and beverages, with 21,401. After the War many of the strongest industries, especially the machine industry, were greatly injured by competition with countries having depreciating currencies, and by the high cost of raw materials. The watch industry, however, was best able to meet competition and was, in 1924, in a flourishing condition. Unemployment, which was not a notable problem before the War, became very high in 1921, and reached a maximum in February, 1922, with 146,302 wholly or partly unemployed. A gradual improvement occurred to 35,314 in July, 1923, with a slight seasonal reaction to 39,673 at the end of December, 1923.

Commerce. Swiss foreign trade has suffered greatly from the War. In 1913 imports totaled 1,920,000,000 francs and exports 1,376,000,000 francs. In 1922, despite greatly increased prices, values were only 1,914,000,000 francs and 1,689,000,000 francs, respectively, and in 1923 they were 2,224,000,000 francs and 1,716,000,000 francs, respectively. The principal countries of source for imports and of destination for exports, with values for 1913 and 1923 were as follows:

	Exports to (values in thousands of francs)		Imports from (values in thousands of francs)	
	1913	1923	1913	1923
Germany ...	305,660	123,443	630,870	416,935
France	141,250	214,192	348,985	394,957
Italy . .	89,153	100,783	207,025	231,915
Great Britain	236,165	363,385	112,666	181,991
United States	136,432	209,485	117,898	177,856

The principal classes of commodities imported in 1923 (in millions of francs) were as follows: cereals, 243; cotton, 207; minerals, 194; silk, 185; wool, 144; colonial products, 124; animal foodstuffs, 116. The leading exports with values expressed in like manner were as follows: silk, 359; cotton, 306; watches and clocks, 203; machinery, etc., 151; animal foodstuffs, 103.

Finance. Budget deficits were not common and never large in Switzerland before the War. In 1913, expenditures were 192,000,000 francs and receipts 187,000,000 with a deficit of 5,000,000 francs. By 1921 expenditures had risen to 508,000,000 francs and receipts to 381,000,000 francs, with a deficit of 127,000,000 francs. Unemployment subsidies and subventions to depressed industries, added to expenses arising from maintaining armed neutrality in the War, contributed to this deficit. Subsidies were gradually reduced, so that for 1923 the deficit

dropped to 46,000,000 francs, and the budget deficit for 1924 to 37,700,000 francs. The public debt of Switzerland on Dec. 31, 1913, amounted to 148,270,000 francs; by the end of 1921 it had increased to 2,063,360,800 francs, and by the end of 1923 to 2,276,000,000 francs. In addition, there was the debt of the Federal railways, which amounted to 1,483,025,684 francs in 1913, to 2,188,676,084 francs in 1921, and to 2,388,500,000 francs in 1923. It was expected that the budget deficits would be eliminated within a few years, but the large amount of the public debt contracted after the beginning of the War created a heavy burden for the Swiss taxpayer.

Communications. Water connections between Switzerland and other countries were unimportant, except by the Rhine from Basel, and internal waterways were not suitable for through navigation. Swiss railways were, therefore, of great importance to the country. At the end of 1921, Swiss state railways had a length of 3588 miles, including 31 miles of funiculars, 296 miles of tramways, and 908 miles of narrow-gauge line. In 1910, the total length was 3147 miles; most of the construction occurred between 1910 and 1915. In 1913, the number of passengers carried was 91,649,336; in 1922, 81,-032,550; and in 1923, 86,883,670. In 1913, the amount of merchandise, baggage, animals, and postal packages carried was 14,614,781 metric tons; in 1922, 13,245,115 tons; and in 1923, 14,652,370 tons. In 1913, receipts reached 212,-721,315 francs and operating expenses 142,405,-716 francs; in 1922 receipts were 344,215,450 and operating expenses 313,712,867 francs; and in 1923, respectively, 365,437,524 francs and 251,880,593 francs. In 1913 there was a surplus, after paying charges on the railway debt, of 1,613,357 francs in the profit and loss account; in every succeeding year through 1922 there was a deficit, amounting to 45,513,680 for 1922; but in 1923, a small net profit was again recorded. Prospects for 1924 appeared favorable.

History. Switzerland's position, during the War, was perhaps more difficult than that of any other neutral. Without a merchant marine and hemmed in on all sides by belligerents, her political and economic situation could hardly be said to be of her own ordering. In the Swiss mind, there were two spectres ever present in the period 1914–18: the fate of Belgium and the danger of a very real starvation. The first hastened a general mobilization of all available man power (about one-tenth of the population), immediately on the declaration of war. But the continuation of hostilities and the lessening of the fear of invasion, together with the added financial burden that the upkeep of the military establishment imposed, began gradually to provoke dissent with the result that the government was compelled from time to time to demobilize detachments of troops. Distress among soliders' families occasioned governmental measures for relief beginning with 1917, while private agencies contributed unstintingly to the same end. In 1918, too, the pay of the soldiers was increased. Conditions were made tolerable for the men under arms by the activities of the Swiss Red Cross which was greatly aided in its work by a grant of almost $100,000 from the American Red Cross. In all, the War cost Switzerland, in the defense of her frontiers, some $200,000,000. Money was raised by loans, by increased duties, by war profits, taxes, and special levies. It was not until late in 1920 that troops were definitely withdrawn from the frontiers and the regular channels of communication once more thrown open generally.

Economically, the plight of Switzerland was equally wretched. Her most important export was milk and its products, which the Central Powers purchased in large quantities. On the other hand, Switzerland depended on Great Britain for her foodstuffs, and on Germany for coal, oil, raw materials, etc. To find a via media between the groups of belligerents was the most difficult question before the Swiss government. In 1915, wheat was created a state monopoly; rice, in 1916, was treated similarly. In taking measures of this kind Switzerland endeavored to comply with the Entente's injunction that imports be prevented from finding their way into Germany and Austria. On the other hand, the source of vital raw materials was in Germany, and to refuse to trade with the Central Powers or to fail to send stocks stored in Switzerland for them meant a death blow at the economic life of the little country in the cessation of coal, iron, manure, and sugar exports from Germany and Austria-Hungary. The diplomatic story of Switzerland during 1916–18 is a recital of rebuffs and recriminations. With the continuance of the War the pinch of necessity was felt more and more acutely. In 1917, Germany's unlimited submarine policy affected Switzerland keenly; the dearth of meatstuffs compelled the ordering of two meatless days. In the same year, Argentina's wheat stocks were retained in that country by an executive order so that a bread ration had to be resorted to. Because of the heavy exports of cattle it was necessary to ration the milk supply in 1917 and create a federal bureau for its distribution. Ultimately almost all other necessities of life fell under the control of the central authorities to be rationed out with a greater or less parsimony. These included sugar, oatmeal, barley, macaroni, cheese, butter, fat, oils, potatoes, and coal. There was no lack of prosperity for certain classes, however. In 1916, profiteering flourished in the necessities of life and was not checked until the government perfected its schemes of food-control. Certain industries, notably those whose factories could be converted for the manufacture of munitions, manifested a great activity, serving both belligerents with equal impartiality. The precarious economic situation led to a disturbing occurrence in 1918. The continuous rise of prices, the unrest among the soldiers and the dearth of the common necessities, together with the example of the Russian Revolution, brought on a general strike in Switzerland on Nov. 12, 1918, which soon had the whole country in its grip. The programme put forth by the Social Democratic leaders of the movement contained all the familiar slogans of radical social democracy: proportional representation, full suffrage for women, democratic reorganization of the army, a state-imposed 48-hour week, state social insurance, etc. The strike failed with the refusal of the soldiers to join, and the leaders were turned over to the military tribunals for trial. Sentences, however, were light. Another wave of radical and socialist agitation swept over the country in 1922, when a Socialist proposal for a graduated

and practically confiscatory capital levy was submitted to popular referendum. Some such measure seemed necessary, to its proponents, to meet the cumulating debt which war and postbellum conditions had occasioned; moreover, more than nine out of ten voters could feel that the levy would not touch them directly; nevertheless antisocialist arguments prevailed, and after an almost uniquely intense prereferendum campaign the voters on Dec. 3, 1922, rejected the capital levy by 704,785 to 101,057.

There was no brighter page in European history during this tumultuous period than the record of the Swiss conduct toward foreign nationals, voluntarily or involuntarily detained within Switzerland's borders. The great numbers of tourists caught within the country at the outbreak of the War had to be provided for until transportation facilities were available for their departure home. Upon Switzerland fell the onerous burden of making arrangements for interned soldiers. Before the end of the War at least 25,000 men of nations at war were being housed, fed, schooled, and set to work by Swiss authorities. The charge to the nations involved was surprisingly small, the fee for upkeep demanded being only 5 francs a day per head. To the Swiss Red Cross fell the work of exchanging prisoners. As a result of its arrangements, exchange dépôts were established at Constance and Lyons for the repatriation of German, Belgian, and French prisoners, and at Como-Monza and Feldkirch-Dornborn for the repatriation of Italians and Austrians. The work done in the care of the wounded was particularly commendable. The total of men thus provided for must have run almost to 100,000.

Switzerland, similarly, became more than ever a centre of international activity during the War. The International Red Cross at Geneva exerted itself in the propagation of the humanitarian ideas which before had received general acceptance, but which only too generally were disregarded by all the belligerents. It tried to facilitate communications among the nations at war, provide for prisoners, check the bombarding and torpedoing of hospital stations and ships, and the like. In 1915, an international congress of Socialist women was held at Berne; at Zimmerwald, later in the year, Italian, Rumanian, Bulgarian, German, French, Swedish, Norwegian, Swiss, Polish, Dutch, and Russian Left Socialists met for a general condemnation of the War. British Socialists were denied passports to the conference by their government. It is interesting to note that Lenine was one of the representatives of the Russian group. A reunion of these representatives was held at Kienthal, Apr. 24–30, 1916, where 40 delegates, consisting mainly of Italian, Swiss, and Russian Socialists, attended. There were, besides, two Germans and three Frenchmen. Switzerland, in 1918 and later, became the seat of activities for the reconstruction of the Socialist International. For accounts of these meetings, see SOCIALISM. In September, 1919, the International Council of Peace met at Berne. In 1920, the first meeting of the League of Nations was held at Geneva. In this connection it should be recorded that on May 15–16, 1920, by a vote of 400,000 against 300,000 the Swiss people voted to join the League of Nations. The German-speaking cantons voted, by a majority of 10,000, against participation. Only once did Switzerland forget those rules of hospitality which her people had so painstakingly helped to formulate and in whose application they had so distinguished themselves. In May, 1923, M. Vorovsky, the official Russian representative at the Lausanne Conference, was shot down and killed by a fanatic who subsequently was released after a sensational trial which turned about an examination and pillorying of Sovietism rather than the nature of the actual offense. The Russian government justly characterized the murder and the proceedings that followed as the work of a studied official remissness and in retaliation broke off commercial relations with Switzerland, employing the only effective device at its command, the economic boycott.

Switzerland's rôle in international affairs, after the War, took on important proportions Her continual protests against her dependence upon her neighbors for the maintenance of communications with the outside world were finally heeded by the Peace Conference in 1919, for Switzerland was given freedom of access to the sea via the Rhine. A topic for much discussion after the War was the agitation on the part of the German Austrians in the Vorarlberg province to gain admittance into the Swiss union. The inhabitants of the Vorarlberg were prompted largely by the desire to escape the onerous burdens of the Treaty of St. Germain, and it was largely on account of the question of reparations that the Swiss opposed the step, though many Swiss also objected to the addition of 15,000 more German-speaking people to the already heavy German majority. In 1921, the Swiss Federal Council consented to the incorporation of the little principality of Liechtenstein (q.v.) into the Swiss Customs Union. Diplomatic and consular representation as well as the management of posts and telegraphs were also turned over to the Swiss. Another result of the War for Switzerland seemed the settlement of the long-standing dispute with Italy over the Ticino district. Italy's ambitions in the Tirol had been so well satisfied that it was likely the claim would not be raised again. In the west, however, matters were not so happily concluded. A dispute with France, which since 1921 had bobbed to the surface at intervals, completely emerged in 1923 to become a matter of prime importance. On Nov. 10, 1923, after protracted negotiations, the French government advanced the French customs line to the Swiss frontier and thus eliminated the free zone of Upper Savoy which had existed since 1815. This action had been prescribed by the Treaty of Versailles and had received the approval of the Swiss government, but the Franco-Swiss Convention sealing it was defeated in a Swiss referendum in February, 1923. During the year no one settlement was acceptable to both sides, with the result that France took the high-handed step above-mentioned, despite the protests of the Swiss and in disregard of an excellent suggestion that the whole matter be referred to the International Court of Justice.

SYKES, SIR MARK (1879–1919). An English public official, born at Sledmere, Yorks., and educated at Cambridge. He served in the South African War in 1902 and became secretary to Sir George Wyndham in Ireland in 1904. In 1905 he went to Constantinople as attaché to the British embassy. His knowledge of Mesopotamia and

Palestine proved invaluable during the War, and he was sent on important special missions to Russia, Mesopotamia, and Syria. He also raised a battalion of the Yorkshire regiment. His books include: *Through Five Turkish Provinces* (1900); *Dar-el-Islam* (1903); *Five Mansions of the House of Othman* (1909); *The Caliphs' Last Heritage* (1915).

SYKES-PICOT TREATY. See MESOPOTAMIA; WORLD WAR, DIPLOMACY OF THE.

SYNDICALISM. Syndicalism is a form of revolutionary socialism which, although based on the Marxian theory of the class struggle and of the failure of capitalism, repudiates the state, political organization and activity, and the ownership of the means of production by the state or any other political organization. Instead it believes in strictly industrial organization and in the ownership of the means of production by groups of producers It regards the industrial union as the unit of organization. Its aim, the industrial society, is to be composed of the aggregate of these coördinated industrial units. Control of production is to be vested in the workers Toward that end syndicalism employs revolutionary tactics· the general strike, direct action, sabotage, etc. (See SABOTAGE). The syndicalists take pride in possessing a hard realism which takes account of the existing situation, employs such methods as are required to attain a given end, and does not permit emotion to enter into the issue.

The years 1914-24 were of marked importance for the syndicalist movement. Although it suffered reverses in some countries, as in France, it made on the whole important forward strides. For the first time efforts were made at international syndicalist unity. A number of syndicalist organizations were affiliated with the Red International of Labor Unions, organized at Moscow, July 15, 1920. In opposition to this body, because it was "not capable of organizing the revolutionary workers of the world into one compact fighting body" and was, moreover, an offshoot of communism, the strictly syndicalist International Workmen's Association was established in Berlin, December, 1922–January, 1923.

The foremost syndicalist organization in the United States was the I. W. W. (see INDUSTRIAL WORKERS OF THE WORLD). In spite of its loose membership and numerical inferiority this organization played an important rôle in the American labor movement through the revolutionary aggressiveness of its policy and the individual initiative of its members. During this period it spread to a number of new industries. At the 1916 convention the industrial union was made the basis of its organization. Because of the violent opposition of the I. W. W. to the War, 95 of its members were sentenced to long terms of imprisonment in September, 1917, at Chicago. In addition, the organization and its members were prosecuted by a number of individual States, notably California. But the strength of the I. W. W. appeared not to have suffered to any great extent. The outstanding postwar developments were the Centralia, Wash., affair, and the amnesty granted to the members of the I. W. W. who had been imprisoned under Federal law. This amnesty did not, however, apply to the State prisoners. The I. W. W. is not affiliated with any international organization. At the Fifteenth General Convention at Chicago, November–December, 1923, a membership of 58,000 was represented. Contrary to the general belief, the membership of the I. W. W. does not consist primarily of foreigners but of native Americans of old stock.

In France, the homeland of syndicalism, the syndicalist movement weakened greatly and after the outbreak of the War its adherents became the minority in the General Confederation of Labor, instead of being as before the dominating group. This syndicalist minority seceded in 1921 and formed the revolutionary General Confederation of United Labor. In England the syndicalist movement became very strong during the latter part of the War, and afterward, but its influence was indirect and manifested itself within the existing labor organizations. Syndicalist influence was clearly apparent in the Clyde strikes and the shop stewards movement during the War, and the activities of the Triple Alliance in the postwar period. There existed a syndicalist organization in Germany with a membership of 100,000, but it was very insignificant in comparison with the strength of the socialists and communists in that country. Italy has two syndicalist organizations, the Italian Syndicalist Union and the Italian Union of Labor Their aims were nearly identical and their membership was in 1924 rather low, due to the general decline of radicalism under the Fascist rule. There were also considerable syndicalist elements in Spain, Canada, New Zealand, Australia, South Africa, and Argentina.

SYPHILIS. In the period between 1914 and 1924 our knowledge of this disease continued to increase in several directions. Historically the attempts of the late Iwan Block to uphold the dogma that Old World syphilis was derived entirely from the American aborigines largely were set at nought. Even if the returned mariners of Columbus did become contaminated in America, and even if they did originate a focus of disease in Spain, there are no good reasons for doubting that the malady was already existent in the Old World. Medical history writing has made great advances in recent years, and a new technic has developed. From the purely documentary side it is difficult to uphold the existence of a great European epidemic of the disease late in the fifteenth century. The records of cities, which according to tradition were ravaged by the disease, show no evidence in their archives of any unusual disbursement of public funds during 1495 and subsequent years. Students of old civilizations such as those of Persia and Egypt have pointed out that some of the modern folk designations of syphilis are of high antiquity. It is increasingly evident that the history of syphilis should be rewritten along purely scientific lines, paying little heed to old writers who wrote consciously of the disease on a basis of gossip and tradition.

The belief that syphilis prevails in proportion to the amount of commercialized vice which obtains in a given locality seems to rest on a fallacy of some sort. Since the disease has been reportable there is no evidence of any notable falling off in its incidence, and a large proportion of fresh infections escapes record. New York City in 1924 was quite free from commercialized vice and had been free for some years previously; yet there was an average of 400 new cases reported every week, which means 20,000 annually, a figure which is no index of

the actual number of new infections. In addition, the number of United States and Canadian youth infected in Europe was said to have been very large, fully justifying the use of the prophylactic measures which are often condemned unjustly as condoning vice.

The opinion gained ground during the War that no opprobrium can be attached to medical authority when the efforts at prevention take place after the soldier has been exposed to the danger of contracting the disease. Neglect under such circumstances would be criminal. In regard to prophylaxis before the exposure, this has been well defended on economic grounds, because an infected soldier or sailor becomes a charge on his command and must be interned and treated and prevented from disseminating his disease. But all prophylactic measures whether undertaken before or after exposure, as well as all rapid and certain measures of treatment, have been attacked by moralists as inciting to further immorality by withdrawing the discipline of punishment

The enormous vogue of Salvarsan in the treatment of syphilis is best shown by the fact that the discovery of how to make this German proprietary by United States chemists during the War is said to have netted the United States government half a million dollars from the sale of the drug to consumers through distributing firms.

In speaking of the persistence of syphilis despite the abolition of officially or otherwise segregated vice districts, a word must be said as to the effects of Prohibition, which it was hoped would work favorably against the spread of the disease. Many cases of infection were formerly directly traceable to intoxication, and it was often claimed that commercialized vice could not flourish without alcohol. Nevertheless, as already pointed out, the incidence of the disease does not diminish in large cities; and either Prohibition does not prohibit, or diffusion of the disease is only slightly affected by alcoholic indulgence.

Under the head of treatment, two facts stand out It has been discovered that soluble bismuth salts are valuable as an antisyphilitic, although unlikely to supplant the older remedies; and quite recently the culture of the plasmodium of malaria has been found efficacious in the early stages of paresis.

SYRACUSE. A city of New York State. The population increased from 137,249 in 1910 to 171,717 in 1920 and to 184,511 by estimate of the Bureau of the Census for 1923. The authority of the city planning commission was extended in 1923 to cover supervision of new developments in the outskirts of the city. A $2,500,000 school building programme was being carried out in 1924. The number of industrial plants increased from 760, employing 25,000 persons in 1915 and producing goods valued at $52,226,000, to about 1000 in 1924 with 32,000 employees.

SYRACUSE UNIVERSITY. A coeducational institution at Syracuse, N. Y., founded in 1870 and fostered by the Methodist Episcopal Church, but nonsectarian in administration and policy With the exception of the war years, the number of students registering increased steadily from 3933 in 1914 to 5034 in 1923–24, with 903 in the summer session of 1923 and 1100 additional in the extension division. The faculty increased correspondingly from 300 to more than 500 members, and the library from 100,000 to 150,000 bound volumes, and 70,000 pamphlets. By gift and legacy the university received about $1,000,000 from Mrs. Russell Sage. John D. Archbold's gifts, including the stadium and gymnasium, aggregated over $2,000,000. The School of Nursing was established in 1915, and the College of Home Economics was opened as a school in 1918, and made a college in 1921. The College of Business Administration was established in December, 1920, having been founded as a school in September, 1919. The evening session opened in 1918. Charles W. Flint, D.D., LL.D, succeeded James R. Day, D.C.L., LL.D., as chancellor in 1922.

SYRIA. A former province of the Turkish Empire in Asia but after 1920 a republic whose affairs were supervised by France as a mandatory power. The French mandate for Syria was confirmed by the League of Nations on July 23, 1922. Administratively the republic was divided into the following: (1) the Syrian Federation, comprising the three territories of Damascus (area, 41,640 square kilometers; population as estimated for 1922, 995,000), Aleppo (area, 61,775 square kilometers; population, 718,000), the Alaouite (area, 6200 square kilometers, population, 410,000); (2) Territory of the Greater Lebanon, an autonomous area proclaimed a state in 1920 (area, 25,000 square kilometers; population, 710,562); (3) Territory of Jebel Druze (area, 9760 square kilometers; population, 101,000); (4) Military Zone (area, 38,000 square kilometers; population, 400,000). Total for whole mandate territory: area, 182,375 square kilometers; population, 3,334,562 The population was for the most part of Arabic origin, and Arabic was the prevailing language. Other nationalities represented were Turks, Turcomans, Kurds, Circassians, Armenians, Persians, Jews. A religious classification showed the following: Sunni Moslems (1,200,000), Shiah Moslems (120,000), other Moslems (300,000), Eastern Christians, i e. Greek Orthodox, Armenian Orthodox, etc. (1,210,000), Catholics (20,000), Jews (principally in the four large cities). The important cities with their 1921 populations were Damascus (250,000), Aleppo (200,000), Beirut, capital of Greater Lebanon (150,000), Hama (60,000), Homs (50,000), Tripoli (35,000), Antioch (30,000), Alexandretta (15,000). Education was supported by the French, British, and American missions The last maintained a college at Beirut as did also the Jesuits and Greek Catholics. Female education was receiving considerable attention.

Industry. Syria was an agricultural country though it was estimated that only 10 per cent of the lands west of the Euphrates was being tilled. Of the million acres being worked, fully 750,000 were under wheat and barley. The wheat raised was entirely for local consumption, while barley, after 1919, was being exported in considerable quantities to England and Germany to be used in the making of beer. Other crops of importance were sesame (from which oil was produced), tobacco (1922 yield, 2587 tons), olives (1922 yield, 761 tons), silk, oranges, lemons. Live stock suffered severely during the War, as may be seen by the fact that sheep and goats numbered 4,800,000 in 1914 and only 2,408,000 in 1920, cattle 500,000 in 1914 and only 293,000 in 1920, horses and donkeys 270,000 in 1914 and only 143,000 in

1920. Lead, iron, copper, nickel, lignite, petroleum, and other minerals were discovered but none was mined in paying quantities. Manufacturing was still in an embryonic stage. Sericulture, oil, soap, flour received some attention.

Trade. Previous to the War exports averaged 60,000,000 francs ($11,670,000) and imports 124,000,000 francs ($23,932,000). That the country's trade was showing some recovery after 1920 was revealed by the trade figures for the subsequent years. Imports for 1921 and 1922 were (franc converted at $0 075 for 1921 and $0 082 for 1922): $44,131,575 and $41,119,392. Exports for the same years were valued at $5,238,600 and $7,206,448. The very high adverse trade balance and the falling off of the transit trade with the interior because of customs barriers indicated that the economic situation was a difficult one. The country's revenue (i. e. invisible exchange) was being derived mainly from the spendings of the French army of occupation and from remittances sent by Syrians in North and South America. Leading exports were wool, hides, olive oil, tobacco, fruits, wine, etc. Leading imports were cotton goods, food products, iron and steel, building materials, etc Principal countries of origin in value of imports in 1922 were United Kingdom, France, Egypt, Italy, Germany, United States, Belgium, Turkey Principal countries of destination in value of exports in 1922 were France, Egypt, Turkey, United States, Italy. The port of Beirut handled three-fourths of all the trade Other customs ports were Tripoli, Alexandretta, Aleppo, Damascus.

Communications. There were, in 1922, 1569 miles of railway in Syria. A line traversed the interior from north to south with branches to the chief ports. Alexandretta, by way of Aleppo, was connected with the Bagdad railway which had 190 miles of line in Syria. Damascus, similarly, was on the route of the Hedjaz railway into the south. The railways, because of the hard use with which they met during the War, were in a bad state of disrepair when the French took them over in 1920.

Finance. In May, 1920, the unit of currency was made the Syrian pound (£S), equivalent to 20 French francs ($3 96). Notes were issued by the Bank of Syria and by Jan 1, 1922, there were notes to the value of 201,626,334 francs in circulation The 1922 budget called for revenues of 129,725,000 francs and expenditures of 162,726,000 francs. In 1921 the whole mandate territory had received a subsidy of 25,000,000 francs from the French government, but in 1922 this grant was discontinued in the hope that the local budgets could be made to balance. Revenues for 1922 were greater than those of the previous year and expenditures were cut considerably. The result was a smaller deficit in 1922 and 1923. The Syrian pound continued, however, to depreciate. In October, 1922, it was worth $1.49.

Defense. The forces maintained by the French government in the territory were progressively diminished as disorders decreased. On Jan. 1, 1922, 70,000 troops were stationed in the country; by Sept. 1, 1922, these had been reduced to 31,500. A Syrian legion was being built up around a nucleus of 6500 men.

Government. The Syrian Federation, formed June 22, 1922, was governed by a federal council of 15 members which had charge of the budget, the fixing of duties, and the construction of public works. Each of the three territories in the federation was headed by a governor who was advised by a representative of the French High Commissioner. Similarly, Greater Lebanon was governed by an elected administrative council. The active head, however, was a French governor. The French High Commissioner was the representative of his government in the mandate territory and exclusively in charge of foreign affairs as well as the military and naval forces. The French government provided 50,000,000 francs for the maintenance of the High Commissioner in 1922 and 7,000,000 francs in 1923. To this office General Gouraud was appointed in October, 1919; in April, 1923, General Weygand was named as his successor.

Economic Conditions. That the commercial situation in Syria was steadily improving was shown by the developments of 1923 While there was a decrease in imports of over $10,000,000 there was an increase in exports of about $8,000,000, or over 100 per cent as compared with 1922. Several factors contributed to this situation The silk crop was good, the yield being slightly greater than the preceding year, and was disposed of at a higher price. The cereal harvest was so abundant that a considerable amount was exported. The cotton crop showed an increase of about 6000 bales over that of 1922, reaching a total of about 14,000 bales of 220 pounds each. The price was double that of 1922. The 1923 harvest of fruits, vegetables, medicinal plants, etc., was quite satisfactory, and commanded good prices. The year 1923 also saw a revival of the reëxport trade. There was a slow but gradual revival of trade with Anatolia, and trade with Palestine and Transjordania showed a substantial increase The development of the motor caravan service with Iraq, recently established across the desert between Syria and Bagdad, promised to increase this trade, too, which, formerly, had been a most profitable one for Syria.

History. Though French and British troops did not move on Syria until late in 1918, the location of the country as one of the important transit lands between the east and the west made it the scene of extraordinary hardships for the population. As a result of conscriptions, deportations, disease, starvation, and the exactions of their Turkish rulers, as well as the stringency of the blockade, the native Syrians had been depressed into a condition of complete helplessness. By 1918, it was estimated that the population of the vilayet of Beirut alone had fallen off 150,000. But the débâcle of the Turk, with the capture of Damascus, Tyre, Beirut, Homs, Tripoli, Hama, Aleppo, Alexandretta, during October-November, 1918, and the arrival of French and British troops did not serve to put the fears of the population at rest. Those agreements among the Allies for the partition of the Near East which had been made public had taught the Syrians that an interest in them was not occasioned by strictly altruistic motives. By the secret treaty of London of 1915 and the Sykes-Picot agreement of 1916, Turkey in Asia had been partitioned into spheres of influence among the Allies, the Syrian coast and hinterland falling to France. The British and French armies of occupation were received therefore with open hostility. The withdrawal of British troops in November, 1919, left the French in a precarious position. The proposals of the Syrian Congress of July

2, 1919, for a free Syrian state to extend into Palestine and a request for an annulment of those agreements whose purpose was the partition of Syria having met with rejection, the anti-European hatred was fanned into flame. Affairs were further complicated by the pretensions of Emir Faisal, son of King Hussein of the Hedjaz, who sought to found a constitutional monarchy in Syria and at the same time maintain the friendship of the British and French. Fighting broke out late in 1919 and continued through 1920. Baalbek fell before the Arabs and was recaptured by the French. The French garrison at Alexandretta was attacked in February, 1920 On Mar. 8, a Syrian National Congress meeting once more at Damascus repeated the programme for complete independence and offered the crown to Emir Faisal Emir Faisal accepted and formed a government, much to the delight of Syrian Nationalists. The result was a rekindled ardor, and the attacks on the French increased in number, against, of course, the counsels of the new King, whose desire it was to conciliate the French. Antioch fell before an Arab force in March, while disorders spread far to the south into Palestine. Assistance was received from the Angora government in the north and stubborn fighting went on between the Turks and the French in northern Syria during the whole of 1920. The Nationalists, disregarding General Gouraud's threat that the French mandate would be enforced by arms, attacked the French army sent to occupy Damascus (July, 1920). The result was an overwhelming victory for the French, the occupation of Damascus, and the overthrow of Emir Faisal, who was compelled to leave the country (Aug. 4, 1920) French control was thus complete, though Arab Nationalists continued to make the task of the French administration a difficult one.

In the south in particular (the Hauran district) Nationalists remained in control until April, 1921. Under General Gouraud, pacification proceeded rapidly, plans were started for the economic reconstruction of the country, and new administrative machinery was established. Lebanon, in the south, was given autonomy and enlarged by attaching the plains of Bekaa to the mountains of Lebanon. Jebel Druze (south of Hauran) likewise became an autonomous unit, with an elected council and a Druse governor. The remainder of the mandated territory was divided into the three states of Aleppo, Damascus, and the territory of the Alaouites, each state having a more or less representative and autonomous State Council, and sending five delegates to the Federal Council of Syria. In reality, however, the French officials, under a high commissioner, were the government. As disorders decreased the army of occupation was cut down, so that by September, 1922, only 31,500 men were under arms. It was therefore evident in 1923 that the French were meeting with success in their attempts to restore the country to its former economic importance.

By the Treaty of Sèvres (Aug. 10, 1920), Turkey renounced Ottoman sovereignty over Syria, including Cilicia, and by subsequent action of the Council of the League of Nations, July 22, 1922, France was formally intrusted with a mandate over Syria, although formal promulgation of the mandate was further postponed by Italian objections. The southern and eastern boundaries were fixed in principle by an Anglo-French Convention of Dec. 23, 1920, and definitively by an Anglo-French Agreement of Feb. 3, 1922, effective Mar. 10, 1923. The northern frontier, which by the Sèvres treaty had run eastward from the gulf of Alexandretta to the Tigris, including the corresponding section of the Bagdad Railway, was modified by the Franco-Turkish Treaty of Angora, Oct. 20, 1921; by this treaty France restored to Turkey not only Cilicia but also a long strip running eastward almost to the Tigris and including the Bagdad Railway from a point near Aleppo to Nisibin—about 9000 square miles in all. This new boundary was confirmed by the Treaty of Lausanne, July, 1923. Throughout the first half of 1924 a French censorship prevented the transmission of political news from Syria. However, reports were occasionally received, from plainly partisan sources, of the despotic character of the French administration. It was charged by Syrian propagandists in the United States that the French High Commissioner was vested with all civil and military powers, that the local representative assemblies were merely consultative, that French methods were those applied in the negro colonies where an inferior race was being governed, that the censorship exercised was rigorous, and the upkeep of government costly On the other hand, the French record revealed the following achievements: native Syrian control of police, navigation, mails and telegraph; French subsidization of private schools and an increased school attendance since 1921; extensive aid rendered to Armenian and Greek refugees; irrigation works in cotton areas in particular. In May, 1924, General Weygand was appointed High Commissioner.

SZYMANOWSKI, KAROL (1883–). A Polish composer, born at Timoshevka, Southern Russia. He studied with S. Noskowski in Warsaw, where he made his home. Beginning as an imitator of Chopin, with an admixture of impressionism, he rapidly drifted to Futurism. He wrote two operas, *Hagit* (Warsaw, 1922) and *Le Roi Roger* (not yet produced in 1924); two symphonies; a symphonic poem, *Penthesilea;* a concert overture; a piano concerto and a violin concerto; a number of pieces for violin and piano; and piano pieces.

T

TACNA-ARICA DISPUTE. An international controversy between Chile and Peru that was argued intermittently following the conclusion of the Chilean-Peruvian War and the Treaty of Ancon of 1884. By the treaty, Chile was awarded the province of Tarapaca outright. The provinces of Tacna-Arica, on the other hand, were to remain in Chile's possession for 10 years, upon the conclusion of which a plebiscite was to be held in the territory to decide its ultimate disposition. A payment of 10,000,000 Peruvian *soles* (Chilean dollars) was to be made to the defeated contestant nation. Chile's contention was that the plebiscite provision was inserted in the treaty to allay Peruvian national feeling, it being the intention of the peace commissioners that Chilean sovereignty should remain uncontested, and for that reason no terms were formulated for the holding of the plebiscite. The year 1893 found Peru demanding the execution of the treaty but proposing such arbitrary conditions, e.g. that only Peruvian citizens be permitted to vote in the plebiscite, that no understanding could be reached. The point became a cause célèbre in both countries, political campaigns being waged on it as the single issue. Chile several times signified her desire to observe the terms of the treaty but in each instance was met by Peru's irrevocable demand. Relations were broken off in 1901, resumed in 1905, to be again severed; and again the same play was enacted in 1910 and in 1913. Chile meanwhile had spent great sums in the development of the provinces, commencing irrigation, sanitation and port development projects, and spending $25,000,000 on the railroad from Arica to La Paz, Bolivia, alone It could therefore justly point to the great differences existing between conditions in the contested provinces and those in the neighboring Peruvian territories.

In 1919, aroused by the anti-Peruvian riots in Chilean cities, and the publication of the Chilean-Bolivian treaty of 1905, by which Bolivia had been promised an outlet to the sea by way of the city of Arica, Peru once more pressed her claims. In 1920, she asked that the question be put on the agenda of the Assembly of the League of Nations, only to withdraw the request soon after. In 1921, Chile once more sought the holding of a plebiscite, but meeting no response except the demand that the whole treaty be reconsidered, broke off negotiations. Meanwhile Bolivia, on the grounds that the question had become a universal one and involved the freedom of the Pacific, interjected herself into the affair. It was not until 1922 that the first hope of a settlement appeared. On Jan. 17, 1922, the United States despatched identical notes to Chile and Peru for the purpose of effecting an agreement. On July 15 a protocol was signed by representatives of both nations nominating the President of the United States as arbiter; Chile and Peru accepted the protocol as the basis for discussion, and in February, 1923, delegates arrived at Washington, and the long process of investigation, filing of briefs and counterbriefs, was begun; Peru's final brief was not filed until April 12, 1924.

TACOMA. A city and port of Washington. The population rose from 83,743 in 1910 to 96,965 in 1920, and to 101,731 by estimate of the Bureau of the Census for 1923. A zoning ordinance was adopted in 1919, and an active city planning programme was undertaken in 1920. A notable building programme, begun in 1923, was continued through 1924. Two and a half millions were voted for new public schools, new edifices were constructed for the College of Puget Sound and Annie Wright Seminary, and office, church, hotel, and fraternal buildings were completed during 1914–24. Under a comprehensive port development project, organized in 1918, huge piers were built and publicly owned and operated. Tourist travel to Mt. Rainier (Mt. Tacoma) in Rainier National Park multiplied several times. Camp Lewis, a permanent divisional establishment of the United States Army, was developed, and a costly psychiatric hospital was built for war veterans at American Lake in the environs of the city.

TACTICS, MILITARY. See STRATEGY AND TACTICS.

TAFT, HENRY WATERS (1859–). An American lawyer (see VOL. XXI). In 1917–19 he was chairman of the permanent legal advisory board for Greater New York under the selective service regulations. He was a delegate to the Republican national convention in 1920 and chairman of the coalition campaign committee in the mayoralty election of New York City in 1921. He was president of the New York State Bar Association (1919–20) and became president of the Association of the Bar of the City of New York in 1923.

TAFT, WILLIAM HOWARD (1857–). A president of the United States (see VOL. XXI). He was appointed a member of the National War Labor Conference Board in 1918 and was president of the League to Enforce Peace, engaged in the promotion and ratification of the Treaty of Peace and the League of Nations. On June 30, 1921, he was appointed Chief Justice of the Supreme Court of the United States.

TAHITI. See PACIFIC OCEAN ISLANDS, *Society Islands.*

TALC AND SOAPSTONE. Talc and soapstone share with sulphur, petroleum, and copper the distinction of being one of the minerals of which the United States produces more than all the rest of the world. In 1900 the United States produced approximately 90,000 short tons of talc, valued at about $900,000. In 1910 the production had increased to 150,000 short tons, valued at $1,600,000, while in 1916 it had

increased to 213,561 tons, valued at $2,253,803; by 1922 it had declined to 198,684 tons, valued at $2,859,897. In addition, talc was imported into the United States, mainly from Canada, Italy, and France. The talc is used for gas-burner tips, while the soapstone is an insulator of heat and electricity. Soapstone bricks are used for the lining of digesters and furnaces in which the sulphate pulp is treated in making Kraft paper. Talc is also used for talc powder, textiles, paper, soap, and rubber.

TALMADGE, CONSTANCE (MRS. JOHN PIALOGIOU) (1900–). An American actress, born at Brooklyn, N. Y. She began acting in moving-pictures in 1916 and soon became very popular. Besides other plays, she appeared in *Intolerance, Mrs. Leffingwell's Boots, Romance and Arabella, In Search of a Sinner, Two Weeks, A Temperamental Wife, The Perfect Woman, Mama's Affair,* and *Polly of the Follies.*

TALMADGE, NORMA (MRS. JOSEPH M. SCHENCK) (1897–). An American actress and motion picture producer, born at Niagara Falls, N. Y. She is a sister of Constance Talmadge. She began to act in moving-pictures at 14 years of age and soon achieved notable successes, among them being: *The Crown Prince's Double, The Social Secretary, The Secret of the Storm Country, The Ghosts of Yesterday, Her Only Way, The Forbidden City, The Passion Flower, The Sign on the Door, The Wonderful Thing, Smilin' Through, Secrets.*

TANA TUNNEL. See TUNNELS.

TANGANYIKA TERRITORY. Formerly German East Africa (q.v.), but since 1919 a British mandate territory, situated in south-eastern Africa, with an area of 384,079 square miles, and a native population (April, 1921) of 4,107,000. There were also 14,991 Asiatics and 2447 Europeans on that date. Dar-es-Salaam, the capital and chief commercial centre, had 20,000 inhabitants; Tanga, 16,400; Tabora, 25,000. In 1922, slavery had not yet been abolished, though legislation was in the course of preparation. Under British rule, because of the inevitable readjustments, industry and trade took some time in regaining their normal status. Imports for 1913 were valued at £2,667,925; in 1921, £1,426,125; in 1922, £1,386,212. Exports for 1913 were £1,777,552; for 1921, £1,089,990; for 1922, £1,300,083. The chief exports in 1922 in order of value were sisal hemp, coffee, ground nuts, cotton, grain, copra, hides. The chief imports were cotton piece goods, foodstuffs, building materials, coal, machinery, tobacco, spirits. Purchases were made largely in Zanzibar, Kenya, United Kingdom, and India, and 80 per cent of the trade was carried in British bottoms. Imports from the United States were only £1193 in 1922 to Germany's £43,765 and the Netherlands' £20,087. Imports passed for the most part through the port of Dar-es-Salaam, while Tanga handled most of the exports. The main inland routes were still the two railways built by the Germans.

The victories of the British and Belgian troops in East Africa left the Territory completely under Allied control. In May, 1919, the Supreme Council turned the area over to Great Britain as a mandate territory, but by agreement with Belgium in September, 1919, the western provinces of Urundi and Ruanda were ceded under mandate to the Belgian Congo in order to give the latter a frontage on Lake Tanganyika. Great Britain retained such areas as were needed to allow for the projected Cape to Cairo railway as well as the disputed Ujiji province which contained the western terminus, Kigoma, of the important Central Railway. In 1921, however, Belgium was given the right to use the railway free of duties. Under the Order in Council of July 22, 1920, the British administrative machinery was set up with a governor and a nominated executive council. By the Covenant of the League of Nations, perfect racial equality in matters of residence and trade was assured with the result that the Indians, unlike those in the Kenya Colony to the north, were permitted unhampered social and economic liberty. As a result they rapidly penetrated into all regions of the Territory in the rôle of small traders. By 1921, the British administration was functioning normally; German estates had been sold; the Indian penal and civil codes were introduced; the basis of the currency was made the shilling (Jan. 1, 1922); English names and weights were substituted; and the Kenya Colony system of revenues was installed, i.e. customs duties, trade taxes, native hut and poll taxes. Revenues for 1917–18 were £336,446 and expenditures £157,285; for 1921–22, £978,192 and £1,807,890; for 1923–24 (estimate), £1,257,540 and £1,936,109. Grants were necessary from Great Britain to make up the deficits, the aid being £350,000 in 1920–21, and £914,000 in 1921–22.

TANGIER CONTROVERSY. The status of Tangier port, which, because of its strategic position at the entrance to the Mediterranean, was an intimate concern of the foreign offices of France, Spain and Great Britain, became a serious cause for ill feeling in the years following the War. Spain's attempts during 1919–21 to effect a Franco-Spanish understanding on the basis of an enlarged Spanish interest in Tangier (and thus negate the policy of internationalization temporarily agreed upon in the Franco-Spanish Treaty of Nov. 27, 1912) were rebuffed, for they conflicted with the French ambition which looked to the expansion of French interest not only over Tangier but the whole of Morocco as well. In 1922, Great Britain, finding that the subject was assuming major importance, interjected herself into the controversy and insisted that the entire question be reopened. In July, 1923, a commission composed of French, Spanish and British experts met for the purpose of preparing a new agreement. Early it became evident that the question had taken on an international character, when both the United States and Italy indicated their interest, the United States on the general ground that it had figured in the Algeciras Conference and would therefore be concerned in any new understanding, Italy because of her position as a Mediterranean power. The sittings of the commission were therefore frequently interrupted, as the experts found it necessary to repair to their home governments for further instructions. In October, Italy, with the approval of Spain, demanded that her delegates be given seats at the conference. In October, 1923, the American Department of State made public a note addressed to the British, French, and Spanish governments in which the request for the maintenance of the open door in the settlement of the status of Tangier was reiterated. It was not until Dec. 18, 1923, that the sittings were completed. The pro-

visional agreement, as submitted to the Governments of Great Britain, Spain, and France, contained the following provisions. The Tangier Zone, whose permanent neutrality was assured, was to continue as a part of Morocco under its own constitution. The Municipality of Tangier was to be under both a Committee of Control, made up of the eight consular officers of the powers that had signed the Algeciras agreement, and an International Legislative Assembly consisting of representatives of the powers (Italy here included) and the native Mussulmans and Jews. The customs service, though administered by the Moroccan government, was to be under the control of the international administration Economic equality at the port was to be observed; the capitulations were to be supplanted by a mixed tribunal of French, Spanish, and British magistrates; no fortifications were to be erected; the signatories of the Algeciras agreement (the United States included) were to be invited to adhere to the new convention as soon as it received the ratification of the three contracting parties. That the British and French governments would approve was certain; as to the attitude of Spain, there was at first much doubt, but in 1924 Spain's adherence to the convention was made unconditional. It was conceded generally that Great Britain had won a diplomatic triumph in the new pact over the Mediterranean countries, France, Spain, and Italy, and by the internationalization of the port had made sure of the safety of the route to India

TANNENBERG, BATTLE OF. See WAR IN EUROPE, *Eastern Front.*

TARDIEU, ANDRÉ (1876–). A French public official and author, born in Paris, and educated at the Lycée Condorcet and Ecole Normale Supérieure. He was High Commissioner of France to the United States (1917–19) and Minister of the Liberated Regions and also Minister Plenipotentiary at the Peace Conference (1919–20). In the French Chamber of Deputies in 1923 he led a Nationalist party group which found Poincaré too lenient toward the Germans. His writings include: *Questions Diplomatiques de l'Année* (1904); *La Conférence d'Algésiras; Notes sur les Etats-Unis* (1908); *France and the Alliances* (1909); *Le Prince de Bulow* (1909); *Le Mystère d'Agadir* (1912); *L'Amérique en Armes* (1918); and *The Truth about the Treaty* (1921).

TARIFF IN THE UNITED STATES. *Recent Developments in Tariff Legislation in the United States.* The Underwood Tariff of 1913 lowered the rates which had existed under the Payne-Aldrich Bill The average rate on dutiable goods in 1910 was 42 per cent; in 1915, 33 per cent. The Underwood Tariff Bill also increased the free list. As a result, 63 per cent ad valorem of the goods admitted to the United States in 1915 paid no duty. This was 14 per cent more than in 1910. The construction of a tariff bill is becoming very difficult and complicated. The Underwood Bill covered more than 100 pages and actually enumerated more than 3000 different articles; the list of nondutiable goods was also given. The goods on which duty was to be paid were cited in 14 schedules, the rates ranging from 5 per cent on bar iron to 60 per cent on jewelry, playing-cards, and expensive silk goods. The general result of such a voluminous bill was to confuse the average citizen, and Congress itself felt that the guidance and assistance of experts was greatly needed. A Tariff Board had been provided for in the Payne-Aldrich Bill of 1909, but when the Democrats came into power, it was abandoned So much difficulty was experienced by Congress in the construction of the Underwood Tariff Bill that the Democrats themselves provided in 1916 for a new Tariff Commission, the function of which was to advise the President and Congress on general problems relating to the tariff. The Tariff Commission, in furnishing the required guidance and assistance, should stand in somewhat the same relation to Congress that the Federal Reserve Board occupies with reference to matters of banking and credit. Up to 1924 there was little evidence that the Tariff Commission had been able to impress itself on Congress so as to make the tariff bills simple and effective.

The Fordney-McCumber Bill of 1922. When the Republicans were swept into power by the election of 1920, it was on the distinct understanding that the tariff rates would be revised upward Many citizens seriously thought that such a revision would tend to bring about relief from the depression of 1920 Congress had great difficulty in drafting a bill which was under consideration for 20 months The Senate finally adopted the bill after 2436 amendments had been made to the original. It was not until 1922 that the legislation known as the Fordney-McCumber Bill was passed. The rates of duty are the highest in United States history. Duties were levied on agricultural products, sugar, wool, woolen goods, cotton goods, silk, metals and metal manufactures, tobacco, spirits and beverages, chemicals, jewelry, earthenware and glassware, wood, paper, and many other classes of commodities. High rates were levied on wool, on certain grades of which the duty reached 155 per cent. Rates on cutlery in some instances were as high as 40 per cent ad valorem The rates on embroidery and cotton lace were 90 per cent Many of the articles which had been put on the free list by the Democrats in 1913 were made dutiable under the Fordney Bill. The few articles left on the free list included coffee, cocoa, agricultural implements, newsprint, hides, raw cotton, tea, gunpowder, tin, and potash

Most students of economics and many businessmen believed that the Fordney-McCumber Bill was a mistake. The United States is a creditor nation. The only way in which foreign debtors can pay it is by sending goods. The price which consumers must pay for protected goods is probably not compensated for by any stimulation which industry may have received from the provisions of this bill. The United States cannot continue to export goods unless imports from other countries are received One of the most interesting features of the Tariff Act of 1922 was the flexible tariff provisions. When the President of the United States, "after careful investigation, finds that the rates of duty in the Tariff of 1922 do not in fact equalize the costs of production of any article or articles between the United States and the principal competing foreign country, he shall determine the rates that will so equalize such difference: and 30 days after the proclamation is made the rates of duty proposed by him shall be in effect on the articles named in

the proclamation in lieu of the rates of duty specified in the Tariff of 1922. These rates of duty are to be based upon foreign valuation. He cannot increase or decrease any rate of duty more than 50 per cent of the amount thereof as provided in the Tariff of 1922." It would be a great gain if the Tariff Commission could actually study production costs of foreign competitors and recommend tariff rates on such a basis. This would give a scientific foundation for tariff duties which the United States has never had.

Retaliatory Provisions. Section 317 of the Act provides that "when any foreign country discriminates against articles wholly or in part the product or products of this country, by imposing, directly or indirectly, by any unreasonable charge, fee, duty, exaction, regulation, or limitation, or other method of discrimination and the commerce in them, and the President finds in fact that said foreign country has done and continues so to do, and that the American public interest will be served thereby, he shall by proclamation declare such new and additional rates of duty, as will offset the burdens placed upon our commerce, not exceeding 50 per cent ad valorem on the commodities from the offending country or countries named in his proclamation; or he may by proclamation exclude the articles named. The provisions of a proclamation become effective 30 days after its date. It is the duty of the Tariff Commission to continually make investigation concerning the welfare of our commerce abroad, and to bring to the attention of the President any discrimination."

The Tariff Commission under Section 318 was directed to compile costs of production, import costs, and producers' selling-prices at home and abroad This information would make it possible for the President and Congress to put into effect the retaliatory measures which Congress thought advisable to protect the United States in her search for foreign markets. It was uncertain what the results of the provisions for retaliation and for flexibility in the tariff rates would be. It was hoped that they might lead to trade agreements with foreign countries which would operate according to the "most favored nation" clause. If this should prove to be the result, it would probably be the greatest gain derived from the Tariff Law of 1922

See UNITED STATES, *History*. For tariff legislation in other countries, see section on *History* under those countries. See also FINANCE AND BANKING.

TARKINGTON, (NEWTON) BOOTH (1869–). An American author (see VOL. XXI). His later writings include: *Penrod* (1914); *The Turmoil* (1915); *Penrod and Sam* (1916); *Seventeen* (1916); *The Magnificent Ambersons* (1918), for which he was awarded the Pulitzer prize by Columbia University; and *Alice Adams* (1921); *Gentle Julia* (1922); *The Fascinating Stranger* (1923); and *The Midlander* (1924). His plays are for the most part light and entertaining. The most important are: *The Man from Home* (1906); *Master Antonio* (1916); *Clarence* (1919); *The Wren* (1921); *The Intimate Strangers* (1921); *Rose Briar* (1922); and *Tweedles and Magnolia* (1923).

TASMANIA. A state of the Commonwealth of Australia consisting of the island of Tasmania and several smaller islands. Area, 26,215 square miles; population in 1911, 191,211; in 1922, 213,400; average annual increase, 1.12 per cent. Hobart, the capital, including suburbs, had 52,163 inhabitants in 1921 (38,391 in 1911). Fruit growing was the only agricultural activity to show important increases. Pastoral pursuits were still comparatively unimportant (the wool clip of 1921–22 was smaller than that of 1913). The total mineral production for 1921–22 was £854,730, which was a considerable falling off. Gold, in 1913, yielded £141,876; in 1921–22, £23,471. The state's interest in the generating of cheap hydro-electric power augured an early industrial development. A plant created at Great Lake was designed to supply 70,000 horse power. The value of production for 1921–22 was: agricultural and pastoral, £4,592,004; mining, £854,730; value added by manufacture, £2,813,360 Imports and exports for 1913 were £1,025,081 and £522,865; 1921–22, £1,385,951 and £2,067,443 Exports were chiefly wool, minerals, timber, fruit and jam. Revenues and expenditures for 1913–14 were £1,238,085 and £1,235,514; for 1921–22, £2,180,395 and £2,302,077. The public debt in 1923 amounted to £22,439,176, of which 30 per cent had been spent on railways, 27 per cent on roads and bridges, and 10 per cent on hydro-electric developments. In 1914, the debt was £12,265,012. How prominent a rôle labor played in the state may be seen by the distribution of seats in 1922 in the parliament: Nationalists, 12; Labor, 12; Independent, 1; Country, 5.

TASTE. See PSYCHOLOGY, EXPERIMENTAL.

TAXATION IN THE UNITED STATES. The most important fact about recent taxation is the great increase in revenue derived from it. While State, municipal, and central bodies have all increased their revenues from taxes, the central governments of the belligerent nations are most conspicuous in this respect, for they have borne the main expense of the War. The net cost of the War has been estimated at $215,000,000,000, up to the end of 1920. This is such a large sum that the mind cannot comprehend it It is somewhat easier to realize the money cost of war if it is quoted as so much per day. Professor Seligman gives the following facts.

AVERAGE DAILY WAR EXPENDITURES IN MILLIONS OF DOLLARS

Date	Great Britain	France	Italy	Austria	Germany
1914–15 .	9 46	8 5	4.4	6.4	13.3
1915–16	18.16	12.2	7.5	8.7	15.9
1916–17	26 69	17 6	10 4	10.4	22.7
1917–18	33.36	32.4	6.5	12.3	31.0

Staggering as these figures seem, they are small when compared with the expenditures of the United States after its entry into the War. In the month of December, 1918, its average daily expenditure reached $64,500,000. During that month alone, the United States spent more than $2,000,000,000. These vast sums were not and could not have been raised by taxation; the larger part was obtained by borrowing. The ratio of tax receipts to expenditures in the different countries during the War was: in the United States, 25.9 per cent; Great Britain, 24.7; France, 15.4; Italy, 14.9; Germany, 11.7. Taxation would therefore be very important in the years following 1924.

Most of the war costs were still, in 1924, unpaid by the governments concerned.

Federal Taxation in the United States. Revenue derived from customs was no longer, in 1924, the important item in the Federal budget that it was 20 years earlier. In 1920, the receipts from customs comprised only about one-nineteenth of the total, which was $5,587,000,000. Almost all the balance came from "internal revenue." The subdivisions of the receipts under internal revenue for the years 1914, 1919, and 1920 were:

	1914	1919	1920	1920 Per cent of total revenue
1. Income tax	$60,710,197.52			
Income tax and excess profits				
2. Distilled spirits and beverages	226,179,689.76	$2,600,783,902.70	$3,956,936,003.60	69.2
3. Tobacco	79,986,639.68	490,233,073.72	197,332,105.84	3 4
4. Transportation, communication, and insurance		206,003,091 84	295,809,355 44	5 1
5. Luxuries (autos candy, furs, etc.)		252,348,453.61	307,769,841 36	5.3
6. Estate inheritance		81,357,473 54	270,971,064 27	4.7
7. Excise tax on corporations	10,671,077.22	82,029,983 13	103,635,563.24	1 8
Capital stock of corporations, brokers, etc		29,824,327 95	95,141,732.50	1 6
8 Stamps on legal documents		43,751,340 04	81,259 365.47	1.4
9 Admissions to amusements		58,664,876 88	89,710,525 59	1.5
10 Miscellaneous	2,461,289. 78	5,153,555 15	9,014,694 50	0 1
Total	380,008,893 96	3,850,150,078 56	5,407,580,251.81	94 1

From the above table it will be noted that in 1914 only the income tax, the taxes on spirits, beverages, and tobacco, and the excise taxes on corporations were in existence All the rest were war measures. The Federal income tax produced 69 2 per cent of all the revenue raised in 1920 It was fortunate that the income tax had already been put into operation and was in fair working order by the time the United States entered the War.

Federal Income Tax Laws. The United States had an income tax during the Civil War which was abandoned in 1870. In 1894 the effort was made to reintroduce an income tax, but this could not be accomplished because of constitutional limitations. The 16th Amendment as passed read, "Congress shall have power to lay and collect taxes on income, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration." Shortly after, the income tax law of 1913 was approved The rates included a normal tax of 1 per cent applied to the net income of individuals and corporations. The surtaxes levied on individuals began with a 1 per cent rate on a net income of $20,000 and rose to 6 per cent on the excess of incomes over $500,000. Personal exemptions of $3000 for a single person and $4000 for a married couple were allowed Corporations were allowed no exemptions. The outstanding features of the tax were: first, provision for collection at the source in order to prevent evasion, a method which gave great dissatisfaction and was abandoned in 1917 on the ground that it was unsuitable for a democratic country; secondly, permission for individuals' deducting only those losses incurred in trade; thirdly, definite limitations on the amounts which corporations could deduct for losses. The income tax law of 1913 was in effect until Dec. 31, 1915, when the income tax law of 1916 went into effect. There were two reasons for the new law: first, the customs duties had fallen off because of the decrease in the amount of goods coming from Europe; secondly, the old law needed to be clarified and changed in a number of instances

After the entry of the United States into the War, the income tax law of 1917 was passed and became effective as of Jan. 1, 1917. The new law was remarkable in two respects: first, the rates were higher than any country had ever imposed before; secondly, the act was exceedingly complex, because Congress had grafted the new law on the law of 1916 as an amendment. Both the normal and the surtax rates were increased. The normal rate imposed on individuals was 4 per cent, except on incomes between $1000 and $2000, on which the rate was 2 per cent. The normal rate on corporations was increased to 6 per cent. The surtax rates on incomes above $5000 rose progressively from 1 per cent to 63 on the excess of $2,000,000. The new law provided for "information at the source" The act specifically stated that income and excess profit taxes were not to be deducted, nor was interest on money borrowed for the purchase of tax-exempt securities. Dividends of corporations were to be taxed according to the rates obtaining in the year in which the profit or surplus was accumulated. The object of this provision was to make it impossible for corporations to refrain from declaring dividends in any one year in the hope that the rates of taxes would be lower in some future year. This provision was repealed in 1918 because of difficulties of administration.

In order to raise still greater amounts of revenue to meet the demands of the War, the income tax law of 1918 was framed and continued in force until the Revenue Act of 1921 became effective. The normal rates were again raised, both for individuals and corporations, becoming 12 per cent on taxable income both for individuals and corporations, with the exception of a rate of 6 per cent on the first $4000 of the taxable income of a citizen or a resident of the United States In 1919, the normal rate was reduced to 8 per cent, with 4 per cent on the first $4000 dollars of net income above the personal exemption. To obtain the total tax rate, the graduated surtax rates were added to the normal rate. The income tax law of 1918 smoothed out certain inequalities in the taxing of corporations

The Revenue Act of 1921. On January 1 the Revenue Act of 1921 went into effect, although some modifications were not put into force until a year later. These modifications included the abolition of the excess profits tax. One important change in the law of 1921 related to business losses; if the businessman

suffered a loss in one period, it was permissible, under this new law, to set off that loss against net incomes realized in the two succeeding years The income tax rate on corporations was raised from 10 per cent to 12½ The surtax rates for 1923 and for the first six months of 1924 were somewhat lower than those obtaining in 1921 and 1922.

Revenue Bill of 1924. Secretary Mellon proposed a new tax bill in 1924 which was submitted to Congress. The normal and surtax rates were to be reduced, the latter not to go beyond a maximum of 25 per cent. Counter-proposals were submitted, and as a result the Mellon Bill was greatly modified. The bill as modified was passed by both houses and finally signed by President Coolidge on June 2. It was known as the Revenue Bill of 1924. There was a general reduction of 25 per cent on incomes earned in 1923, payable in 1924. The new normal rates on net incomes (less credits) were 2 per cent on incomes less than $4000 and 4 per cent on incomes of $4000 and not more than $8000. Above $8000 the normal rate was 6 per cent The range of surtax rates was from 1 per cent on incomes between $10,000 and $14,000 to 40 per cent on incomes over $500,000. Heads of families with incomes of $5000 and over were permitted an exemption of $2500 instead of the old rate of $2000. Many excise taxes were repealed, including those on telegraph and telephone messages, candy, yachts and motor boats, carpets, rugs, trunks, purses, and drafts and promissory notes. Theatre tickets costing $ 50 or less were exempted. Taxes on automobiles selling for less than $1000 were exempted from the 3 per cent tax. The rates of estate taxes were increased to a maximum of 40 per cent on amounts of $10,000,000 and over. A new gift tax was imposed with the same rates as the estate tax in order to prevent evasion of the estate tax by the making of personal gifts. There was a new tax of 10 per cent on Mah Jongg sets, which was estimated to yield $2,000,000. The proposals which finally took shape in this revenue measure had been the subject of much discussion both in Congress and the press for several months. While the reduction of the tax on lower incomes was generally favored there was some criticism of the lower surtax scale applied to the higher incomes.

The War Profits and Excess Profits Tax. Provision was made in the Act of 1916 for the levy of a tax of 12½ per cent on the profits of the manufacture of munitions. In March, 1917, this tax was made a general war profits tax. In October of the same year this war profits tax was replaced by the excess profits tax. In the following year a law was provided under which the excess profits tax appeared in a new form as the war profits and excess profits tax. This law was applicable to corporations which had been organized for the sake of profit. The method adopted for arriving at the excess profits was to subtract from the total profits of the year the average rate of profits earned on the invested capital during the three years before the War began (1911–13), provided the rate of return had been as much as 7 per cent and not more than 9 per cent. Hence the base of the tax was the excess over an assumed normal profit. The law assumed that after allowance had been made for increases or decreases in working capital, an 8 per cent return on the amount of capital invested was fair in those industries in which the risk was not exceptional. The rates of the tax levied against the excesses were graduated from 20 per cent to 60 per cent. After the War was over, businessmen felt that this tax was too heavy to be borne, and it was given up at the end of 1921. Aside from its being a matter of history, the chief interest in the tax lies in the effort to determine what might be called a normal return on capital invested.

Capital Stock Tax of Corporations. The revenue act of 1918 provided for a tax on domestic and foreign corporations. In 1921, the act provided for a payment by every domestic corporation of a special excess tax with respect to carrying on business The corporation was obliged to pay $1 for each $1000 in excess of $5000 of the average value of the capital stock as it was during the preceding year. Foreign corporations were not allowed an exemption and had to pay at the same rate on all capital invested in the United States. This tax yielded a revenue of $95,000,000 in 1920.

Inheritance Taxes. These were provided for in the revenue act of 1916. They were to be levied on estates, after certain deductions had been made, and not on the shares of each heir In this law no distinction was drawn between direct and collateral heirs. If the estates were valued at less than $50,000, they were exempt The rates ranged from 1 per cent to 25 per cent on estates valued at $10,000,000 above the exemption. The law tried to provide against certain contingencies: (1) property which had been taxed once could not be retaxed within five years, so that if estates changed hands rapidly at the death of each successive owner, the property would not be largely consumed by taxes; (2) if property was proved to have been given away within two years before the death of the owner, the gifts were to be judged as made "in contemplation of death" and so were liable to the tax. It was difficult for the State to prove that such transfers of property were made in contemplation of death, and the courts consistently held that the burden of such proof rested on the State. The result was that the State did not often try to show that "transfers of property were in contemplation of death." The Federal inheritance tax yielded $103,635,000 in 1920, which was 1.8 per cent of the total revenue.

Taxation in States. The decade 1914–24 saw four noteworthy developments in State taxation. First, State taxes were increased; secondly, the income tax was increasingly used in different States; thirdly, State inheritance taxes grew; fourthly, returns from automobile taxes increased.

Increase in State Taxation. In 1910 the total receipts from State taxes were approximately $254,000,000. By 1915 this had increased to $352,000,000. In 1920 the grand total of State receipts from taxes was $692,000,000. A part of this great increase was due to the decline in the purchasing power of the dollar. Some part of the increase in 1920 was due to the War, but the Federal government bore the main burden of the war expenditures. Of the total revenue received by the States in 1920, the receipts from taxes comprised about 78 per cent. Of the total receipts from taxes, the general property tax yielded about 45 per cent. Business taxes, including taxes on corporations,

licenses, and insurance companies, yielded 23.3 per cent. Inheritance taxes yielded 8.6 per cent, and taxes on corporations, 8.1 per cent. Nonbusiness licenses yielded 9.1 of the total income from taxes. The yield from miscellaneous taxes was 5.9 per cent. Two important items of State expenditure are education and highways. In the table below the percentages of expenditure for these two items may be compared with the figures given above.

PERCENTAGE DISTRIBUTION OF EXPENDITURES, 1910–15–20

	1910	1915	1920
Total State Expenditure	100	100	100
Education	37 6	32.4	30.1
Highways	4.4	12.7	22 0
Other	58.0	54.9	47.9
Total State and local expenditure	100	100	100
Education	25.5	26 1	27.6
Highways	16.2	17 4	19 2
Other	58.3	56.5	53.2
Total local expenditure	100	100	100
Education	26.6	27 6	29.6
Highways	17.9	18.2	18.5
Other	55.5	54.2	51 9

It will be observed that the percentage of expenditure of the States for education in 1910 was much lower than that of 1920. The percentage spent on highways increased from 4.4 in 1910 to 22 in 1920. When we consider the combined expenditure of State and local governments, we find that the percentage spent for education increased, although not so rapidly as that for highways.

State Income Tax. The use of an income tax by States is not an innovation. Pennsylvania in 1840, Maryland in 1842, Massachusetts as a colony in 1692 and as a commonwealth in 1821, South Carolina in 1868, Georgia in 1863, and other States experimented with income taxes. Interest in this form of taxation was reawakened by its revival. The Wisconsin tax, which went into effect in 1911, has been the best-known. Massachusetts reintroduced the income tax in 1916. In 1919 four other States introduced the income tax, and in 1920 New York also put into effect a very thorough-going income tax law. The majority of the States which have adopted income taxes used progressive rates. There is no reason why the States should not use this form of taxation, provided the problems of double taxation can be definitely settled. The difficulty does not lie so much in the double taxation that exists in Federal and State income taxation, as in deciding the principles of levy. Shall the tax be levied on one who resides in one State but carries on business in another State in which the income tax exists? If the income tax exists in both States, should an individual be required to pay in both States? If the individual receives part of his income from business outside the State, shall he pay on all his income or only on that part which is earned within the State? Perhaps he may own shares of a corporation located in one State and place them in a safety deposit box in a different State from that in which he resides. Should he then be called on to pay taxes on the same income in three States? These questions reveal the difficulties of State income taxation. Much injustice is resulting because of a lack of comity between the various States. Very definite principles should be adopted which would apply to them all.

State Inheritance Tax. In 1919 State inheritance taxation yielded $45,770,000. This was 8.6 per cent of the whole yield from taxes. There has been an increase in the number of States using inheritance taxation. In 1890 only six States had inheritance taxation, and this was levied only on collateral heirs. The taxation of direct heirs came later. By 1900, 21 States had adopted such taxation; by 1910, 38 States; and by 1924 only Alabama and Florida were without inheritance taxes. Practically all the States levying a direct inheritance tax use the progressive principle Frequently the rates increase more rapidly with remoteness of relationship. Where the relationship is collateral, the exemptions are usually low. Where the relationship is direct, the exemptions are much higher.

Automobile Taxes. The returns to the States from the taxation of automobiles was rapidly becoming very important According to recent governmental statistics, there were in the United States about 12,500,000 motor vehicles, almost 11,000,000 private passenger cars, about 1,300,000 motor trucks and commercial cars, and 183,000 motorcycles. The returns for all States, from registration, approximated $150,000,000 Automobiles were also taxed in other ways than by registration licenses. In certain States and municipalities, individuals were taxed for licenses to drive for hire. In certain municipalities there was a set tax on automobiles for the upkeep of roads. A number of States had taxes on gasoline, and while this sort of tax bade fair to yield increasingly large sums, it must be borne in mind also that automobiles entail increasing expenditures for the upkeep of roads and the construction of new highways.

Municipal Taxation. More than one-third of the people of the United States live in cities of over 30,000 population. As cities grow in size, the per capita cost of rendering service increases, rather than decreases. The per capita cost payment of 146 cities in 1915 was $34 53. By 1919 this had increased to $35.58. Some of the important per capita items of expense for all cities in the United States for 1919 were: schools, $6.88; general governmental expense, $2.22; police department, $2.33; sanitation, $1.76; highways, $2.04. The cities obtained their revenue from a variety of sources. About two-thirds of the total revenue was derived from the general property tax. Of the amount derived from taxes, 91.3 per cent was derived from general and special property taxes; .2 per cent from poll taxes; and 8.5 per cent from nonbusiness taxes. During the decade 1914–24 certain reforms were organized in municipal finance. First, many cities established a budgetary system. The overloading of expenditures by different departments was avoided by establishing a central purchasing department for the city. In New York City the effort was made to avoid the duplication of records kept by different departments by centralizing the auditing and collecting departments under one control. Secondly, the cities issued large amounts of bonds. Many of them had great difficulty in meeting their interest and principal obligations when they fell due. Municipalities were encouraged to issue bonds during the period of high expenditures by their ability to issue tax-exempt bonds. The grand

total of obligations of this sort had become very great and was rapidly increasing.

The limitations which many cities put on their borrowing power do not seem sufficient protection against very heavy municipal indebtedness for future generations. The whole problem of municipal borrowing requires careful analysis and necessitates the formulation of principles of future municipal finance.

For taxation in other countries, see articles on those countries. See also FINANCE AND BANKING and TARIFF.

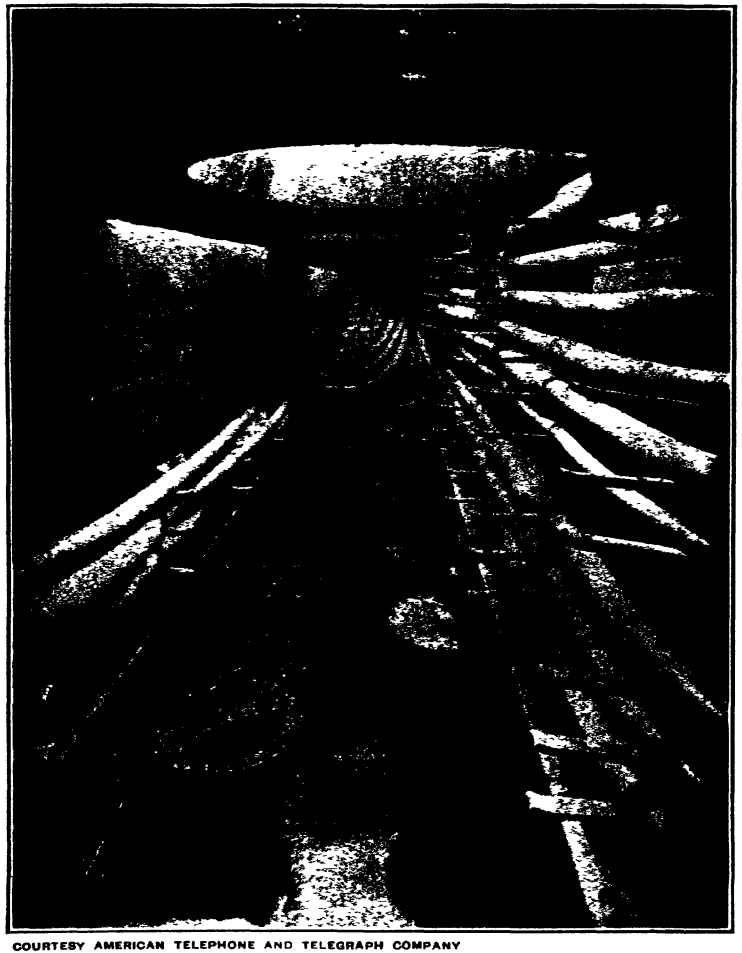
TAXONOMY. See ZOÖLOGY.

TAYLOR, HENRY CHARLES (1873–). An American agricultural economist, born at Stockport, Iowa, and educated at Drake University, Iowa State College, the University of Wisconsin, and abroad. In 1901 he was instructor in commerce at the University of Wisconsin and from 1908 to 1919 chairman of the department of agricultural economics. From 1919 to 1921 he was chief of the Office of Farm Management, in the United States Department of Agriculture, and in 1921–22, chief of the Bureau of Markets and Crop Estimates. He became chief of the Bureau of Agricultural Economics in 1922. He was the author of *Introduction to the Study of Agricultural Economics* (1905) *and Agricultural Economics* (1919).

TAYLOR, (JOSEPH) DEEMS (1885–). An American composer and critic, born in New York City. He received his musical education from O. Coon in New York. In 1916 he was war correspondent of the New York *Tribune* and from 1917 to 1921 associate editor of *Collier's Weekly.* In 1921 he succeeded James Huneker as music critic for the New York *World.* His compositions include a symphonic poem, *The Siren Song;* the choral works with orchestra, *The Chambered Nautilus* and *The Highwayman;* an orchestral suite, *Through the Looking-Glass;* and songs. He contributed a paper on music to *Civilization in the United States* (1921).

TCHEREPNIN, NIKOLAI NIKOLAIEVITCH (1873–). A Russian composer, born at Petrograd. He studied composition under Rimsky-Korsakov at the Conservatory there. In 1901 he became conductor of the Belaiev Symphony Concerts and professor at the Conservatory. His works consist of the ballets, *Armidas Pavillon, Narcissus,* and *The Masque of the Red Death* (after Poe); a symphonic poem, *Narcisse et Echo;* a prelude to Rostand's *La Princesse Lointaine;* a suite, *Le Jardin Enchanté; Scène dans la Caverne des Sorcières* (after *Macbeth*); *Fantaisie Dramatique; Gavotte; Poème Lyrique* for violin and orchestra; a piano concerto; a string quartet; several choral works with orchestra; choruses à cappella; piano pieces; songs, and duets.

TEACHERS' COLLEGE. See COLUMBIA UNIVERSITY.



TEASDALE, SARA (MRS. ERNST B. FILSINGER) (1884–). An American poet, born at St. Louis, Mo., and privately educated. She spent several years in travel Her work has a charming lyric quality and fine rhythmic feeling. Her books include: *Sonnets to Duse and Other Poems* (1907); *Helen of Troy and Other Poems* (1911); *Rivers to the Sea* (1915); *Love Songs* (1917); *Flame and Shadow* (1920). She edited *The Answering Voice: One Hundred Love Lyrics by Women* (1917).

TEETH AND DISEASE. See RHEUMATISM, CHRONIC.

TELEGRAPHY. The War spurred the engineers of the telegraph companies to get as much service out of each line of wire as possible. To this end there was a notable development, both in quantity and quality, of printing telegraph systems and multiplex telegraph systems and the use of vacuum-tube repeaters During the War the United States Signal Corps installed a very elaborate telegraph system in France, in which the printing telegraph was very generally used. In 1920 the Western Union Company used printing telegraphs for 80 per cent of its trunk line traffic. Printing telegraph systems depend for their operation on the maintenance of absolute synchronism between two rotating elements at the respective ends of the line. This is obtained by special short impulses of current sent two or more times per revolution and by the use of tuning-forks. The printing systems in use in 1924 were of two types, "continuous synchronism" and "start-stop" In the former, as its name implies, the devices are in continuous operation In the latter the device is started for each letter. Sending is accomplished by a machine using a prepared tape which is made up on a machine operated like a typewriter. From 50 to 60 words per minute may be sent by one machine, and by using multiplex combined with printing, as many as 800 messages per hour may be transmitted over one wire. The messages are received ready for delivery and the frequency of errors is reduced.

It became a regular practice to use telephone circuits simultaneously for telegraph purposes. By the use of induction coils to choke out the high-frequency telephone currents and of condensers to stop the direct currents of the telegraph, these two types of currents may be sent over the same wire simultaneously and separated at the receiving end. A single pair of wires may serve for two telegraph circuits and one telephone circuit. By means of carrier currents the number of telephone conversations may be increased. In submarine cable telegraphy machine sending and receiving became the usual practice and the use of vacuum-tube repeaters and amplifiers made it possible to carry messages direct from one city terminus to another without manual repeating in between; thus there is direct connection between New York and London. Telephone, telegraph, and cable engineers united to standardize the terms, definitions, and phraseology of the entire art of communication, and this work was published by the American Institute of Electrical Engineers (1922). Consult McNicoll, *American Telegraph Practice,* and Kingsbury, *The Telegraph and Telephone Exchanges.* See RADIO TELEGRAPHY.

TELEPHONY. In 1917 there were in the United States 11,716,000 telephones connected to 21,175 central stations by 28,000,000 miles of wire. They were used in that year for 21,846,000,000 messages or at the rate of about six messages per day per telephone. In 1921 this had increased to 13,875,000 telephones, about 63 per cent of the total for the whole world. By Jan. 1, 1924, there was a further increase to more than 15,000,000 telephones in the United States and 35,000,000 miles of wire, of which 88 per cent was in the form of cables. Two-thirds of the cable was underground; one-third was aërial. The War was a great stimulus to

the art of communication because of its importance to the military forces of the nation. This had its effect not only in bringing into regular practical service devices such as the vacuum-tube repeater which were previously in an experimental stage, but in expediting coordination of available facilities and improving the reliability and capacity of existing systems. Before the United States' entrance into the War the vacuum-tube repeater (three-electrode thermionic tube) had been used in long-distance telephony, thereby making possible successful communication between New York and San Francisco (1916). To improve the reliability of the long-distance service and to prevent interruption by storms, most of the wires used in this service were combined into cables containing many pairs of wires, well insulated and protected, and strung on steel cables hung on the poles.

While good communication over long distances could be obtained over open-air lines by the use of repeaters, the introduction of cables called for a greater use of "loading coils." These are induction coils connected in series with each of a pair of wires at regular intervals in order to counteract the capacity of the wires, which in cables is great, and to increase the efficiency of transmission. Loading coils have been used since 1900, particularly for underground and submarine cables, but the more general use of cables since 1914 stimulated the development both of the quantity and quality of loading coils. New magnetic materials such as permalloy were developed for the core, and new forms such as powdered iron alloy came into use. For submarine cables permalloy tape is wound spirally around the wires to give continuous loading as distinguished from the "lumped loading" of coils The increase in the use of telephones in the large cities brought about the development of cables containing 1200 pairs of wires of #24 B & S gage in a cable having an outside diameter of two and five-eighths inches, including the lead armor. This is a means of increasing the capacity of the underground duct laid and standardized in size many years before. The insulation of these wires consists of very thin paper of a special character, having very low specific inductive capacity and low losses. Automatic telephone exchanges had been in service in isolated installations of moderate size for some years, but in the interval since 1920 their development and increased use was remarkable. The independent companies used them first in locations where the service was not very complicated, such as towns with one central station. In 1921 the Bell system installed its first automatic central in Omaha, and on Jan. 1, 1924, the Bell system had 30 such stations serving 185,000 subscribers in 17 cities. The earlier installations, by independent companies, were of the so-called step-by-step system, but these were largely superseded by the panel type system which became the standard of the Bell system.

The principal and outstanding features of the panel system include a device on the subscriber's instrument for transmitting a series of a definite number of successive impulses of urrent corresponding to the number of the party called. A line finder, at the central station called, is a selecter whose function is to find a terminal of a particular line on which a call originates out of a group with which it is associated, and to connect a "first selecter" and a "sender" to that line. A comparatively large number of subscribers' lines may be served by a comparatively small number of line finders. The line finder finds the calling line and connects the selecter and sender thereto. The "sender" switch receives the electrical impulses from a subscriber's dial on a decimal basis, stores them, and translates them to a nondecimal basis corresponding to the particular group of lines and trunks involved in the path of the call. The sender replaces the intelligence of the operator. The "selecter" switch, controlled by the sender, has the duty of selecting a particular group of trunks and one trunk of that group. It has the same function as the switchboard plug and cord, which in a manual station can be plugged by the operator into any one of a number of jacks which are the terminals of trunks or lines. There are "district selecters," "incoming selecters," and "final selecters" in the circuit, in the order named, from the calling line to the called line. The district selecter selects a trunk to the proper exchange, either the home or a distant exchange. The incoming selecter selects a trunk to the outgoing board of the same exchange. The final selecter selects the terminals of the line of the called party. The accompanying figure is an elementary diagram of the circuit and the principal devices in a circuit using the panel type of machine switching, from Morehouse, Graft, and Charlesworth, in the *Transactions* of the *American Institute of Electrical Engineers* (1923).

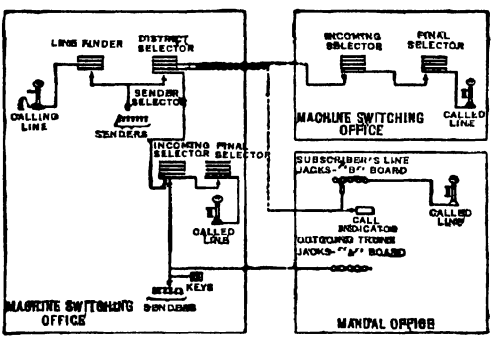

DIAGRAM SHOWING CONNECTIONS FROM MACHINE SWITCHING TO MACHINE SWITCHING, MACHINE SWITCHING TO MANUAL, AND MANUAL TO MACHINE SWITCHING

Carrier Current Telephony. This name was given to the method of transmitting telephone messages by means of modulated high-frequency currents, similar to radio currents but of a frequency of the order of 10,000 to 50,000 cycles and sent over a wire. By this means several telephone messages using carrier waves of different frequencies may be sent simultaneously over the same line and separated at the receiving end by suitable tuning devices such as are used in radio tuning. In 1919 Baltimore and Pittsburgh were connected by a cable using this scheme, which provides simultaneous service for five telephone messages and duplex telegraph service over one pair of wires. By means of rectifier (detecter) and amplifier tubes, these telephone messages may be sent on further on separate lines. Carrier current telephony in 1924 was being used to send telephone messages

over trolley wires and high-tension transmission lines without interfering with the usual service of the lines. In 1921 a telephone cable was put in service between Key West and Havana, a distance of 105 miles, the longest submarine telephone cable in service up to 1924. By means of carrier currents and multiplex telegraphy, several telephone and telegraph messages may be sent simultaneously, as described above. Messages from anywhere on the continent may be sent over this cable by direct connection

The subject of inductive interference has been of great interest to the telephone and telegraph engineers. It relates to the unfavorable effects which the large currents and high voltages of power transmission lines have on communication circuits These effects are threefold: electromagnetic, due to the large currents; electrostatic, due to the high voltages; and stray currents, due to grounds. This matter in 1924 was being given careful scientific study by a committee representing all concerned, with the expectation of devising regulations which would obviate the troubles and be fair to all concerned.

Public Address System. This is a development incidental to telephony and radio. Communication is made possible by the invention and improvement of amplifying tubes and powerful loud speakers. Its first notable demonstration was on Armistice Day in 1921, on the occasion of the address by President Harding at Arlington Cemetery. His voice was carried by telephone to New York and San Francisco, where it was amplified and broadcast by numerous powerful loud speakers to audiences of many thousands.

Photographs Transmitted by Wire. In 1924 the American Telephone and Telegraph Company gave the first public demonstration of sending photographs by wire between Cleveland and New York. This is accomplished by means of rotating cylinders at the respective ends of the line, held in exact synchronism by impulses of carrier currents At the sending end a transparent film picture is placed on the cylinder and a very fine beam of light is sent through the film and moved along the rotating cylinder in the manner used in talking-machines, moving one inch axially for 65 turns of the cylinder. The beam of light varies in intensity, depending on the opacity of the various portions of the picture through which it passes, and impinging on a photo-electric cell, it causes a corresponding variation in the intensity of the current transmitted to the distant end. There a film is set on the cylinder behind a slit on which a steady light is thrown. The slit is opened wide when a large current is transmitted and closes for a weak current. The light through the slit traces a spiral line on the film, thick or thin, depending on the intensity of the current received, which, when developed, gives the gradations of the original picture The general effect is that of a line engraving. A 5×7 picture is transmitted in 5 minutes, not including the time of development. Consult Jansky, *Principles of the Telephone;* Kingsbury, *The Telegraph and Telephone Exchanges;* Miller, *Telephone Practice;* Mitchell, *Principles and Practice of Telephony.* See TELEGRAPHY; RADIO TELEPHONY.

TEMPERATURE. See METEOROLOGY.

TEMPLE UNIVERSITY. A coeducational institution at Philadelphia, Pa., founded in 1884. The student enrollment increased from 3579 in 1915 to 9609 in 1923; the faculty increased likewise from 290 in the earlier year to 450 in latter, and the number of volumes in the library from 9200 to 25,615. In 1920, gifts and pledges were received to the amount of $300,000 for a new building. President, Russell H. Conwell, D.D., LL.D.

TENNANT, DAVID HILT (1873–). An American zoologist, born at Janesville, Wis., and educated at Olivet College and at Johns Hopkins University. He was lecturer in biology (1904–05), associate (1905–06), associate professor (1906–12), and professor (1912–) at Bryn Mawr College. Professor Tennant was a member of various expeditions of the Carnegie Institution to the West Indies, Australia, and Japan His published work was on the development of parasitic worms and experimental studies on hybridization of echinoderms.

TENNESSEE. Tennessee is the thirty-fourth State in size (42,022 square miles), and the nineteenth in population; capital, Nashville. The population increased from 2,184,789 in 1910 to 2,337,885 in 1920, a gain of 7 per cent. The white population increased from 1,711,432 to 1,885,993; the Negro population, on the other hand, decreased from 473,088 to 451,758 The native whites increased from 1,692,973 to 1,870,515, while the foreign-born population decreased from 18,459 to 15,478. The urban population of the State rose from 441,045 to 611,226; the rural decreased from 1,743,744 to 1,726,659. The growth of the principal cities was as follows: Memphis (q.v.), 131,105 in 1910 to 162,351 in 1920; Nashville (q.v.), 110,364 to 118,342; Knoxville, 36,346 to 77,818; Chattanooga, 44,604 to 57,895.

Agriculture. Tennessee is one of the minor cotton-producing States, and while the boll weevil invaded the southwestern part in 1921–22, its effects had not been very serious, the cold of winter serving largely to keep it in check. A comparison of acreage and production of cotton for several years is given below: in 1913, acreage 865,000, production 379,000 bales; 1915, 772,000, 303,000 bales; 1917; 882,000, 240 000 bales; 1920, 840,000, 325,000 bales; 1922, 1,007,000, 400,000 bales. The estimated production for 1923 was 340,000 bales.

While the population of the State increased 7 per cent in the decade, the number of farms increased only 2.7 per cent (from 246,012 in 1910 to 252,774 in 1920). The acreage of land in farms decreased from 20,041,657 to 19,510,856, or 2 6 per cent, but the improved land in farms increased from 10,890,484 to 11,185,302 acres, or 2.7 per cent. The value of all farm property apparently increased 104 4 per cent. or from $612,520,836 in 1910 to $1,251,964,585 in 1920; the average value per farm from $2490 to $4953. In interpreting these values, and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 252,774 farms in 1920, 148,082 were operated by owners, 807 by managers, and 103,885 by tenants. The corresponding figures for 1910 were 144,125, 826, and 101,061. White farmers in 1920 numbered 214,592, and colored farmers, 38,182. In 1910, the white farmers numbered 207,704; colored

farmers, 38,308. There was a decrease in colored population, 1910–20, amounting to 4.5 per cent, which affected the farm labor situation. Farms free from mortgage in 1920 numbered 105,128, and those under mortgage, 32,264; in 1910, 118,285 farms were free from mortgage and 24,006 mortgaged. Cattle in 1920 numbered 1,161,846, of which 669,360 were dairy cattle. In 1910 the cattle numbered 996,529; dairy cattle, 397,104. Sheep, in 1920, numbered 364,196, compared with 795,033 in 1910. Hogs had increased in number from 1,387,938 to 1,832,307. The estimated production of the principal farm products in 1923 was as follows: corn, 78,589,000 bushels; wheat, 4,508,000 bushels; oats, 4,345,000 bushels; potatoes, 2,728,000 bushels; sweet potatoes, 3,856,000 bushels; tobacco, 121,922,000 pounds; hay, 1,502,000 tons; peanuts, 1,066,000 bushels. Comparative figures, for 1913, are: corn, 68,675,000 bushels; wheat, 8,400,000; oats, 6,300,000; potatoes, 2,432,000; hay, 1,089,000 tons; and tobacco, 64,800,000 pounds.

Mining. The principal mineral products of the State are coal, cement, and clay products. During the decade 1914–24 the production of coal remained fairly constant, as will be noted in the following figures. 5,943,258 tons in 1914, valued at $6,776,573; 5,730,361 in 1915, $6,479,916; 6,137,449 in 1916, $7,522,445; 6,194,221 in 1917, $13,592,998; 6,831,048 in 1918, $19,305,203; 6,662,428 in 1920, $26,778,000; 4,460,326 in 1921, $14,932,000, 4,876,774 in 1922. The falling off in production in the last two years of the period was due chiefly to the coal miners' strike in 1921. It will be noted that while the production of coal remained practically constant during the decade, the value in the latter years greatly increased. This is due chiefly to conditions resulting from the scarcity of coal, and partly to the inflated condition of the currency. The copper output during the decade varied from 18,661,112 pounds smelted in 1914 to 14,556,278 in 1916, 15,053,568 in 1918; 16,727,803 in 1920; 14,226,232 in 1922. The total value of the mineral products of the State was $33,754,823 in 1921; $55,023,232 in 1920; $37,134,899 in 1919; $39,229,614 in 1918; and $19,647,145 in 1914.

Manufactures. The industrial development of Tennessee was rapid in later years. There were, in 1920, six cities with more than 10,000 inhabitants, and containing 19.2 per cent of the total population of the State These reported, in 1919, 56 7 per cent of the value of the State's manufactured products. In 1909 there were in the State 4609 establishments; 4775 in 1914; and 4589 in 1919. Persons engaged in manufacture numbered 87,672, 88,514, and 113,300; and the capital invested amounted to $167,923,784, $211,423,167, and $410,203,443, in those years. The value of manufactured products in 1909 was $180,216,548; in 1914, $212,071,489; and in 1919, $556,253,162. The large increase in value of products in 1914–19 was due largely to changes in industrial conditions brought about by the War, and cannot be properly used to measure the growth of manufactures during the period; but the increase in number of persons employed indicates clearly a decided growth in the manufacturing activities of the State.

Education. Tennessee has the same educational problems with which all the southern States are obliged to contend: a large rural population combined with a large colored population. Unusual attention was given to these problems in the decade 1913–23, and much progress was made, especially in the latter part of that period. In 1923, the Legislature passed a measure which reorganized to a large extent the school system. The Department of Education was created to supersede the Department of Public Instruction, and the head of the new department was called the Commissioner of Education rather than Superintendent of Public Instruction. The Legislature of 1921 passed a new county board of education law, under the provisions of which a county board of education consisting of seven members elected for a term of seven years, one member retiring each year, was created. The same Legislature enacted a measure extending the term of office of the county superintendent to four years instead of two years. High schools increased in number and efficiency during the period. They are under the control of the county board of education and operated under a special tax levied by the county, together with a State tax and a supplementary appropriation by the State. In 1923, there were 550 county high schools, 195 of them being standard four-year schools. The State system of elementary schools covers every county in the State. Since 72 per cent of the total enrollment in the public schools is in the rural elementary schools, this phase of the State's educational system presents the most important problem and is most difficult of solution. Educational agriculture was organized in the State in 1917–18. At that time there were courses in 12 schools with an enrollment of 189. This increased in 1923 to 64 schools with an enrollment of 1789. In 1913, the total enrollment in the county schools was 439,854 (371,948 white, 76,222 colored); while 69,399 white and 26,448 colored, a total of 95,487, were enrolled in the city schools. The total enrollment in the white schools in 1921 was 466,844; in the schools for colored pupils, 101,958, or a total enrollment of 568,802. The enrollment in the county elementary schools was 437,577; in the county high schools, 20,920; in the city elementary schools there were enrolled 131,225, and in the city high schools, 15,906. The total expenditure for schools in 1921 was $13,412,857. The percentage of illiteracy in the State decreased from 16.3 in 1910 to 12 6 in 1920: among the native white population from 11 9 to 9.2; among the Negro, from 33.3 to 23.9 per cent. In the foreign-born white population it increased from 8 2 per cent to 8.7.

Finance. For finance, see STATE FINANCES

Political and Other Events. The State political control for the most part during the decade 1914–24 remained Democratic. Governor Hooper, Republican, was renominated in 1914 but was defeated by the Democratic candidate, Thomas C. Rye. Important measures for regulating the sale of liquor, passed by the Legislature of 1913, went into effect on Mar. 1, 1914. In July, 1915, affairs of the city of Nashville went into the hands of a receiver, after the disappearance of 11 cash books of the city, covering the period 1908–12. The city treasurer was arrested, charged with misappropriation of municipal funds. The Grand Jury in June returned indictments against the finance commissioner, the comptroller, and the assistant city treasurer. The latter officer fled to Australia. In 1916 Governor Rye and Senator McKellar

were reëlected. In the presidential voting of this year, President Wilson received 152,955 votes, Charles E. Hughes, 116,257. A fire in Nashville, on Mar. 22, 1916, destroyed 600 buildings and caused a loss of more than $1,500,000 Thomas C. Rye was for a second time reëlected in 1918, and John K. Shields, Democrat, was reelected to the Senate. In 1918 A H. Roberts was elected governor on the Democratic ticket, but in 1920 he was defeated by Alf Taylor, Republican, brother of the late Senator and Gov. Robert L. Taylor. Gov. Alf Taylor served one term and was defeated by Austin Peay, Democrat. In the presidential voting of this year, W G Harding received 219,829 votes; J. M. Cox, 206,558. State control again passed to the Democrats in 1922 Senator McKellar was reëlected Governor Peay was inaugurated in January, 1923. He was renominated in August, 1924. In August, 1924, Senator Shields was beaten for renomination by Gen. L. D Tyson, a Spanish-American War and World War veteran, who commanded a brigade in the 30th Division

Legislation. The most important acts of the Legislature in the decade 1914-24 are indicated below. The Legislature of 1915 passed several measures designed to bring about stricter enforcement of the prohibition law. In 1917 provision was made for a budget system and for a compulsory system of party primary elections. A general prohibition law was also passed, and the insurance laws were amended in important details. The laws relating to health were also amended. The Legislature of 1919 abolished the death penalty for murder in the first degree. By a provision of this Legislature, women were permitted to vote in presidential elections A State police force was created, and a workmen's compensation law was passed. The Legislature of 1923 passed a measure drafted by Governor Peay for the consolidation of the State's activities into a small number of executive departments answerable directly to the governor. This resulted in the reorganization of the government under nine departments, each under an executive officer appointed by the governor, thus centralizing power and responsibility.

TENNESSEE, UNIVERSITY OF. A nonsectarian, coeducational institution at Knoxville, Tenn., founded in 1794. The Colleges of Medicine and of Dentistry and the School of Pharmacy are at Memphis, Tenn The university increased its student enrollment from approximately 1200 in 1916 to 1821 in 1923-24, plus 1019 in the summer of 1923, and increased its faculty in the same period from about 200 to 271 members and the library from 40,000 to 70,000 volumes In 1917, the State Legislature authorized a bond issue of $1,000,000 for new buildings and improvements, and the levy of a half mill tax for the support of the institution. Harcourt A. Morgan, B.S.A., LL.D, succeeded Brown Ayres, Ph.D., LL.D., as president in 1919.

TENNIS. The growth in the popularity of tennis has been phenomenal and world-wide during the decade ending with 1924. If baseball be entitled to be called America's national game, tennis deserves even more the appellation of the "international game" The competition for the Davis Cup, emblematic of the world's championship, now attracts annually entries from a score of countries, whereas in former years the United States, various divisions of the British Empire and France, alone strove for possession of this trophy. But this fact in itself gives only a faint indication of the wide appeal tennis is making. National tourneys, sectional tourneys, intercity matches, college and school tourneys and thousands upon thousands of club tourneys are held each season practically the world over.

The United States recovered its laurels as the premier tennis nation in 1920 when a team consisting of William T Tilden II and William M. Johnston journeyed to New Zealand and recaptured the Davis Cup by defeating the Australasian defenders, Norman E. Brookes and Gerald L. Patterson. The United States, with Tilden and Johnston again bearing the brunt of the burden, successfully defended the trophy in 1921, 1922 and 1923. The recently offered Wightman Cup, an international trophy for women players, also was won in 1923 by an American team consisting of Mrs. Molla Bjurstedt Mallory, Miss Helen Wills, Miss Eleanor Goss and Mrs Hazel Hotchkiss Wightman playing against an English team comprising Miss Kathleen McKane, Mrs B C Covell, Mrs. Geraldine Beamish, and Mrs R C Clayton. Mlle. Suzanne Lenglen of France, however, has stood out for several years as the cleverest woman tennis player, easily overcoming the strongest opponents the United States and Great Britain could produce.

The United States Lawn Tennis Association, the governing body of amateur tennis in America, enacted a rule in 1924 barring from competition any player who contributed articles on the sport to the press or magazines. This so-called player-writer rule bars such stars of the game as William Tilden II and Vincent Richards and has given rise to somewhat bitter controversy It was provided that this rule should not go into effect until 1925, but Tilden soon after its enactment resigned as a member of the Davis Cup team Richards also tendered his resignation but later withdrew it.

Court tennis, racquets and squash, all in a sense allied to lawn or turf tennis, have profited by the advance made by the last named sport and are played more generally than ever before. It is to the more exclusive clubs, however, that their popularity is chiefly confined. In court tennis, Jay Gould of the United States, after long reigning supreme, met defeat in 1923 at the hands of E. M. Baerlein of England in the play for the Bathurst Cup in France. George F. Covey of England retained the world's professional court tennis title in 1923 by defeating Walter Kinsella of the United States Jock Soutar of the United States remains as the world's professional racquets champion. See OLYMPIC GAMES.

TERAUCHI, MARSHAL. See JAPAN, *History.*

TERMAN, LEWIS MADISON (1877–). An American psychologist, born in Johnson County, Ind., and educated at Clark University. He became a high school principal in Smith's Valley, Ind., in 1898. After teaching in the California State Normal School in Los Angeles he went to Stanford University and became professor of education there in 1916. During the War he acted as major in the division of psychology in the Surgeon-General's office in Washington. He was also a member of a board of five psychologists appointed to revise the army mental test methods for use in schools.

TESCHEN, ZIPS, AND ORAVA QUESTIONS. The disposition of these three districts, the first up to 1918 part of Austria and the second and third of Hungray, occasioned a serious dispute between Poland and Czecho-Slovakia. The Duchy of Teschen, though embracing only an area of 2282 square kilometers, but possessing great mineral wealth of coking and gas coal, and situated on the more important road and railway arteries of Central Europe, occupied a place of first rank. In 1910 there were settled here 233,850 Poles, 115,604 Czechs, and 76,916 Germans. It is important to note that the Polish settlements, largely in the mining areas, dated back only to the last half of the nineteenth century and were made up of immigrants from Western Galicia Poles were in the majority in the centre and east; in the west the Czechs were most numerous; while the Germans were settled in the towns (Bielitz, Teschen, etc), and formed the middle class. Ethnical considerations were therefore far from simple; the problem was further complicated by the economic importance of the duchy It forms part of the vast Silesian coal field, and here were mined in 1913 7,594,865 tons of coal and 1,146,580 tons of coke. Such was the basis of the protracted struggle for possession before the Peace Conference, and after. On the grounds of history and economic necessity (Karvin coal supported the great Czech iron and chemical industries at Witkowitz, Moravska, Ostrava, etc., while the Oderberg-Jablunka railway was vitally necessary for the maintenance of communications between Slovakia and the West), the Czecho-Slovaks could make out a convincing case. The Poles, on the other hand, supported their claims on ethnical grounds, although these were disputed, as the Polish population was relatively unstable. Other considerations had, however, entered into the controversy. On the collapse of Austria in October, 1918, two local Silesian organizations took possession of the duchy and effected a common administration On Nov. 5, 1918, control was divided between the two, the Czechs establishing themselves in the smaller western portion east of Freistadt, and the Poles in the remainder. In January, 1919, against Czecho-Slovak protests, Polish troops occupied eastern Teschen. The Czechs, on their side, took Oderberg after a skirmish; an armistice on February 5 laid down a new line more favorable to Czecho-Slovakia this time. In view of all these complications and the inability of an Inter-Allied Commission, at work on the spot, to suggest a solution, the Peace Conference finally decided to permit the two governments to settle the question between themselves. As they were unable to do this, the Supreme Council, on Sept 27, 1919, ordered plebiscites in the whole duchy as well as in Zips and Orava. By this time the contested region was filled with soldiers, customs officials, and a general ill will. The tension increased, aided by hostile propaganda in both countries, with the result that rioting and strikes grew in frequency. Amid such a state of affairs the holding of the plebiscite was found impracticable and the Inter-Allied Commission so reported to the Supreme Council (July, 1920). An appeal to the contesting powers again revealed a deadlock. This time, in the interests of European peace, the Supreme Council called upon the Council of Ambassadors to effect a settlement (July 11, 1920). On July 28, in accordance with the decision of the Supreme Council, the Council of Ambassadors announced its findings for Teschen, Zips, and Orava. The boundary as finally laid down gave Czecho-Slovakia the Oderberg-Jablunka line and all territory west of it, including the mines of Ostrau-Karvin and the city of Freistadt. The town of Teschen was to remain with Poland, which also acquired the German enclave of Bielitz in the midst of a rich agricultural region. The necessity for dividing a region that was economically and culturally a unit was unfortunate but the nationalistic fevers awakened by the War made any other solution impossible. The contest was not finally closed until December, 1923, when, on the appeal of Poland, the Permanent Court of International Justice reviewed the proceedings and pronounced in favor of the boundary line of July 28, 1920.

Involved in the same controversy was the disposition of the counties of Zips and Orava (formerly of Hungary). Northwest Zips and northeast Orava were claimed by Poland on historical and ethnical grounds. In 1910, there were in Orava 2000 Magyars, 1528 Germans, 59,096 Slovaks, and 16,120 "others" (the Magyar way of referring to Poles); in Zips there were 18,658 Magyars, 38,432 Germans, 97,077 Slovaks, 12,327 Ruthenes, and 5629 "others." Both countries were occupied by Czecho-Slovakia in November, 1918, on the ground that the inhabitants of the highlands were not ethnically Polish; but the difficulties attending the Teschen solution prevented a settlement here The decision of the Council of Ambassadors of July 28, 1920, gave Poland northeastern Orava with the line of demarcation south of the main Carpathian divide, and northwestern Zips with the line north of the divide. Economically the partition seemed justified because of the close connection between the frontier villages and Galicia, but on ethnical grounds there appeared more reason for entire union with Czecho-Slovakia.

TEWFIK, AHMED. PASHA (1843–). Turkish statesman, born at Constantinople. From 1859 to 1870 he served in the Turkish army, resigning in the latter year to enter the translation bureau of the government. During the Russo-Turkish War he acted as political agent for the army and later became Turkish minister at Athens. In 1884 he was ambassador at Berlin, and was recalled in 1895 to be minister of foreign affairs in his home government. He was Grand Vizier in 1909, again in 1912, and for the third time in 1918. The government which he formed in 1918 excluded all the members of the Committee of Union and Progress. He resigned in March, 1919, but again assumed charge of the government in October, 1920, and retained it until November, 1922, when the Sultan, Mohammed VI, abdicated. On the break-up of the old régime at Constantinople, he fled to Egypt.

TEXAS. Texas is the first State in size (265,896 square miles), and the fifth in population; capital, Austin. The population increased from 3,896,542 in 1910 to 4,663,228 in 1920, a gain of 19.7 per cent. The white population increased from 3,204,848 to 3,918,165; Negro, from 690,049 to 741,694; native white, from 2,964,864 to 3,557,646; and foreign-born white, from 239,984 to 360,519. Both urban and rural populations mounted, the former from 938,104 to 1,512,689; the latter from 2,958,438 to 3,150,539. The growth of the principal cities

was as follows: San Antonio (q.v.), 96,614 in 1910, 161,379 in 1920; Dallas (q.v), 92,104, and 158,976; Houston (q.v.), 78,800, and 138,276; Fort Worth (q.v.), 73,312, and 106,482; and Galveston, 36,981, and 44,255.

Agriculture. As Texas is one of the chief cotton-producing States, agricultural conditions were early affected by the ravages of the boll weevil, which made its first appearance in that State in the nineties. The insect continued to spread over the State where cotton is grown, but although the yield of cotton fell considerably during several years, especially in 1918–21, for the most part the production was comparatively constant except in occasional years when climatic conditions favored the weevil. This will be noted from a comparison of the acreage and production for several years: in 1913, 12,597,000 acres, 3,945,000 bales; 1915, 10,510,000 acres, 3,227,000 bales; 1918, 11,233,000 acres, 2,697,000 bales; 1920, 11,898,000 acres, 4,345,000 bales, 1921, 10,745,000 acres, 2,198,000 bales; 1922, 12,125,000 acres, 3,290,000 bales. The estimated production in 1923 was 4,168,000 bales.

While the population of the State increased 19.7 per cent in the decade, the number of farms increased only 4.4 per cent (from 417,770 in 1910 to 436,033 in 1920); the acreage of land in farms from 112,435,067 to 114,020,621, or 1.4 per cent, and the improved land in farms from 27,360,666 to 31,227,503 acres, or 14.1 per cent The value of farm property showed an apparent increase of 100.5 per cent, from $2,218,645,164 in 1910 to $4,447,420,321 in 1920, the average value per farm, from $5311 to $10,200. In interpreting these values and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the 436,033 farms in 1920, 201,210 were operated by owners, 2514 by managers, and 232,309 by tenants. The corresponding figures for 1910 were 195,863, 2332, and 219,575. White farmers in 1920 numbered 357,249 and colored farmers 78,784. In 1910 white farmers numbered 347,852, and colored farmers, 69,918 Farms free from mortgage in 1920 numbered 105,490; those under mortgage, 69,940. In 1910, farms free from mortgage numbered 128,082; those mortgaged, 64,008 The total number of cattle in 1920 was 6,156,715, of which 1,463,707 were dairy cattle. In 1910 cattle numbered 6,934,586; 1,013,867 dairy cattle. Sheep in 1920 numbered 2,573,485, compared with 1,808,709; hogs, 2,225,558, compared with 2,336,363. The estimated production of the principal farm products in 1923 was as follows: corn, 85,907,000 bushels; wheat, 16,370,000 bushels; oats, 51,119,000 bushels; barley, 3,346,000 bushels; potatoes, 1,789,000 bushels: sweet potatoes, 5,322,000 bushels; hay, 617,000 tons; rice, 5,143,000 bushels, and peanuts, 81,766,000 bushels. Comparative figures for 1913 are: corn, 163,200,000 bushels; wheat, 13,650,000; oats, 32,500,000; barley, 168,000; rice, 9,696,000; potatoes, 2,340,000; and hay, 464,000 tons.

Mining. Through the remarkable development of the oil fields of the State, Texas has become in recent years one of the most important of the mineral-producing States in the value of its products. In 1921 it ranked seventh. Petroleum production in the decade 1914–24 was as follows: 20,068,184 barrels in 1914, valued at $14,942,848; 24,942,701 in 1915, $13,026,925; 27,644,605 in 1916, $25,760,335; 32,413,287 in 1917, $42,891,555; 38,750,031 in 1918, $74,867,537; 96,868,000 in 1920, $313,781,000; 106,166,000 in 1921, $162,663,000; 118,684,000 in 1922. The great increase in production in the last years of the decade resulted from the development of important new petroleum fields. The increased value in the two years 1922–23, while due largely to the increase in the output, reflects also the decreased purchasing power of money resulting from inflation, with consequent higher prices. The output of natural gas is very valuable. In 1914 this amounted to 13,433,639 M cubic feet, valued at $2,469,770; 1916, 15,809,579, $3,143,871; 1918, 13,439,624, $5,027,449, 1920, 37,063,000, $7,042,000; 1921, 44,504,000, $8,893,000. Natural-gas gasoline after 1916 became an important product. In that year the output was 1,292,811 gallons; in 1918, it was 7,326,122 gallons; 1920, 32,956,028; 1921, 77,141,201. The State also produces sulphur, cement, clay products, a small quantity of iron ore, gypsum, and other minerals. The total value of the mineral production in 1921 was $212,141,250, compared with $371,250,979 in 1920; $190,563,015 in 1919; $110,306,367 in 1918; and $30,363,426 in 1914.

Manufactures. Texas has increased greatly in importance as an industrial State, especially in the period 1914–19, when the petroleum refining industry increased to an extraordinary extent. There were, in 1920, 29 cities having more than 10,000 inhabitants. These formed 23.4 per cent of the State's population, and produced 40 8 per cent of the value of the State's manufactured products. There were in the State 4588 manufacturing establishments in 1909; 5084 in 1914; and 5724 in 1919. Persons engaged in manufacture numbered 84,575, 91,114, and 130,911; and the capital invested amounted to $216,875,579, $283,543,820, and $585,770,451 in those years. The value of products in 1909 amounted to $272,895,635; in 1914, to $361,279,303; and in 1919, to $999,995,796. The large increase in value of products was due chiefly to changes in industrial conditions effected by the War, and cannot be used to measure the growth of manufactures between the industrial censuses of 1914 and 1919; but the increase in number of persons engaged in manufacture clearly indicates a decided growth in the manufacturing activities of the State The refining of petroleum is the first industry in point of value of product. As this industry did not develop to any extent till after 1914, the only available figures are those of 1919, in which year the product amounted to $241,757,000 in value. Slaughtering and meat packing is second in importance, with a value of $42,530,000 in 1909; $52,990,000 in 1914; and $125,364,000 in 1919. The manufacture of cotton-seed oil and cake is third, with $29,916,000 in 1909; $41,945,000 in 1914; and $102,112,000 in 1919. Flour-mill and gristmill products, in fourth place, amounted to $32,485,000 in 1909; $35,110,000 in 1914; and $73,064,000 in 1919.

Education. The chief educational problems of Texas come from its great expanse and widely scattered population. The decade 1913–23 saw continuous progress in their solution. The Legislature at its various sessions passed many laws which resulted in improved conditions:

for one, the Better Class Amendment to the State Constitution, passed in 1918, which removed all limit on the rate of local tax which a district may vote for support of its schools. Numerous campaigns for education carried on during this period aroused the entire State to greater interest in all the schools, and particularly in the rural schools. The salaries of public school teachers were increased on an average of 54 per cent during the decade; and with this increase came improvement of the qualifications of teachers. With better support, the schools increased the length of their terms. Many improvements were made in rural schools, especially in the direction of consolidation and the transportation of pupils. Considerable advance was made in vocational education under the Smith-Hughes Law which gives Federal aid to States. A system of free textbooks was introduced, approved and established; and a plan of classifying and affiliating elementary schools was initiated. A campaign was waged for the passage of a law providing for the establishment of a county unit system of managing schools. Schools for Negroes and Mexicans were greatly improved. Recognition for the work of women on equal terms with that of men progressed. The enrollment in the public schools in 1909–10 was 821,631; in the elementary schools in 1921–22 it was 1,048,619, and in the high schools, 163,178. The expenditures for the support of schools in 1922 was $38,356,046. The percentage of illiteracy in the State decreased from 11.6 in 1910 to 9.6 in 1920: in the native white population, from 3.7 to 2.5; among the Negro, from 31.4 to 23.4. In the foreign-born white population it increased from 28 per cent to 33.3

Finance. For finance, see STATE FINANCES.

Political Events. The State remained overwhelmingly Democratic in the decade 1914–24, although as usual the party was divided by factions. The Ku Klux Klan acquired great strength in 1922 and took an important part in deciding elections of State and other officials, but its power waned considerably in 1924. In 1914, James E. Ferguson was elected governor. At this election an amendment to the constitution providing for the initiative and referendum was defeated. Governor Ferguson was reelected in 1916, and Senator Culberson was reelected. In the presidential voting of this year, Wilson received 285,909; Charles E. Hughes, 69,949. In August, 1917, impeachment charges were filed against Governor Ferguson for alleged misappropriation of public funds. The charges were made by the Speaker of the House, and on August 23 the House voted for the impeachment of the Governor on 21 different counts Trial began in the Senate on Aug. 30, 1917, and on Sept. 25, 1917, that body removed the Governor from office and disqualified him from further holding any office in the State. He had resigned a few hours before. Of the 21 charges, 10 were sustained; nearly all these related to the misuse of trust funds and public money. The Governor denied all these charges and ran for the governorship again in 1918. He was defeated by the former Lieutenant-Governor, W. P. Hobby, who had succeeded him at the close of the impeachment proceedings. Morris Sheppard was reëlected to the United States Senate in 1918. Ferguson was a candidate for the United States presidency on a so-called American ticket. Pat M. Neff was elected governor. In a nominating primary for United States Senator in 1922, Earl B. Mayfield and James E. Ferguson won in the first primaries over Senator Culberson. In the run-off primary, Mayfield was nominated, and in November he was elected. Governor Neff was also reelected. The Ku Klux Klan developed great strength in the State, and it was alleged that Senator Mayfield was nominated largely as a result of its support, the anti-Klan vote scattering among a number of other candidates. Charges of excessive expenditures in his election were filed with the Committee on Elections in the Senate. These charges were still pending, Aug. 12, 1924. In the presidential convention held in May, 1924, William G. McAdoo of California received the indorsement for president.

Legislation. The most important acts of the Legislature in the decade 1914-24 are noted below. A resolution for a constitutional amendment providing for woman suffrage was defeated in the House by a vote of 90 to 32. The Legislature of 1919 submitted to the people the question of holding a constitutional convention It also submitted a constitutional amendment for woman suffrage. Both were defeated. In 1921 the Legislature passed an amendment forbidding Japanese and Chinese to hold land in Texas except under certain conditions It also passed an amendment designing to make more effective the provisions of the existing law in respect to the conservation of the State's natural resources, and provided for the organization of coöperative marketing associations. It also proposed a constitutional amendment restricting the suffrage to native-born or naturalized citizens and authorized absentee voting in primary elections. The commission form of government was extended to towns with less than 5000 population, and a constitutional amendment was adopted increasing the amount of the pensions paid to Confederate soldiers and sailors and their widows. The Legislature of 1923 enacted a measure substituting electrocution for hanging in capital punishment. It amended the prohibition law so as to make it more stringent in its provisions and passed an enabling act providing an increase in pensions for Confederate veterans.

TEXAS, UNIVERSITY OF. A coeducational State institution founded in 1881 The main university is at Austin, the medical branch at Galveston, and the College of Mines and Metallurgy at El Paso The student enrollment increased from 2576 in 1914 to 3235 in 1918; 4571 in 1920; and 5100 in 1923–24, with 3145 in the summer session of 1923. The faculty was increased during the decade from 191 to 354, the library from 110,000 bound volumes and 30,000 pamphlets to 237,682 volumes and 49,349 pamphlets. The productive funds of the university aggregated $10,856,372.02 in 1924. The Genaro García collection of materials in the Latin American field was secured in 1921 at a cost of $104,539. The department of journalism was opened in 1914; the department of library science in 1918; and the School of Business Administration, which in 1912–13 was organized as a department of the College of Arts and Sciences, became a separate school in 1922–23. The College of Mines and Metallurgy was created in 1919, following the passage of an act by the State Legislature constituting the State School of Mines and Metallurgy a branch of

the University of Texas. Robert E. Vinson, D.D., LL.D., became president in 1916, upon the resignation of Sidney E. Mezes, who accepted the presidency of the College of the City of New York. In 1923, President Vinson resigned to accept the presidency of Western Reserve University, Cleveland, and William S. Sutton, M.A., LL.D., dean of the School of Education, was appointed acting president.

TEXAS FEVER. See VETERINARY MEDICINE.

TEXTILE MANUFACTURING. The American textile industry in 1921, according to the United States Census, ranked second among the various manufacturing industries of the country when considered on the basis of the total value of the product. This value was represented by the vast amount of $6,960,927,643, which was the output of 26,039 establishments with an average number of wage earners of 1,510,875. In this total production textile fabrics and materials aggregated $3,896,448,661, articles from textile fabrics for personal wear $2,710,656,748, and other textile fabrics $353,822,234. It must be realized, however, that 1921 was a year of some depression in the textile industry though it manifested signs of a recovery from the serious setback which had begun in the spring of 1920 and continued through that year. In 1919, a year of abnormal activity, the value of the product was $9,216,102,814, representing the output of 28,552 establishments with an average number of wage earners of 1,611,309. Both years, however, represented a gain over 1914 when 23,483 establishments with 1,061,058 wage earners had a production valued at $3,447,997,219.

The textile industry in the United States is ordinarily divided into five principal groups, as follows: cotton manufactures, wool manufactures, knit goods, silk manufactures, and cordage and twine, jute and linen goods, this ranking being made on the basis of the value of their products.

In all of these various lines there had been activity in the decade between 1914 and 1924 and this is indicated by Table I, which shows the new textile mill construction for the 10-year period. It must be remembered that usually the new mills were large affairs, as modern conditions of profitable operation called for large units.

Cotton Manufactures. Cotton goods, cotton small wares, and cotton lace goods form the most important branch of the American textile industry. Of these three the manufacture of cotton goods naturally is by far the most important as cotton small wares and lace goods form a comparatively small portion of the total output. The cotton-goods manufacturing industry includes mills engaged in the preliminary processes preparatory to spinning, in spinning, and in the weaving of piece goods. The number of establishments, persons engaged, amount of wage, cost of material, and the value of the total product are shown in Table II.

TABLE II—COTTON-GOODS INDUSTRY IN THE UNITED STATES [a]

Years	Number of establishments [b]	Persons engaged	Salaries and wages	Cost of materials	Value added by manufacture [c]	Value of products
1914	1,168	338,726	$161,680,000	$431,603,000	$244,966,000	$676,569,000
1919	1,278	445,423	392,839,000	1,277,786,000	847,486,000	2,125,272,000
1921	1,328	425,319	364,182,000	707,442,000	570,779,000	1,278,221,000

[a] From the Bureau of the Census report on the cotton-goods industry, 1921.
[b] Statistics for establishments with products valued at less than $5000 are not included in the figures for 1921; there were 10 establishments of this class which reported 8 wage earners and products valued at $22,600. For 1919, however, data for 10 such establishments, reporting 20 wage earners and products valued at $26,000, and for 1914 data for 11 such establishments, reporting 18 wage earners and products valued at $23,000, are included in the figures with the exception of the item "Number of establishments."
[c] Value of products less cost of materials.

In 1923, the United States had approximately 24 per cent of the world's total of cotton spindles (see Table III on page 1288). The cotton-goods industry is confined principally to the New England and South Atlantic States, with a few mills scattered through the Middle West The centres of the greatest activity are Bristol County, Mass., with 7,702,569 spindles, and Gaston County, N. C., with 901,492 spindles. Table IV gives the distribution of the industry according to the number of spindles for the 10 leading States.

At the end of 1923 the total number of cotton spindles in the southern States was 17,163,599 as compared with 13,478,297 in 1914, the average annual increase being 446,791. Southern cotton mills, with still less than half the spindles in America, however, were consuming considerably more than half the cotton manufactured in the country.

The increased spindleage and greater efficiency of cotton mills in the United States enabled that country as regards the consumption of cotton to maintain a higher level than in prewar years, as compared with other nations where there was a great falling off in consumption, in the United Kingdom and continental Europe Notwithstanding strikes in the New England cotton mills in 1922, the consumption of cotton increased over the previous year in the United States by 12.6 per cent. In 1913, the United Kingdom in its manufactures used more than 4,500,000 bales and the Continent approximately 7,500,000 bales; in 1922, they took, respectively, but 2,900,000 and 4,800,000 bales. On the other hand, the Far East was increasing its proportion of the world total. The actual and relative consumption of all kinds of

Growth of Mercerization. In 1898, after German and English mercerizers had sought to gain a market in the United States for their yarns and fabrics with the peculiar lustre acquired in the process, the American mercerization industry was founded. It was started in a small way but upon a firm basis and from 1898 to 1904 some 34,000,000 pounds of cotton yarn were estimated to have been mercerized, sumption of mercerized yarns was over 50,000,000 pounds. At the end of 1923 the annual capacity of the largest yarn-mercerizing plant in the United States, working on a single shift basis, was nearly half of the latter amount. In addition, piece mercerizing aggregated hundreds of millions of yards annually and represented as broad a variety of utility as yarn mercerizing.

Wool and Wool Manufacturing. In 1922, Australia led the world as a producer of wool with 618,475,000 pounds, or about 23 per cent of the total, while the United States ranked second with 261,095,000 pounds, or 9.7 per cent of the world supply; and Argentina was third, with 231,483,000 pounds, or 8.6 per cent of the total. After the production and importation of the wool comes the manufacture of the raw material—which includes scouring, carding, spinning, and weaving—into various kinds of cloth, such as worsted goods, woolen goods, carpets and rugs (other than rag), felt goods, and wool-felt hats.

Wool manufacturing according to the census of 1921 ranked second in the value of its product of the five primary textile groups. Raw wool was produced in all of the 48 States, but most of it came from the middle western and far western States. Wool manufacturing, on the other hand, centres in the New England and Middle Atlantic States. Of the 814 establishments reporting for 1921, 198 were located in Pennsylvania, 180 in Massachusetts, 86 in Rhode Island, 57 in Maine, 43 in Connecticut, 39 in New Hampshire, 38 in New York, 28 in New Jersey, 18 in Vermont, and 127 in other States. The numbers of woolen and worsted spindles and looms in the United States are shown in Tables IX and X. The number of persons engaged, wages, value added by manufacture, and total value of product are shown in Table VI.

Knit Goods. This industry in the United States, as will appear from the accompanying tables, from the census of manufactures of 1921, experienced a remarkable growth from 1914 on. It includes the separate industries hosiery, fancy knit goods, underwear, knitted cloth and contract work Cotton hosiery and cotton knit underwear combined represented approximately 52 per cent of the value of the total output ot knit goods in the United States

TABLE VI—WOOLEN AND WORSTED GOODS INDUSTRY IN THE UNITED STATES [a]

Years	Number of establishments [b]	Persons engaged	Salaries and wages	Cost of materials	Value added by manufacture [c]	Value of products
1914	737	164,690	$86,500,000	$246,497,000	$132,987,000	$379,484,000

in 1909, but by 1919 this proportion had been reduced to about 41 per cent, due largely to the phenomenal growth of the outerwear industry, which used more wool and silk than cotton. In 1921 New York was the leading State in the industry, producing about 27 per cent of the total value of the output. During that year New York had 710 knit-goods establishments; Pennsylvania, 614; North Carolina, 109; New Jersey, 82; Massachusetts, 81, other States, 482 The number of establishments, employees, value added by manufacture, and total value of product are given in Table XII.

In the 1921 Census there was to be seen a marked increase in quantity and value of fancy knit goods as compared with 1919, and an enormous increase over 1914. The fabric branch of the industry showed a continued growth, with the adoption of these materials for women's wear. While there was a moderate increase in the production of union suits, there was a steady decline in the production of separate shirts and drawers, the output of these garments amounting to a little more than half of the 1919 output. The hosiery production seemed to indicate a stable condition.

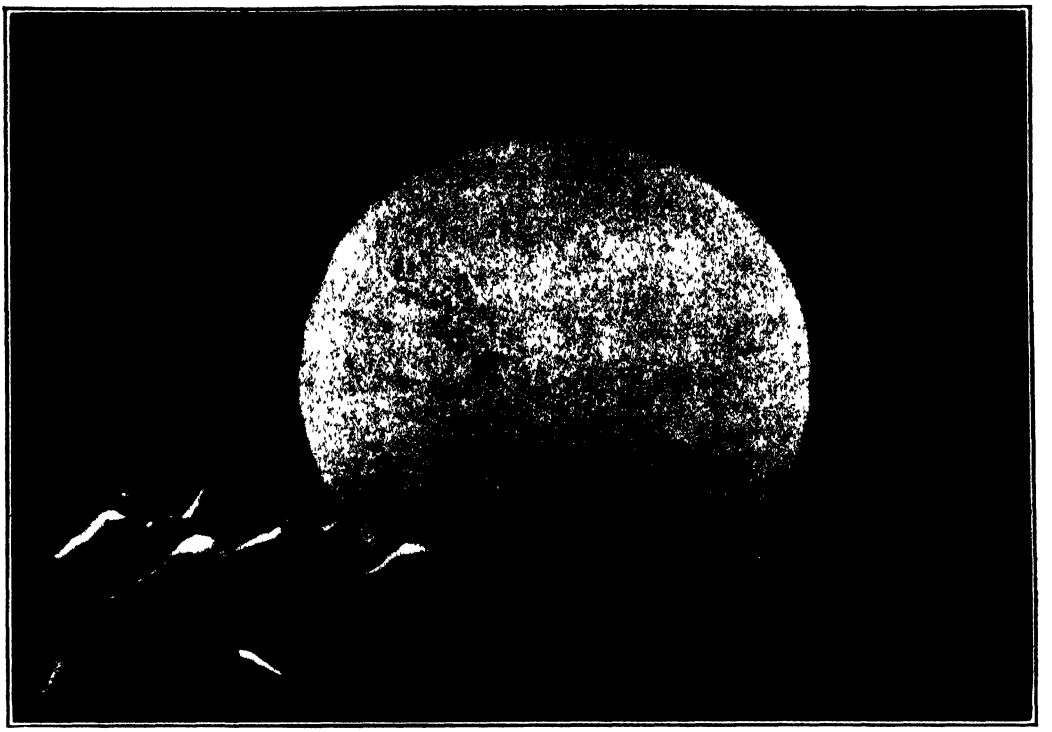
Other Textile Industries. The other industries, such as cordage and twine, jute and linen goods, while important, do not rank with these already considered and for that reason may be discussed in the present limited space. In 1921, the cordage and twine industry, with 118 establishments, represented an output of $75,356,000. The jute industry, with 24 establishments, represented a production of $17,506,000.



THARAUD, JEAN (1877–) and JEROME (1874–). French novelists (see VOL. XXII). They were awarded the Grand Prix de Littérature of the French Academy in 1920. Their works include: *Dingley, l'Illustre Ecrivain; La Maîtresse Servante; La Fête Arabe; La Tragédie de Ravaillac; La Bataille à Scutari d'Albanie; La Vie et la Mort de Dépoulède; L'Ombre de la Croix; Un Royaume de Dieu; Quand Israel Est Roi; Marocaines; Une Relève; La Randonnée de Sama Diouf; L'An Prochain à Jérusalem.* English translations have been made of *Sama Diouf* and *Un Royaume de Dieu.*

THEATRE, AMERICAN AND ENGLISH An introductory word is perhaps essential to justify the transposition of the supplementary article on DRAMA in THE NEW INTERNATIONAL ENCYCLOPÆDIA to the heading, THEATRE. In brief, this course is a recognition of the fact that the renaissance in dramatic art throughout the world during the last 25 years and in America in particular in the last 10 or 15 years was characterized fundamentally by a realization that the theatre is a distinct and separate art and not a mosaic of several arts, certainly not merely or even primarily a question of drama as literature. Producer and scene designer, actor and musician, came into their own more and more with each passing season as collaborators in this art alongside the playwright. In fact, producer and scenic artist forged beyond the dramatist, challenging him to keep up with the pace they set in order that the art of the theatre might be kept in proper balance.

In this process of becoming independent and not only æsthetically effective but socially significant, the contemporary art of the theatre found in America, and particularly in New York, a haven of refuge, an international clearing-house. Like the Byzantine Greeks at the end of the Middle Ages who fled the dissolution of the Eastern Empire, swarmed into Italy and western Europe and sowed the seeds of the Renaissance, the leading artists of all the continental theatres came to America in an ever-swelling stream because war and the economic and spiritual stagnation of the ensuing peace hampered æsthetic self-expression on their native stages.

During the early years of this influx, accident played the ruling rôle. America was the first open door into which the hounded artist could dodge. Increasingly, the movement assumed definite, conscious and controlled character. Without erecting barriers against any one, America had in later seasons deliberately chosen to invite and welcome those artists who seemed most likely to further by their example and stimulus its own dramatic renaissance. The peak of the movement in this aspect was reached in 1923 when, under the sponsorship of Morris Gest, the Moscow Art Theatre with the entire first line of its world-celebrated acting company arrived in personal charge of its co-founder, Constantin Stanislavsky, to present 13 of its productions for a total of 279 performances in 10 cities and thereby to prove emphatically the worth of thoroughgoing preparation, of the repertory system, of the actor as most indispensable of the theatre's craftsmen and of the coöperative organization of the theatre without a star. Likewise, late in the same year and under the same sponsorship, Max Reinhardt, foremost central European stage director and sharer with Stanislavsky, Gordon Craig and Adolph Appia in the honors of stirring and guiding the contemporary world renaissance of theatrical art, came to New York to exemplify in *The Miracle* his theory of fusing performers and spectators in a vividly emotional experience.

The achievements of the Continental theatres from which the American theatre had thus drawn new life were not for the most part a matter of the last decade It is true, the so-called "expressionist" drama and method of staging plays had developed into a conscious if often still sporadic and ineffectual movement within this period. The revolt against the "realistic" ideology in the theatre followed in the footsteps of similar revolt in the graphic and plastic arts, with diverse attempts to dig beneath and behind the outer aspects of life to the hidden soul within and to "express" or "present" it directly to the human emotions rather than to carry it through the medium of "representing" its superficial aspects. Ernst Toller, author of *Masse Mensch,* Georg Kaiser, author of *From Morn to Midnight,* and Walter Hasenclever, among German playwrights; Nikolai Yevreynov, playwright and producer and proponent of the theory of "monodrama," Vsevolod Meyerhold, producer, and the Kamerny Theatre of Moscow, among Russian dramatic artists; and numerous others of lesser stature

A Scene from the Abstract Production of "Macbeth" by Arthur Hopkins from Designs by Robert Edmond Jones

throughout continental Europe, contributed toward this movement.

But, except for the possible influence on the development of the American playwright, Eugene O'Neill, this movement had not found a secure home on the American stage, achieving its bravest defeat with the abstract interpretation of *Macbeth* at the hands of Robert Edmond Jones, designer, and Arthur Hopkins, producer, in the spring of 1921.

The effective impact of foreign stimulus and example on the American theatre was beholden, rather, to personalities and forces whose genesis dated back 20 and 25 years to the Moscow Art Theatre and to Reinhardt, who exerted their influence in person, and to Gordon Craig and Adolph Appia, whose conception of the art of the theatre as a unique and unified art on its own account was exerted from afar or by proxy on American visitors who received the stimulus of their works, their personalities or their ideas abroad and returned to leaven our native stage with them.

In no respect is the contrast between the American theatre and the English more evident than in this mind open to new ideas and in readiness to absorb and often improve on them. From the time the outbreak of the War in 1914 called a halt to the promising repertory theatre movement and to the project for a national theatre as a Shakespeare memorial in London, the English stage was impervious to new impressions from outside and all but barren of native experimental effort. Exceptions to this rule of doldrums were the rebirth, after discouraging struggle, of the Stratford-on-Avon Players, under the sponsorship of Archibald Flower and other Stratford citizens and the guidance of W. Bridges-Adams; the persistent and scarcely appreciated efforts of the Everyman Theatre in Hampstead and of the Old Vic south of the Thames in London; and the continuation of the Birmingham Repertory Theatre, sole survivor of the promising provincial movement that included Manchester, Liverpool and Glasgow before the War. For the most part, however, the chief concern of these theatres was the revival of classic plays.

Among British playwrights, likewise, the 10-year period was discouragingly fruitless. Bernard Shaw alone preserved the reputation of the group, for, without counting short sketches, he added to his canon such major works as *Heartbreak House*, pungent and bitter commentary on the futility of the War; *Back to Methuselah*, mastodonic summary of human civilization in five parts; and *Saint Joan*, ripest flower of his incisive intellect and imagination. John Galsworthy comes second, with *The Skin Game* and *Loyalties* as his most notable contributions to the depiction of contemporary human psychology on the stage. Of the elder figures, Barrie wrought with his old skill in *The Legend of Leonora* and *Dear Brutus* and less successfully in *Mary Rose*, while Pinero's *The Enchanted Cottage* is almost the sole faint reminder of the position he held through the decades that bounded the turn of the century. No playwright of the first order emerged from among the younger generation unless it be Clemence Dane, whose *A Bill of Divorcement* was not matched by her later *Will Shakespeare*. On the Irish side, Lennox Robinson alone fulfilled the promise of his early days when the Abbey Theatre with Synge as its most priceless treasure was holding out hope of a renaissance of English drama. Robinson's output was meagre, but *The Lost Leader* and *The White-Headed Boy* indicated that more would still be heard from him.

The vitality of the American stage presents a strong contrast. Rather, the vitality of the New York stage, for the handicap of prohibitive railroad rates and the competition of the motion picture and other forms of popular amusement during the 10 years all but wiped out the serious theatre outside the metropolis and several of the larger cities Little by little, "the road" was building up its own dramatic structure by the development of Little Theatres, but the process was slow and halting Meanwhile, the audience in the city unfolded, expanded, with an expanding theatre.

Although our playwrights loitered behind our stage designers and our producers, there was more vitality and promise in them than ever before. Eugene O'Neill, still in his early thirties, led with *Beyond the Horizon*, *Diff'rent*, and *Anna Christie* among his major realistic works and *The Emperor Jones* and *The Hairy Ape* as brilliant ventures into expressionism—all written and produced within the last five years of the decade.

But O'Neill was not alone; other noteworthy practitioners of realism were Rachel Crothers; Owen Davis, with *Icebound;* Arthur Richman, with *Ambush;* Gilbert Emery, with *The Hero* and *Tarnish*. Romantic realists included Zoë Akins, reaching her best level in *Déclassée* and *Daddy's Gone a-Hunting;* Edward Sheldon, with the world-popular *Romance;* Percy MacKaye, whose outstanding achievement was his expansive civic masques. Writers of comedy and satire were particularly strong in numbers: George S. Kaufman and Marc Connelly, represented by *Dulcy*, *To the Ladies* and *Beggar on Horseback;* Frank Craven, by *Too Many Cooks* and *The First Year;* George M. Cohan, by *Seven Keys to Baldpate* and *Broadway Jones;* James Forbes, by *The Show Shop* and *The Famous Mrs. Fair;* Jesse Lynch Williams, by *Why Marry?* and *Why Not?;* George Middleton, Guy Bolton, Martin Brown, Don Marquis and many others. Bold experimenters in new forms included Zona Gale, with *Miss Lulu Bett* and *Mr. Pitt;* Elmer Rice, with *On Trial* and *The Adding Machine;* Susan Glaspell, with *Bernice* and *Inheritors*.

Besides these, we have many more who address themselves to an adult intelligence. It is possible to name 30 whose premières could be attended by the reasonably exacting playgoer with at least an even chance of finding something to hold his attention. In sheer numbers, probably no European capital could surpass us. And out of these numbers, by competition, by contagious rivalry and mutual stimulus, something seemed bound to happen.

Our producers, though a nondescript lot, grew more rapidly than the playwrights in their realization of the opportunity offered them. Outgrowing the complacent traditions of the age of the "Elder Showmen," they displayed a willingness to experiment undreamed of a decade earlier. Most heartening was the sound development of groups as producers, such as the Washington Square Players and their inheritors, the Theatre Guild; the Provincetown Players, discoverers of O'Neill; the Neighborhood Playhouse, example of the theatre as both

social and æsthetic experimental force; and the Equity Players, the actors' own theatre. Not the least heartening aspect of the growth of the producer as guiding hand in the unified art of the theatre was the attention devoted to training in play production and play writing in our colleges, especially at the Carnegie Institute of Technology in Pittsburgh and in the "47 Workshop" under Prof. George Pierce Baker at Harvard.

In the vanguard of the awakening American theatre stood the stage designer. Reacting before his fellow craftsmen to the stimulus from abroad, he outdistanced them, only to be wrongfully charged with trying to warp the art of the theatre and draw undeserved attention to himself. Such scenic artists as Robert Edmond Jones, Norman-Bel Geddes, and Lee Simonson, however, had the interest of the entire theatre at heart and generously served the cause of its balanced development rather than their own craft.

Like the playwright, the actor, too, lagged, waiting for more efficient direction and above all, more economic and more human and reasonable theatrical administration to give of his best to an art in which he plays the central rôle.

Nothing can summarize more vividly the range of activity which made up these years from 1914 to 1924 than a list of the outstanding productions made within this period, together with the names of those craftsmen most prominently identified with them. This list is reprinted from the volume, *Our American Theatre*, by Oliver M. Sayler, with the permission of the publisher, Brentano.

Important Productions on the American Stage, 1914-24

Season of 1914-15. *Saint Louis, a Civic Masque*, by Percy Mackaye, produced on Art Hill, Forest Park, St. Louis, Mo., May 28, 1914, by Joseph Lindon Smith and Oliver M. Sayler, with 7500 citizens—preceded by *The Pageant of Saint Louis*, by Thomas Wood Stevens, *On Trial*, by Elmer L. Reizenstein (now Rice), produced at the Candler Theatre (now the Sam H. Harris), New York, Aug. 19, 1914, by Arthur Hopkins and Cohan and Harris, *The Phantom Rival*, by Franz Molnar, produced at the Belasco Theatre, New York, Oct. 6, 1914, by David Belasco, with Leo Ditrichstein; *Pygmalion*, by George Bernard Shaw, produced at the Liberty Theatre, New York, Oct. 12, 1914, by Liebler and Company, with Mrs. Patrick Campbell, *A Pair of Silk Stockings*, by Cyril Harcourt, produced at the Little Theatre, New York, Oct. 20, 1914, by Winthrop Ames; *Chin-Chin*, by Anne Caldwell, R. H. Burnside and Ivan Caryll, produced at the Globe Theatre, New York, Oct. 20, 1914, by Charles B. Dillingham, with Fred Stone and David Montgomery; *Watch Your Step*, by Irving Berlin and Harry B. Smith, produced at the New Amsterdam Theatre, New York Dec. 8, 1914, by Charles B. Dillingham, with Vernon and Irene Castle and Frank Tinney (designers, Robert McQuinn and Helen Dryden), *The Show Shop*, by James Forbes, produced at the Hudson Theatre, New York, Dec. 31, 1914, by Selwyn and Company, with Douglas Fairbanks and George Sidney. *Children of Earth*, by Alice Brown, produced at the Booth Theatre, New York, Jan. 12, 1915, by Winthrop Ames, with Herbert Kelcey and Effie Shannon; *Marie-Odile*, by Edward Knoblauch (now Knoblock), produced at the Belasco Theatre, New York, Jan. 26, 1915, by David Belasco, with Frances Starr; *Androcles and the Lion*, by George Bernard Shaw, produced at Wallack's Theatre, New York, Jan. 27, 1915, by Granville Barker, with O. P. Heggie—preceded by *The Man Who Married a Dumb Wife*, by Anatole France, with scenery by Robert Edmond Jones; *Jephthah's Daughter*, dance drama, music by Lilia Mackay-Cantell, produced at the Neighborhood Playhouse, New York, Feb. 12, 1915, by the Festival Dancers as the first bill of the Playhouse, *A Midsummer Night's Dream*, by William Shakespeare, produced at Wallack's Theatre, New York, Feb. 16, 1915, by Granville Barker; *Interior*, by Maurice Maeterlinck, *Licensed*, by Basil Lawrence (Lawrence Langner), *Eugenically Speaking*, by Edward Goodman, and *Another Interior*, a pantomime arranged by Ralph Roeder—four one-act plays produced at the Bandbox Theatre, New York, Feb. 19, 1915, by the Washington Square Players as their first bill; *The Glittering Gate*, by Lord Dunsany, produced at the Neighborhood Playhouse, New York, Mar. 6, 1915, by the Neighborhood Players, *The Doctor's Dilemma*, by George Bernard Shaw, produced at Wallack's Theatre, New York, Mar. 26, 1915, by Granville Barker, *John Gabriel Borkman*, by Henrik Ibsen, produced at the 48th Street Theatre, New York, Apr. 13, 1915, by Emanuel Reicher, *Nobody Home*, by Guy Bolton and Jerome Kern, produced at the Princess Theatre, New York, Apr. 20, 1915, by F. Ray Comstock and Morris Gest.

Season of 1915-16. The Stratford upon Avon Players, in Shakespearean repertory, with Frank H. Benson and Murray Carrington, appearing in many cities outside New York. *Constancy*, by Neith Boyce, and *Suppressed Desires*, by George Cram Cook and Susan Glaspell, produced at the Wharf Theatre, Provincetown, Mass., in the summer of 1915, by the Provincetown Players as their first bill, *The Boomerang*, by Winchell Smith and Victor Mapes, produced at the Belasco Theatre, New York, Aug. 10, 1915, by David Belasco, with Arthur Byron, Wallace Eddinger and Martha Hedman, *The New York Idea*, by Langdon Mitchell, revived at the Playhouse, New York, Sept. 28, 1915, by William A. Brady, with Grace George, *The Unchastened Woman*, by Louis K. Anspacher, produced at the 39th Street Theatre, New York, Oct. 9, 1915, by Oliver Morosco, with Emily Stevens; *Major Barbara*, by George Bernard Shaw, produced at the Playhouse, New York, Dec. 9, 1915, by William A. Brady, with Grace George, *The Weavers*, by Gerhart Hauptmann, produced at the Garden Theatre, New York, Dec. 14, 1915, by Emanuel Reicher, for the Modern Stage Society, *The Devil's Garden*, by William B. Maxwell and Edith Ellis, produced at the Harris Theatre, New York Dec. 28, 1915, by Arthur Hopkins, Diaghilev's Ballet Russe, presented, with extended repertory, at the Century Theatre, New York, Jan. 16, 1916, by the Metropolitan Opera Company (designers, Leon Bakst, Alexander Benois, Alexander Golovin, etc.), *Erstwhile Susan*, by Helen R. Martin and Marian de Forest produced at the Gaiety Theatre, New York, Jan. 18, 1916, by Corey, Williams and Riter, with Minnie Maddern Fiske, *The Cohan Revue, 1916*, by George M. Cohan, produced at the Astor Theatre, New York, Feb. 9, 1916, by George M. Cohan, *The Magical City*, by Zoe Akins, produced at the Bandbox Theatre, New York, Mar. 20, 1916, by the Washington Square Players, *Justice*, by John Galsworthy, produced at the Candler Theatre (afterward the Sam H. Harris), New York, Apr. 3, 1916, by John D. Williams, with John Barrymore, *A Night at an Inn*, by Lord Dunsany, produced at the Neighborhood Playhouse, New York, Apr. 22, 1916, by the Neighborhood Players; *The Tempest*, by William Shakespeare, produced at the Century Theatre, New York Apr. 24, 1916, by John Corbin and Louis Calvert, for the Drama Society; *Caliban, by the Yellow Sands*, by Percy Mackaye, produced at the Stadium of the College of the City of New York, May 25, 1916, by Oliver M. Sayler, Joseph Urban, Robert Edmond Jones, Richard Ordynski, Garnet Holme, Cecil Sharpe, Hazel Mackaye and Irving Pichel for the New York City Shakespeare Tercentenary Celebration Committee with Isadora Duncan, John Drew, Edith Wynne Matthison, etc., and 2500 citizens (designers, Joseph Urban and Robert Edmond Jones)—reproduced at the Harvard Stadium, Cambridge, Mass., July 2, 1917, by Oliver M. Sayler, Frederick Stanhope, Robert Edmond Jones, Irving Pichel, Samuel A. Eliot, Jr., Virginia Tanner, Percy Burell and Hazel Mackaye, with 5000 citizens.

Season of 1916-17. *Good Gracious, Annabelle*, by Clare Kummer, produced at the Republic Theatre, New York, Oct. 31, 1916, by Arthur Hopkins (designer, Robert Edmond Jones), *Bound East for Cardiff*, by Eugene O'Neill, *The Game*, by Louise Bryant, and *King Arthur's Socks*, by Floyd Dell—three one-act plays produced at the Provincetown Playhouse, New York, in the autumn of 1916, by the Provincetown Players as their first bill in New York City; *Trifles*, by Susan Glaspell, and *Bushido*, from the Japanese of Takeda Izumo, two of a bill of four short plays produced at the Comedy Theatre, New York, Nov. 13, 1916, by the Washington Square Players; *The Inca of Perusalem*, by George Bernard Shaw, *The Queen's Enemies*, by Lord Dunsany, and *Great Catherine*, by George Bernard Shaw—three short plays produced Nov. 14, 1916, at the Neighborhood Playhouse by Gertrude Kingston; *The Gods of the Mountain*, by Lord Dunsany, *Sir Who Pass While the Lentils Boil* and *Nevertheless* by Stuart Walker—three short plays produced in the Portmanteau Theatre at the 39th Street Theatre, New York, Nov. 27, 1916, by Stuart Walker; *A Kiss for Cinderella*, by James M. Barrie, produced at the Empire Theatre, New York, Dec. 25, 1916, by Charles Frohman, Inc., with Maude Adams; *A Successful Calamity*, by Clare Kummer, produced at the

THELEN, MAX (1880–). An American lawyer, born at Rising City, Neb., and educated in law at the University of California. In 1904 he began the practice of law in San Francisco. He was for many years counsel for several railroads and for the California State Railroad Commission, of which he was a member from 1912 to 1918. He lectured on international law at the University of California from 1907 to 1913. During the War he was chairman of the special war commission and was also chairman of the petroleum commission of the California State Council of Defense. During the period of the War and after, he filled many important positions on advisory boards, on matters relating to railroads, and was Director of Public Service for the United States Railroad Administration in 1919–20. For his services he was awarded the Distinguished Service Medal. He was a member of legal and other societies and was the author of *Leading Railroad and Public Service Commissions* (1912).

THEOSOPHICAL SOCIETY. A society founded in New York City, in 1875, by Mme. H. P. Blavatsky, assisted by Henry S. Olcott, William Q. Judge, and others. The international headquarters were removed in 1879 to Adyar in India, the residence of Dr. Annie Besant, president of the society. Its objects, in general, are to study all matters relating to theosophy and to furnish information in regard to it. The headquarters of the American section are at Chicago, and branches are maintained in all parts of the world. The society continued its activities in the decade 1914–24. Many new lodges were organized. The membership increased from 4714 in 1916 to 7048 in 1918, and to some 8000 in 1923. L. W. Rogers, elected in 1920, was president of the American section.

THEUNIS, GEORGES (?–). A Belgian statesman. He began his career in the army, but soon tired of garrison duty and left it for a position on the stock exchange of Brussels. He reëntered the army in 1914 with the rank of colonel and was at once appointed by the government to buy war supplies in England. His success in this work led to his appointment as Belgian High Commissioner at London and later as Belgian delegate in the settlement of the financial and economic questions arising out of the indemnity conferences. In 1910 he was made finance minister, and at the end of 1921 he became premier. Here many difficulties confronted him, among them the problem of Flemish disaffection and the occupation of the Ruhr. In 1924 he attended the Reparations Commission's conference in London and took part in the deliberations in regard to the Dawes Report which was finally adopted in August, 1924.

THIBAUD, JACQUES (1880–). A French violinist, born at Bordeaux. He received his first instruction from his father and then entered the Paris Conservatoire, where he studied under Marsick and won the first prize in 1896. After his début at Paris in 1898, he made several very successful tours of Europe and visited the United States for the first time in 1903. In December, 1914, an American tour was suddenly interrupted by the death of his father, and after that he served a year in the French army. The experiences through which he passed must have made an indelible impression on his mind and affected his whole conception of art. On his reappearance in 1916, he revealed a breadth of conception and an emotional intensity of which his previous performances had given no intimation. From a player of charming elegance and refinement he had, in an incredibly short time, grown into one of colossal power.

THIBAUDET, ALBERT (1874–). A French literary critic, born at Tournus, Saône-et-Loire, and educated at the Sorbonne, where he became a professor. His studies on Barrès, Bergson, and the intellectual currents of the last generation in French letters, are genuine and disciplined analyses of modern life. His works include: *La Poésie de Stéphane Mallarmé; Les Heures de l'Acropole; Trente Ans de Vie Française; Gustave Flaubert; La Vie de M. Maurice Barrès; Le Bergsonisme.*

THOMAS, JAMES HENRY (1878–). An English Labor politician, born at Newport. He started to work when but nine years of age as errand boy and later was engine cleaner, fireman, and engine driver for the Great Western Railway Company. He soon became prominent in the labor unions and in 1910 was elected president of the Amalgamated Society of Railway Servants, since merged in the National Union of Railway Servants, of which he was secretary for many years. He was elected to Parliament in 1910. During the War he used his great influence with the railway men in composing labor disputes and obtained large increases in wages for them. In March, 1919, he visited Lloyd George in Paris by airplane to consult him in regard to a railway strike crisis. He was made Privy Councilor in 1917 and Colonial Secretary in the Labor cabinet in 1924.

THOMPSON, WILLIAM BOYCE (1869–). An American banker, born at Virginia City, Mont., and educated at the Columbia University School of Mines. Engaging in business in New York City, he became director and officer in many important financial institutions. From its organization until 1919 he was a director of the Federal Reserve Bank in New York and in 1919 became president of the Roosevelt Memorial Association. He headed the American Red Cross Commission to Russia in 1917 and was envoy extraordinary from the United States to the first centennial of the Proclamation of Independence of the Republic of Peru. In 1921–22 he was a member of the advisory committee of the American delegation at the Disarmament Conference.

THOREK, MAX (1880–). An American surgeon who, having received his degree from Rush Medical College in 1904, settled in Chicago and for a time was connected with the medical department of Loyola University as professor of clinical surgery. He was later chosen president and surgical chief of the new American Hospital and is also one of the consulting surgeons of Cook County Hospital. He has done considerable work in experimental surgery, has written numerous surgical papers, and in 1909 translated into English Krause's *Surgery of the Brain and Spinal Cord.* In

1924 appeared his large monograph *The Human Testis*, in which are summed up all the developments in the grafting of the male gonad.

THORNDIKE, EDWARD LEE (1874–). An American educational psychologist (see VOL. XXII). He became in 1921 professor and director of psychology of the Institute of Educational Research. He published after 1914 numerous important monographs and papers on the application of mathematics to educational measurement, and also new editions of his standard two-volume work on *Educational Psychology*

THRACE. Largely a transition land between the Turkish and Balkan peoples, without natural boundaries, and with mixed racial groups. Thrace, like Macedonia to the south, has been one of the storm-centres of the Balkans. The Treaty of Bucharest (1913) placed Greece, on the east, at the Mesta River. Between the Mesta and the Maritza, by the same treaty, Bulgaria acquired the region known as Western Thrace. East of the Maritza, including Adrianople and Kirk Kilissa, and stretching to the Straits, extended the region known as Eastern Thrace, which continued to remain in Turkish hands. Western Thrace, with a total population of 200,500, comprised 44,000 Greeks, 124,000 Turks, 29,500 Bulgars, 3000 others; Eastern Thrace, with a population of 805,369, was made up of 395,515 Greeks, 344,011 Turks, 67,843 Bulgars. For the realization of the Greater Greece, therefore, it was necessary to expand to the south and east to absorb these Greek populations and at the same time complete the encirclement of Constantinople, the barring of Bulgaria from the Ægean, and the shutting off of Turkey from its contacts with Europe. Thus, in the way of Greece stood Bulgaria and Turkey, and largely because these were allied with the Central Powers, was Venizelos convinced that Greece's lot had to be thrown in with the Entente. Bulgaria, of course, was not unaware of where her own interests lay. In 1915, as the price of her entry into the War, she exacted from Turkey two important strips of territory, one being the Adrianople enclave, particularly Karagach, and the second the left bank of the Maritza. But with the Entente triumphant the realization of Greek nationalistic hopes seemed assured. By the Treaty of Neuilly (Nov. 27, 1919) Bulgaria was compelled to cede Western Thrace to the Allies for Greece, and Greek sovereignty was circumscribed only in these three respects: (1) Bulgarian freedom of transit of the Ægean was guaranteed; (2) the Maritza might be constituted an international river if Greece and Bulgaria requested it; (3) racial minorities, particularly at Adrianople, were to be protected. While the cession, territorially, was of no great importance—the region has only a length of 80 miles and an average depth of 30—and really left Bulgaria with a strategic boundary line, economically it meant Bulgarian disaster. Bulgaria was deprived of her front on the Ægean, of contact with the ports of Kavalla, Porto Lagos, Dedeagach—in short of the fruits of the First Balkan War—and compelled to be once again a Black Sea country. Bulgarians, in 1919, felt that they were then where they had been in 1911.

Here was the realization of one part of the Greek programme. But it was only a minor part, for Eastern Thrace was the section Venizelos, above all things, desired. Lloyd George had shown himself consistently friendly to the Greek aspirations. By gaining over the powerful British support, Venizelos saw his hopes crowned with success when in 1920 Greek troops received permission to occupy Eastern Thrace. By the Treaty of Sèvres (Aug. 10, 1920), the stamp of permanency seemed to be put on the proceedings, for Turkey was compelled to grant to Greece all of Eastern Thrace to the Chatalja lines (i.e. the western boundaries of the Zone of the Straits). Greece now not only had a firm foothold on the whole Ægean, possessed Adrianople and Kirk Kilissa, but also had an outlet on the Black Sea. But Venizelos fell in November, 1920, and with his passing the star of Greece entered into its decline. The fortunes of Greece in the years 1921 and 1922 are reviewed elsewhere in this work (see GREECE, TURKEY, SMYRNA). The destiny of Eastern Thrace depended upon the success or failure of the Greek arms, and with the Turkish nationalist victory, Greeks were compelled to see their representatives renounce Eastern Thrace and Adrianople to the "Grand National Assembly of Turkey," by the Mudania Agreement of Oct. 11, 1922. Turks immediately occupied the area up to the right bank of the Maritza. By the Treaty of Lausanne (July 24, 1923) Greece was completely humiliated. Not only was she compelled to part with Smyrna (q.v.) and the Dodecanese (q.v.), but the whole of Eastern Thrace was taken from her to be turned back to Turkey. Greece's frontier stopped at the Maritza, with the exception of the Karagach district opposite Adrianople; Turkish sovereignty was once more proclaimed over Adrianople and Kirk Kilissa. For the prevention of boundary disorders, the Treaty of Lausanne, in an annexe, provided for the demilitarization of a special area stretching from the Ægean between Makri and Imbrije Burnu to the Black Sea between Anberler and Serkes Burnu, and including the Greek, Bulgarian, and Turkish boundaries in Eastern Thrace

THROOP POLYTECHNIC INSTITUTE. See CALIFORNIA INSTITUTE OF TECHNOLOGY

THURINGIA. A Free State of Germany formed, on Dec. 24, 1919, by the union of the following states: Saxe-Weimar, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sonderhausen, Saxe-Gotha (Coburg had merged with Bavaria), Reuss (formed on Apr. 4, 1919, of the two republics of Reuss) Total area, 4546 square miles; population in 1919, 1,512,806. Principal towns with their 1919 population: Weimar, the capital, 41,403; Gera, 74,993; Gotha, 48,543; Jena, 53,906 The German Reich, on Apr 30, 1920, recognized the union as being consonant with the provisions of Article 18 of the new German constitution of 1919. Elections to the first diet of Thuringia were held in June, 1920, and this body, on Mar. 11, 1921, adopted the constitution which a Volksrat or People's Council, made up of representatives of the old legislatures had drawn up Like the other states of the Reich, Thuringia has a single-chamber diet elected by proportional representation. The executive power is vested in a ministry elected by the diet and made up (1921) of five ministers with portfolio and three councilors of state (without portfolio). There is no president Legislative power is in part delegated and in part directly

applied, for the electorate may exercise the initiative and referendum. See GERMANY.

THURSTON, ERNEST TEMPLE (1879–). An English novelist, born at Halesworth. At the age of 16 he published two volumes of verse, and his first novel appeared two years later. His writings include: *The Apple of Eden* (1905); *Traffic* (1906); *The Evolution of Katherine* (1907); *The Realist* (1907), *Sally Bishop* (1908); *The City of Beautiful Nonsense* (1909); *The Greatest Wish in the World* (1910); *The Garden of Resurrection* (1911); *The Antagonists* (1912); *Richard Furlong* (1913); *The Passionate Crime* (1915); *The Five-Barred Gate* (1916); *Enchantment* (1917); *The World of Wonderful Reality* (1920); *The Green Bough* (1921); *The Eye of the Wift* (1922). His plays include: *The Greatest Wish* (1912); *Driven* (1914); *The Cost* (1914); *The Wandering Jew* (1920).

TIBET. A Chinese outer territory, with an area of 463,200 square miles, and a population estimated at from 2,000,000 to 6,000,000. Lhasa, the capital, had from 15,000 to 20,000 inhabitants in 1923. Agriculture was carried on, but only to a slight extent because of the difficult topography. Pastoral pursuits were more common. Communications, by means of caravan, were maintained with China and India, an active barter in tea, silks, cotton goods, carpets, leathers, dried fruits and household utensils for the native wool, fox skins, musk, salt, and borax, being prosecuted. In 1921–22, a typical post-war year, exports into India, mainly raw wool, totaled £231,100; imports from India, £551,300, mainly cotton goods. The British penetration, actuated by a desire to establish economic relations between India and Tibet and to reach southern China, continued during the period 1914–24. The political situation remained anomalous. The Chinese government's refusal to accept the terms of the Simla agreement of 1914 which provided for an autonomous Outer Tibet and an Inner Tibet ruled from Peking, and the continued demands of Tibetans for independence, brought about a state of suspicion and hostility which broke out into open war in 1917. Tibetans marched on Chamdo, claimed for both Outer and Inner Tibet, and took it in 1918. An armistice followed, and in the next year the Chinese displayed their desire for peace by proposing a renewal of treaty discussions But the Chinese government showed its weakness by its inability to put down native uprisings in the Inner Tibet, while Great Britain's interest in safeguarding the Indian frontier complicated matters. By 1924, it was evident that Outer Tibet had practically become a dependency of Great Britain. The Dalai Lama remained at the head of the native government.

TICK ERADICATION. See VETERINARY MEDICINE.

TIFFANY, LOUIS COMFORT (1848–). An American artist (see VOL. XXII). He established the Louis Comfort Tiffany Foundation for art students at Oyster Bay in 1918 and gave it a $1,000,000 fund, the income from which was to be used for maintenance and operation. The Foundation consisted of his country home, the Museum, Tiffany Chapel, and over 60 acres of land, and he deeded to it his entire collection of paintings, glass, and other art objects.

TILDEN, WILLIAM T. II. (?–). Tennis player, born at Philadelphia, Pa. He won the national singles championship of the United States from William M. Johnston in 1920 and has retained the title ever since. As a member of the American Davis Cup team his magnificent playing has contributed greatly to the successful defense of the international trophy.

TILNEY, FREDERICK (1875–). An American neurologist, born in Brooklyn, and educated at Yale University and the Long Island College Hospital. In 1903 he settled in New York City and was appointed visiting neurologist to Roosevelt and Bellevue Hospitals He became full professor of neurology at Columbia University in 1914. In addition to numerous contributions on neurological subjects to periodical literature he wrote: *A Study of the Hypophysis Cerebri* (1911); *Morphology and Evolutionary Significance of the Pituitary Body*, with L. F. Warren (1919); *Epidemic Encephalitis*, with H. S. Howe (1920); *The Form and Functions of the Central Nervous System*, with H. A Riley (1920, 1923).

TIMBER. See FORESTRY.

TIN. In 1914, the world production of tin amounted to 116,569 long tons, of which more than one-half came from the Straits Settlements and the Malay Peninsula. In 1917, the tin production for the world was estimated at 128,243 long tons, and from this point there was a decline until 1921, when the world produced but 99,728 long tons. In 1922, the output increased to 128,586 long tons and supplies reached the level of pre-war days. The leading producers in 1922 were the Malay Straits with 35,288 long tons, Bolivia with 31,942 long tons, Banka with 15,922 long tons, Billiton, etc., with 14,500 long tons, China with 12,435 long tons, Australia with 2657 long tons and Siam and India with 6500 long tons.

The most notable tendency in regard to the production of tin was the increase in the exports from Bolivia, which increased from 22,355 metric tons tin contents of ore in 1914 to 32,123 metric tons tin contents of ore in 1922, this being shipped in the form of black tin concentrates, part of which came to the United States and was smelted in American refineries. During the decade the tin-mining industry virtually became extinct in Cornwall, England, after having flourished there for a number of years. The world possessed a large smelting capacity for tin, a substantial portion of it located in the United States, and as a result there was found considerable variation in the imports. Thus in 1912 imports in the United States were 116,003,385 pounds, valued at $50,371,102. In 1914 there was an import of 95,049,612 pounds, valued at $32,861,188; and in 1919 maximum imports of 164,579,905 pounds, valued at $104,588,690. This import declined to 154,201,000 pounds, valued at $46,302,701, in 1922.

In the season of 1920–21 there was a very limited demand for tin, and even on the reduced basis the production exceeded the consumption. Accordingly, various large producers and certain colonial governments decided to enter into an agreement to hold the accumulated supplies rather than sacrifice them on the market, or in other words, form a pool which would be gradually liquidated under favorable circumstances.

TIRES. See MOTOR VEHICLES; RUBBER.

TIROL. A province of the Republic of Austria. Its area in 1910 was 10,301.7 square miles; in 1923, 4882 square miles. Its popula-

tion in 1910 was 946,613; in 1923, 313,699. See AUSTRIAN REPUBLIC; TIROL, GERMAN SOUTH.

TIROL, GERMAN SOUTH. On the possession of this area, made up of the districts of Trentino (area, 2454 square miles) and Alto Adige (area, 2953 square miles) centred a bitter struggle between Austria and Italy, and though Italy emerged victorious in 1919 by gaining the region through the Treaty of St. Germain, subsequent events revealed that it still remained a source of grave conflict. Racial figures reveal the situation. The Trentino, in 1910, seated 13,450 Germans and 360,847 Italians; Alto Adige had 215,796 Germans, 6704 Italians, and 19,605 Ladins (who speak a dialect akin to Italian). Italy's claims, therefore, for frontier rectification north of the Trentino could be based only on strategical grounds. Austrian control of the Alpine passes meant that the plains of Lombardy and Venetia lay always open to a hostile attack, and the easy success with which the Austrian armies had poured into Italy in 1916 gave point to the contention. This consideration had been behind one of the guiding principles of the Italian foreign policy. In the early months of the War, when both sides were exerting all their efforts to gain either Italian adhesion (Allies) or to assure Italian neutrality (Central Powers), a series of conversations was carried on between the Italian and Austrian foreign offices that indicated a readiness on the part of Austria to listen to Italian demands. On Apr. 8, 1915, the proposals of Sonnino called for territorial compensations that included the Trentino and a part of Alto Adige stretching to north of Bozen and cutting athwart the Meran railway from the Brenner Pass. Baron Burian for Austria made two Austrian offers, the second of which offered to cede the Trentino, but halted at the transfer of Bozen. On May 3, stating that an agreement was impossible, Sonnino declared for Italy that the treaty of alliance with Austria was terminated and that henceforth Italy reserved to herself "complete liberty of action." It is interesting to note that a week preceding, on Apr. 26, 1915, Italy had signed with the Allies the secret Treaty of London, by which, for her actual support in the War, she was assured not only the Trentino and Bozen but the whole German South Tirol to the Brenner Pass, including the old German towns of Bozen, Brixen, and Meran and the wholly German-populated valleys of the Oltzthal and the Zillerthal. On this treaty Italy plainly took her stand at the Peace Conference. Regardless of the fact that there were 230,000 Germans in the territory, that the Ladins in October, 1918, had expressed their sympathies as being with the German Tirolese, and that the whole Tirol was a perfect political and economic unit, the Peace Conference finally yielded to the Italian demands and incorporated, substantially, the London line into the Treaty of St. Germain (on May 29, 1919). Thus, in the conflict between Point Nine of President Wilson's Fourteen Points and the matter of treaty obligations, the highly vaunted democratic principles of the War met with defeat. There was widespread disaffection, too, on the part of the smaller powers because Italy, unlike themselves, was not compelled to sign a Minorities Treaty. It was plain that for an Italia Irredenta an Austria Irredenta had been substituted. The events of 1919–24 only served to confirm this fact. On Jan. 20, 1919, the Austrian Tirolese Diet passed a resolution refusing to recognize the cession of South Tirol; in April, 1921, the Austrian Tirolese, realizing that the weakness of their own country might stand in the way of an eventual readjustment, voted for union with Germany. Economically, the leading Tirolese industries of wine and fruit growing were languishing because of the destruction of the former Austrian and German markets. On the other hand, Italy, perversely it seemed, did everything to fan the flame of Tirolese discontent. From April, 1922, on, with the advent of Fascism, the population was subjected to a series of outrages, which, under the Mussolini régime, turned into legal oppression. Italianization of the inhabitants proceeded rapidly in 1923–24: Italian place names were substituted for the universally known German; Italian was prescribed as the official language of public bodies and the courts; Italian officials began to be introduced in completely German-speaking parishes and Austrian railway and postal employees were dropped for Italians; all instruction in elementary schools was being changed to Italian while religious instruction was undergoing the same change (beginning October, 1923). Finally, in 1924, Italians began to confiscate the property of the German citizens residing in the South Tirol, in direct violation of the Treaty of St. Germain. Thus, there was bitterness and want and the development of a deep seated hostility in 1924.

TITANIUM OXIDE. See CHEMISTRY.

TITCHENER, EDWARD BRADFORD (1867–). A leading American psychologist (see VOL. XXII). On the twenty-fifth anniversary of his association with the Cornell University laboratory he was honored with a volume of commemorative *Essays* (1917) written by his former pupils. In 1924 he was preparing *Systematic Psychology,* which was to incorporate the experimental findings of the Cornell laboratory on perception, movement, and the integration of sensational attributes. Besides scientific papers, the only work published by Titchener since 1914 is *A Beginner's Psychology* (1915).

TITTONI, TOMMASO (1885–). An Italian statesman, born at Rome, educated at Naples, Oxford, and Liége. He was elected to Parliament as deputy for Civitavecchia in 1886 and resigned in 1897 to accept the post of prefect of Perugia. He held a similar office in Naples in 1900 and was made a senator in 1902. As foreign minister in the cabinet of Giolitti, he made an effort to bring Italy into closer connection with Austria and also with France. Later, as foreign minister in the Fortis cabinet, he proposed to reduce the duty on Spanish wines; the storm occasioned by this proposal wrecked the cabinet, Dec. 24, 1905. In March, 1906, he was appointed ambassador to London, but in a couple of months he was again called to his former post under Giolitti; this he retained till 1909. In 1910 he was appointed ambassador to France. He declared himself in favor of Italian neutrality in 1914, and after Italy's entry into the War he resigned from the French ambassadorship. Premier Nitti gave him the post of foreign minister in 1919 and that of first delegate to the Peace Conference, but he was obliged to resign in November because of ill health. He was appointed president of the Senate in December, 1919, and later Italian delegate to the Council and Assembly of the League of Nations, but his health

did not permit him to act. His publications include: *Sei Anni di Politica Estera* (1912); *Italy's Foreign and Colonial Policy* (1915); *The Responsibility of the War* (1916); *Conflitti Politici e Riforme Costituzionali* (1919); *Per la Guerra e per la Pace* (1919).

TODD, ARTHUR JAMES (1878–). An American sociologist, born at Petaluma, Cal., and educated at the University of California and Yale University and in Paris and Munich. He was connected with settlement and probation work in San Francisco for several years and in 1911 became instructor in sociology at the University of Illinois. In 1914–15 he was professor and head of the department of the University of Pittsburgh, and from 1915 to 1921, professor of sociology and director of the training course for social and civic work at the University of Minnesota. In 1919 Professor Todd was also visiting professor of sociology at Northwestern University. He was editor for the American Institute of Criminal Law and Criminology and wrote: *The Primitive Family as an Educational Agency* (1913); *Theories of Social Progress* (1918); and *The Scientific Spirit and Social Work* (1919).

TODD, HENRY DAVIS, JR. (1866–). An American army officer, born at Claverack, N. Y., and graduated at the United States Military Academy in 1890. He entered the artillery division of the army and was promoted through the grades until he reached the rank of lieutenant-colonel of artillery in 1913. He commanded the 33d Division from September 18 to Dec. 7, 1917, the artillery supporting the 1st Division in the St. Mihiel offensive, and the 58th Field Artillery Brigade at the Meuse-Argonne battle. He was with the 33d Division in Luxemburg as part of the army of occupation. In August, 1919, on the demobilization of the 33d Division, he entered the General Staff College in Washington. He was made brigadier-general in the Regular Army in 1920 and was assigned to command the coast defenses of Manila Bay on June 3, 1921.

TOGOLAND. Formerly a German protectorate on the coast of West Africa, between the Gold Coast and Dahomey, but since 1919 partitioned between Great Britain and France as mandate territories. It had an area of 33,700 square miles, and a native population of 1,032,000. The whites, on Jan. 1, 1913, numbered 368, of whom 320 were Germans. Lome was the chief port. Products for export were palm kernels and oil, rubber, ivory, and copra, though cotton, coffee, tobacco, and cacao were becoming important. Exports for 1913 were 9,138,000 marks (£456,000) and imports 10,631,000 marks (£531,000). For 1913–14, the budget balanced at 4,057,136 marks and the colony was self-supporting. Railways totaled 204 miles. In 1913 a cable line linked Germany with Togoland, and a wireless station at Kamina was in direct communication with Berlin. German local officials attempted to keep the territory neutral during the War, but the offer was refused and local British and French troops invaded the country. Opposition was slight with the result that the colony was completely occupied in August, 1914. Mandates were granted Great Britain and France by the Supreme Council in May, 1919; in July, 1919, the country was partitioned by both interested parties provisionally, and in September, 1920, permanently. France received the port of Lome and the entire seacoast of 32 miles. Her total area, which is contiguous to Dahomey, is 21,200 square miles, with a population of 672,000. The British mandate, contiguous to the Gold Coast, has an area of 12,500 square miles, and a population of about 200,000. Under the British and French the two zones were made self-supporting. Revenues for 1918, for both, were £127,444 and expenditures £118,953. The British zone was attached to the Gold Coast; the French to Dahomey, pending the issue of definite mandates. The country, under the new administration, rapidly regained its stability so that trade for 1919 surpassed the 1913 figures. Imports for the whole in 1919 were £665,332, and exports £850,744. In 1921, imports to the British area were £34,000 and exports from it £46,000. In the French area for 1921 these were 10,918,270 francs and 6,129,677 francs. The most important recent development was the growth of the cotton and cocoa crops. The three railway lines of 204 miles were all in the French territory. In 1923, the French administration took measures against slavery and the use of alcohol and narcotics among the natives.

TOLEDO. The third city of Ohio and the third railroad transportation centre of the United States. The population increased from 239,905 in 1914 to 283,000 in 1924. Toledo's 671 manufacturing industries are so diversified that the great development in the decade 1914–24 can be attributed to no special group, although the manufacture of automobile accessories and equipment has played an important part. Toledo is the world's leading city in soft coal shipments and the centre of the metal wheel industry. The area of the city increased 6 square miles. The assessed value of property was almost doubled in the decade 1914–24. The bonded debt was increased from $9,732,577 to $18,591,244. The tax rate was advanced to take care of improvements and to provide facilities. The Summit Street extension, to link up the South Side by a direct route to the business section, was completed. The Art Museum, costing originally $850,000, a gift from E. D. Libbey, was outgrown and in 1924 was being doubled in size through another gift from Mr. Libbey. The sewerage system was increased by 41 miles to provide intercepting sewers and pumping station. The street railway company was operating under a service-at-cost plan. Bank deposits increased from $50,563,338 in 1914 to $137,000,000 in 1924. There was under construction in 1924 a Safety Building to house Police and Fire Department headquarters, at a cost of approximately $1,000,000. Building in the city's business district received a tremendous stimulus in 1924, and a survey showed that construction estimated at $40,000,000 was in progress. The public school system expanded greatly in the decade. In 1924 there were 41,000 pupils. In ten years, $6,500,000 was spent on buildings, including a million-dollar high school to match the two constructed in 1913. The Great Lakes–St. Lawrence Waterway will establish Toledo as the leading port of the Great Lakes in ocean shipments.

TOLEDO, UNIVERSITY OF THE CITY OF. A municipal institution at Toledo, Ohio, founded in 1872. The student enrollment increased from 1147 in 1918 to 1506 in 1923, the faculty from 30 to 66 members and the library from 4558 to 11,057 volumes. The annual income rose from $145,000 to $174,000. A new science building was completed in 1921 and a department of ele-

mentary teachers' training was established in 1922. President, A. Monroe Stowe, Ph.D.

TOLLER, ERNST (1893–). A German dramatist, born at Samitschin. He attended college at Bromberg, studied at the universities of Heidelberg, Munich, and Grenoble and entered politics in 1918. He was second chairman of the council of workingmen, soldiers, and peasants during the revolution in Munich (1919) and was condemned for his participation to five years' imprisonment in the fortress of Niederschönfeld. There he wrote the plays which have profoundly stirred audiences in Germany: *Wandlung* (1919); *Masse Mensch* (1921); *Die Ludditen* (1921); and *Der Deutsche Hinckemann* (1922). He has also written some verse.

TOLMAN, RICHARD CHACE (1881–). An American chemist, born at West Newton, Mass., and educated at the Massachusetts Institute of Technology, where he was a Dalton fellow. He also studied at Berlin and Crefeld. He was an assistant and instructor at the Massachusetts Institute of Technology (1907–09) and a research associate (1909–10). In 1911 he became assistant professor of chemistry at Cincinnati University and in 1912 accepted a similar appointment at California University. In 1916 he became professor of physical chemistry at Illinois University. At the beginning of the War he was made chief of the dispersoid section of the Chemical Warfare Service with the rank of major and in 1919 was made associate director of the fixed nitrogen research laboratory of the Ordnance Bureau of the United States Army, of which he became director in 1920. His early investigations had to do with colloids, ionization, and similar subjects in physical chemistry. He later investigated the behavior of smokes and reactions of nitrogen compounds. In addition to various minor publications, he is the author of *Investigations on the Relativity of Motion* (1917).

TOLMINO. See WAR IN EUROPE, *Italian Front.*

TOMMASINI, VICENZO (1880–). An Italian composer, born in Rome. He studied there under Pinelli (violin) and Falchi (composition) and later under Max Bruch in Berlin. He is one of the few living impressionists who have not yet crossed the border-line into futurism. He wrote the operas *Medea* (Trieste, 1906), *Amore di Terra Lontana* (not produced), and *Uguale Fortuna* (Rome, 1913); a ballet on themes of Scarlatti, *Le Donne di Buon Umore* (Rome, 1917); the symphonic poems, *Poema Erotico* and *Il Beato Regno;* a prelude to *L'Hymne à la Beauté;* a suite and *Chiaro di Luna* for orchestra; two string quartets and a violin sonata; choruses à cappella; songs; and piano pieces.

TONKING. See FRENCH INDO-CHINA.

TORONTO, UNIVERSITY OF. An institution founded in 1827 at Toronto, Canada, consisting of seven faculties with four arts colleges, supported by the provincial government. The student enrollment in 1914 was 4000, compared with an enrollment of 5044 in the year 1922–23. The figures varied in the years between, reaching their lowest owing to the War in 1918 with a registration of 2296, and their highest in 1922 with a registration of 5349 due chiefly to returned soldiers. The faculty was increased during the decade fom 453 to 621 members, and the library from 138,658 bound volumes and 46,648 pamphlets, to 187,426 volumes and 63,327 pamphlets. The income also increased from $936,727 in 1914 to $1,932,700 in 1923. The Rockefeller Foundation after 1921 had been giving annually the interest on $1,000,000 for the development of the faculty of medicine. Trinity College was under construction in 1923–24. President, Sir Robert A. Falconer, K.C.M.G., M.A., LL.D., Litt.D.

TOTEMISM. See ANTHROPOLOGY.

TOURET, FRANK HALE (1875–). An American Protestant Episcopal bishop, born at Salem, Mass., and educated at Harvard University and the Episcopal Theological Seminary. In 1903 he was ordained to the Protestant Episcopal priesthood and was curate of churches in Providence, Troy, and Colorado Springs until 1908, when he became rector of St. Luke's Church in Fort Collins, Colo. From 1910 to 1917 he was director of Grace Church in Colorado Springs and in 1916 was elected bishop of the Missionary District of Western Colorado. He was elected bishop of Idaho in 1919.

TOVEY, DONALD FRANCIS (1875–). An English composer, born at Eton. He was a private pupil of S. Weisse (piano), Sir W. Parratt (counterpoint), and J. Higgs (composition). From 1906 to 1912 he gave several of his own works at chamber music concerts (The Chelsea Concerts) in London. In 1914 he was appointed Reid Professor of Music at the University of Edinburgh, where, in 1917, he established the Reid Symphony Concerts. He contributed numerous articles on music to the eleventh edition of the *Encyclopædia Britannica* and also to its supplement. As a composer he shows decided preference for chamber music, in which field he produced a piano quintet, a piano quartet, a 'cello sonata, a clarinet sonata, two string quartets, and three trios. He also wrote a symphony; a suite for string orchestra; a piano concerto; incidental music to Maeterlinck's *Aglavaine et Sélysette;* church music; and piano pieces. An opera, *The Bride of Dionysus,* although published, had not yet been produced in 1924.

TOWNER, HORACE M. (1855–). A governor of Porto Rico, born at Belvidere, Ill., and educated at the University of Chicago. He was admitted to the bar in 1877 and after practicing law for some years became judge in the third judicial district of Iowa. From 1911 to 1923 he served continuously in Congress, and although he was elected for another term in 1923, he resigned to accept the post of Governor of Porto Rico, for which his service as chairman of the Congressional Committee on Insular Affairs had especially prepared him.

TOWN PLANNING. See CITY PLANNING.

TOWNSHEND, CHARLES (VERE FERRERS) (1861–1924). A British soldier, commander-in-chief of the Mesopotamia campaign in the War (see VOL. XXII). Although he failed in his attempt to reach Bagdad and was made a prisoner at Constantinople, the Turks, when they saw that War was going against them, gave him the opportunity to help the Allies and at the same time to gain his freedom. He afterward told how he walked from a meeting with the Turkish cabinet, with the edict for the opening of the Dardanelles in his pocket, a free

man. General Townshend resigned from the army in 1920 after 40 years of service He published *My Mesopotamia Campaign* (1920). He died in 1924.

TRADE UNIONISM. The history of trade unionism during 1914–24 may roughly be divided into three periods, the stagnation during the War, the tremendous expansion in the years after the Armistice, and the relative decline in the succeeding few years due to the industrial depression resulting from the War and the peace treaties. For some years before the War, trade unionism had been steadily growing in most countries. The War brought this growth to a sudden halt. The International Federation of Trade Unions and the Trade Internationals ceased to exist and international relations among trade unionists were in abeyance. The effect of the War on trade unionism was, however, by no means uniform in the various countries. While in some countries, as in Germany, trade unions lost in membership and influence, other countries, like Great Britain and the United States, saw a steadily growing development of organized labor. The postwar period witnessed an immediate rebirth of international trade unionism as well as an unprecedented increase in the membership of the labor organizations of practically all countries, although where such increase had been due to war prosperity the membership fell off again once the after-effects of the War made themselves felt. But in general trade unionism had far more strength in 1924 than it had in 1914. The total number of trade unionists in the world had at least doubled within the 10 years. As for mode of organization, the trade or craft union still remained the standard. With the appearance of new industrial problems, however, and with the increasing hold which the idea of industrial democracy had obtained in one form or another on the imagination of the worker, industrial unionism had made rapid progress, although it was still more a potentiality and an aim than an actual system of organization. The industrial world which confronted the trade unionist of 1924 was more complex than it was in 1914. New industrial problems had come to the fore and with them new attempts at solution. The various forms of industrial democracy (q.v.), which had been advanced and in some cases applied, were entirely a product of the decade, and they had taken different shape in the various countries. Another important development was the spread of syndicalism (q.v.), not only in strictly syndicalist labor organizations, but also within the rank and file of orthodox craft unions. See HOURS OF LABOR; LABOR ARBITRATION; LABOR BANKS; LABOR LEGISLATION.

International Trade Union Organizations. The most important trade union international before the War was the International Federation of Trade Unions with headquarters at Amsterdam. In 1912 it had a membership of 7,394,461, representing 19 countries. It was a rather loose organization and went to pieces immediately at the outbreak of the War. During the War an Inter-Allied Trade Union Conference was held at Leeds in 1916 and a Central Powers and Neutral Conference was held at Berne in 1917. Although both conferences and the three labor bureaus at Amsterdam, Paris, and Berlin made attempts to revive some sort of international labor activity, the International Federation of Trade Unions was as dead as the Socialist International. After the War, at the conference at Amsterdam in July, 1919, the old International was reconstructed, although in 1924 it was in reality a new organization. It was an alliance of national trade union federations and trade internationals or, as they are commonly termed, international trade union "secretariats." Its objects were the promotion of the interests of the organizations affiliated with it and of the trade union movement in countries not affiliated with it, the promotion of combined action on all questions of trade union interest, the prevention of international blacklisting, and the provision of funds for these purposes. In July, 1920, the International declared a boycott of the White government in Hungary, which 20 days later had to be abandoned as unsuccessful. The American Federation of Labor had been one of the constituent organizations which formed the International in 1920. Because of the close alliance between the International Federation of Trade Unions and the Socialist International, Samuel Gompers denounced the former as Socialist and the A. F. of L. withdrew in the autumn of 1921. In May, 1924, the advisability of a reaffiliation of the A F. of L. with the International was under discussion. The total membership of the new International at the time of its formation was about 24,000,000. Due to the heavy losses in the membership of the British, Italian, French and other affiliated organizations and to the withdrawal of the A. F. of L., the membership sank to 18,923,931 at the end of 1922. The International Federation of Working Women, established at Geneva in October, 1921, having a membership of 3,500,000 in December of the same year, was an organization independent of the International Federation of Trade Unions, but had the friendliest relations with that body and accepted its principles. Apart from the great International, but affiliated with it, there existed also 28 Trade Internationals or international "secretariats," each one of them comprising the workers within a single industry. Their combined membership in 1922 was a little over 18,000,000. The International Federation of Christian Trade Unions claimed in 1922 over 3,000,000 members. Because of the moderate tendencies of the great International, the International Council of Trade and Industrial Unions or Red International of Labor Unions was formed in July, 1920, by representatives of the All-Russian Trade Unions' Central Council, and a group of communist and syndicalist national federations, and the Executive Committee of the Third International, "to act as a militant international committee for the reorganization of the trade union movement. As may be surmised, this organization was in close connection with the Third International for the purpose of joint action. It carried on an active campaign against the International Federation of Trade Unions, whose methods it termed "yellow" Figures given out on the occasion of its Second Congress, Moscow, December, 1922, and purporting to be complete statistics, claimed the affiliation of 32 countries and a membership of 12,274,000, of which, however, 7,914,000 fell to the share of Russia. For the Syndicalist International see SYNDICALISM.

United States. American trade unionism is

confronted with specifically American conditions and difficulties which preclude a development along European lines and give the American labor movement a distinct character. In spite of these obstacles, however, American organized labor advanced very far during the 10 years. From 1914 onward American public opinion changed its attitude toward organized labor, coming to accept it as a legitimate expression of American democratic ideals. The active support which organized labor gave to the government in the prosecution of the War increased its prestige greatly. It benefited materially from the war prosperity as well as from the relative absence of the competition of immigrant labor during the War. With the close of the War, however, unemployment arrived and gave labor a decided setback. An offensive for the "open shop," which reached its most intensified form in the great steel strike of 1919, was carried on by the employers' organizations and did serious harm to American trade unionism. Another blow to labor was the settlement of the Coronado Case in 1922. The verdict pronounced the liability of trade-union funds for damages in case responsibility had been established. The new movement for industrial democracy found its chief expression in the United States in the Plumb Plan, a scheme sponsored by the railway unions for tripartite control of the railroads by the State, the owners, and the workers. There was a big increase in the number of trade unionists between 1914 and 1924. Perhaps the outstanding event, however, in the American labor movement during that period was the successful organization of the sweated workers in the needle trades into such powerful bodies as the Amalgamated Clothing Workers of America and the International Ladies' Garment Workers' Union and the formation of other groups such as the Amalgamated Textile Workers, the Amalgamated Food Workers, and the American Federation of Teachers.

American Federation of Labor. This organization, comprising most of the trade unionists in the United States and many of those in Canada, counted a great increase in its membership, 1914–24, although the later years of industrial depression cut in on this advance. From 2,020,671 in 1914 the membership rose steadily to 4,078,740 in October, 1920, after which it showed a falling-off. At its Portland Convention in October, 1923, the A. F. of L. reported a membership of 2,926,468. The organization was strictly a federation of craft unions, in spite of the fact that its largest affiliated body, the United Mine Workers of America, with a membership of 400,000, was an industrial union and that there existed within its ranks an active minority in favor of industrial unionism, which, in 1918, led the A. F. of L. into its unsuccessful policy toward unionization of the steel workers and brought about the great steel strike of 1919 with its decisive victory for the "open shop." The A. F. of L., being conservative in policy, did not appeal to the unskilled worker. This conservative tendency manifested itself, aside from the withdrawal from the Amsterdam International, in its consistent opposition to the formation of an American Labor party and in its friendly relationship with the American Legion. The authority of the official element led by President Gompers and the rigid central control had so far been able to keep down the radical elements, although in the last years of the decade a steadily growing opposition with new tendencies had appeared. This became apparent in the Montreal Convention in 1920 when a resolution for government ownership of railroads and inland waterways with democratic control was adopted in spite of Gompers's opposition.

Next to the A. F. of L. the four railroad brotherhoods, with a membership of 400,000, were of foremost importance in the American labor movement. They made handsome gains during the War and, although conservative in character, were more progressive than the A. F. of L. They were the sponsors of the Plumb Plan and showed sympathy for separate political representation of labor. The needle-trade unions are perhaps the most wide-awake labor organizations in the United States. During the 10 years they changed materially the working conditions in their industry and won important concessions for their members. They were socialist in tendency and showed most active sympathy for the struggles of the other workers in the United States. Their membership was approximately 285,000.

Great Britain. British trade unionism made important numerical gains after 1914. Its membership rose from 3,918,809 in that year to 8,023,761 in 1919. In the following years, however, the membership fell to about 5,000,000 or 40 per cent of the wage earners, as a result of post-war conditions and unemployment. The Trade Union Congress, the national organization of the British trade union movement, reported 2,866,077 members in 1914; 6,505,482 in 1920; and 4,352,818 in 1923. Far more significant than their numerical increase was the growth of the influence of the British trade unionists, which may be measured by the fact that in 1924 the Labor party, which is primarily the political expression of British trade unionism, became the governing party. Another feature of this great development was the tendency to form large labor aggregations. The movement for "less unions and more unity" through amalgamation brought the majority of the British trade unionists into relatively few and large bodies, such as the Miners' Federation (750,000 members), the National Union of Railwaymen (327,000), the General Labor Union (500,000), the Amalgamated Transport Workers (1,000,000), the Amalgamated Engineering Union, and the United Textile Factory Workers' Association. At the outbreak of the War, British labor agreed to a general truce between labor and capital. At the famous Treasury Agreement of 1915 the trade unions through their officers, with the exception of the Miners' Federation, abrogated their trade-union rights and agreed to compulsory arbitration. This agreement was given legislative force for the trades concerned with the supply of munitions in the Munitions of War Act of 1915. Under the increasing hardships of the War, however, sections of the rank and file grew restive, felt that they had been betrayed by their leaders, and expressed their revolt through a number of unofficial strikes. This revolt of the men against their leaders culminated in the shop stewards' movement and in the strikes on the Clyde during 1916 and 1917, and threatened at times to disrupt the old form of trade-union organization. The miners, who had not abrogated their freedom to act, showed an independent attitude throughout the War. The rebellious spirit of British labor manifested itself also through the widespread acceptance of

various theories of industrial unionism, syndicalism, and industrial democracy. The establishment of Whitley Councils in various trades by the government was a concession to this spirit This unrest did not abate with the Armistice. Guild socialism (q.v.) spread in the years after the War and the miners made their demand in 1919 for the nationalization of mines which resulted in the Coal Commission and the Sankey Report. In 1920, at the time of the Russo-Polish conflict, the trade unions formed councils of action and by this direct method exerted successful pressure on the British government in favor of nonintervention. In the later years, as a result of the after effects of the War, British labor went through a severe crisis of unemployment, which cut sharply into the membership of the trade unions and decreased their power of action. The outstanding single event of the postwar period and the most severe blow to British labor was the failure of the miners' strike in 1921 and the resultant breakup of the Triple Alliance, the most powerful single labor organization in the world.

Germany. The German trade-union movement is undoubtedly the largest and most influential national labor movement. The German Republic could not last without its consent, as became clearly apparent in 1920 when the German trade unionists by a general strike brought to nought the otherwise successful Kapp Putsch. During the War, German trade unionism was stagnant, but after the War it increased by leaps and bounds until, in 1924, there were about 12,000,000 trade unionists in the country. The largest organization was the General Federation of German Trade Unions with a membership of 7 874,000. It is affiliated with the Amsterdam International, as is also the Federation of Unions of Salaried Employees, with a membership of 640,000. The Federation of Christian Trade Unions, and the Federation of Unions of Christian Salaried Employees, with a combined membership of 1,500,000, were affiliated with the International Federation of Christian Trade Unions. The Federation of Civil Servants was a postwar development and had 1,500,000 members. The Union of Hand and Brain Workers with 320,000 members adhered to the Red International of Labor Unions. See SYNDICALISM.

TRAIN. See ARMIES AND ARMY ORGANIZATION.

TRAIN, ARTHUR (CHENEY) (1875–). An American lawyer and writer, born at Boston, Mass., and educated at Harvard University and its law school. He practiced for several years in New York and from 1901 to 1908 was Assistant District Attorney, a position in which he served again in 1914–15. He was a fiction writer of considerable talent, his books including: *The Man Who Rocked the Earth* (1915); *The Earthquake* (1918); *Tutt and Mr. Tutt* (1920); *The Hermit of Turkey Hollow, By Advice of Counsel,* and *As It Was in the Beginning* (1921); *Tut, Tut, Mr. Tutt!* and *His Children's Children* (1923).

TRANSCAUCASIAN SOVIET REPUBLICS, FEDERATION OF. See RUSSIA; ARMENIA; AZERBAIJAN; GEORGIA.

TRANSFORMERS. See ELECTRIC POWER TRANSMISSION AND DISTRIBUTION.

TRANSJORDANIA, EMIRATE OF, or KERAK. A territory, inhabited by Arabs, lying to the east of the Jordan and to the north of the kingdom of Hedjaz. Area, undetermined; population, estimated at between 300,000 and 500,000, mostly Arabs and Moslems, though there were about 30,000 Christians. Amman, the capital, had 2300 inhabitants. Other towns are Kerak (2500), Es Salt (8000), Ma'an (3000), Madeka (2000), Jerash (1500). The country is for the most part desert, except for the 30-mile district between the Jordan and the Hedjaz railway. The population being nomadic largely, pastoral pursuits were the leading activity. Phosphate deposits have been found, as well as potash, in the Dead Sea. Communications were maintained by a motor road from Amman to Jerusalem and by the portion of the Hedjaz railway running through the country from Daraa to Ma'an. The estimated revenue for 1922–23 was £204,000; the British grant-in-aid, £100,000. The country played a prominent part in the Crusades, then with the defeat of the Christians fell to a series of independent rulers who came out of Egypt. Under the Ottoman Turks (1517–1918) its part was an obscure one until the building of the Hedjaz railway made it easily accessible. In April, 1918, it was invaded by the Emir Faisal, and by the Peace Treaty it was made part of the Palestine mandate under the supervision of the British high commissioner. Emir Faisal, as ruler of Syria, was recognized as sovereign in Transjordania, but after his fall, his brother, the Amir Abdullah, was set upon the throne (April, 1921). In May, 1923, local autonomy was formally granted the Territory by the British high commissioner in Palestine. That Arab dissatisfaction was widespread, however, was indicated in September, 1923, when demands were made for a parliamentary government and the expulsion of the Europeans. See PALESTINE.

TRANSPORT. See VESSEL, NAVAL.

TRANSPORT SERVICE, UNITED STATES NAVAL. See WAR IN EUROPE, *Naval Operations.*

TRANSVAAL PROVINCE. See SOUTH AFRICA, UNION OF.

TRANSYLVANIA. Before the War an integral part of Hungary, but since December, 1918, a Rumanian province. Area, 22,312 square miles; population in 1910, 2,678,367. Cluj (Klausenburg), the principal city, had an estimated population of 65,500 in 1920. The inhabitants in 1910 were divided racially as follows: 55 per cent Rumanian, 34.3 per cent Magyar (known locally as Szeklers), 8.7 per cent German (i.e. Saxons). There were also some Ruthenians and Slovaks. Among all these the Jews numbered about 65,000. The people pursued for the most part agricultural and pastoral activities, the industrial life occupying only a small place. The Rumanians were chiefly peasants, herdsmen, and hillsmen, largely illiterate, and culturally and economically completely dominated by their Magyar overlords. Klausenburg, the capital, was the centre not of Rumanian, but of Hungarian intellectual life. The limit of Transylvania, on the edge of the Rumanian Forelands, coincided with a number of important towns in the Banat, i.e. Arad, Temesvár, and Nágy Varad, and it was to gain these towns, so important as focal points to the surrounding agricultural country, that Rumania sought the inclusion of the Banat (q.v.) in her territories. On Dec. 2, 1918, a Transylvanian Assembly, perceiving how imminent was the disruption of the Dual Monarchy, declared its

union with Rumania. The Saxons acceded; the Magyars, sensing their racial submergence, refused their allegiance until well into 1921. On Jan. 11, 1919, Rumania by royal decree annexed the territory; the subsequent treaties confirmed the transfer. In 1920, the Transylvanian national council was dissolved and a provincial government was erected. Transylvania was represented by 45 senators and 112 deputies in the Rumanian parliament. The leading problem here, as in all the Rumanian lands, was that of racial minorities. That the Rumanians had no intention of treating the Magyars tenderly was shown, beginning with 1919, when they proceeded to expel large numbers of Magyar landlords, ostensibly in the interest of land reform. Here, so soon, was appearing a new irredentism in the heart of the once Rumania Irredenta. See WAR IN EUROPE, *Balkan Front*.

TREATY OF LONDON (APR. 26, 1915). See WAR, DIPLOMACY OF THE.

TREES. See FORESTRY.

TRELEASE, WILLIAM (1857–). An American botanist, born at Mt. Vernon, N. Y., and educated at Cornell, Harvard, Michigan, and Washington Universities. After serving as lecturer at Johns Hopkins University, he became instructor in botany at the University of Wisconsin (1881–85). He was then appointed professor of botany in Washington University and in 1913 professor of botany at the University of Illinois. From 1889 to 1912 he was director of the Missouri Botanical Garden. Professor Trelease wrote: *The Genus Phoradendron* (1916); *Plant Materials of Decorative Gardening* (1917); *Winter Botany* (1918); and many papers and reports on botany and entomology.

TRENCHARD, SIR HUGH MONTAGUE (1873–). A British air marshal. He entered the army in 1893, served through the South African War, and afterward took part in three campaigns as a member of the West African Frontier Force, receiving the D. S. O. in 1906. He became an assistant commandant of the Royal Flying Corps at Upavon in 1912. Before the end of the first year of the War he was made head of the military wing of the air forces under Sir J. French, in which office he was markedly successful. By 1917 he had reached the rank of major-general, and when the air ministry was formed in the same year he went back to England as chief of staff. He resigned in April, 1918, and shortly afterward was given the command of the Independent Force and raided German territory during the last months of the War. In 1919 he was made air marshal and became chief of the air staff.

TRENCH WARFARE MATERIAL. Trench warfare was a development peculiar to the War in Europe. The line of battle extended from the English Channel to Switzerland, its flanks resting on militarily impregnable obstacles which precluded outflanking. The numbers engaged made the battle lines practically continuous, reduced the chance of success of a war of manœuvre, and eventually resulted in the deadlock inevitable to a war of position when the opposing forces are evenly matched. A recurrence of trench warfare of the sort experienced in the War will depend on the likeness of the conditions of any future conflict to those just described. The possibility of similar conditions being encountered is considered so slight that little attention is being paid to improvement of devices which find effective employment only during a war of position. The state of the art, therefore, was in 1924 practically the same as at the signing of the Armistice. See ORDNANCE.

Grenades. The modern grenade is in effect a small explosive shell thrown at the target by the soldier with his good right arm or by means of an attachment (tromblon) fastened to the muzzle of his rifle. The so-called defensive grenade consisted of a gray-iron casting, the grenade body, which contained an explosive charge of nitrostarch and a suitable firing mechanism designed to prevent explosion until the thrown grenade was a safe distance from the thrower. The defensive grenade was intended to burst into fragments and was used only by men actually within the trenches, the walls of which would protect the thrower from flying fragments. This fragmentation type of grenade was the most used and the most useful of all developed during the War. An American contribution to trench warfare was the offensive grenade, the body of which was made of paper which produced its deadly effect by the flame or concussion of the explosive itself. This type was safe to use in open offensive movements since there were no fragments of metal to fly back and injure the thrower. Gas grenades, the bodies of which consisted of two sheet-metal cups welded so as to be gas-tight, were under development and were used principally to make the enemy trenches and dugouts uninhabitable on release of their toxic contents.

Phosphorus grenades, of construction similar to the gas type, were used to scatter burning phosphorus over an area 10 to 15 feet across. The dense cloud of white smoke thus produced was utilized to build smoke screens for the protection of troops in open attack on machine-gun nests. Incendiary grenades were essentially paper bombs filled with highly inflamable material and intended for use in destroying structures by fire. In still another class was the Thermit grenade, consisting of a terne-plate container filled with Thermit, a patented composition which developed an intense heat while melting. These grenades found their principal use in destroying captured guns which could not be moved, by fusing the breech mechanism to an extent preventing further use. A combination mount and rifle grenade was also developed by the British and later adopted by the United States Army. The great majority of rifle grenades were of the French Viven-Bessière type, provided with a hole extending entirely through the middle of the grenade. In order to use this grenade a specially-designed holder is fitted to the muzzle of an ordinary service rifle. When the rifle is fired, the bullet passes through the hole in the grenade and the discharged gases following the bullet have enough energy left to throw the grenade approximately 200 yards. The rifle grenade was used both as a defensive and an offensive weapon, since the firers were well out of range of the exploding missile, which had an effective radius of nearly 75 yards on burst.

Trench Mortars. The trench mortar, in its simplest form, consisted merely of a seamless drawn-steel tube three inches in diameter, closed at one end and provided with a projecting firing-pin at the closed end. A simple bipod, which with the tube itself constituted a tripod, gave elevation and direction to the tube. In action, a very simple form of projectile consisting of a lap-welded 3-inch steel tubing, filled with nitrostarch explosive and provided at its lower end

with means for attaching an ordinary shot-gun shell, was dropped gently down the muzzle. When the primer of the shot-gun shell struck the projecting firing-pin at the bottom of the closed tube, the cartridge was discharged, and the shell was thrown with considerable velocity in a high arc for several hundred yards. In order to obtain greater range, rings of black powder in muslin bags were wrapped around the shot-gun shell and were ignited on its discharge. Light vanes, added in prolongation of the shell body, surrounded the shot-gun shell in order to prevent tumbling of the projectile in fire. This material was indeed ordnance reduced to its simplest terms, but due to the simplicity of design and ease of manufacture, the readiness with which troops could be trained in its employment, and its adaptability to the peculiar conditions of trench warfare, it found an enormous use. Three-inch and four-inch Newton-Stokes mortars of British design, in general conformity to the above description, were used to a great extent by the American Expeditionary Forces. Provided with more accurate elevating and traversing mechanism and separate propelling charges, six-inch Newton-Stokes and French 24mm. mortars were also used to a considerable extent. See STRATEGY AND TACTICS, MILITARY.

The Livens projecter, of British design, was essentially a long steel tube, closed at one end, intended to be buried in the ground, and supported by a pressed steel base plate. These tubes were set up in groups of 25 or multiples thereof and were fired simultaneously by electricity, sometimes to the number of 2500. The projectile used was a gas drum cylindrical in shape, about 24 inches long and eight inches in diameter; and when fired in large numbers, it worked great havoc in the ranks of the enemy. Although the British used this type with great success throughout the latter period of the War, and the French and Americans also adopted it and used it freely, the Germans were never able to discover the nature of the device which was causing such damage and were never able to produce anything similar to it.

Pyrotechnics. Pyrotechnics found very extensive use in the War. The exigencies of trench warfare frequently demanded the transmission of orders and information simultaneously by several different methods. In order to supplement the telephone, telegraph, and visual signaling, fire signaling was resorted to, and pyrotechnic devices were developed to meet all needs, including signal rockets, parachute rockets, signal pistols and their ammunition, position and signal lights, flares, smoke torches, and lights to be thrown by the Viven-Bessière tromblon, the French device attached to the end of the rifle in which a rifle grenade fits.

Pyrotechnics won themselves a reputation as a dependable means of communication when all other means, except by runners, were interrupted, and it is probable that they will find a continuing place in the liaison systems of all armies. After the War, considerable attention was devoted to producing pyrotechnic signals which would be entirely dependable as to functioning, could stand rough handling, and would not deteriorate after storage under field conditions. Airplane flares, to be dropped from aircraft for the illumination of No Man's Land, have been developed since the War to give a candle power of 400,000 and a burning-time of seven to eight minutes, with a larger size having a candle power of 800,000 and a burning-time of four minutes. Wing-tip flares giving a candle power of 10,000 and burning-time of one minute have also been developed for use by aviators attempting to make forced landings at night or on fields not otherwise illuminated.

TRENGGANU. See MALAY STATES, NON-FEDERATED.

TRENTINO. See TIROL, GERMAN SOUTH; WAR IN EUROPE, *Italian Front.*

TRENTON. A manufacturing city, the capital of New Jersey. The population increased from 96,815 in 1910 to 119,289 in 1920, and to 127,390 by estimate of the Bureau of the Census for 1923. A high school and a grade school were built between 1914 and 1924; another high school costing $1,250,000 was under construction in 1924. A comprehensive zoning ordinance was prepared and public hearings held prior to its adoption. The assessed valuation of the city rose from $69,948,350 in 1914 to $137,263,001 in 1924, capital invested in manufacturing from $55,535,000 to $108,000,000, and the value of the finished product from $53,588,000 to $125,000,000.

TREVES, SIR FREDERICK (1853–1923). A British surgeon (see VOL. XXII). During the War he was president of the Headquarters Board at the War Office and a member of the Advisory Board of the Army Medical Service. His *Surgical Applied Anatomy* passed through its seventh edition in 1918. His chief contribution to literature since 1914 is a book of reminiscences, *The Elephant Man* (1923).

TRIANON, TREATY OF THE. See PEACE CONFERENCE AND TREATIES.

TRIESTE. See FIUME-ADRIATIC CONTROVERSY.

TRINIDAD. An island in the West Indies north of the mouth of the Orinoco, constituting with the island of Tobago (114 square miles) a British colony. Area of Trinidad, 1862 square miles; population in 1911, 333,552; in 1922, 374,650. In 1922 there were 121,249 East Indians in the colony as compared with 110,000 in 1911. The largest city, Port of Spain, had 61,531 inhabitants in 1921 (60,000 in 1911). In 1920, Trinidad was chosen as the seat of a West Indian agricultural college. The leading products continued to be the following, as indicated by export values in 1922: cacao, £1,342,331 (1913, £1,403,379); sugar, £1,145,278 (1913, £418,067); asphalt, £339,824 (1913, £230,565); coconuts, £77,420 (1913, £85,369); petroleum, £472,767 (1913, £75,020). The last made great advances in 1914–24. During 1922, 85,566,303 gallons of crude oil were exported; in 1923, this was increased to 106,804,098. Imports for 1913 were worth £2,828,550; for 1920, £8,490,232; for 1921, £6,903,694; for 1922, £4,604,880. Exports for the same years were £3,065,863, £8,408,611, £4,683,988, £4,229,403. Transhipments for the same years were £2,139,810, £1,077,934, £509,988, £612,527. The United States trade with Trinidad in 1923 was: exports to, $4,394,054 (1915, $3,971,000); imports from, $5,161,979 (1915, $6,739,000). In 1922 there were 123 miles of railway as compared with 95 in 1914. Government accounts follow for 1922 (1913–14 figures in parentheses): revenue, £1,661,607 (£970,789); of which customs was £525,723 (£433,276); expenditure, £1,939,215 (£951,962); public debt, as for Dec. 31, 1922, £3,452,424 (£1,476,615). There were no changes in administration.

TRINITY COLLEGE. An institution for the higher education of men at Hartford, Conn., founded in 1823. The enrollment in 1914 was 248; in 1923, 260. The faculty numbered 27 in 1914 and 30 in 1923, and the library was increased from 70,000 to 100,000 volumes. The productive funds in 1923–24 were $2,300,000. The library and administrative buildings, the gift of J. P. Morgan, were completed in 1914, and a gift of $150,000 was received by the college from the J. P. Morgan fund in 1917. In 1923 the centennial celebration was held, and the centennial fund of $1,000,000 was completed. The Rev. Remsen Brinckerhoff Ogilby, LL.D., succeeded the Rev. F. L. Luther, LL.D., as president in 1920.

TRINITY COLLEGE. A Roman Catholic institution for women founded in 1865 at Washington, D. C., by the Sisters of Notre Dame of Namur; it is affiliated with the Catholic University of America. The number of students increased from 166 in 1914 to 380 in 1924, the number of members in the faculty from 26 to 50, and the volumes in the library from 16,000 to 29,000. The Stewart estate adjoining the campus was bought in 1915. A building and endowment fund was undertaken in 1924. Sister Raphael, A.B., M.D., succeeded Sister Catherine Aloysius, A.B., as president.

TRINITY COLLEGE. An institution in Durham, N. C., founded in 1851. The student enrollment increased more than 57 per cent, from 671 in 1914 to 1058 in 1924, not including a summer term established in 1919 and enrolling, in the summer of 1923, 371. The faculty membership increased 185 per cent in the same period, from 49 to 140; and the endowment approximately 100 per cent, from $1,590,316 to $3,063,896. The number of volumes in the library rose from 60,882 to 105,808. The annual income mounted from $101,806 to $300,898, and the value of the buildings from $503,000 to $875,537. President, William P. Few, Ph.D., LL.D.

TROELTSCH, ERNST D. (1865–1923). A German religious philosopher, born at Augsburg, and educated at the leading German universities. He was called to a professorship in the University of Berlin in 1912. At the close of the War he entered politics under the democratic standard. In 1920 he became minister of education and religion in the Prussian state government, and in 1921 he was appointed to the same office in the German federal cabinet. His writings are concerned largely with the philosophy of Protestantism. They include: *Soziallehren der Christlichen Kirchen und Gruppen* (1912); *Zu Religions Lage, Religions Philosophie und Ethik* (1913); *Augustin* (1915); *Deutsche Zukunft* (1916); *Humanismus und Naturalismus* (1916); and *Geschichte der Philosophie des Positivismus* (1919).

TROTSKY, LEON (LEON BRAUNSTEIN) (1877–). A Russian Communist leader, born near Elisavetgrad, South Russia, and educated at the University of Odessa. He became a member of the left wing of the Social-Democratic party and in 1898 was arrested and later deported to Ust-Kut, Siberia. He soon escaped, however. He attended the International Socialist Conference at Stuttgart, that at Copenhagen, and the Pan-Slavonic Congress at Sofia in 1910. In 1914 he criticized the Socialists for supporting their governments in the War and considered the Zimmerwald Manifesto too moderate. Neither France, Switzerland, nor Spain would harbor him, so he came to the United States in 1917 and helped publish the Russian newspaper *Novy Mir* in New York City. After the revolution of March, 1917, he went back to Russia and was elected president of the Petrograd Soviet. As he represented the extreme left wing of the Communist party, he often opposed Lenine's more moderate proposals. He signed the Peace of Brest-Litovsk and organized the Red Army, whose commander-in-chief he became. He made, as he said, "an armed alliance of the workman and peasant, where there is no room either for the middle-class property holder or the rich peasant. The state tolerates them economically but does not give them political rights, much less weapons."

TROWBRIDGE, AUGUSTUS (1870–). An American physicist, born in New York City, and educated at Columbia University and in Berlin. During 1898–1900 he was instructor in physics at the University of Michigan and in 1900–06 a member of the faculty at the University of Wisconsin. In 1906 he became professor of physics at Princeton University. During the War he served in the intelligence department at Pershing's headquarters in France and was honorably discharged in 1919 with the rank of lieutenant-colonel. He received the Distinguished Service Medal and the Distinguished Service Order, as well as the decoration of the Legion of Honor. He was chairman of the division of physical sciences and member of the fellowship board of the National Research Council (1920–21).

TRUSTS. The year 1914 was important for students of trust legislation. During this year two noteworthy acts were passed by Congress, the Federal Trade Commission Act and the Clayton Act. The Bureau of Corporations which went into operation in 1904 had been rendering very distinct aid in the curbing of certain evils in the trusts. The creation of the Federal Trade Commission was a direct outcome of the Bureau of Corporations. The chief provisions of the Trade Commission Act follow. (1) A Federal Trade Commission of five members appointed for seven years at an annual salary of $10,000 each was created. (2) The act specifically condemned as unlawful unfair competition by industrial combinations. (3) The principal duty of the Trade Commission was to take action against unfair practices when it was convinced that such existed. The Commission was to serve a complaint and hold a hearing and was authorized to order the discontinuance of any practices found to be unfair. In case the order of the Commission was not obeyed, it had the power to lay the case before the Circuit Court of Appeals. The court might issue an injunction. The decision of the Commission was greatly strengthened by the fact that its findings, if supported by adequate testimony, were regarded as conclusive. (4) The power of the Commission was extended to include the investigation of corporations engaged

in interstate commerce, with the exception of banks and common carriers. (5) The Commission was authorized to demand from corporations annual reports and other information relative to the conduct of their business. (6) It might initiate investigations relative to the manner in which previous decrees had been carried out by industrial combinations The Commission might publish its findings if it seemed in the public interest (7) On direction of the President or of either house of Congress, or on application of the Attorney General, the commission was required to investigate any alleged violations of the antitrust acts and to recommend such changes as should bring the practices into conformity with the requirements of the act. (8) If the Federal Court made the formal request, the Federal Trade Commission might act in an advisory capacity, relative to the form which the decrees of the court should take. The purpose of the Federal Trade Commission Act was to prevent unfair practices of industrial combinations rather than to inflict punishment when such practices occurred. The power of the Federal Trade Commission was made, under the provisions of the act, much more definite and real than that of any previous governmental body created for the purpose of regulating industrial combinations.

The Clayton Act contained, first, a series of prohibitions against local price discriminations, holding companies, tying contracts, and interlocking directorates; secondly, a statement of the remedies to be applied; and thirdly, a defining of the position which labor was to occupy under it. Price discrimination, where the effect might be to lessen competition or to create a monopoly, was declared unlawful. This provision was not intended to interfere with bona fide transactions and the selection of customers. Any exclusive selling or leasing contracts whose effect was to limit competition was declared unlawful: "The acquisition of stock in one corporation by another, or the combination of two or more corporations through stock ownership, where the effect 'may be specifically to lessen competition, . . . to restrain . . . commerce, . . . or to tend to create monopoly' is prohibited." Interlocking directorates were prohibited, provided the object of forming such a directorate was to restrain competition by combination in a way not permitted by the act. The violation of any of the measures of the act was considered the definite responsibility of the individual directors, officers, or agents who authorized or permitted the acts constituting such violation. It was definitely declared in the act that all laws relating to combination were not to apply to combinations of labor. The courts were forbidden to issue injunctions in labor disputes unless necessary to prevent irreparable damage. Trials for contempt of court in labor cases was to be by jury, except when the contempt was committed in the presence of the court.

In foreign countries combinations are not forbidden either for domestic or foreign trade For this reason industrial enterprises in the United States are at a distinct disadvantage in competing against foreign corporations. After the Clayton Act was passed in 1914, many writers called attention to this handicap under which American exporters labored. The result was the Webb-Pomerene Act of 1918, which was sponsored by President Wilson. This law permitted the American exporters to combine for the purposes of foreign trade on the condition that they file annual reports with the Federal Trade Commission regarding the character of their enterprises. From one point of view this act might be considered a success, as a large number of combinations had already been formed in 1924. From another point of view, the United States was in an anomalous position. The Clayton Act forbade combinations for domestic manufacture and sale but permitted combinations for selling abroad

Under the existing legislation relating to trusts, the Sherman Act of 1890 and the Clayton Act and Federal Trade Commission Act of 1914, many important suits were fought in the courts. The work of the Commission had not been generally spectacular, but it had rendered real service in checking unfair practices and discouraging combinations likely to affect public welfare unfavorably. A few cases are outstanding both in importance and in public interest. Chief among these was the United States vs. the United States Steel Corporation The government brought suit against this giant combination on the ground that it was a monopoly and was engaged in unlawful restraint of trade. The decision of the District Court, rendered in October, 1911, was favorable to the corporation. The decision of the Supreme Court was not rendered until March, 1920; in effect it was that the United States Steel Corporation had not used aggressive measures against its competitors, and that the corporation did not possess full monopolistic advantages. The majority decision of the members of the Supreme Court was definite in its statement that mere size does not necessarily mean monopolistic powers. While the United States Steel Corporation was much larger than any of its competitors, it was not in a position to dominate prices of steel products, for the value of its output was not as great as the total value of all its competitors combined. The great argument was that the object of antitrust legislation was to condemn monopoly and unfair methods of competition. The corporation could not be condemned on either count. The majority opinion of the judges was that the public interest would suffer more if the corporation should be compelled to break up into smaller units. Certain practices in which the corporation had indulged for the purpose of maintaining prices were condemned. Certain pools, associations, and gentlemen's agreements had been formed with the competitors of the trust, but they had not been successful and had been abandoned nine months before suit was brought The court held that the formation of such price agreements was proof that monopolistic advantage did not exist. Four judges were in favor of the decision outlined above, and three dissented. Two judges did not vote; one had previously been associated with a proceeding against the corporation, and the other had publicly expressed the opinion that the corporation was using unlawful methods. Had all the members of the Supreme Court participated, the decision would probably have been different The public may expect a wide variation in opinion in the application of the so-called "rule of reason" to different suits brought by the government against industrial combinations.

Another important action of the late years of the decade against industrial combination

was that of the meat packers of Chicago. In 1910 suits were brought against the National Packing Company, an organization holding certain independent properties which had been acquired by the Swift, Morris and Armour companies. The board of directors of this company was made up of representatives of the three large packing firms. In 1912, while under fire, the National Packing Company was dissolved by the members themselves, and its assets were distributed among the three companies involved. The extent to which this dissolution actually restored competitive conditions was not generally known. In December, 1919, a decree was issued which materially affected the packers, known as the "Big Five" (the Armour, Swift, Morris, Wilson, and Cudahy companies). Under threat of a suit for dissolution, the "Big Five" agreed to a decree enjoining certain practices which were considered opposed to the public interest. The decree of the court was entered on Feb. 27, 1920. It provided that the "Big Five" were forbidden perpetually to form any contract or combination in restraint of interstate commerce. The companies concerned were forbidden to own stock in any stockyard market in the United States or in any stockyard terminal railroad in the United States. The defendants were enjoined from carrying on either directly or indirectly the manufacture, jobbing, selling, or distributing of a large number of commodities, including vegetables, confectionery, fish, soft drinks, preserves, coffee, tea, chocolate, flour, and sugar The exception permitted was when these commodities were utilized by the defendants in carrying on their business as packers. From this part of the decree it is obvious that the "Big Five" were entering other lines of endeavor and had acquired considerable influence on the prices of foodstuffs in different localities. The packers were also enjoined from owning or operating in the United States any markets except those located at their plants. They were also forbidden to own stock in public cold-storage warehouses and to engage in the business of buying and selling fresh milk and cream.

From these and other sections of the decision it is obvious that the court objected to the influence which the "Big Five" might exert on the prices of the foods of the nation. The packers were limited by decree to the ownership and operation of the meat industry. In so far as the commodities over which they had attempted to gain control were meat substitutes, it is clear why this decision of the court was made. The judgment of the court in this case is interesting because of the peculiar character of the limitations placed on the combination. The opinion of many students of the trust problem was that the packing industry was more democratic and less monopolistic than formerly. The packers themselves made efforts to convince the public that such was the case. See LABOR LEGISLATION.

TSAO KUN (1865–). A president of China, born at Tientsin of humble parentage. His career began when as a boy he entered the provisional army, where his ability was soon recognized. He attended the Pelyang Military Academy and saw service in the Chino-Japanese war in 1894; after graduating he was appointed director of the Soldiers' Training School at Shiao Chan. He was at Mukden almost two years and in 1911 assisted in the revolution which overthrew the Manchu dynasty and established the republic. His political power grew rapidly. In 1917, when Li Yuan-hung was president, General Chang Hsun effected his *coup d'état* which put the young Emperor on the throne, but Tsao Kun and his army forced him out. In 1918 he fought against Dr. Sun Yat-sen's South China army. Later he gained control at Peking and was elected president on Oct. 5, 1923. On October 16, he dismissed lax officials who had permitted brigandage, and on Jan. 13, 1924, he accepted the resignation of the entire cabinet. See CHINA, *History*.

TUBERCULOSIS. During the decade 1914–24, medical views about this affection underwent numerous and notable modifications. It is known that the mortality has notably lessened, except in some European countries subjected to hardships and underfeeding. The explanation of this improvement has not been so clearly ascertained. Crusades against the disease in the past were based on very imperfect knowledge, such as the assumption of the danger of man-to-man contact in spreading the disease and of the deadly quality of the expectoration. In 1924 the best opinion was that nearly all individuals entertain the bacillus in their tissues when young and that the harboring of this germ, so far from being a menace to later years, induces a process of immunization, in the absence of which a vast number of individuals might develop the disease in active form in adolescence and maturity. It is this immunization which may protect the individual in later life from contact with the bacillus as spread by open cases of tuberculosis. In other words, a strain of mankind without this immunity might develop the disease in a true pestilential form such as has often appeared among aboriginal races.

We are still quite unable to understand why well-nourished and intelligent men and women develop the disease in the absence perhaps of any obvious factor of causation. The only help in accounting for these cases may be supplied by a theory of Ferran, the Spanish bacteriologist, who believes that the bacillus goes through a series of mutations, only one of which is dangerous to the organism. Should this phase be reached, apparently the ordinary safeguards of good health, abundant nourishment, etc., are insufficient for defense. Trudeau and other phthisiologists state that of a certain number of incipient cases, some are already beyond hope because they simply will not respond to curative measures. It seems doubtful whether this large fraction can ever be salvaged without the discovery of a true specific.

TUBERCULOSIS, BOVINE. See VETERINARY MEDICINE.

TUBES. See RAPID TRANSIT.

TUBUAI ISLANDS. See PACIFIC OCEAN ISLANDS.

TUFFIER, THÉODORE (1857–). A distinguished French surgeon, a pioneer in the surgery of the thorax, including the lungs, orifices of the heart, arch of the aorta, etc. He was born in Bellême in Orne and was educated in medicine at the University of Paris. Some of his writings are of small compass, the more pretentious comprising *Du Rôle de la Congestion dans les Maladies des Voies Urinaires*

(1885); *Etudes Expérimentales sur la Chirurgie du Rein* (1889); *Chirurgie du Poumon* (1897); *Petit Chirurgie*, with Desfosses, 5th ed. (1919); *Traité Médico-Chirurgicale des Maladies de l'Estomac*, with Matthieu and Sencert (1913).

TUFTS COLLEGE. A coeducational institution at Medford, Mass., founded in 1855. Its School of Medicine and Dentistry is at 416 Huntington Avenue, Boston, Mass. The student enrollment of the college was 1223 in 1914, as compared with 2087 in the year 1923–24. The faculty also was increased, from 242 in the earlier year to 329 in the later; the library from 72,000 to 85,000 volumes, and the productive funds from approximately $2,000,000 to $2,834,588. In 1923–24 a chemistry laboratory was being built at a cost of $275,000. John A. Cousens, LL.D., succeeded H. C. Bumpus, Ph.D., as president in 1919.

TULANE UNIVERSITY OF LOUISIANA. An institution for higher learning, founded at New Orleans, La., in 1834. The student enrollment on Nov. 1, 1914, was 2510, as compared with a registration of 4047 on Nov. 1, 1923, an increase of more than 60 per cent. During that period the faculty increased from 297 to 369 members; the number of volumes in the library, from 68,700 to 93,184; the productive endowment, from $4,297,987 to $6,349,715; and the revenue fro i the productive endowment only, from $221,533 to $357,669. In 1920 President Dinwiddie inaugurated a campaign for additional endowment. Pledges amounting to $2,100,000 were received, and of this amount $1,216,000 had been collected at the close of 1923. In 1918 Newcomb College for Women removed to its new campus adjoining the other university buildings and erected three new buildings. Albert B. Dinwiddie, Ph.D., LL.D., succeeded Robert Sharp, Ph.D., LL.D., as president in 1918.

TULSA. A city of Oklahoma. Situated in the centre of a vast and newly-opened oil-producing area, the city increased phenomenally in population, from 18,182 in 1910 to 72,075 in 1920, and to 102,018 by estimate of the Bureau of the Census for 1923. Between 1919 and 1924 Tulsa County built 150 miles of paved roads radiating in every direction from the city. A water supply project which was to bring water 60 miles by gravity from a 50-foot dam in the Ozark Mountains, at a cost of $7,500,000, was under way in 1924. Building permits rose from $1,194,639 in 1910 to $7,781,252 in 1923, and bank deposits from $33,000,000 in 1916 to $62,059,000 in 1924. The International Petroleum Exposition was established in 1923. In a race riot in June, 1921, between 25 and 50 persons, white and colored, were killed, many were injured, and several blocks of the city were burned. Two years later, in 1923, Governor Walton declared martial law in Tulsa County and sent a military court of inquiry to the city to investigate the whippings and mob violence that had been rife for several months.

TUMULTY, Joseph Patrick (1879–) Secretary to President Wilson, born at Jersey City, N. Y., educated at St. Peter's College. He practiced law in New Jersey and was elected to the New Jersey Assembly in 1907. In 1910 he was appointed private secretary to Woodrow Wilson, then governor of New Jersey, and clerk of the Supreme Court of New Jersey in 1912. When Mr. Wilson became President of the United States in 1913, Mr. Tumulty was made his private secretary and served in that capacity till 1921. His close association with President Wilson made his book, *Woodrow Wilson as I Know Him* (1921), of especial interest.

TUNGSTEN FILAMENT LAMPS. See Electric Lighting.

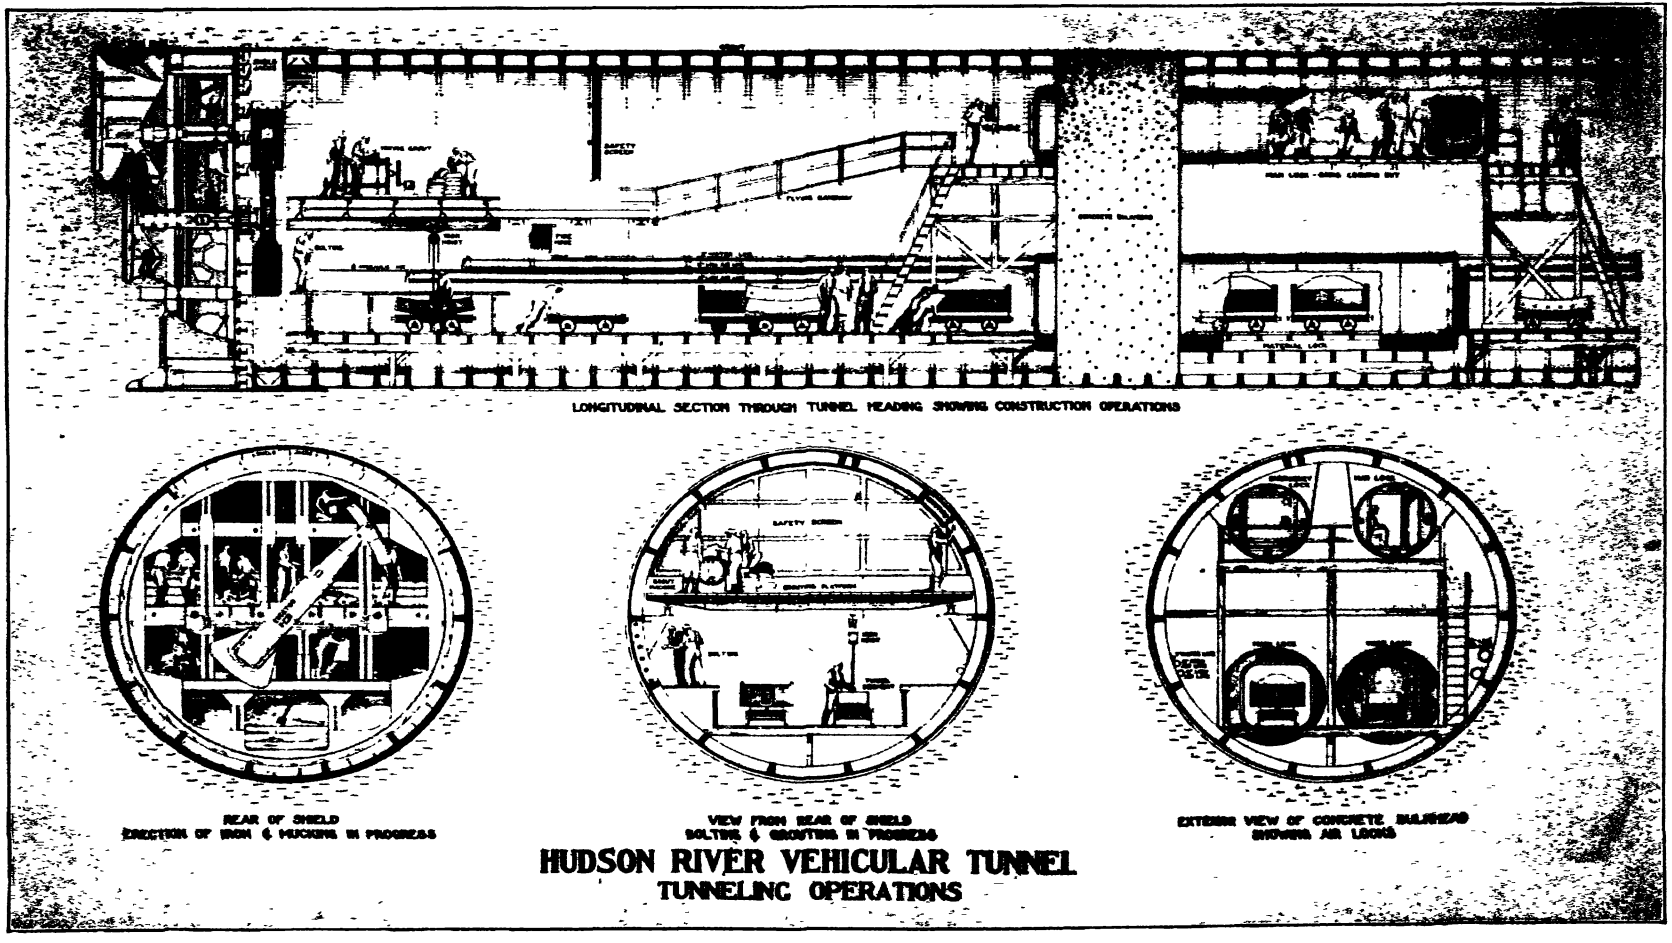
TUNIS, or Tunisia. A French protectorate in North Africa with an estimated area of 50,000 square miles. By the 1921 census the population totaled 2,093,946, of whom 48,436 were Jews, 1,889,388 Arabs and Bedouins, 54,476 French, 84,799 Italians, 13,520 Maltese. Total European population was 156,122, a gain of 7646 over 1911. Populations of large cities were: Tunis, the capital, 170,381; Bizerta, 20,763; Ferryville, 4675. Agriculture continued to predominate and showed gratifying advances. The 1,491,518 acres under wheat yielded 289,000 tons in 1921; 1,227,704 acres under barley, 250,000 tons; 158,441 acres under oats, 60,000 tons; 58,367 acres of vineyards produced 3,733,266 gallons of wine. The mean production of dates during 1917–21 was about 38,000 metric tons. Olive trees produced about 45,000 metric tons of oil in 1922. Other products were almonds, oranges, lemons, shaddocks, pistachios, alfa grass, henna, and cork. Other important products were phosphates (2,357,000 tons in 1923) and iron (845,000 tons in 1921). Fishing and the sponge industry also continued to be important. The great increase in live stock over the period 1913–21 is noteworthy. Cattle in 1913 and 1921, 157,100 and 488,348; horses, 29,500 and 74,245; mules and asses, 107,700 and 174,351; camels, 123,900 and 132,196; sheep, 843,100 and 2,037,551; goats, 561,700 and 1,113,845. In 1921, the total area occupied by French colonists was 2,530,000 acres; by Italians, 427,000 acres; and by other Europeans, 116,200 acres. The presence of an agricultural bank and central coöperatives among farmers greatly stimulated the whole industry. The advances made were mirrored in the trade record. Exports for 1913 and 1922 were 178,663,000 francs and 444,680,000 francs; imports for the same years were 144,254,000 francs and 856,377,000 francs. Proportions by countries of origin (imports) and destination (exports) of the Tunis trade for 1922 were: France, 48 and 48 per cent; Italy, 9 and 22 per cent; United Kingdom, 12 and 5 per cent; United States, 7 and 2 per cent. The 1922 budget called for expenditures of 207,164,000 francs; in 1913, this was only 85,000,000 francs. The charges for the debt service constituted almost a fourth of the total expenditures. The debt, Jan. 1, 1922, totaled about 580,000,000 francs. In 1920 a loan of 255,000,000 francs was authorized, of which the first section of 40,000,000 francs was floated. The reigning bey, Side Mohammed, succeeded to the throne July 10, 1922. In 1922, an increased share in the government was bestowed on the natives. Five regional councils at Tunis, Bizerta, Susa, Kef, and Sfax were erected as well as a grand council for the whole protectorate. The latter, made up of two sections, one French and the other native, was given the power to examine the governmental budget.

TUNNELS. In the United States considerable tunnel construction was undertaken in the period from 1914 to 1924 in connection with various important power and irrigation projects, as well as in connection with railways and urban rapid transit and acqueducts. (See Rapid

TRANSIT; AQUEDUCTS). The hydraulic tunnels naturally varied considerably in importance, ranging from such pressure tunnels as that at Niagara Falls to those in connection with power and irrigation development, in the western United States. The Niagara Falls rock tunnel, which was 32 feet in diameter inside the concrete lining and 36 feet inside the rock break line, was constructed with a length of 4300 feet on the American side around the Falls, to parallel the hydraulic canal and to supply water to the Niagara Falls Power Company. It was a siphon tunnel dipping down from the level of the upper river to a maximum depth of 130 feet and rising to practically upper river level again from the forebay of the upper plant, which was an extension of Hydraulic Plant No. 3 of the Niagara Falls Power Company. The tunnel was designed for a flow of 10,000 feet per second, to afford power for a new plant containing three 70,000 horse-power reaction turbines. The new tunnel had a semicircular arch and a trapezoidal base section with rounded corners and was concrete lined.

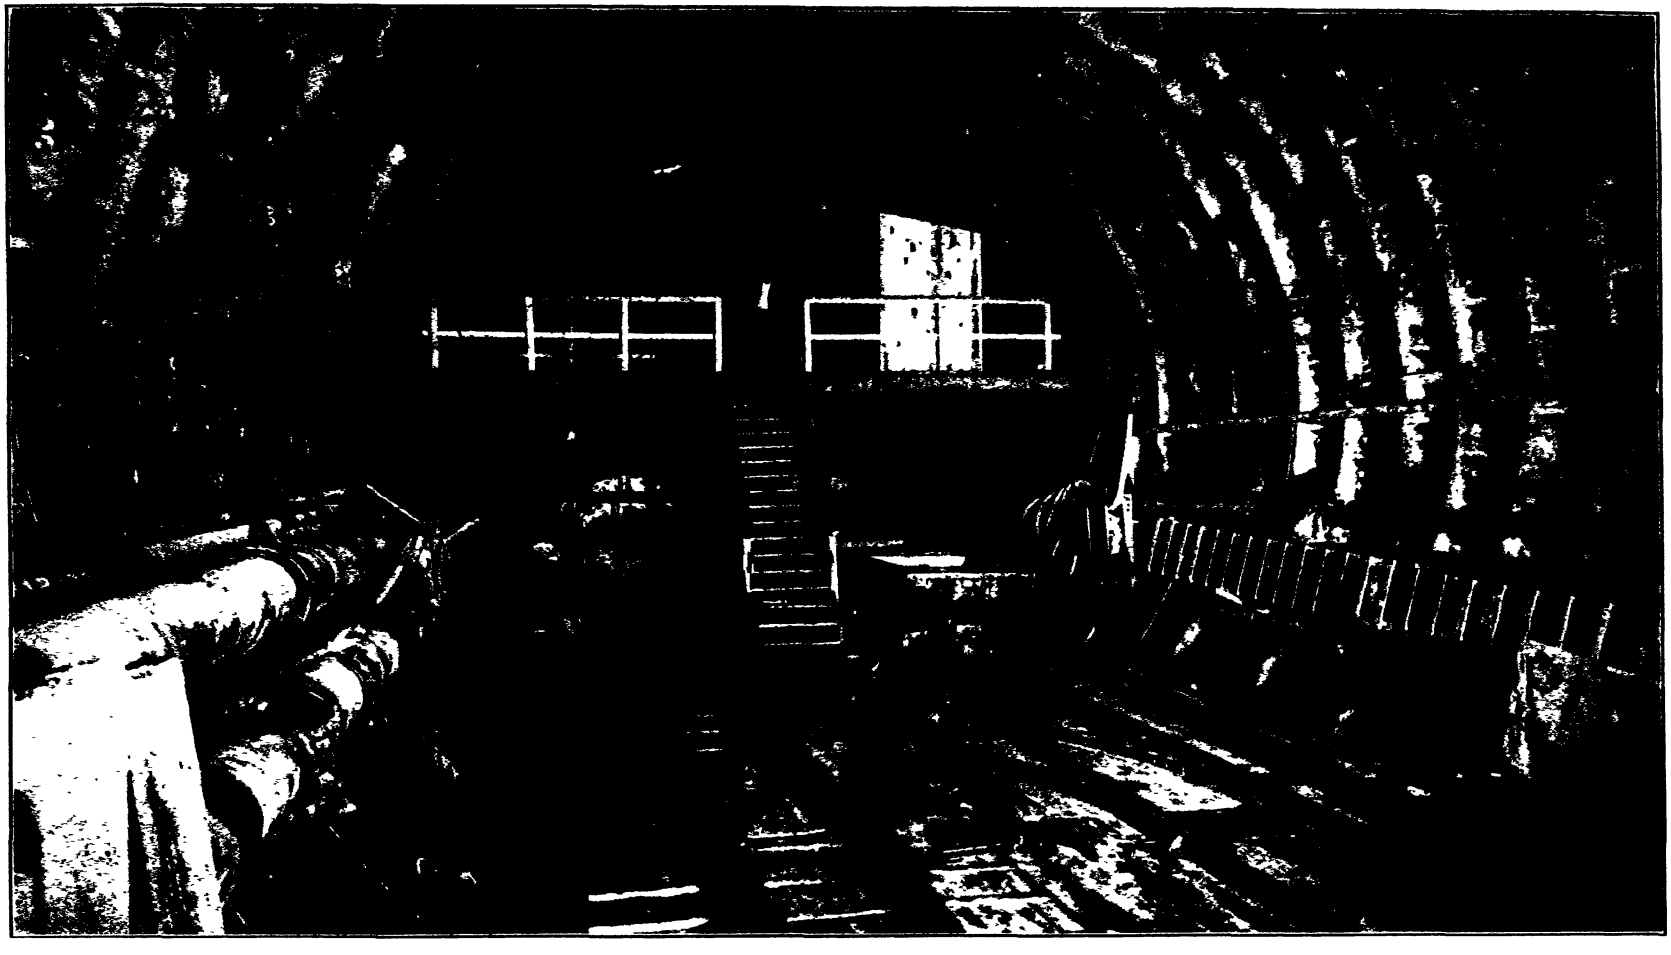
An important tunnel in the West was that for the Kern River plant which was originally constructed with a section of 6 feet 6 inches. This measurement was enlarged to 13 feet 6 inches by a 14-foot section.

Liberty Tunnel, Pittsburgh. Up to the inception of the Hudson River vehicular tunnel, the largest highway tunnel built was the Liberty Tunnel, through the South Hills at Pittsburgh, Pa. This tunnel provided two separate roadways each for two lines of traffic, with space for street cars, and was excavated in shale; each tube was of horseshoe form with semicircular roof arch of 13 feet 3¼ inches radius and with side walls 7 feet 2 inches high within the crown of the roadway. The length from portal to portal was 5715 feet, and the tunnel was designed for an estimated capacity of 1690 vehicles per hour in each direction at the maximum, or two lines of vehicles both traveling at 15 miles per hour, the vehicles 100 feet apart in each line.



When construction of long vehicular tunnels to accommodate considerable motor traffic was first proposed, opinion was not unanimous as to whether such traffic was essentially different from ordinary street traffic in its difficulties or dangers. One group argued that the danger of carbon monoxide poisoning was very serious in view of the confined space of the tunnel. Here at Pittsburgh the region served was purely residential, so that in addition to street cars the traffic consisted largely of passenger motor vehicles, and the problem was to provide for the ventilation, particularly as the motor cars would emit carbon monoxide gas, with the possibility of disastrous effects on persons passing through, from the high concentration of such exhaust gases. After considering this question very carefully, elaborate ventilating machinery was installed at the Liberty Tunnel, but the tunnels themselves were first operated with restricted traffic, with a constant check of the air conditions to determine the carbon-monoxide content Not only the local authorities but representatives of the Pittsburgh Station of the Federal Bureau of Mines were actively interested in this matter and were constantly on duty in the tunnel to watch the air conditions.

In the preliminary studies based on the maximum traffic of 114 automobiles in either tube of the tunnel at any one time, it was assumed that the total carbon-monoxide emission, taken at 1.5 cubic feet per vehicle per minute, would be 170 cubic feet per minute for each tube of the tunnel. It was concluded from experimental data that the carbon-monoxide content of 6 parts in 10,000 at the exit, or one-half that quantity, would be an allowable average; so it was planned to supply 280,000 cubic feet of fresh air per minute to each tube. The tunnel itself formed a ventilation duct drawing in air at one end through suitable lateral nozzles in the side walls located near the entrance and facing toward the other end of the tunnel. The ventilating currents, consequently, would move with the traffic, but there was provided for each tunnel an air-pumping plant which would afford an emergency maximum pumpage of 280,000 cubic feet of air per minute per tube, or a normal maximum of 20,000 cubic feet of air per minute. Normal pumpage discharge velocity at each nozzle would be 2940 cubic feet per minute or about 33 miles per hour, and with a maximum pumpage the discharge velocity would be 4210 feet per minute or about 47 miles per hour.



While the system of ventilation design was based on work done by Saccardo in ventilating tunnels in Italy and had been used on some American railway tunnels, nevertheless a considerable amount of experimental work was carried on and conditions were formulated for safe operation. Accordingly the Liberty Tunnel in Pittsburgh, with its twin passages, was the subject of considerable discussion, and although ventilating apparatus was provided in its design, yet for six months it was operated without artificial ventilation, and during this time the natural ventilation seemed to dispose of the gas satisfactorily for moderate traffic. When there was congestion of traffic, owing to a chance interruption or to an unusual movement of vehicles, the heavy production of gas was likely to develop a serious situation; accordingly it was realized that artificial ventilation was essential and that at the same time there must be adequate policing and supervision to control operation.

Ordinarily a normal monoxide content of 4 parts in 10,000 was considered permissible, and when this amount was exceeded, traffic was reduced. It was found that the variation of the carbon monoxide depended not only on the amount of traffic but also on the air currents due to the direction of the wind and the movement of the vehicles. Up to May, 1924, there had been no serious trouble in the tunnel. Then a gas poisoning accident in which a pedestrian who had gone into the tunnel to seek refuge from the rain was overcome was attributed largely to the unfavorable wind. In the following week, on May 10, congestion resulting from abnormal traffic due to the street railway strike was such that a number of persons were seriously affected by the high concentration of automobile exhaust gases. The police and fire departments and the Bureau of Mines local corps were called on to remove a number of persons overcome in the tunnel. While no serious aftereffects were reported, it was realized that the safe operation of the tunnels could be secured only by considerable vigilance.

Hudson River Vehicular Tunnel. In addition to the notable tunnels for rapid transit or subway service around New York City, which

CONSTRUCTING A SUBAQUEOUS TUNNEL BY THE SHIELD PROCESS

HUDSON RIVER VEHICULAR TUNNEL

Interior of tunnel lining showing bulkhead with the manlocks above and the mucklocks below

for the most part involved cut and cover methods, active work was started in 1922 on a twin-tube vehicular tunnel under the Hudson River between New York and Jersey City. This project involved twin tubes of cast iron with a mean length of 6881 feet, with subway and open cut approaches. The distance between grade points was 9300 feet. As originally planned, the outside shell diameter of both tubes was 29 feet, and the estimated cost was $28,669,000; but further consideration and special investigation of ventilation, based on Pittsburgh experience and other studies, demonstrated the necessity for larger ducts both of fresh and of exhaust air than the original diameter permitted, so that the diameters of the under-river tubes were therefore increased to 29 feet 6 inches, and the diameter of the north tube in New Jersey was increased to 30 feet 4 inches, adding $750,000 to the original estimated cost.

For the construction of these tunnels, twin shafts were sunk on the shore, although on the New York side one river shaft served both tubes. From these shafts five shields were in operation, two working west from New York and two east from New Jersey, and one working west from the north tunnel shore shaft in New Jersey After the south tunnel inland had been completed, the shields driving the river tubes were to meet under the river. As the work of developing and executing this project went on, it was found necessary to increase its general scope considerably. Not only were widened approach roadways decided on, but more elaborate designs for the approach section were made, and a tiled lining was contemplated along with considerable architectural treatment.

The ventilating system provided for the admission of fresh air from a duct in each tube beneath the roadway, which was 20 feet in width, while above the roadway an exhaust air duct was provided. With the experience and skill acquired in many tunneling operations about New York City, no extraordinary difficulties were encountered, as the under-river work involved boring through silt or soft mud The various extensions and improvements brought the estimated cost up to some $42,000,000, a considerable increase over the original estimates.

Moffat Tunnel. One of the most notable tunnel projects put under way between 1914 and 1924 was the 6-mile Moffat Tunnel through the Continental Divide about 50 miles west of Denver, Colo. Work was begun on it in 1923. In the previous year the Legislature of Colorado authorized a commission which might issue bonds for the prosecution of the work, and on Sept 18, 1923, the Moffat Tunnel Commission entered into a contract to construct the tunnel for $5,250,000, the contractors agreeing to do the work for a fixed fee of $140,000. The tunnel passes under James Peak and was to be a part of the line of the Denver and Salt Lake Railroad, replacing the grade over Summit Pass. According to the plans, the Moffat Tunnel was to be 32,150 feet in length, or almost exactly 6 miles. The east portal is 3 miles beyond Tolland, on the Denver and Salt Lake Railroad, and the west portal 1 mile from Irving; these two stations are about 50 and 80 miles respectively from Denver. A grade of 0.3 per cent ascends from the east portal at El. 9198 to the summit at mid-length and at El. 9242; thence on, a grade of 0.9 per cent descends to the west portal at El. 9085. Maximum grades of 2 per cent are provided on the approaches, which are short and consist largely of fills.

Shandaken Tunnel. The Shandaken Tunnel of the Catskill water supply for New York City (see AQUEDUCTS) was completed early in 1924 and put into service. This tunnel, the longest built up to 1923, extended through rock a distance of 18 13 miles, exceeding the length of the Simplon Tunnel through the Alps by 5.8 miles. Work was started on it in the fall of 1917 under plans and specifications prepared by the Board of Water Supply of the City of New York. The tunnel is concrete-lined and has a finished horseshoe-shaped section 10 feet 3 inches wide and 11 feet 6 inches high. Its slope is 4 feet 5 inches per mile, and its carrying capacity, 600,000,000 gallons in 24 hours. For its construction seven shafts were sunk ranging in depth from 320 to 630 feet and spaced at intervals of 2 miles. From these shafts, however, only 12 headings were worked simultaneously.

Rove Tunnel. The world's largest tunnel was put through in 1916 as an important element of the Marseilles-Rhone Canal (see CANALS), an artificial waterway 51 feet in length which extends from the Rhone River at Arles to the Bay of Marseilles. A typical section of this canal is 82 feet wide and 10 feet deep, and the tunnel was constructed so as to pierce the mountain ridge north of the city of Marseilles and to give direct access to the harbor. The tunnel is 4½ miles in length and is built with an approximately semicircular arch of 41-foot radius, affording an excavated section 79 feet wide and 50 feet high, with the canal proper forming a square invert 59 feet wide and 15 feet deep. Thus there is a clear area of 3250 square feet or a section about six times as great as an ordinary double-track railway tunnel. Although the length, 4½ miles, was not as great as that of other European and American tunnels, nevertheless the excavation in cubic yards amounted to 2,800,000 as compared with 2,100,000 for the Simplon Tunnel which had a length of 12.3 miles.

The method of construction followed was to excavate three arch headings which were opened one into the other so that a central section of rock was left to be removed. The headings were about 100 feet in cross section and were pushed forward at a rate of 15 to 18 feet a day. In driving these headings, compressed-air locomotives were used, and in the main section steam locomotives with artificial ventilation. The tunnel was masonry-lined, backed on concrete made of a specially-lined cement; and work was carried on from both ends, mostly through hard rock, so that little if any timbering was needed The canal and tunnel were comprehensively described in *Le Génie Civil* (May 20, 1916)

Otira Tunnel. In 1922 there was completed for the New Zealand Government Railways, on the line connecting the ports of Christchurch and Greatmouth on the east and west coasts of the South Island, a tunnel under Arthur's Pass, known as the Otira Tunnel, 5¼ miles in length. At this pass the summit elevation was 3050 feet and that of the tunnel 2435 feet; previous to the construction of the tunnel, the transfer of passengers and freight had to be made by stages and wagons. The tunnel was for a single-track line of 3½-foot gauge and was built on a tunnel grade of 3 per cent. In section it was 16 feet 9 inches above subgrade and 13 feet

wide at subgrade, with sides flaring outward to a width of 14 feet 6 inches at the spring of the semicircular roof, and it was excavated through solid rock; the arch was lined with precast blocks of concrete.

Tana Tunnel, Japan. For the Tokkadia line of the Imperial Government Railway of Japan there was begun in 1918 an important double-track tunnel as a part of the 30-mile cut-off in mountainous country. This tunnel, 15 miles in length, was of horseshoe section with a width of 28 feet and a height of 22½ feet above subgrade, and accommodated two tracks of 2½ feet grade. Here also brick or concrete blocks were used for the arch, while brick or monolithic concrete was used for the side walls.

Second Simplon Tunnel. The War in Europe and the restriction of European government activities naturally interfered with tunnel projects which might have been possible under normal conditions. In 1921, however, the second Simplon Tunnel was completed, with a total length, from portal to portal, of 19,825 meters (12.36 miles). This second tunnel was not altogether a new construction, as it involved the enlargement of the pioneer or ventilation heading which was driven parallel to the first tunnel when the latter was constructed.

English Channel Tunnel. The War did not put an end to discussion of the proposed crossing of the English Channel by means of a submarine tunnel under the Straits of Dover. Because of the continued refusal of the British government to grant the necessary authority nothing positive was accomplished. The distance was 27 miles, and in view of the great developments in tunnel construction, many believed the project was entirely feasible. In 1923 Sir Percy Tempest, the chief engineer of the tunnel company organized for this work, and also general manager for the Southern Railway, whose lines would connect with the tunnel, issued a statement in which he said that the material to be encountered for the entire distance excavated was very favorable; the deep bed was of chalk marl or chalk infiltrated with clay. He believed that with the special boring machine designed for this work, a heading 12 feet in diameter could be driven at the rate of 120 feet per day, and that two machines started at the opposite ends should meet in less than three years. The plan proposed was first to finish this pilot tunnel or heading and then to enlarge it to full section so that the concrete-lined tunnel would be finished by the estimated time of four and a half years. The estimated cost of this undertaking was $145,000,000. With the existing traffic the annual revenue would pay more than 5 per cent of the costs. It was obvious, however, that political and military considerations other than the engineering possibilities were the governing reasons for the failure of the British government to authorize the undertaking. On July 7, 1924, Premier Macdonald announced in the House of Commons that the government had decided against the Channel Tunnel. It was believed that the scheme would be quiescent for a time. See RAPID TRANSIT.

Bibliography. Recent works in this field include: Brunton, David W., and Davis, John A., *Modern Tunneling*, revised edition (New York, 1922). This edition includes new chapters on railroad tunneling by J. Vipond Davies; considerable attention is devoted in them to American practice in tunnel construction. See also Hewett, B. H. M., and Johannesson, S., *Shield and Compressed-Air Tunneling* (New York and London, 1922), as well as the engineering journals.

TURBINE, STEAM. See STEAM ENGINES AND TURBINES.

TURKESTAN, CHINESE. See SIN-KIANG.

TURKESTAN, RUSSIAN. Since the Russian Revolution, an autonomous republic in Central Asia federated with the Union of Socialist Soviet Republics. It was governed after Apr. 12, 1921, when Moscow relinquished control, by its own Central Executive Committee and Council of People's Commissaries. It comprised the provinces of Ferghana, Samarkand, Semiryetchensk, Syr-Darya, and Transcaspia and has an area of 571,650 square miles and a population of 7,201,551 (1920.) The population in 1912 was 6,416,700. The leading cities with their estimated populations are: Tashkent 200,000; Khokand, 110,000; Namangan, 100,000; Samarkand, 90,000. The people were largely Mussulmans of Turko-Mongol origin belonging to the Kirghiz, Uzbeg, Sart, and Turkoman groups. This racial diversity militated against all attempts on the part of the Turks to win over the population to Pan-Turanianism. There were sporadic movements of this kind both during the War and after, notably in 1922, when Enver Pasha appeared in the country for a short time, only, however, to be driven back into the hills of Bokhara. For the same reason what little government authority existed was taken over by the Russian Communists, who represented an infinitesimal part of the population. All the Russians in the region did not comprise more than 6 per cent of the inhabitants. Cotton culture continued to thrive to such an extent that wheat growing was largely abandoned. Before the Revolution there was an increased activity manifested in the cultivation of the vine and in orcharding, while factories were being erected for the exploitation of cotton products. The events of 1917 broke communication with European Russia and put an end to the sources of oil from Baku upon which the factories depended for fuel, with the result that the new industrial life immediately languished. Starvation and disease left their marks on the population, the ravages of malaria in 1923 being particularly heavy. See RUSSIA.

TURKEY. A country on the Mediterranean, in 1924 almost completely confined to Asia Minor. In 1914, Turkey possessed a total area, excluding Arabia, of about 700,000 square miles. Its population at that time was about 21,274,000. By the Treaty of Lausanne of July 24, 1923, the Turkish boundaries were delimited so as to include only about half of its area of 1914, and less than half of its former population. Turkey's territory was thus made up of Anatolia, the Constantinople district, Thrace east of the Maritza River (in Europe), Kars, Ardahan, and some few islands, especially Imbros and Tenebos. The population, too, was seriously reduced. The Greeks and Armenians were expelled, the loss of men on the battlefields ran into hundreds of thousands, and disease probably had an even heavier toll among men of military age. It is estimated that the population of Anatolia was reduced by about three million. The great majority of the inhabitants in 1924 were Turks; there were some Kurds, Laz, Yuruks, Turcomans, Jews, and Gypsies. The established state religion was Mohammedanism, and until March,

1924, the caliph was the supreme head. However, late in the evening of Mar. 3, 1924, the Mayor and Chief of Police called on Caliph Abdul Medjid and his son and notified them that they and their families were to be expelled across the frontier at dawn. There were still a few followers of the Russian church as well as Jews and a few Protestants. Owing to the disturbed conditions throughout Turkey, a number of business men left. Some Germans were reported to have reached Turkey during the latter part of 1922 and the first part of 1923; most of these sought either employment or concessions. Recent statistics gave the following principal cities with their inhabitants· Constantinople, about 900,000, Smyrna, 99,000; Konia, 71,000; Brousa, 65,000; Adana, 64,000; Adrianople, 56,000; Kaisariya (Cæsarea) 50,000; Aintab, 48,000; Ourfa, 43,000; Angora, 35,000; Sivas, 31,000; Mardine, 31,000; Magnesia, 28,000; and Trebizond, 27,000. Other important cities of more than 20,000 are Kiliss, Diar-Bekir, Maraash, Eski-Shehir, Tarsus, Erzerum, Samsoun, and Adalia

Agriculture. As Turkey was primarily an agricultural and pastoral commonwealth, land was the cardinal factor of its economics. How to revise land tenure, inheritance, and mortgage laws so as to insure clear titles and develop private initiative was a paramount problem. Real property in Turkey fell within the following categories. Mulk, Vakuf, Mirie, Metruke, and Mewat. The last two did not enter into the question, as they comprised lands devoted to public roads, prayer grounds, or pastures and uncultivated waste lands. Mirie lands were State-owned but capable of use and disposal by private individuals within multifarious restrictions Vakuf lands, the usufruct of which reverted to pious foundations, such as mosques, schools, libraries, and fountains, were administered by the government; they were in reality only leaseholds, but might be held and operated by natives and foreigners alike. The only freeholds in Turkey were mulk lands, and these were not extensive aside from the "tchifliks" or feudal estates (originally mirie lands). An important portion of the real estate of the country, especially in or near cities and towns, except for the direct income from it, was practically useless as a basis of credit, since it could not in effect be mortgaged. The cultivated area was estimated at about 11 per cent of the total. It was estimated that the number of peasant farms amounted to about 900,000, and the individual farms averaged between 2½ to 12½ acres, but as the landlord and tenant system was commonly practiced in Kurdistan, Anatolia, and Thrace, these conclusions were largely speculative. More than one-third of the cultivated area was devoted to wheat; other cereals, particularly barley, corn, rye, oats, millet, rice, raised the total cereal area to about four-fifths of the total land under cultivation. Besides cereals and a large variety of vegetables, Turkey produced cotton, tobacco, several kinds of valuable seeds (including linseed, sesame, poppy, and canary seed), olive oil, opium, nuts, fruits (especially figs and raisins), silk, wine, gum tragacanth, rose oil, licorice root, and valonea. Crops during 1923 were far below normal Exact statistics were unavailable. Cereal production was far below the prewar level. The production of opium in 1923 was estimated at only about 3000 cases as against a normal crop of 5000; tobacco, 23,000 metric tons as against 33,000; figs, 20,000 metric tons as against 40,000; raisins, 30,000 metric tons, as against 40,000; mohair, 30,000 bales as against 100,000; cotton, 60,000 bales as against 120,000; silk, 100 metric tons as against 8000. While there was no dairy industry or any stock breeding, Turkey's sheep and goats were a source of considerable revenue for their fleeces (wool and mohair), skins and casings. Although the War drew heavily on stocks of horses, mules, water buffaloes, camels, donkeys, sheep, and goats, it was estimated that from 40 to 60 per cent of the flocks and herds still existed. However, in 1913 the number of sheep and goats is stated to have been 35,185,000, and cattle and buffaloes 6,132,000. The census of 1923 indicated only 14,200,000 sheep and goats, and 3,800,000 cattle. These figures cover approximately the same area In the Konieh plain, where about 150,000 acres were brought under cultivation in 1915 through a German irrigation scheme, the yield of wheat and oats multiplied from three to fifteenfold. It is possible also to reclaim by irrigation, drainage, or dry farming vast areas lying fallow in 1924. The conditions of tenants during the period were deplorable, but with an increase in production it was expected that this condition would be much improved. The woods from Turkey's forests equal any in the world for hardness, strength, and durability. As the principal forests (about 88 per cent) were the property of the government, they constituted a national asset of capital importance, covering an estimated area of about 20,000,000 acres. Although these forests prevailed over the entire Black Sea slope of Asia Minor, heaviest in Kastamuni, there were also extensive timber lands about Sivas, Brousa, and Adalia, and in the Taurus Mountains. About 745,000 trees were cut annually from the forests in Kastumuni. The principal forests consisted of pine and oak. The best woods were oak, pine, birch, chestnut, and walnut. Water power was plentiful in Turkey, but almost entirely unused.

Mining. While no comprehensive geological survey was undertaken in Turkey, it was generally believed that the country possessed vast mineral wealth Some of it, such as coal, chrome, emery, lead, copper, boracite, meerschaum, salt, marble, mercury, antimony, and gypsum, was already being extracted, with a promise of material development. Coal was mined after 1900 in the western section of Kastamuni near Heraclea and Zunguldak. The coal production in this region from 1904 to 1907 averaged about 633,000 long tons a year; from 1908 to 1912 about 830,000; from 1913 to 1918 only about 360,000—probably owing to the War—and in 1920 about 500,000 tons. In 1922, the production was about 450,000 tons, and in 1923 about 600,000 tons. The normal annual output in metric tons of the Turkish mines in operation in 1924 was as follows: Antimony ore, 1500 metric tons; asphalt, 7000; boracite, 16,000; chrome ore, 15,000; copper, 1500; emery ore, 15,000; iron pyrite, 20,000; lead, 13,000; lignite, 30,000; manganese ore, 12,000; meerschaum, 250; zinc ore, 2000, gold, 45 kilos; silver, 250; and mercury, 4500 flasks.

Manufacturing. Industries in Turkey were mostly quite primitive. In 1924 it was evident that factories were being started on a small scale, but the supply of labor seemed likely to make the work difficult, in so far as the real laborers of Turkey, viz., the Greeks and Ar-

menians, had been expelled. The chief industry was the cotton manufacturing industry, which had a total of about 50,000 spindles. The *Bulletin de la Chambre de Commerce et d'Industrie de Constantinople* gave the total number of establishments, with the exception of Constantinople, Smyrna, Brousa, Dalikesser and Eski-Shehir, as 33,058, during 1921, with the total number of workmen as 75,216. Of this number of establishments, the textile comprised 20,057. The other establishments were leather, metal, wood, foodstuffs, pottery, and chemicals. The expulsion of the Greeks and Armenians practically denuded the carpet and rug industry of Turkey and transferred this industry to Greece. At Smyrna and Adana private enterprises began to manufacture cotton cloth and cotton oil; at Constantinople, yarn, paper, and cement; at Smyrna, machinery, soap, shooks, and tannin; at Brousa, towels, garments, and leather; at Kutaia, glazed tiles and pottery; at Constantinople, Smyrna, and Mersina, ice. Statistics of these industries were unavailable. Apart from porters and boatmen in the seaports there was no professional labor class in Turkey Skilled artisans worked mostly on their own account. In silk spinneries and cotton mills, women and children were employed. Generally speaking, labor was casual.

Cost of Living. Unlike most of the countries of the Near East, the cost of living in the interior of Turkey did not increase materially. An increase was felt only in the larger cities and on the coast. The index of the cost of living at Constantinople (1914 as 100) stood at 1058 in June, 1922; 1197 in June, 1923, and 1194 in August, 923. The legal tender of Turkey is the gold pound, the par value of which is $4.40. The Turkish paper pound averaged only about $1.50 in 1919; 70 cents in 1920; 65 cents in 1921; 62 cents in 1922; 61 cents in 1923; and 52 cents in February, 1924.

Commerce. Owing to the fact that during the period 1914–24 the territory of Turkey underwent marked changes, comparative figures of foreign trade would be practically meaningless. Constantinople might be called the receiving port of Turkey, and Smyrna its shipping port. However, a number of exports were shipped from Constantinople. No figures were available for the trade of the interior of Turkey, i.e. Anatolia, such statistics having never been made up, inasmuch as the lack of transportation facilities hindered the movement of this trade. In fact, the grain-producing regions were regularly unable to dispose of their products to the non-producing regions, except by caravan, which was a very slow process. Official trade statistics, as given, ended with the year 1914, since which time the only figures available are for the trade of Constantinople. Of course, a considerable amount of this trade would be reëxports from the interior. The total trade, according to Turkish official statistics for the financial year 1914 (Mar. 14, 1913, to Mar. 13, 1914) was £T62,245,803 ($273,881,533; converted at par, 1 Turkish pound = $4.40). Imports for the year totaled £T40,809,682 ($179,562,601); exports, £T21,436,121 ($94,318,932). The following statement shows the trade of Constantinople for the financial years indicated:

	Imports	Exports
1918–19	$139,143,564	$57,641,808
1919–20	118,577,387	33,338,117
1920–21	78,864,202	19,746,878

Complete figures for the trade of 1922 were unavailable. The total imports into Constantinople amounted to £T67,884,181 ($42,088,192). The total value of the trade of Constantinople for the first half of 1923 was as follows: imports, £T38,474,991 ($24,023,994); exports, £T12,941,998 ($8,282,847). Conversions were made at the average exchange rate of the Turkish pound for the first half of 1923, $0.64. The principal articles of import during 1921 were cotton, cotton goods, cereals, wool and woolens, petroleum products, Colonial products, and metals and metal manufactures. The principal articles of export from Turkey were opium, dried fruit, hides and skins, wool and mohair, oil seeds, carpets, and tobacco. The principal countries selling to Turkey during 1921 were the United Kingdom, the United States, Italy, and France. The chief purchasers from Turkey were Rumania, Greece, the Netherlands, the United Kingdom, and France. The Turkish trade balance from 1914 on was unfavorable.

Communications. New Turkey had in operation 2455 miles of normal-gauge and 329 miles of narrow-gauge railways. The Angora-Sivas line was being constructed in 1924, and various other projects were under consideration for the further construction of railway lines and branch lines. The Minister of Public Works set the total mileage of highways at 15,104, but added that only 1829 miles were in good condition. There were no navigable rivers in Turkey, but the long coast line compensated to some extent for the lack of highways and waterways. The number of post offices in Turkey was estimated at 1814. The length of telegraph lines in Turkey was about 28,890 miles, and the length of wire about 49,200 miles. There were about 1017 telegraph offices. Turkey's shipping after the War was in poor condition. It was estimated that Turkey had not more than 110,000 tons of shipping at the beginning of the War. The Turkish Chamber of Commerce estimated the strength of the Turkish merchant marine of Nov. 1, 1923, at about 83,000 tons. Six of these vessels exceeded 3000 tons, and all were under the Turkish Shipping Board which also controlled 35 vessels aggregating a tonnage of 37,000. Most of the Turkish shipping was limited in equipment. Turkey under the National Assembly limited its coastal shipping exclusively to vessels under Turkish registry, with the result that a new impetus was given to the development of a national merchant marine.

Finance. Turkey's external debt on Mar. 1, 1923, was 160,404,940 Turkish gold pounds. On Dec. 31, 1921, the total amount of treasury notes in circulation was £T153,859,936, and treasury bonds £T5,147,919. On this date prewar metal money stood at £T38,000,000 and other metal money £T20,000,000, coined by the Turkish mint during the War. Turkey's external debt increased over 1914–24, not because of any further loans, but because interest payments on existing debts were defaulted. The budgeted revenue for 1921–22 was £T22,889,661; expenditure £T21,890,867. No later official figures were available. The budget for the 1923–24 and for 1924–25 showed, as far as known, heavy deficits.

Education. In Turkey, elementary education was nominally obligatory for all children of both sexes. The provisional law of Oct. 6, 1913, stated that all children from 7 to 16 were to receive primary instruction. The state schools were under the direct control of the Minister of

Public Instruction. Besides state schools there were various madressés, or theological seminaries. The schools numbered about 36,230 and contained about 1,331,000 pupils. There were a number of foreign schools, mostly conducted by French, English, and American missionaries. The newly expressed chauvinistic attitude of the Turks tended to decrease materially the number of foreign schools.

Defense. It is stated that up to the time of the Armistice nearly 2,700,000 men had been recruited for military service in Turkey. During the War the maximum combatant strength was approximately 650,000. The strength of the Kemalist army, which drove the Greeks out of Turkey in August, 1922, was estimated to have been 190,000 men, of which 20,000 were in Eastern Thrace. The naval forces of the Angora government were insignificant.

History. The consistently friendly policy which the German Emperor had pursued toward Turkey with the beginning of the twentieth century bore fruit before the War was many months old. Russia's known designs on the Straits, England's retention of Cyprus and the spread of the English influence in Egypt, the Pan-Slavic movement which implied the irretrievable loss of Turkish territory in Europe—all militated against the maintenance of a friendly attitude toward the Allies. Late in October Turkey's hand was forced when a German-Turkish squadron, headed by the German Admiral von Souchon, bombarded Russian Black Sea ports. On October 31, Russia retaliated by declaring war The other Allies followed suit. The character of the struggle was immediately and profoundly changed. From being a war localized in Europe, its incidence spread over the Near East and touched India. The great Moslem populations under the British rule whose allegiance to the Caliph always presented the danger of a Holy War, became an ever-present reminder of the volcano upon which the British Empire was perched, with the result that attention had to be diverted increasingly to this area. So far the German diplomacy succeeded. English troops before long were engaged in Mesopotamia and in defense of the Suez Canal. Here was the origin of the ill-fated expedition to force the Dardanelles and of the prolonged struggle in the Saloniki region. War, by Turkey, was carried on with the usual ferocity. (At any rate, so it was generally believed during the War. After the War, numerous American and European students of Levantine affairs concluded that the "Turkish atrocities" and "massacres" had been much exaggerated, and were not by any means one-sided.) According to war-time reports, a policy of extirpation against Greeks and Armenians was carried out relentlessly, with the result that whole villages were wiped out, men butchered or driven into the south, and women and children carried off. The Armenians caught the greater part of the Turkish fury. Out of a population of 2,000,000, by 1916 it was estimated that 1,000,000 had been deported and 500,000 slain. (See ARMENIA.) Their nearness to the Russian frontier saved 200,000 others who sought refuge in flight. But only one insurgent spirit was stilled in this fashion. A more potent one was that of the Arabs, headed by the Grand Sherif of Mecca, who struck at the security of the whole Ottoman Empire by refusing to take up the Caliph's Holy War, and finally, in 1916, by declaring independence. (See ARABIA.) Turkish arms, except on one front, were from thence on everywhere unsuccessful. After an initial setback the British succeeded in overrunning Mesopotamia; in 1917, Palestine was lost to the Turks; and in 1918, Syria. In Transcaucasia, Turkey emerged triumphant after the collapse of Russia, and by the Brest-Litovsk Treaty received back the former Turkish provinces of Kars and Ardahan. Beset by enemies on all sides and confronted by pressing internal problems of which famine and brigandage were only the more evident, on Oct. 12, 1918, the Turkish government appealed to the United States by way of the Spanish ambassador at Washington for an immediate cessation of hostilities. On October 30 Turkey surrendered to the British Vice Admiral Calthorpe and on the next day accepted the terms of the armistice of Mudros Its conditions were drastic: the Dardanelles, Bosporus, and Black Sea were to be opened to the Allies; the army was to be demobilized, and all Turkish war and merchant ships surrendered; troops were to be withdrawn from Transcaucasia With its acceptance collapsed, too, the Young Turk movement, and Enver, Taalat, and Djemal with the other members of their party fled the country.

The subsequent history of Turkey was startling. Unlike her allies, she refused to accept the status of a conquered nation, and in the period 1919–24 so assiduously played the diplomatic game that as a result of the Greek defeat and the mutual jealousies of the French and the British, Turkey emerged to a large extent triumphant. In 1919, her rulers were prepared to accept the loss of Mesopotamia, Syria, Palestine, and Arabia as well as the restoration of the Capitulations (which Turkey had terminated on her entrance into the War), and an international control of the Straits. But the unwise decision of the Supreme Council early in 1919, at the prompting no doubt of Venizelos, to deprive Turkey of Thrace as well as Smyrna, aroused a storm that could not be stilled. Turkey was soon to be swept by the same nationalistic aspirations that held all the unrecognized races of Europe. The arrival of Greek troops in Smyrna in May, 1919, was the cause for Mustapha Kemal's journey into Asia Minor on an errand whose purpose was destined to be completely and victoriously realized four years later. Mustapha Kemal Pasha, a brilliant young army officer who had rendered distinguished service at Gallipoli and elsewhere, put himself at the head of a Nationalist movement, aiming to save Turkey from dismemberment and exploitation, to rouse Turkish patriotism on a purely national, rather than a religious basis, and to liberalize the Turkish government. So successful was his ardent appeal that within a year he had established at Angora a National Assembly obeyed throughout Anatolia. The Sultan was discredited; the Caliphate maintained its position only on sufferance. The signing of the Treaty of Sèvres on Aug. 10, 1920, by Turkish representatives who were not recognized by the Nationalists merely added strength to all those hostile forces that were preparing for a struggle The document reflected the selfish interests and warring rivalries of the powers in the Near East. By it, Turkey was to become a shadow of its former self. Thrace, the islands of Tenedos and Imbros, the Dodecanese, Smyrna (for five years preceding a plebiscite), Cyprus, Egypt, Armenia, Mesopotamia, Syria, Palestine,

the Hedjaz, were lopped off. Constantinople was to remain Turkish, but the Dardanelles, the Sea of Marmora, and the Bosporus were to form a "Zone of the Straits" under international control. An independent Armenia was established and the drawing of its frontiers entrusted to President Wilson. President Wilson finally delimited a state of 30,000 square miles with an outlet, Trebizond, on the Black Sea, but the Turkish Nationalists refused to accept the treaty, as, ironically enough, did the governments of all of the signatories. Meanwhile, with the consent of the Supreme Council, Greek forces had occupied Eastern Thrace and spread over Smyrna. Hostilities, which were to end so disastrously for the Greek ambitions, did not begin for another year. During the interim, the Nationalists availed themselves of every pause for the consolidation of their position. Attempts at conciliation by the Constantinople government were spurned. It was toward Soviet Russia that Kemal turned for aid. In an understanding effected late in 1920, Nationalist Turkey was promised financial and material aid as well as supplies of men; to facilitate a readier communication with Transcaucasia, a Turkish army marched into the Armenian Republic of Erivan in September, 1920, and by November had not only humbled it but celebrated its victories by bloodshed. The massacres recalled the days of 1915–16. The result was the establishment of a Soviet state of Armenia, the cession once again of the provinces of Kars and Ardahan to Turkey, and the establishment of communications between Erzerum and Azerbaijan.

Greece was the pivotal point of the Near East and the destiny of Turkey waited on the revelation of the Greek purpose. The startling reversal that Venizelos met in the Greek elections of 1920; the triumphant return of King Constantine as a result of the plebiscite of Dec. 5, 1920; the withdrawal of Allied aid to Greece, the flight of Venizelos, all these gave substance to the belief that the persecution of Turkey could not continue. Dissension in the Allied councils was now too plain. The English support of Greece had been uncertain; the French in a year had made a *volte-face* and were openly favorable to Turkey. The purposes of the two countries conflicted sharply, as a result of their imperialistic ambitions in the Near East. All these factors led to an attempt in February, 1921, to revise the Treaty of Sèvres, at the expense of Greece, and for the grudging reconciliation of the Nationalists. Greece, against the advice of the Supreme Council, refused to compromise and in March, 1921, took into her own hands the enforcement of the Treaty of Sèvres. King Constantine, up to his abdication the staunch sympathizer of his imperial brother-in-law, was now fighting the battle of Christendom against the "unspeakable Turk." As the bloody and unnecessary war between Turks and Greeks dragged on during 1921–22, France took the opportunity to seek her own advantage, at the expense of Allied unity. On Oct. 20, 1921, an agreement was signed with the Angora government by which, for the price of withdrawal from Cilicia, the French gained immunity in Syria, as well as important financial and mining rights and a lease of a part of the Bagdad railway. Italy likewise concluded a secret agreement with Angora. In the war in Asia Minor the Greeks were partially successful in 1921; in the summer of 1922, exhausted, poorly led, with a shattered *morale* as a result of the uncertainties of the home situation, the Greeks everywhere gave way, murdering and pillaging as they retired, and in September, were compelled to evacuate the city of Smyrna. Before the end of October the country was free of the invader. (For a discussion of the war, see GREECE.) The alarm of Europe at this turn of events would be difficult to exaggerate. A triumphant Turkey menaced the security of Thrace, Syria, Mesopotamia, Arabia, the well-being of the Christian populations of Asia Minor and the Jews of Palestine, and the peace of mind of the whole Moslem world. Possibly it was the firmness of Great Britain that averted serious trouble if not a general war. Premier Lloyd George strenuously objected to the appearance of a Turkish force in Europe, hastened troops into the Chanak region to oppose a passage into Thrace, and in spite of a studied French and Italian indifference, worked heroically, by a mixture of doggedness and forbearance for the arrangement of a peace. An armistice was signed at Mudania, October 10, which was tantamount to a Turkish triumph, for the Greeks were compelled to evacuate Thrace. The Turks met with the Allies on Nov. 20, 1922, at Lausanne, to draft a definite peace treaty. The conference sat for 11 weeks, broke down in February, 1923, without hope for continuance, it seemed, because of the Turkish rejection of the Allies' proposals, and then resumed sittings on April 23. On July 24 a treaty was signed by Great Britain, France, Italy, Japan, Greece, Rumania, and Turkey which unmistakably revealed the regeneration of the Turkish spirit and the breakdown of Allied unity. In an atmosphere of intrigue which clearly indicated that Europe had learned nothing from the War, a peace was effected which left Turkey secure in Europe and in control of Constantinople, the Bosporus and the Straits Syria, Palestine, Mesopotamia, the Hedjaz, and Yemen were severed from Turkey, the Dodecanese were given to Italy and not to Greece, while Eastern Thrace to the Maritza line and the whole of Anatolia, including Smyrna, were left in Turkish hands. The Capitulations were abandoned in unequal exchange for promises of judicial reform, the Armenians discreetly forgotten, and the Christian problem solved by the elimination of the Christians; that is, provision was made for a wholesale exchange of Turk subjects in Greece for Greek subjects in Asia Minor. Conventions for the regulation of the Straits and the demilitarization of the Greek-Bulgarian-Turkish frontier in Eastern Thrace were also signed.

From the date of the signing of the National Pact on Sept. 13, 1919, which committed Mustapha Kemal and his party to a common programme of reform, to the signing of the Lausanne Treaty, the world witnessed Turkey's transformation not only internationally but internally as well. By the fundamental law of Jan. 20, 1921, all legislative and executive authority was vested in the Grand National Assembly, elected for four years, and established at Angora. By this body Kemal was chosen its president as well as commander-in-chief, first in 1921, and again in 1923. On Nov. 3, 1922, the National Assembly became in name what it had been in effect, the government of Turkey, by the forced abdication of Sultan Mohammed VI, who had ascended the throne in 1918. Abdul

Mejid was then elected Caliph or supreme religious head of the Moslem world, by the National Assembly. The plans of the new government called for the reduction of the tithe on agricultural products and the revision of taxation, reduction of the army and navy to the lowest possible limit, strengthening of the police, improvement of education, etc. The social position of women, in conformity with western ideas, was revolutionized, and even their legal position was given serious attention. Nothing so clearly indicated the parting with the old ways as the readiness with which the Turks surrendered the Caliphate. This office, for centuries held by Ottoman sultans, nominally implied spiritual headship over the entire Moslem world, and had been exploited by the Turkish government during the War in relatively futile efforts to rally all the faithful in a Holy War; but its real importance was grossly exaggerated by public opinion in the Occident. In reality, the Caliph had long been disregarded not only by the schismatic Shiahs of Persia, but by the millions of orthodox Mohammedans in non-Ottoman countries In accordance with their policy of substituting Turkish national patriotism for Ottoman Pan-Islamism, the Nationalists at Angora in March, 1924, deposed Abdul Mejid and renounced the Ottoman claim to the Caliphate. Immediately rival aspirants to the Caliph's vacant office appeared on every hand—the King of Egypt, the Sultan of Morocco, the Aga Khan of Bombay, and the King of the Hedjaz. But the Caliphate remained an unappropriated honor. Toward foreign influence in Turkish affairs, the Assembly, remembering the unfortunate history of the previous two decades, remained hostile, and every project to speed reconstruction by the aid of foreign money was discouraged. TURNER, WILLIAM (1871–). An American Roman Catholic bishop, born at Kilmallock in Ireland. He graduated from the Royal University of Ireland, in 1888 and studied at the American College at Rome and in Paris. In 1893 he was ordained priest and from 1894 to 1906 was professor of philosophy at St. Paul Seminary. From the latter date to 1919 he occupied the same chair at the Catholic University of America. In 1919 he was consecrated bishop of Buffalo. Bishop Turner is the author of *History of Philosophy* (1903), and *Lessons in Logic* (1911). He edited *The American Ecclesiastical Review* and was associate editor of *The Catholic Historical Review.*

TURPAIN, ALBERT CAMILLE LÉOPOLD (1867–). A French physicist, born at La Rochelle, and educated there at the Ecole Fénélon. He became professor of physics at the University of Poitiers and was one of the first to perform experiments in wireless telegraphy. His works include: *Recherches Expérimentales sur les Oscillations Electriques* (1899); *La Télégraphie sans Fil et les Applications Pratiques des Ondes Electriques*, 2d ed. (1908); *Leçons de Physique*, 2 vols., 6th ed. (1920); *Manipulations de Physique* (1908); *Téléphonie* (1909); *Télégraphie* (1910); *La Lumière* (1913); *Vers la Houille Blanche* (1918); and *Manipulations Electro-Techniques* (1920).

TUSKA, GUSTAVE ROBISHER (1869–). An American civil engineer, born in New York City, and educated at the College of the City of New York and at the Columbia University School of Mines. He entered on the practice of his profession as assistant engineer with the Link Belt Engineering Company (1891) and became in 1899 chief engineer of the Panama Railroad and of the Panama Steamship Company. During 1897–1921 he was with the American Process Company in charge of the construction of plants handling waste products and also served as consulting engineer on municipal waste disposal plants in New York, Chicago, Buffalo, St. Louis, Washington, and other cities. During the War he served on the staff of the chief of engineers of the United States Army and was a member of the steel committee of the War Industries Board. During 1915–17 he lectured at Columbia on municipal disposal work and in 1919 was appointed a member of the Mexican Commission by the United States government.

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE. A nonsectarian, coeducational normal and industrial school for the education of negro youth, at Tuskegee, Ala., founded by Booker T. Washington in 1881. The student enrollment rose from 1527 in 1914 to 2440 in 1923–24 with a summer school for teachers, registering more than 600 annually. In the same period, the faculty increased from 192 to 241 members and the library from 20,000 to 28,000 volumes. The productive funds rose from $1,942,112 to $2,709,110 and the yearly income from $473,764 to $515,412. A group of boys' trades buildings was constructed in 1919 at a cost of $226,000, and the Ellen Curtiss James Hall, a dormitory for girls, and 1920. Junior college courses of three years in agriculture and two years in teacher training and business practice were added to the regular academic course. The Institute received an anonymous gift of $250,000 for permanent improvements in 1916 and $800,000 from the will of Mrs. Russell Sage in 1919. Robert Russa Moton, LL.D, succeeded Booker T. Washington as principal on his death in 1915.

TUTANKHAMEN. It would probably be difficult to discover an Egyptian king of whom less is known historically and who at the same time is better known to the civilized world. The fame is of course due to the discovery of his tomb and its indescribably sumptuous contents by Lord Carnarvon (q.v.) and Howard Carter (q.v) in 1922. This Pharaoh whose funerary furnishings are the most splendid yet discovered belongs chronologically to the end of the eighteenth dynasty. He was the husband of the third daughter of Akhenaten, or Amenhotep, the famous heretic king, and came to the throne a short time before or after the death of his father-in-law—probably after it. We do not know whether he was of royal blood. It is believed that he died when he was hardly more than a boy. At the time of his marriage his wife, Ankh-es-en-pa-Aten, could hardly have been over ten years old. Just how long Tutankhamen ruled is also unknown, though certainly it was at least for six years.

It is common knowledge that Akhenaten, the dreamer, by his substitution of a monotheistic religion had alienated the priestly caste, who

found themselves well in the way of losing power. It is equally well known that in all probability the idealism of the king was incomprehensible to the uneducated, who must have longed for a return to the traditional form of worship of the country During the reign of Akhenaten also, the foreign policies of Egypt lacked vigor, and the Empire abroad was crumbling. It is small wonder that soon after his death there should have been a violent reaction toward the traditionally accepted forms of religion. How soon this took place may be estimated from the fact that on the back of one of the chairs found in the tomb of Tutankhamen appears the symbol of the god Aten, while elsewhere in the same room the name of the youthful ruler is spelled with the ending "amon," showing that the maintenance of his position upon the kingly throne probably required him to return to an allegiance to the older form of worship. In view of his youth it is a matter of speculation how he came to occupy the throne at all. He seems to have been too young to have counted for much on his own part. Perhaps the answer is to be found in the fact that his successor, Aye, who during Tutankhamen's reign was chief priest, represented himself on the wall of the burial chamber of the young king's tomb. Since it is most unusual for any other than the deceased king himself to appear in decorations of his tomb, the suspicion arises that this priest chose to have the young Tutankhamen on the throne as a matter of policy, for the boy would be likely to prove pliable in the hands of this powerful friend of the family, who felt perhaps that the time was not ripe for him to seize the throne for himself.

TYPHOID FEVER. In the War, typhoid in the ordinary course of events would have been a tremendous menace to the troops, but the successful use of mass preventive measures, as carried out in the mobilization of 15,000 United States troops along the Rio Grande when hostilities with Mexico threatened, had shown what can be done in war time. The warring troops were as rapidly as possible immunized against typhoid, the two paratyphoid fevers, and dysentry; usually three serial inoculations were practiced. In addition, the older sanitary measures, such as proper construction of latrines and disposal of feces, antifly campaigns, etc., were practiced. As a result the troops were remarkably free from these infections throughout the War, although it was found that protective inoculation of troops after prolonged exposure to hardships could not always be guaranteed. In civil practice it was shown over and over that combined prophylaxis against typhoid in cities can stamp out the disease even in communities as large as Chicago. The water supply must be pure, and city dwellers about to go on summer vacation and to drink from doubtful wells were urged to subject themselves to preventive inoculation. Campaigns against the house and stable fly were encouraged by health authorities. It is often found that the greatest obstacle encountered in eradicating the disease entirely is the so-called "typhoid carrier" who still harbors the virus about his, or more often her, person, and who is able to contaminate the food supply of houses and institutions. The worst carriers are cooks and others who come in contact with the food.

TYPHUS FEVER. During the War in Europe, knowledge of this affection was notably augmented. Much was also learned from a study of Mexican typhus, which occasionally crosses into the United States; during 1923 there was a small epidemic in southern California. The part played by the louse as the sole medium of transmission became fully realized, and prevention of its spread was effected chiefly by delousing and by the use of approximately louse-proof apparel by those necessarily exposed. A few cases appeared in western Europe during the War but gave no trouble, and it was shown in the intensive antityphus campaign that there were a few cases in Paris which may not have been imported, recalling the so-called Brill's disease sometimes encountered in New York. It was realized that the true virulent disease might run a mild course and that the malignancy of epidemics is due to rapid passage through its victims, facilitated by overcrowding and the low resistance of the patients, who are often in a state of semistarvation. During the War the countries ravaged by typhus were Russia, the Balkans, Poland, and Galicia, and the disease extended eastward into Asia. Its invasion of the rest of Europe was held in check only by the most intensive efforts; only a few hundred cases occurred in mid-Europe. The cause has never been determined, although many organisms have been accused and serological studies have been of use in diagnosis. No specific remedy has been discovered.

TYRWHITT, SIR REGINALD YORKE (1870-). A British admiral, born at Oxford. He joined the navy in 1883 and was promoted through the grades till he reached the rank of rear-admiral in 1919. He had an important part in the War as commander of the destroyer flotillas in actions in Heligoland Bight in August and December, 1914, and off Dogger Bank in 1915.

UFER, WALTER (1878–). An American painter, born in Louisville, Ky. He studied chiefly at the Royal Academy of Dresden and then in Chicago and at Munich. Returning to the United States, he settled at Taos, N. M., and became known from 1914 as one of the foremost painters of the Pueblo Indians. He paints their life and country with deep and sympathetic insight into the Indian character, in vivid color, and with fine decorative feeling He recently received many awards, including the First Logan Medal of the Art Institute of Chicago (1917); the Altman Prize, National Academy of Design, New York (1921), and the Temple Gold Medal, Pennsylvania Academy, Philadelphia (1923). He is represented in the Public Museums of Brooklyn, Chicago, and Philadelphia; the Corcoran Gallery, Washington, D. C., and in other museums.

UGANDA. A British protectorate in East Africa with an area of 110,300 square miles, including 16,000 square miles of water, and an estimated population (December, 1922) of 3,132,312. Of these, natives numbered 3,125,522, Asiatics, 5529, Europeans, 1261. There were 3651 Asiatics in 1914 and 1017 Europeans. Chief towns are: Mengo, in Kampala (population 40,000); Entebbe, the capital (population 12,000). Cotton continued the most important single activity. In 1913–14 the cotton export was valued at £317,687; in 1921 at £1,281,000; in 1922, at £877,625. Next in order were (exports of 1922): coffee, £99,227; ivory, £47,000 (1921); oilseeds, £41,000 (1921); chillies, £52,768; hides and skins, £26,000 (1921); rubber, £3741. Coffee and rubber production showed advances particularly as a result of European interest. The total exports in 1922 were £1,215,793 as compared with £524,260 in 1913–14. After 1917, the customs administrations of Uganda and Kenya were combined and imports were credited to the Kenya Colony. Revenues for 1913–14 were £256,559 and expenditures £290,180; for 1923 (estimate) these were £879,050 and £1,062,871. The poll tax accounted for the greater part of the revenues in the postwar years. The debt was £844,895 in December, 1922. After 1914 a cessation was made of imperial grants-in-aid. British penetration into the interior continued so that by 1915 almost the whole protectorate was, with the exception of Rudolf province, well in hand During the War, great numbers of natives (estimated at 150,000) saw service as carriers in the African campaigns. In 1921, a legislative council, made up of nominated members, met for the first time. The Indians refused to participate because of the social and economic segregation to which they were subjected. See KENYA COLONY.

UKRAINE. While the Ukrainians had some claim to self-determination on the grounds of language, it is doubtful whether socially and culturally they formed a distinct and homogeneous nation. Before the War, there were some 35,000,000 of them in central-eastern Europe. In Russia, 30,000,000 were to be found; 3,500,000 in Austria, in Galicia and Bukovina chiefly, and known more commonly as Ruthenians; and 500,000 in Hungary. In Hungary, their national consciousness had been kept alive by the repressive policy of the Magyars; in eastern Galicia, because of their hatred of the Poles, they clung to their language, religion and folkways (see GALICIA; POLAND.) In Russia, with the beginning of the twentieth century, there began to appear evidences of a tenderly fostered and not very virile Ukrainian movement that aimed at regional automony. Though most of the Ruthenians in Galicia were peasants and 60 per cent were illiterate, Lemberg became the cultural seat of the agitation and from it radiated thin lines of influence into the Russian provinces. The break-up of the Russian empire gave the Ukrainians their long sought opportunity. The independence of Russian Ukraine was proclaimed on Nov. 21, 1917; that of Austrian Ukraine, on Nov. 19, 1918; on Dec. 14, 1918, the government of Ukraine, a directory of five members, was set up as a provisional government; and on Jan. 3, 1919, the union of Eastern (Russian) and Western (Austrian) Ukraine took place. Though the Ukrainians had been recognized as constituting a nation by Russia and the Central Powers in the Brest-Litovsk treaties (March, 1918), they were pointedly refused a hearing by the Paris Peace Conference. In fact, they were compelled to see their hopes vanish as the commissioners apportioned out territories they claimed as peculiarly their own. To Rumania, Czecho-Slovakia, and Poland went Bessarabia, the Carpathian Ruthenians, Bukovina, and Galicia. The region itself was never for long under a single rule nor did it, until 1922, enjoy any surcease from the trials of war. In 1919, the central government, under Hetman Petlura, was waging war against the Poles. In 1920, the Ukraine joined arms with Poland against Russia with the result that its representatives were signatory to the treaty of Riga (October, 1920), by which the region's independence was recognized by both powers. However, by the treaty the Polish boundary was pushed so far east that Galicia and Volhynia were lost to the Ukraine. Petlura's government continued to exist for a time; but gradually power was being accumulated in the hands of a Soviet which made its appearance first in 1920. Nothing quite so completely revealed the incompetence of any group to rule as the ease with which bandits made the country their prey. From 1919 on, armed forces terrorized the countryside. The Jews in particular were singled out as vic-

tims, the tale of their suffering being possibly the darkest of all those miserable annals with which the history of central and eastern Europe was filled in the three years following the Armistice. In the words of the Chief Rabbi of the British empire: "150,000 human beings were bayoneted, bombed, buried alive, drowned, thrown alive into lime pits, and subjected to the most diabolical tortures that only a Dantesque imagination could conceive" Not until 1922 was it evident that the country was settling down to a peaceable activity, and this was due only to the loss of its national identity, for on Dec. 30, 1922, delegates from the Ukraine in company with those of Russia, White Russia and the Transcaucasian Federation completed a treaty by which the Union of Socialist Soviet Republics was set up. From thence on the history of the Ukraine was, more properly, that of Russia. Economically, there was every justification for the federation; for, while the Ukraine possesses great wheat, barley, and sugar fields, as well as valuable coal and iron deposits, it is, like the other Russian regions, dependent upon the oil from Baku, the lumber of the northern forests, Siberia's dairy products, and the cotton of Transcaucasia and Turkestan. See RUSSIA.

UNEMPLOYMENT. The decade 1914–24 saw severe unemployment crises, especially in the years following the War. In the belligerent European countries unfavorable conditions of employment gave way during the War to less than normal unemployment, because of the drafting of many millions of workers into the armies, the stimulation of many lines of production by military needs, and the establishment of central control in industry. Neutral countries which were in a position to cater to the military needs of the belligerents enjoyed a rather lasting war prosperity. The most severe crises of unemployment occurred a few years after the Armistice when the war prosperity came to an end and the after effects of the War threw the industrial machinery of the world into violent disorders. Millions of men returned from the front seeking their old positions, while the substitutes who had taken their places during the War clung tenaciously to their new means of livelihood. The great postwar unemployment crisis began to accumulate force in 1920 and was still existent in 1924 in some countries like Great Britain and Germany. The occupation of the Ruhr was a potent cause of renewed unemployment.

United States. Chiefly as a result of the War, the United States experienced its most severe unemployment crisis in many years in 1914 and the early part of 1915. The unemployed constituted 15.8 per cent in 1914, and 16 per cent in 1915, of the total labor force. In New York alone their number was variously estimated at from 140,000 to 500,000. Numerous emergency measures were instituted by city governments, committees of citizens, and diverse leagues and associations. The very sharp upward turn in business, however, during the summer and the early fall of 1915 had a very wholesome effect on the labor market, and employment conditions improved rapidly, chiefly because of the enormous manufacture of munitions. This improvement continued during 1916 and 1917 when the proportion of the unemployed to the total labor force was 7.1 per cent and 4.7 per cent, respectively. In 1917 there was great scarcity of labor and consequently a great demand for it. This was due both to the drafting of millions of men into the military service and the great increase in industrial activity. This situation remained unchanged until the late fall of 1918 when some of the employers began to lay off their workmen, although there was still a great deal of demand for manufactured products and the labor market continued to be good until the early fall of 1920 At that time there was considerable curtailment of production and many workers were thrown into unemployment. Statistics show that in September, 1920, there occurred in many important industries decreases of from 4 to 14 per cent in the employment. Unemployment gained momentum in the last months of the year and reached its maximum intensity in January and February, 1921. The outstanding event of this latter year in the unemployment situation was President Harding's National Unemployment Conference in October, which set unemployment before the country in an official way as being chiefly a problem of industry. The conference estimated the number of unemployed at from 3,500,000 to 5,000,000. During this period Michigan had the greatest decrease in employment with 82 per cent, and Ohio and Indiana with 50 per cent Secretary of Labor James J. Davis estimated the unemployed in the beginning of 1922 at between 5,000,000 and 6,000,000, but this figure is probably an exaggeration. During the course of 1922 the situation improved materially. In 1923, unemployment declined still further and production became normal. The United States Bureau of Labor Statistics published in recent years a study of the extent and the causes of unemployment, which summed up the situation as follows: "Industrial wage earners in those States for which data are available lose about 10 per cent of their working time through unemployment, mainly from lack of work and exclusive of idleness due to slackness and labor disputes. On this basis an average of at least a million and a half industrial wage earners in the United States are constantly unemployed, taking poor and prosperous years together."

Great Britain. From the outbreak of the War, until 1917, unemployment declined steadily in Great Britain. In the first seven months of the latter year the percentage of unemployment among trade unions paying unemployed benefits averaged less than one-third of one per cent as compared with an average of nearly four per cent during the preceding 10 years. After August, 1917, the number of unemployed increased, and in 1919 the situation became seri-

ous due to the rapid demobilization. Following upon this unfavorable condition of the labor market there came an interval of about eight months during which the rate of unemployment was low. But in the autumn of 1920 the most acute crisis, that of unprecedented unemployment, began. It was still grave in 1924. In June, 1921, the number of men out of work, entered on the insurance list, was 2,177,000, and those partially unemployed were 998,000. The average of the unemployed during 1922 and 1923 was 1,500,000. While the direct causes of the great unemployment crisis in Great Britain must be sought in the War and its after effects, the general cause of it was the excess of the industrial population which during the eight previous years had not been able to flow through the channels of emigration into employment abroad. The government instituted various relief measures. The main principle of its policy was the extension of compulsory unemployment insurance. The chief official sources of relief in 1924 were: (1) national schemes of work or assistance; (2) local schemes of work; (3) poor law relief; (4) unemployment insurance.

Germany. The employment situation in Germany was very bad in the fall of 1914, but it improved steadily during the four years of the War, due primarily to government efforts. The rapid demobilization at the end of the War caused a serious unemployment crisis. The government started various measures for relief and in six months there was a marked improvement. The number of the unemployed was reduced from 1,500,000 at the beginning of 1919 to 500,000 at the end of the year. During the following years the labor market continued to gain. The ratio of unemployed to the total number of workingmen was reported to be less than one per cent during the first seven months of 1922. After that an increase in unemployment occurred, and at the end of 1923 there were 3,000,000 without work; 60 per cent of the workers were employed only two or three days a week during that year. See other countries of Europe for similar figures. See also SOCIAL INSURANCE.

UNIFLOW ENGINE. See STEAM ENGINES AND TURBINES.

UNION COLLEGE. A nonsectarian institution for men at Schenectady, N. Y., founded in 1795. The student enrollment increased from 474 in 1914 to 728 in 1923–24, the faculty increased during the decade from 38 to 65 members and the library from 43,000 to 62,000 volumes. The productive funds increased approximately 163 per cent from $950,000 to $2,500,000. President, Charles Alexander Richmond.

UNION OF SOCIALIST SOVIET REPUBLICS. See RUSSIA.

UNION OF SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

UNITARIANS. In the United States this denomination developed within New England Congregationalism. The American Unitarian Association, organized in May, 1825, for missionary purposes, became the executive arm of the denomination. The Unitarian church imposes no theological test of membership on either the laity or clergy. It had three divinity schools throughout the decade 1914–24 as well as the Tuckerman School for the training of parish assistants, the Hackley School at Tarrytown, Proctor Academy at Andover, N. H., and several philanthropic organizations. Instead of foreign missions it conducted a department of foreign relations, which kept in touch with and often extended aid to the liberal religious movements in other lands, such as South America, the countries of northern and central Europe, Italy, Egypt, India, China, Japan. It maintained departments of religious education, social service, new Americans, and a publishing department. There were also the Alliance of Unitarian and Other Liberal Christian Women, and the Laymen's League. The basis of its membership differs so widely from established custom that the term communicants is rejected and adherents used as more nearly correct. According to figures issued by the denomination, covering Dec. 31, 1923, there were 119,000 adherents, 398 active churches, 29 inactive churches, 12 preaching stations, and 483 clergymen. According to the Federal Census of 1916, there were 82,515 members, 399 church edifices, 414 organizations, and 483 clergymen. Headquarters were at 25 Beacon Street, Boston, Mass.

UNITED BRETHREN IN CHRIST. An outgrowth of the German Reformed and Mennonite Churches, organized in Maryland in 1800, and later divided into two bodies, the Old and the New Constitutions In polity and theology the United Brethren in Christ is similar to the Methodist Episcopal Church. During the 10 years 1913–23, inclusive, the membership of the Old Constitution remained practically stationary at approximately 20,000. The membership of the New Constitution increased from 310,886 in 1913 to 379,314 in 1923; the Sunday school enrollment from 382,388 to 433,610, and the members of the Christian Endeavor Society from 86,051 to 96,585. The aggregate salaries of ministers increased from $1,113,114 to $2,202,515; the giving to benevolences from $452,570 to $1,384,649; and the giving for all purposes from $2,914,313 to $6,315,993. During the period the United Brethren Church, New Constitution, was building up three homes for orphaned children, which had an aggregate of 4250 acres of land and property valued at $1,193,000. A preachers' pension plan, recently adopted, was being standardized in 1924.

UNITED KINGDOM. See GREAT BRITAIN.

UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA. This denomination was formed in 1858 through the union of the Associate and Associate Reformed Churches. In organization and government it is in accord with other Presbyterian bodies. During the decade, 1914–24, its development was as follows, taking into account American churches only. The membership increased from 148,220 to 165,186; the number of congregations declined from 988 to 924; the number of ministers from 999 to 937; the number of presbyteries from 64 to 58; the number of Sabbath schools from 1001 to 929; the number of pupils increased from 146,262 to 171,922; the young people's societies increased from 899 to 918, and decreased in membership from 31,489 to 26,837; the contributions of the American church increased from $3,129,076 to $5,845,370.

Missions were maintained in India, Egypt, the Sudan, and Abyssinia. The statistics of these mission fields showed 11 presbyteries; 235 ministers; 183 congregations; 341 mission stations; 56,534 communicants; contributions of mission congregations, $122,150; 123 young people's societies, with a membership of 5041; 392 Sabbath schools, with 26,629 pupils en-

rolled. The matter of union with other Presbyterian bodies was under consideration during the decade, but all that was accomplished was in the line of much more closely federated work. A New World Movement was inaugurated in 1919, for the purpose of securing dedication of life and the enlistment of prayer, and the endowment of the educational and missionary work of the Church. The subscriptions of the churches to this movement amounted to $11,000,000. A committee was appointed in 1919 to prepare a new Confessional Statement for the denomination. The General Assembly of 1924 adopted this revised statement with the exception of one article and the preamble, which went over to the next meeting of the General Assembly.

UNITED STATES OF AMERICA. The United States of America consists of 48 states and the District of Columbia, located between the 25th and 49th parallels of latitude north, and in addition the noncontiguous territories of Alaska, Hawaii, Guam, Panama Canal Zone, Philippine Islands, Porto Rico, American Samoa and the Virgin Islands. The total land area of continental United States exclusive of Alaska is 2,973,800 square miles, and the population at the 1920 census was 105,710,620. The areas and population of the noncontiguous territories are given in Table I.

TABLE I—AREA AND POPULATION OF THE UNITED STATES

Territory	Area Square miles	Population in 1920
Continental United States ..	2,973,774	105,710,620
Alaska	590,884	55,036
Guam	210	13,275
Hawaii	6,449	255,912
Panama Canal Zone	527	22,858
Philippine Islands	115,026	10,607,872
Porto Rico	3,435	1,299,809
American Samoa	77	8,056
Virgin Islands	132	* 26,051
Total	3,690,514	117,999,489

* Nov. 1, 1917.

POPULATION

The United States is the only important country of the world which has even a fairly complete history of the growth in population from its beginning. The first Federal census was taken in 1790 and subsequent enumerations at 10-year intervals. In 1790, the total population of the United States as then constituted was 3,929,214 and at the last census in 1920 it was 105,710,670, an increase of 2565 per cent for the 130 years. Table II gives the population of continental United States at each census, together with the actual and percentage increase for each decade.

The Bureau of the Census estimates the total population for intercensal years and periods. Table III shows the estimated total population of continental United States on July 1 of each year from 1910 to 1924.

TABLE II—POPULATION OF THE UNITED STATES, WITH DECENNIAL INCREASE 1790–1920

Census year	Population	Total decennial increase	Per cent of increase
1790	3,929,214	...	.
1800	5,308,483	1,379,269	35.1
1810	7,239,881	1,931,398	36.4
1820	9,638,453	2,398,572	33.1
1830	12,866,020	3,227,567	33.5
1840	17,069,453	4,203,433	32.7
1850	23,191,876	6,122,423	35.9
1860	31,443,321	8,251,445	35.6
1870	* 39,818,449	* 8,375,128	* 26.6
1880	50,155,783	* 10,337,334	* 26.0
1890	62,947,714	12,791,931	25.5
1900	75,994,575	13,046,861	20.7
1910	91,972,266	15,977,691	21.0
1920	105,710,620	13,738,354	14.9

* Estimated correction for error in census of 1870.

TABLE III—ESTIMATED TOTAL POPULATION ON JULY 1 FOR INTERCENSAL YEARS

Year	Population July 1	Year	Population July 1
1910.....	92,267,000		
1911.....	93,682,000	1918.....	103,588,000
1912	95,097,000	1919.....	105,003,000
1913.....	96,512,000	1920.....	106,418,000
1914..	97,927,000	1921.....	107,833,000
1915.....	99,343 000	1922.....	109,248,000
1916.....	100,758,000	1923	110,663,000
1917.....	102,173,000	1924.....	112,800,000

From 1790 to 1860 the population showed a relatively uniform rate of growth amounting to an increase of about one-third per decade Had this ratio of increase continued after 1860 the total population of continental United States in 1920 would have been upwards of 180,000,000.

The decline in the percentage rate of increase in the first three decades following the Civil War was very gradual. From 1860 to 1890, the average increase was approximately 26 per cent per decade. For 1890 to 1900, the rate dropped to 20.7 per cent. From 1900 to 1910, it was at 21 per cent, but for the decade between 1910 and 1920, the rate of increase showed a marked decline to 14.9 per cent. This sharp decline in the rate of increase for that decade is partly due to the decline in immigration and to the return of many former immigrants to their native land, during the War However, even if the effect of immigration and emigration is allowed for there has been a very significant decline in the rate of population increase during that last decade. (See discussion by W. S. Rossiter: "Increase of Population in the United States." *Census Monograph No. 1*, Bureau of the Census, Department of Commerce, 1922.) If the decline in the rate of increase for the next decade should be as large as for the one just passed the increase shown by the fifteenth census in 1930 would be less than 9 per cent

The United States has passed the pioneer stage of development and it is probable that future censuses will continue to show moderate rates of increase characteristic of more fully settled and developed countries. The rates of increase in population for England and Belgium before the War were between 10 and 11 per cent, while Germany increased 15 per cent, Italy 6.6 per cent and France only 1.6 per cent per decade.

It is of interest to note, however, that although the rate of increase has been rapidly declining the actual numerical increase in population has been relatively stationary for the past four decades. The largest numerical increase recorded for any decade was 15,977,691 between 1900 and 1910. Between 1910 and 1920, the increase was 13,738,354. On the average, therefore, the United States is adding about 1,400,000 persons to its population each year or almost 4000 persons per day. The increase alone during any one of the last four decades was

greater than the entire population of the country in 1830.

Increase in Population by Geographic Divisions, States and Cities. The distribution of population by geographic divisions and individual States for 1910 and 1920 and the increases for this decade with comparisons with the percentage increase in the preceding decade are shown in Table IV.

migration of population compared with the period between 1900 and 1910. In the last mentioned decade the population of the Pacific States increased 73.5 per cent and the Mountain States 57.3 per cent. Between 1910 and 1920, these two divisions continued to show higher percentages of increase than other sections of the country but the rates of increase declined to 32.8 and 26.7 per cent respectively. Only one

Oregon	783,389	0.8	672,765	0.7	110,624	16.4	62.7
California	3,426,861	3.2	2,377,549	2 6	1,049,312	44.1	60.1

[a] A minus sign (−) denotes decrease.

It is clear from the data in this table that there was a decided slackening in the westward of the nine geographic divisions showed a rate of increase in the last decade higher than in

the decade 1900 to 1910. This was the East North Central Division consisting of the States of Ohio, Indiana, Illinois, Michigan, and Wisconsin. This was the region which showed the most notable industrial expansion of this period. In marked contrast is the low rate of increase shown for the East South Central States and the West North Central Division. In the former region the northward migration of Negroes during and after the War was at least partly responsible for the low rate. In the West North Central States the decline in the rate of increase was largely due to stabilized agriculture and absence of any marked industrial development.

The largest numerical increase occurred in the East North Central States with a total of 3,224,072 more persons than in 1910. The Middle Atlantic States reported the next largest increase amounting to 2,045,252; the South Atlantic Division increased 1,795,377, while the West South Central and the Pacific Divisions each increased approximately 1,400,000.

Of the 48 states of the Union, 45 showed increases of population from 1910 to 1920. The three reporting decreases were Mississippi, 0.4 per cent, Vermont, 1 per cent, and Nevada, 5.5 per cent. The largest rate of increase for any State was 63.5 per cent in Arizona, followed by Montana with 46 per cent, California with 44.1 per cent, Wyoming with 33.2 per cent, Idaho with 32.6 per cent, and Michigan with 30.5 per cent. Six other states—Florida, New Jersey, Connecticut, Oklahoma, Ohio, and Utah—each showed rates of increase between 20 and 30 per cent for the decade.

Aside from the three states showing decreases, the five states showing the lowest rates of increase were New Hampshire, 2.9 per cent; Missouri, 3.4 per cent; Maine, 3.5 per cent; Kansas, 4.6 per cent; and Kentucky, 5.5 per cent.

Eight states contributed more than half of the total increase of 13,738,354 shown at the last census. These in the order of their contributions were: New York, Pennsylvania, California, Ohio, Michigan, Illinois, Texas, and New Jersey. The first three each showed an increase of over 1,000,000 persons, while in the other five the increase ranged between 600,000 and 1,000,000 each.

At the 1920 census, there were 2500 cities in the United States having a population between 2500 and 25,000; 219 cities having from 25,000 to 100,000 inhabitants, and 68 having more than 100,000 persons. During the 10-year period 1910 to 1920, 474 towns and other communities passed, because of population increases, into the class of cities having 2500 to 25,000 inhabitants. During the same period, 59 cities passed from this class into that having 25,000 to 100,000 population, while 18 left this class for the one comprised of cities of over 100,000.

By far the larger portion of the large cities is located in the Eastern and Central industrial States. At the 1920 census, 38 out of the 68 cities of over 100,000 inhabitants were located in the three geographic divisions of New England, Middle Atlantic and East North Central States. These 38 cities had a total population of approximately 19,500,000 out of an aggregate for the group of 27,500,000. Also 144 out of the 219 cities in the class 25,000 to 100,000 were located in these three divisions and they furnished 6,500,000 out of the 10,340,000 inhabitants in this class of cities.

Of the 68 cities having 100,000 or more inhabitants in 1920, there were 25 which had a population of 250,000 or over. A study of the changes in the population of these 25 cities at the last two censuses illustrates the changing trends in large urban populations for the last two decades.

TABLE V—POPULATION OF CITIES HAVING 250,000 INHABITANTS OR MORE IN 1920, WITH INCREASE AND RANK 1920 AND 1910

City	Population		Increase 1910–1920		Rank	
	1920	1910	Number	Per cent	1920	1910
New York	5,620,048	4,766,883	853,165	17 9	1	1
Chicago	2,701,705	2,185,283	516,422	23 6	2	2
Philadelphia	1,823,779	1,549,008	274,771	17 7	3	3
Detroit	993,678	465,766	527,912	113.3	4	9
Cleveland	796,841	560,663	236,178	42 1	5	6
St. Louis	772,897	687,029	85,868	12 5	6	4
Boston	748,060	670,585	77,475	11 6	7	5
Baltimore	733,826	558,485	175,341	31.4	8	7
Pittsburgh	588,343	533,905	54,438	10 2	9	8
Los Angeles	576,673	319,198	257,475	80 7	10	17
Buffalo	506,775	423,715	83,060	19 6	11	10
San Francisco	506,676	416,912	89,764	21 5	12	11
Milwaukee	457,147	373,857	83,290	22 3	13	12
Washington	437,571	331,069	106,502	32 2	14	16
Newark	414,524	347,469	67,055	19 3	15	14
Cincinnati	401,247	363,591	37,656	10 4	16	13
New Orleans	387,219	339,075	48,144	14 2	17	15
Minneapolis	380,582	301,408	79,174	26 3	18	18
Kansas City, Mo.	324,410	248,381	76,029	30 6	19	20
Seattle	315,312	237,194	78,118	32 9	20	21
Indianapolis	314,194	233,650	80,544	34 5	21	22
Jersey City	298,103	267,779	30,324	11 3	22	19
Rochester	295,750	218,149	77,601	35 6	23	25
Portland, Ore.	258,288	207,214	51,074	24.6	24	28
Denver	256,491	213,381	43,110	20.2	25	27

Only four out of these 25 cities retained the same ranks in 1920 as they had in 1910, while 10 improved their positions and 11 took lower ranks than in 1910. Detroit moved from ninth up to fourth place, Los Angeles from 17th to 10th, while two cities, Portland, Oregon, and Denver, which were outside the first 25 in 1910, moved into this class in 1920.

Urban and Rural Population. There has long been observed in the United States a strong movement of population from the country to the city and this tendency seems to be increasing. The census defines urban population as that living in cities or other incorporated places of 2500 inhabitants or more.

In 1790, this country was substantially all rural. Only six cities had a population of 8000 or more. From this time urban population has been increasing until at the 1920 census more

than half of the population lived in cities of 2500 or over. Even as recently as 1880, 71 4 per cent of the population was rural and only 28.6 urban. In 1890 the proportions were 63.9 per cent rural and 36.1 per cent urban; by 1900 the latter proportion had moved to 40 per cent and in 1910 to 45.8 per cent. In 1920, for the first time, urban population passed the highway mark, forming 51.4 per cent of the total, while rural population made up only 48.6 per cent. Between 1910 and 1920 urban population increased by over 12,000,000 or 28.8 per cent, while the rural population increased only 1,600,000 or 3.2 per cent. Part of this increase in urban population was due to the fact that 474 small towns which in 1910 had less than 2500 inhabitants had passed this mark by 1920 and were included as urban. However, even if allowance is made for this, the predominating increase in urban population is still evident showed a decidedly larger increase than the urban class.

Changes in Population Considered by Sex, Nativity and Color. The following tabulation shows the sex distribution of the population of continental United States at each of the last three censuses:

Census year	Males	Females	Males to 100 females
1900	38,816,448	37,178,127	104 4
1910	47,332 277	44 639,989	106 0
1920	53,900,431	51,810 189	104.0

It is a peculiarity of population statistics that the number of males in nearly all instances exceed the number of females. This has been true of every census of the United States since 1830, when for the first time the returns showed the sex of every person enumerated. In 1920

TABLE VI—INCREASE IN URBAN AND RURAL POPULATION: 1890–1920

Census	URBAN Total	URBAN Increase	URBAN Per cent of increase	Per cent urban	RURAL Total	RURAL Increase	RURAL Per cent of increase
1890	22,720,223			36 1	40,227,491		
1900 .	30,380,433	7,660,210	34.2	40 0	45,614,142	5,386,651	13 4
1910 . .	42,166,120	11,785,687	38.8	45 8	49,806,146	4,192,004	9 2
1920 .	54,304,603	12,138,483	28 8	51 4	51,406 017	1,599,871	3 2

If the population living in all incorporated places instead of that in places of 2500 and over had been considered as urban, the total urban population in 1920 would have been 63,277,000 or 59.9 per cent of the total and the rural population only 42,434,000 or 40.1 per cent On this basis the corresponding proportions in 1910 were 54.7 and 45.3 per cent.

In 1920, the census for the first time compiled the numbers of persons living on farms or the total agricultural population. This figure was 31,614,219 or 30 per cent of the total population, and 61.5 per cent of the population classified as rural.

For the decade 1910 to 1920, the movement from rural to urban continued to be heaviest in the areas in which it began, i.e. the industrial North Eastern and North Central States The three groups New England, Middle Atlantic and East North Central States showed a stationary rural population from 1900 to 1910 and slight decreases for 1910 to 1920, while all of the heavy increases in these sections fell to the urban population. Even in the three southern divisions of the country the increase in urban population in the last decade far exceeded the rural. Likewise, in the Pacific States, the urban increase was much greater than the rural. It was the number of males exceeded by more than 2,000,000 the number of females, which was a considerably smaller excess than in 1910 when the males exceeded females by nearly 2,700,000 Also, the proportion of males to females was lower in 1920 than in any of the three preceding censuses. A similar decrease in the proportion of males was noted after the Civil War in the decade between 1860 and 1870. No doubt the greater mortality of males due to the war, the emigration of more males than females and perhaps an increase in the proportion of female immigrants tended to affect the 1920 ratio. The statistics show that about three-fifths of the decrease in the excess of males in 1920 was among the foreign-born white population.

With regard to nativity and color, the census divides the population into the following chief groups: (1) native whites of native parentage; (2) native whites of foreign parentage; (3) native whites of mixed parentage, (4) foreign-born whites and (5) colored, separating the latter two classes by nationality. It would lie too far outside the scope of this article to treat this subject in detail. The accompanying table gives the more important classes and the rates of increase in each since 1890 in comparison with the total.

TABLE VII—GROWTH OF WHITE AND COLORED ELEMENTS IN POPULATION

Census year	Total population	Per cent of increase	Whites	Per cent of increase	Native Whites	Per cent of increase	Of native parents	Per cent of increase	Foreign born	Per cent of increase	Colored	Per cent of increase
1890.....	62,947,714	24 9	55,101,258	26 7	45,979,391	24 5	34,475,716	20 2	9,121 867	39.1	7,864,456	16.2
1900 ...	75,994,575	20 7	66,809 196	21 2	56,595 379	23.1	40,949 362	18.8	10,213,817	12 0	9,185,379	17 1
1910	91,972,266	21 0	81,731,957	22 3	68,386,412	20.8	49,488,575	20 8	13,345,545	30 7	10,240,309	11 5
1920	105,710,620	14 9	94,820,915	16.0	81,108,161	18.6	58,421 957	18 1	13,712.754	2 8	10,889 705	6 3

only in the mountain group of States (Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, and Nevada) that the rural element

It is of interest to note that the rate of increase of whites in the decade 1910 was 18.6 per cent compared with 14.9 for the total

population. For native whites of native parents the rate of increase was 18.1. For the two classes not shown in the table, the native whites of foreign parentage increased by 21.5 per cent, a higher rate than that for any other group of the white population. In many urban and industrial sections the rate of increase in this class of the population exceeded 30 per cent.

In 1920, the foreign-born white population totaled 13,712,754, which represented an increase of only 2.8 per cent over those shown in this class at the 1910 census. Foreign-born whites in 1920 formed only 13 per cent of the total population but it is significant to note that of the adult male population over 21 years of age, they formed 22.1 per cent or over one-fifth of the total.

The colored population increased only 6.5 per cent in this decade, as compared with 11.5 per cent in the preceding decade. The total colored population in 1920 numbered 13,712,754, of which 10,463,131 were Negroes, 244,437 American Indians, 111,010 Japanese, 61,639 Chinese. The increase in the total Negro population from 1910 to 1920 was only 635,000 or 6.5 per cent, the lowest ever recorded. The number of Indians declined by 21,246 in the last decade while the Japanese increased 38,853 or 54 per cent, and the Chinese decreased by 9892.

Persons Gainfully Employed. In connection with the decennial enumeration, the Bureau of the Census also compiles the number of persons engaged in specified gainful occupations. These occupations are classified into nine main groups. The 1920 census showed a total of 41,614,248 persons gainfully employed or a little less than 40 per cent of the total population. Of the total number of workers, 24,862,000, or about 60 per cent, were employed in the basic industries of agriculture, mining and manufacturing. The following tabulation gives the number of workers in each of the nine principal groups at the census of 1920:

Agriculture, forestry, and animal husbandry	10,953,158
Extraction of minerals	1,090,223
Manufactures and mechanical industries	12,818,524
Transportation	3,063,582
Trade	4,242,979
Public service (not elsewhere classified)	770,460
Professional service	2,143,889
Domestic and personal service	3,404,892
Clerical	3,126,541
Total	41,614,248

It is of some interest to present the geographic distribution of the number of workers in agriculture compared with the number in manufacturing and mining combined. These figures together with the value of the products of each group by geographic divisions are shown in Table VIII.

TABLE VIII—COMPARISON OF AGRICULTURE WITH MANUFACTURES AND PRODUCTION OF MINERALS ON BASIS OF NUMBER OF PERSONS ENGAGED AND VALUE OF PRODUCT, BY GEOGRAPHIC DIVISIONS: 1919

Geographic Division	Persons engaged in— Agriculture	Manufactures and production of minerals [a]	Value of agricultural products [b]	Value added by manufacture plus value of products of mineral industries [a]
United States	10,636,826	11,893,558	$20,933,487,000	$28,206,165,000
New England	221,162	1 543 095	463,106,000	3,249,884,000
Middle Atlantic	633,664	3,816,142	1,497,641,000	9,287,921,000
East North Central	1,586,291	3,091,676	4,323,955,000	7 596,274,000
West North Central	1,664,919	708,772	5,540,245,000	1,690,804,000
South Atlantic	2,114,586	1,073,132	2,509,661,000	2,211,625 000
East South Central	1,782,628	480,570	1,722,324,000	846,211,000
West South Central	1,781,389	413,863	2,702,169,000	1,220,595,000
Mountain	414,009	222,382	914,787 000	634,264,000
Pacific	438,178	543,926	1,259,599,000	1,168,587,000

[a] Including production of oil and gas.
[b] Total value of crops plus total value of live stock products and domestic animals sold or slaughtered on farms, includes some duplication representing value of crops consumed by live stock.

Agriculture. General statistics and other information in respect to agriculture in the United States are given in the article AGRICULTURE. For special discussions of the important crops see CORN, OATS, POTATOES, WHEAT, COTTON, etc. The following articles bear on agricultural activities: AGRICULTURAL EDUCATION, AGRICULTURAL EXPERIMENT STATIONS; AGRICULTURAL EXTENSION WORK, AGRICULTURAL CREDIT; AGRICULTURE, INTERNATIONAL INSTITUTE OF; AGRICULTURE, UNITED STATES DEPARTMENT OF, HORTICULTURE; BOTANY; DISEASES OF PLANTS, TRACTOR; RECLAMATION; DAIRYING; LIVE STOCK; FOOD AND NUTRITION; FERTILIZERS; SOIL; VETERINARY MEDICINE. The articles on individual States consider local agricultural matters in detail.

Mineral Production. It was natural that the War should serve as a stimulus to a greater mineral production and from 1914 to 1918 there was a continuous increase in the value of metallic and non-metallic minerals mined. Table IX shows the condition of the industry over the period 1913–23.

Table X presents a survey of the principal minerals, by production and value, for the years 1913, 1920 (the peak year of the period), 1922, and 1923.

The more important minerals mined in the United States are treated under the following separate heads: COAL; COKE; COPPER; GOLD; IRON AND STEEL; LEAD; PETROLEUM; SILVER. See also ALUMINIUM; ASPHALT; BAUXITE; CEMENT; GRAPHITE; GYPSUM; LIME; NATURAL GAS; PHOSPHATE ROCK; PLATINUM; QUICKSILVER; RADIUM; TALC AND SOAPSTONE; STONE; SULPHUR; TIN; ZINC. The articles on the individual States contain sections on mineral production.

MANUFACTURES

Twenty years ago the United States was known chiefly as an agricultural and raw material producing nation. The developments of the last two decades brought this country to the

TABLE IX—TOTAL VALUE OF MINERAL PRODUCTS OF THE UNITED STATES FROM 1913 TO 1923

Year	Metallic Value	Nonmetallic Value	Unspecified (metallic and nonmetallic)	Total Value
1913	878,869,000	1,554,298,000	378,000	2,433,545,000

forefront as an industrial nation. If development continues in the future as it has in recent years it will not be long until Eastern United States will be one of the highly industrialized areas of the world. The growth of industrial activity is best brought out by the data from the census of manufactures which are available at varying intervals since 1850. These figures are summarized in Table XI.

TABLE XI—SUMMARY OF MANUFACTURING INDUSTRIES OF THE UNITED STATES, 1850–1921

Census year	No of establishments	No of wage earners—average	Wages paid	Cost of materials	Value of products	Value added by manufacturing
			Millions of dollars			
1850	123,025	957,059 [b]	237	555	1,019	464
1860	140,433	1,311,246 [b]	379	1,032	1,886	854
1879	254,852	2,732,595 [b]	948	3 397	5,370	1,973
1889	355 405	4,251,535	1,891	5,162	9,372	4,210
1899	207,514	4,712 763	2,008	6,576	11,407	4,831
1904	216,180	5,468,383	2,610	8,500	14,793	6,294
1909	268,491	6,615,046	3,427	12,143	20,672	8,529
1914	275,791	7,036,337	4,079	14,368	24,246	9,878
1919	290,105	9,096,372	10,534	37,376	62,418	25,042
1921 [a]	196,267	6,946,570	8,200	25,337	43,653	18,317

[a] The 1921 census of manufactures relates only to establishments having products valued at $5000 or more, whereas at previous censuses the corresponding limit was $500. It is estimated that establishments with products valued between $500 and $5000, while constituting about 21 per cent of the total number employed, only constituted six tenths of one per cent of total wage earners and had an output of only three-tenths of one per cent of the total value of products.

[b] Includes salaried officials, clerks, etc.

In 1850 the total value of products of the manufacturing industries of the United States was only $1,019,000,000. By 1899 these had increased to $11,407,000,000; by 1909 this latter value had been nearly doubled, and in 1919 they reached the enormous total of $62,418,000,000. A considerable portion of this latter figure, however, was due to higher prices per unit and not entirely to increased quantity of product. Some approximation to the increase in physical volume of production can be arrived at by reducing the figures for later years by the use of price index numbers. Table XII gives figures on cost of material used, value of products and value added by manufacture for each census of manufactures since 1899 (1) as stated by the Census and (2) estimated on the basis that prices in succeeding periods had remained at the same level as in 1899. These latter computations are based on the all commodity wholesale price index of the Bureau of Labor Statistics, United States Department of Labor The index given in the first column of the table is the same as that computed by the Bureau except that for convenience the base has been transferred from 1913 to 1899. It must be remembered that the Department of Labor index is based on many products which do not enter into manufacture and for many reasons can give only rough approximations when used in this way. However, the resulting figures do

stand in approximately the same relation to each other as the weighted physical volume of the products and serve to give some idea of the physical growth of the manufacturing industries independent of the effect of price changes.

that the natural growth of the industries was almost sufficient to offset the lower activity due to the period of depression from which industry was recovering in 1921.

Another measure which may be employed to

TABLE XII—COMPUTATION OF APPROXIMATE VALUE OF MATERIALS, PRODUCTS AND VALUE ADDED BY MANUFACTURE AT 1899 PRICES

Year	Price Index	Cost of Materials (Millions of Dollars) As Stated	Cost of Materials (Millions of Dollars) At 1899 Prices	Value of Products (Millions of Dollars) As Stated	Value of Products (Millions of Dollars) At 1899 Prices	Value added by Manufacture (Millions of Dollars) As Stated	Value added by Manufacture (Millions of Dollars) At 1899 Prices
1899	100	6,576	6,576	11,407	11,407	4,831	4,831
1904	115	8,500	7,319	14,793	12,863	6,294	5,473
1909	129	12,143	9,413	20,672	16,025	8,529	6,612
1914	131	14,368	10,968	24,246	18,508	9,878	7,541
1919	275	37,376	13,591	62,418	22,697	25,042	9,106
1921	196	25,337	12,927	43,653	22,271	18,317	9,363

It will be noted that the value of products as stated by the census rose from $20,672,000,000 in 1909 to the maximum of $62,418,000,000 in 1919, an increase for the decade of over 200 per cent. Based on 1899 prices, the values of these products for the same years were $16,025,000,000 and $22,697,000,000, or an increase of $6,672,000,000, or 41.6 per cent. In the preceding decade, 1899 to 1909, computed on the same basis, the value of products rose from $11,407,000,000 to $16,025,000,000, an increase of 40.5 per cent. Computed on this basis the relative increase in the physical output of the manufacturing industry of the United States was about the same during the last decade as during the preceding.

The census of 1921 is the first of the biennial censuses of manufactures authorized by Congress. This latter census relates only to establishments having products valued at $5000 or more, whereas at previous censuses the corresponding limit was $500. The Bureau of the Census states that although the establishments with products valued between $500 and $5000 constitute 21.6 per cent of the total number of establishments in 1919, they represented only six-tenths of one per cent of the total number of wage earners and only three-tenths of one per cent of the total value of products. Consequently, their omission has only a slight effect upon the completeness of the data. Bearing this in mind, it is of interest to note that the value of products in 1921 when computed

gauge the trend of the manufacturing industries independent of the price factor is the average number of wage earners employed as given in Table XIII. In this case, however, the increasing introduction of labor-saving machinery and the varying efficiency of labor are factors which affect the results, but which cannot be evaluated In the decade between 1899 and 1909 the number of wage earners increased 40.3 per cent and between 1909 and 1919 the increase was 37.5 per cent. These figures agree fairly well with those arrived at from values of product computed at a constant price if allowance is made for the above-mentioned factors. However, between 1919 and 1921 the average number of wage earners declined from 9,096,000 to 6,947,000, a decrease of nearly 24 per cent. It is improbable that this decline can be entirely ascribed to labor-saving machinery or greater efficiency of labor, although both factors have played a large part during the post-war reconstruction period. In all probability there was a greater decline in industrial output in these two years than that indicated by the value of product at constant prices, but it was probably not so great as that shown by the figures for the number of wage earners.

Manufacturing Industries by Groups. The census classifies all manufacturing industries in 14 general groups. These groups together with some of the principal figures for the censuses of 1909, 1919 and 1921 are shown in Table XIII.

TABLE XIII—SUMMARY OF MANUFACTURING INDUSTRIES BY GENERAL GROUPS

Group	Average Number of Wage Earners 1909	1919	1921	Cost of Materials 1909 (Millions)	1919 (Millions)	1921 (Millions)	Value of Products 1909 (Millions)	1919 (Millions)	1921 (Millions)
Food and kindred products	411,575	684,672	568,734	$3,188	$10,112	$5,938	$3,938	$12,439	$7,850
Textiles and their products	1,445,720	1,611,309	1,510,876	1,763	5,382	3,804	3,087	9,216	6,961
Iron and steel and their products	1,026,553	1,585,712	1,031,523	1,800	4,816	3,003	3,164	9,404	5,601
Lumber and its manufactures	911,593	839,008	675,069	718	1,360	1,189	1,588	3,070	2,430
Leather and its finished products	309,766	349,362	280,071	670	1,714	934	993	2,610	1,544
Paper and printing	415,990	509,875	467,072	451	1,307	1,331	1,179	3,013	3,149
Liquors and beverages	77,827	55,442	35,374	186	223	158	674	604	292
Chemicals and allied products	267 261	427,008	329,472	931	3,748	3,070	1,527	5,610	4,537
Stone, clay and glass products	342,827	298,659	250,812	184	409	421	532	1,086	1,019
Metals and metal products other than iron and steel	249,607	339,469	235,170	892	1,910	995	1,240	2,760	1,575
Tobacco manufactures	166,810	157,097	149,985	177	484	609	416	1,013	1,018
Vehicles for land transportation	202,719	495,939	281,350	307	2,498	1,576	562	4,059	2,509
Railroad repair shops	304,592	515,709	418,285	215	548	507	438	1,354	1,267
Miscellaneous industries	482,206	1,227,111	712,777	661	2,868	1,801	1,334	6,180	3,872

at 1899 prices is only slightly less than the 1919 figure on the same base. This is quite a different conclusion than would be drawn from the decline in value as stated by the census which showed a decrease of $18,765,000,000 in value of product for the two years. From the figures based on 1899 prices it seems probable

The most important group from the standpoint of value of products is that of foods and their products which increased from less than $4,000,000,000 in 1909 to $12,439,000,000 in 1919. The two groups, textiles and their products, and iron and steel and their products, are practically tied for second place, although in

1921 the former group was well in the lead. A marked increase has occurred in the group of chemicals and allied products which were valued at $1,527,000,000 in 1909 and at $5,610,000,000 in 1919. Vehicles for land transportation shows the development of the automobile industry. This group increased from $562,000,000 in 1909 to $4,059,000,000 in 1919, an increase for the 10 years of 622 per cent. The next largest relative increase for any group was in miscellaneous industries which expanded during the decade 1909 to 1919 from $1,334,000,000 to $6,180,000,000, an increase of 364 per cent. The only group to show a decrease for the decade was that of liquors and beverages.

Manufacturing Industries by States and Geographical Divisions. Table XIV summarizes the most important items from the three censuses of 1909, 1919 and 1921 by States and by the nine geographic divisions used by the census. The largest actual increase in the value of products for any geographic division during the decade 1909–19 was for the Middle Atlantic States, including New York, New Jersey, and Pennsylvania. The value of the products produced in this division increased $12,712,000,000 during the 10 years, or 178 per cent of the 1909 value. The East North Central States, including Ohio, Indiana, Illinois, Michigan and Wisconsin, ran a close second in actual increase. The value of products produced in this territory rose from $5,212,000,000 in 1909 to $17,737,000,000 in 1919, an increase of $12,525,000,000, or 240 per cent. The greatest relative increase for any division was in the Pacific States where the value of products rose from $844,000,000 in 1909 to $3,158,000,000 in 1919, representing an increase of 274 per cent. This was followed by the West South Central States with an increase for the same 10 years of 264 per cent.

TABLE XIV—SUMMARY OF MANUFACTURING INDUSTRIES BY GEOGRAPHICAL DIVISIONS AND STATES, 1909, 1919 AND 1921

	Number of Establishments			Number of Wage Earners (Thousands)			Value of Products (Millions)

The three geographical divisions, New England, Middle Atlantic and East North Central, contain the principal manufacturing industries. This territory, which may be described roughly as east of the Mississippi and north of the Ohio and the Mason and Dixon line, produced 72.7

per cent of the value of all manufactured products in 1909, 71.8 per cent in 1919, and 71 7 per cent in 1921. See also articles MOTOR VEHICLES; FOOD AND NUTRITION; IRON AND STEEL; BOOTS AND SHOES; LEATHER; RUBBER; SILK; SILK, ARTIFICIAL; TEXTILE MANUFACTURING; WATER POWER; PAPER AND WOOD PULP; SHIPPING; SHIPBUILDING; MOVING PICTURES; RADIO; and the section *Manufactures* under the articles on the individual States.

FOREIGN COMMERCE

The War had a marked effect upon the foreign trade of the United States. For the five pre-war years, 1910 to 1914 inclusive, the average exports of domestic merchandise amounted to $2,130,000,000 per year while imports averaged $1,689,000,000. During the next five years, 1915 to 1920, domestic exports averaged $6,161,000,000 and imports amounted to $3,223,000,000. The foreign trade of this country reached its maximum in 1920 when domestic exports totaled $8,080,000,000 and imports $5.278,000,000 After that the value of the foreign trade declined, amounting to $3,765,000.000 for exports and $3,113,000,000 for imports in 1922 and in 1923 to $4,091,000,000 and $3,792,000,000 respectively.

The record of foreign trade in value, although of prime significance, as a measure of its economic importance, is not entirely satisfactory. Value is the product of two variables—quantity and price. During a period of rapidly changing price levels it is difficult to know whether the major portion of changes in total value are due to this factor alone or whether the physical volume of trade has also changed. Various methods have been employed to measure the relative physical volume of foreign trade but probably the most satisfactory is to compute the value of the quantities of commodities exported or imported each year using a constant price. The Federal Reserve Board computes a monthly index of foreign trade on this basis using only the more important commodities. The Department of Commerce computed the value of the foreign trade of the United States for a series of years based on 1923 prices. These data are summarized in Table XVI. This table shows that while the value of domestic exports in 1920 as stated was 379 per cent of the five-year pre-war average, the physical volume of these exports was only 142 per cent of the pre-war value, or an increase in actual quantity of 42 per cent In 1923, domestic exports were 92 per cent greater in actual value than the pre-war average but in value at 1923 prices or physical volume they were only 10 per cent greater.

Imports in 1923, on the other hand, while they

1923	4,091	192	4,091	110	3,792	225	3,792	155

were 125 per cent greater than the pre-war average in value as stated, were 55 per cent greater in physical volume.

Thus, although both exports and imports were larger in the latter years of the decade than they were before the War, imports expanded much more than exports both in value as stated and in volume. This change in the trend of our trade towards a closer balance between exports and imports was largely the natural result of the War and its accompanying developments. The great expansion of our industries required larger supplies of raw material, much of which, like silk and rubber, must be imported. Our higher standards of living and the growth of our population required more of our products for home consumption while the increasing competition of newly developed countries like Canada and Argentina tended to decrease our exports of crude materials and foodstuffs.

Furthermore, the shift of the United States from a debtor to a creditor nation rendered a large favorable balance in merchandise trade less necessary as well as less desirable.

On the other hand, there was a steady increase in the exports of manufactured products, as is evident from the data in Table XVII. Before the War crude materials formed approximately one-third of both exports and imports while manufactured goods ready for consumption formed 31 per cent of exports and 23 per cent of imports. In 1923, manufactures ready for consumption formed over 36 per cent of the total exports and crude materials only 29.4 per cent. In imports the opposite tendency was found, with crude materials becoming more important than formerly.

Before 1914, only two of the six Grand Divisions were important purchasers of products from the United States. These were Europe and North America, which together in the five pre-war years 1910–14 averaged to take 85.5 per cent of all exported goods. Europe alone took 62.3 per cent; North America 23.2 per cent, while 5.6 per cent went to each of South America and Asia, 2.2 per cent to Oceania and 1.1 per cent to Africa. The significant change after the War was the increased proportion going to Asia, which in 1923 took 12.3 per cent of all exports. The proportion going to North and South America also increased, amounting to 26.1 and 6.5 per cent respectively in 1923. In the same year Oceania received 3.5 per cent and Africa 1.5 per cent, while Europe took only 50.2 per cent. This was the lowest proportion of our exports ever sent to Europe in any year for which records are available.

In the case of our import trade approximately 50 per cent was received from Europe before the War. In 1918, the proportion coming from that Grand Division fell as low as 14 per cent but later it increased, amounting to 31.8 per cent in 1922 and 30.5 per cent in 1923.

The proportion of imports from North American countries increased from an average of 20.6 per cent for the five pre-war years to 26.4 per cent in 1923, while those from Asia amounted to 15.3 and 26.9 per cent for the same periods. Small increases occurred in the proportion of imports from the other three Grand Divisions.

smaller in the later years of the decade, the rise in price was sufficient to make the total value much greater than before the War. Refined mineral oils ranked second, while automobiles and parts ranked third in 1923 although before the War they were of very much smaller relative importance. Coal, tobacco,

The individual countries of most importance in the foreign trade of the United States are shown in Table IX. The five countries which have been the most important purchasers of goods from this country are the United Kingdom, Canada, Germany, France, and Japan. The United Kingdom averaged to take 26.2 per cent of our total exports before the War and 21.2 per cent in 1923. Canada took 14 5 and 15.6 per cent in the same two periods, while the

pork products, wheat and flour, copper, and lumber were among the other important exports.

Table XXI shows a few of the most important commodities imported into the United States. Of these, silk and sugar are in the first rank, with coffee, rubber, wool, hides and skins, and pepper of next importance. Each of these commodities shows a large increase both in volume and value in the post-war years compared with pre-war. The largest increases in the actual

trade with Germany declined from 14 per cent pre-war to 7.6 per cent in 1923. Japanese trade increased from 2.1 per cent before the War to 6.4 per cent in 1923 while France took approximately 6.5 per cent of the total in each period.

In the case of imports, Canada, the United Kingdom, Japan, Cuba, and the British East Indies were of most importance. The proportion from the United Kingdom declined compared with pre-war, while that from each of the other countries mentioned increased. Germany, which before the War furnished 10.4 per cent of the total imports, sent only 4.3 per cent in 1923.

As shown in Table XX unmanufactured cotton is by far the most important single commodity exported from the United States. Although in actual quantity export was much

quantity imported occurred in paper, rubber, and silk See also the articles SHIPPING; SHIPBUILDING; PANAMA CANAL.

RAILWAYS

The total railway mileage in operation in the United States in 1922, according to preliminary reports of the Interstate Commerce Commission, was 262,828 miles. This represents a net gain of only 4795 miles over the figure 10 years previous (1912), and represents an actual loss in operated mileage compared with the peak year of 1917 when 266,059 miles were reported in operation. The era of railroad building in the United States may be said to have started in 1850. At that time there were only 9021 miles

Wood pulp	14,631	63,292	74,701
Burlaps, jute	29,421	49,256	66 971

of railroad in operation in the United States. By 1860 this had increased to 30,626 miles, a growth for the decade of 21,605 miles, or nearly 140 per cent During the next decade economic development was checked somewhat by the intervention of the Civil War, but in spite of that, 21,296 miles or practically the same growth as in the preceding decade, was added to the country's railroads Between 1870 and 1880 over 40,000 miles were built and between 1880 and 1890 nearly 74,000 miles For the next decade building slackened somewhat, the increase amounting to only 31,773 miles, but between 1900 and 1910 the mileage was increased by 51,028 miles However, from 1910 to 1920 there was a net increase in operated mileage of only 13,829. Even in the early years of the decade the growth was at the rate of between 3000 and 4000 miles per year, or considerably smaller than the rate in the preceding decade. With the beginning of the War in 1914, railroad building in the United States declined greatly and after 1917 the number of miles in actual operation decreased each year. This growth and decline is summarized in Table XXII.

TABLE XXII—RAILROAD MILEAGE OPERATED IN THE UNITED STATES[a] 1850 TO 1922

Year	Miles of line in operation	Increase per decade Miles
1850	9,021	6,203

Total	193,345	240,439	252,815

Railroad Traffic. Coincident with the growth in mileage there was a large increase in traffic. Between 1890 and 1920, the operated mileage increased 96,630 miles, or 57 per cent, while the number of passengers carried rose from 492,000,000 to 1,235,000,000, an increase of over 150 per cent. The equivalent number of passengers carried one mile increased nearly 300 per cent The tons of freight carried rose from 632,000,000 in 1890 to 2,260,000,000 in 1920, or more than 250 per cent, while the equivalent tons of freight carried one mile increased 432 per cent.

During the decade 1910–20, there was a significant increase in the traffic handled by the roads without a corresponding growth in mileage. In 1920 the number of passengers carried was 263,000,000 more than in 1910 and the equivalent number carried one mile increased 45 per cent over the 1910 figure. The increase in freight traffic during this decade was even

larger, amounting to over 60 per cent in the equivalent tons carried one mile.

The increase in efficiency is shown by the fact that between 1910 and 1920 the average tons of freight per train increased from 380 to 647 while the average number of passengers per train rose from 56 to 80.

31, 1922, only 64,139. In tractive power the average locomotive had increased from 27,282 pounds in 1910 to 36,365 pounds in 1920. In total tractive power, therefore, the locomotive equipment in 1920 showed a gain of over 50 per cent compared with 1910.

During the same decade the number of pas-

TABLE XXIV—RAILROAD TRAFFIC

Item	1890	1900	1910	1920
Number passengers carried	492,430,865	576,831,251	971,683,199	1,234,862,048
Number passengers carried one mile	11,847,785,617	16,038,076,200	32,338,496,299	46,848,667,987
Mileage of revenue passenger trains	285,575,804	363,469,596	549,015,003	561,633,392
Average passengers per train	41	41	56	80

Average tons per train	177.42	270.86	380.38	646 87

The change in the character of the freight traffic handled by the roads between 1910 and 1922 is indicated by the figures in Table XXV, which summarizes the freight movement by the principal groups of commodities. The most significant change is the increase in the quantity of the products of agriculture handled. For total freight carried this group increased from 160,402,000 tons in 1910 to 220,250,000 tons in 1920 and 221,847,000 tons in 1922. The tonnage

senger train cars increased from 47,179 to 56,102, but total freight cars increased from 2,133,531 in 1910 to only 2,322,025 in 1920. This latter figure shows a decline from the number during the War. Table XXVI shows the number and capacity of freight cars by classes in 1910, 1915, and 1920. It will be noted that the number of flat cars decreased very greatly while there were large relative increases in tank and refrigerator cars.

TABLE XXV—SUMMARY OF FREIGHT TRAFFIC MOVEMENT ON RAILROADS BY PRINCIPAL GROUPS OF COMMODITIES

Commodity group	Thousands of Tons Originating on Road 1910	1915	1918	1920	1922
Products of agriculture	78,737	113,040	116,051	110,840	111,783

Manufactured and miscellaneous	339,392	326,092	463 011	494,556	426,288
Merchandise L. C L.	71,601	81,275	98,368	89,901	70,927
Total	1,745,325	1,797,312	2,307,226	2,254,038	1,859,484

of minerals increased during the War and up to 1920 but in 1922 was but little above the 1910 figure. Forest products showed a tendency to decline, being less in both 1920 and 1922 than in 1910.

Finances. As a result of the demand made upon the roads during the War, including operation under government management and the difficulties experienced in the reconstruction period, the railroads of the United

TABLE XXVI—RAILROAD FREIGHT CARS

Number and Capacity by Classes

Class of car	1910 Number	1910 Average capacity Tons	1915 Number	1915 Average capacity Tons	1920 Number	1920 Average capacity Tons

Total	2,133,531	36	2,341,556	39.7	2,322,025	42.4

Equipment. In the matter of equipment the railroads showed comparatively small increases during the decade 1910–20. In 1910 the total number of locomotives in service on the steam roads were 60,019 while at the end of 1920 the number was 68,942, and on Dec.

States suffered financially during the past decade. As shown in Table XXVII, the total railroad capital outstanding, including stocks and bonds, amounted to $18,417,000,000 in 1910 By 1915 this had increased to $21,128,000,000, a gain of $2,711,000,000. During the next five

years the gain was only $663,000,000, entirely in the form of preferred stocks and bonds. In 1910, the total dividend and interest payments amounted to $805,000,000, but in 1920 less than $759,000,000 was paid out for these purposes.

TABLE XXVII—RAILROAD CAPITAL
Thousands of Dollars

	1910	1915	1920

Net income	379	355	58	978

The largest single item of expense in the railroad budget was that for wages. In 1910, the average number of employees on the railroads was 1,699,000 with an annual payroll of $1,144,000,000, or an average of $673 per employee. In 1920, the number of employees was nearly 20 per cent larger while the payroll had increased more than 200 per cent, giving an average annual compensation per employee of $1820. After that, with the railroads under private management, there was some decrease, so that in 1922 the average number of employees was slightly less than in 1910 but the pay roll was still 133 per cent larger and the average annual salary was $1622.

TABLE XXIX—RAILROAD EMPLOYEES· AVERAGE NUMBER AND COMPENSATION

Year	Average number of employees	Total annual compensation	Average compensation per employee
1900	1,017,653	$ 577,264,841	$ 567
1910	1,699,420	1,143,725,306	673
1915	1,491,849	1,236,305,445	829
1918	1,841,575	2,613,813,351	1,419
1919	1,913,422	2,843,128,432	1,486
1920	2,022,832	3,681,801,193	1,820
1921	1,660,617	2,765,236,353	1,665
1922	1,645,244	2,669,180,772	1,622

Taxes and assessments paid by the railroads also increased greatly in the 10 years. In 1910, the total taxes and assessments amounted to $108,304,947 and by 1920 these had risen to $282,750,533, an increase of over 160 per cent.

To compensate for these and other increased expenses, there were adjustments in the freight and passenger rates from time to time. In 1924, practically all freight rates were at least double what they were in 1910 and some were considerably higher The receipts per ton mile of freight in 1913 averaged 0.719 cents; in 1920 this amounted to 1.052 cents and for 1923 an average of 1 115 cents. This is an increase of approximately 55 per cent for the 10 years which is considerably less than the relative increase in the major items of expenditure by the roads. See also the articles RAILWAYS; CANALS.

HISTORY

Wilson Administrations. President Wilson was inaugurated on Mar 4, 1913, the first Democratic President since Cleveland and only the third since the close of the Civil War. He was reelected in 1916. During his two terms in office he selected for his official family the following men: Secretary of State: W. J. Bryan (to 1915), Robert Lansing (to 1920), B. Colby; Secretary of the Treasury, W. G. McAdoo, C. Glass, D F. Houston; Secretary of War, L. M Garrison, N. D. Baker; Attorney General, J. C. McReynolds, T W. Gregory, A. M. Palmer; Postmaster General, A. S. Burleson; Secretary of the Navy, J. Daniels; Secretary of the Interior, F K. Lane, J. B. Payne; Secretary of Agriculture, D. F. Houston, E. T. Meredith; Secretary of Commerce, W. C. Redfield, J. W. Alexander; Secretary of Labor, W. B. Wilson.

Domestic Legislation. Although most of Wilson's administrations were almost completely overshadowed by the events of the War both before and after the entry of the United States, nevertheless the Democratic party under the supreme leadership of Wilson accomplished much of importance in purely domestic affairs.

Financial Legislation. In his inaugural address President Wilson lodged special protest against the Payne-Aldrich tariff which "cuts us off from our proper part in the commerce of the world, violates the first principle of taxation, and makes the government a facile instrument in the hands of private interests; a banking and currency system based on the necessity of the government to sell its bonds 50 years ago and perfectly adapted to concentrating cash and restricting credits; an industrial system . . . which holds capital in leading strings, restricts the liberties and limits the opportunities of labor, and exploits without renewing or conserving the natural resources of the country; a body of agricultural activities never yet given the efficiency of great business undertakings or served as it should be through the instrumentality of science taken directly to the farm, or afforded the facilities of credit best suited to its practical needs: watercourses undeveloped; waste places unreclaimed; forests untended, fast disappearing without plan or prospect of renewal; unregarded waste heaps at every mine."

Tariff Revision. Shortly after his election President Wilson called the 63d Congress into session (Apr. 7, 1913) to revise the tariff downward. Wilson, believing in a closer relationship between the executive and legislative branches of government, delivered his message to Congress personally, thereby breaking a precedent which had existed from the time of the elder

Adams. The leadership in the tariff revision was taken by Oscar Underwood of Alabama, the chairman of the Ways and Means Committee. It was passed in the House without any special difficulty, but the Democratic majority of six in the Senate was scarcely large enough to pass it in toto. The usual bargaining and compromises followed. The Underwood Act as finally passed made an average reduction of 26 per cent on the figures of 1907. The protective system was maintained although an attempt was made to allow a moderate amount of foreign competition. The duty on 958 articles was reduced, on 307 it remained unchanged, and on 86 (mainly in the chemical schedule) it was raised. There was to be no duty on wool after Dec. 1, 1913; the duty on sugar was to be gradually reduced and taken off completely on May 1, 1916; duties on woolens and cottons were heavily reduced. The sugar provisions were never completely carried out owing to the international situation. An important feature of the tariff bill was the income-tax provision which was made possible by the Sixteenth Amendment which was proclaimed in effect Feb. 25, 1913. The law provided a tax of 1 per cent on incomes over $3000 ($4000 in the case of married persons), with an additional 1 per cent on incomes of $20,000 to $50,000; an additional 2 per cent between $50,000 and $75,000; 3 per cent between $75,000 and $100,000; 4 per cent between $100,000 and $250,000; 5 per cent between $250,000 and $500,000; and 6 per cent above $500,000. The tariff board which had been created by the Republicans was allowed to lapse by the Democrats but was revived in 1916 by the appointment of a bipartisan commission of six members for 12-year terms. See TARIFF IN THE UNITED STATES and TAXATION IN THE UNITED STATES.

Federal Reserve System. As soon as the question of the tariff was out of the way, Congress and the President turned their attention to banking and currency. The result was the passage in December, 1913, of the Federal Reserve Act. Generally speaking, this connected the two outstanding weaknesses of the National Banking Act of 1863, which was a war-time measure and adopted primarily for the purpose of supplying a market for United States government gold bonds. The currency which resulted from this act was inelastic and nonfluid It could not be expanded when business warranted, and it could not flow from one section of the country to another in time of need. The act continued the prohibition of the issuance of State bank notes; it put the control of the system in the hands of a group of Federal officials known as the Federal Reserve Board; it created 12 Federal Reserve banks to which all national banks had to belong, other banks allowed to become members; to provide for elasticity of currency it permitted the issuance of paper money backed up largely by sound commercial paper. (See FINANCE AND BANKING.) In order to relieve the situation of the farmers, the Federal Reserve Act was supplemented by the Federal Farm Loan Act of 1916. Under this law farm loan associations are formed in designated areas under conditions prescribed in the law, their members being borrowers only. The borrowers submit applications for loans under specified conditions and restrictions as to size, security, and valuation of the land. See AGRICULTURAL CREDIT.

Antitrust Legislation. With the tariff, and banking and currency problems cleared up, the Democrats turned their attention to the trust problem. President Wilson appeared before Congress on Jan. 14, 1914, and in introducing the question of trust regulation he urged that the problem be approached in a friendly way and stated that the government and "big business" were ready to meet each other halfway "in a common effort to square business methods with both public opinion and the law." Despite this statement Wilson said that it was the purpose of the Democrats "to destroy monopoly and maintain competition as the only effective instrument of business liberty" Two important acts were passed in connection with trust regulation, the Federal Trade Commission Act of Sept. 14, 1914, and the Clayton Antitrust Act of October 15. The first law created a commission of five persons to carry out the antitrust laws and to prevent unfair methods of competition by persons or corporations subject to the antitrust laws. The Clayton Act prevented price discrimination; acquisition of stock in competing companies, interlocking directorates, and the so-called "government by injunction." In 1918 a further trust act provided that the antitrust acts should not apply to companies engaged in export trade. It was hoped that this would encourage large corporations to engage in foreign commerce For further details concerning trusts and trust legislation see TRUSTS.

Labor Legislation. The *Clayton Act* contained very important provisions concerning labor. Human labor was declared not to be a commodity, and therefore labor and agricultural organizations could not be considered combinations in restraint of trade. Injunctions in labor disputes were forbidden unless necessary to prevent irreparable injury to property rights for which there was no remedy at law. Strikes, picketing, and boycotting were declared not to contravene any Federal law. Finally, cases of contempt of court were to be tried by jury, except when the offense was committed in the presence of the court.

In 1915 the *La Follette Seamen's Act* was passed. This required a language test, namely, that 75 per cent of the crew on American-owned or operated vessels should "understand any orders given by the officers of such vessel"; that 65 per cent of the deck crews employed on American vessels should ultimately be able seamen, having passed physical and professional examinations by government officers; made less serious the offense of desertion by members of the ship's crew under special conditions; required half payment of wages to the crew in every port; and required refusal of clearance to a vessel in which, on information to the collector, it was stated that the provisions of the act relating to language and full quota of able seamen had not been complied with. This law lost a good deal of its force through its loose phraseology and diverse constructions put on it by the Department of Commerce. American shipowners claimed that they would be unable to meet foreign competition under the provisions of this act and would be compelled to go out of business.

In 1916 the *Adamson* eight-hour law was passed, affecting railway labor. This act was virtually forced on Congress by the threat of a great strike by the four railway brotherhoods. The chief provision of this act was that from Jan. 1, 1917, employees engaged in train opera-

tion on inter-State steam railroads exceeding 100 miles in length should be paid their present daily wage for the first eight hours and should be paid pro rata for overtime rather than on the basis of time and a half, which was demanded by the brotherhoods. A commission was to be appointed by the President to report back to Congress on the wage increase by Nov. 1, 1917. See RAILROADS.

Further labor measures of importance provided for compensation for Federal employees injured in the performance of their duty, the prohibition of child labor under certain conditions, and an eight-hour day for Alaskan coal miners. For the vicissitudes of the attempt on the part of President Wilson and Congress to regulate child labor through the Federal control over inter-State commerce and taxation, see CHILD LABOR. In 1917 Congress passed an act appropriating millions of dollars to the various States in aid of vocational education. See EDUCATION IN THE UNITED STATES.

Prohibition Amendment. For a complete account of this amendment, including its introduction and passage in Congress, its ratification by the several States, and the passage of the Volstead Enforcement Act, see PROHIBITION.

Woman Suffrage Amendment. See WOMAN SUFFRAGE.

Colonial and Foreign Policies. *Philippines.* As the question of the independence of the Philippine Islands had figured very importantly in Democratic platforms since 1900, President Wilson continually urged on Congress the advisability of giving the islands greater self-government and of definitely promising them their independence. The result was the Jones Organic Act, passed in 1916, which declared in its preamble that it was the purpose of the United States to recognize the independence of the islands as soon as a stable government should have been established. The Senate amended the House bill to the effect that complete independence should be granted within two or, at the discretion of the President, four years. The House killed this provision. The Jones measure abolished the old commission and provided for an upper house elective for all but two members. The suffrage was extended to all males who spoke and wrote a native dialect. Formerly the vote was limited to some 225,000 inhabitants. Under the Jones bill 800,000 could vote. See PHILIPPINE ISLANDS.

Porto Rico also benefited from the colonial administration of the Democrats. The Porto Ricans since the passage of the Foraker Act of 1900 had seriously objected to the preponderance of Americans in the executive council and the denial of full rights of American citizenship. In 1914 President Wilson, by executive order, directed that the Porto Rican Council be changed so that the natives should have a majority. The question of citizenship was settled on Mar. 2, 1917, when President Wilson signed a Porto Rican civil government bill. This measure extended the suffrage, granted an elective upper house, and conferred full American citizenship on all inhabitants. See PORTO RICO.

Alaska. On Mar. 2, 1914, an act authorizing the President to construct, maintain, and operate railroads in Alaska not exceeding 1000 miles in length, at an expense not exceeding $35,000,000, was approved. Construction began in 1915. See ALASKA.

The Caribbean. Although the Democrats followed the policy of granting a greater degree of freedom to the American colonies, they nevertheless greatly expanded the doctrine of Roosevelt in the Caribbean and Latin America by knitting more closely the financial and economic ties which bound the United States to these Spanish republics, and virtually established protectorates over several of them. This policy was contrary to that which many believed the Democrats would follow. (See CUBA; PANAMA). An aggressive American policy in the Caribbean started during Roosevelt's administration when he stepped into *Santo Domingo* to supervise her finances. He explained this step on the grounds that if the United States refused to permit foreign countries to intervene in Latin America to collect their just debts it was only fair to them to have the United States step in and collect them for them. Roosevelt's financial supervision in Santo Domingo was superseded by a virtual protectorate during Wilson's administration. American marines were landed in 1914 to "oversee" the elections. In 1916 the entire country was occupied by American military forces. The government and laws of the country were suspended, and the American marines were supreme. In 1920 a Dominican commission, which had been appointed to aid the American military the year before, resigned because its request for the restoration of the independence of the republic went unheeded See SANTO DOMINGO.

Haiti fell under American domination as a result of a revolution of 1915. American marines were landed to restore order. By terms of a treaty virtually forced on the republic, the control of the finances and the constabulary was taken over by American officers, with the announcement that "the United States government has no purpose of aggression and is entirely disinterested in promoting this protectorate." The occupation was continued until the summer of 1924, when it was announced that the occupation would cease. See HAITI, *History.*

Nicaragua. For the terms of the establishment of the protectorate in 1916, see NICARAGUA, *History.*

Undoubtedly one of the prime reasons for this extended American influence in the Caribbean was the protection of the Panama Canal. In consonance with this policy, the American government purchased the Danish West Indies in 1917. See VIRGIN ISLANDS; see also CENTRAL AMERICAN UNION. See NICARAGUA for a discussion of the acquisition of a naval base in Fonseca Bay and a 99-year lease on the Corn Islands.

Mexico. President Wilson inherited a jumbled Mexican situation from his Republican predecessor. After the murder of Madero in 1913 the country was torn into factions, and civil strife was prevalent under the leadership of Huerta, Zapata, Villa, and Carranza. In the summer of 1914 Carranza became president and had a rather hectic administration, lasting until 1920, when he also was murdered. His successor was Obregon. Although President Wilson shortly after his inauguration announced a policy of "watchful waiting," he was embroiled in two serious conflicts with Mexico, the Tampico and Columbus affairs. The tendering of their good offices by Argentina, Brazil, and Chile averted a serious conflict in the former instance. For the details of American re-

lations with Mexico during President Wilson's administration see MEXICO, *History*.

The Far East. Relations with Japan were strained by the passage of laws by the State of California prohibiting the ownership of lands by aliens who could not be naturalized. Japan protested against the discrimination and the violation of treaty rights, and the President sent Secretary of State Bryan to California in an effort to secure a change in the State legislation, without success. The countries exchanged notes and a modus vivendi was finally arranged whereby the United States agreed to test the laws in the courts, and Japan made promises as to future immigration. In 1917 Secretary of State Lansing and Viscount Ishii, special ambassador from Japan, concluded an important agreement concerning American relations in the Orient. The United States admitted the interest of Japan in China, but both countries agreed to oppose the acquisition by any country of special rights in China which would tend to impair her integrity and sovereignty. (See JAPAN, *History;* IMMIGRATION.) On May 2, 1914, President Wilson recognized the Republic of China despite the fact that he had previously advised American bankers not to participate in the international railway loans affecting that country. See CHINA.

Panama Canal Tolls Act. President Wilson, by exercising his power as leader of the Democratic party, secured the repeal of the Canal Tolls Act which had been passed in the latter part of Taft's administration. The issue had arisen because of the protest of Great Britain that the Hay-Pauncefote Treaty had been violated by the exemption of American coastwise vessels from paying tolls. Wilson in a special message asked for the repeal on the grounds that the law was a mistaken economic policy, a contravention of treaty obligations, and that the repeal would aid him in the conduct of foreign affairs. For the treaty with Colombia see COLOMBIA, *History*.

Dependencies. For the outlying possessions of the United States, see the articles: ALASKA; GUAM; HAWAII; PHILIPPINES; PORTO RICO; SAMOA, AMERICAN; VIRGIN ISLANDS.

Matters pertaining to American activities during the period 1914–24 are also discussed in the following articles: FISHERIES; FINANCE AND BANKING; TELEPHONY; TELEGRAPHY; ELECTRIC MOTORS IN INDUSTRY; ELECTRIC POWER TRANSMISSION; AËRONAUTICS; ARMIES AND ARMY ORGANIZATION; NAVIES OF THE WORLD; EDUCATION; UNIVERSITIES AND COLLEGES; LAW, PROGRESS OF THE. See also the separate articles on the American religious denominations, universities and colleges, and the important cities.

European War. The European War, in which the United States promptly declared its neutrality, had immediate important economic and legislative effects on the country. In August a bill was passed admitting foreign-built ships to the American registry with certain restrictions as to coastwise trade. A War Risk Insurance Act was adopted, providing for emergency insurance for ships. It was promptly seen that the stopping of a large part of the imports would curtail the revenues and produce a deficit. To prevent this development an emergency revenue bill was passed, providing for an increased internal-revenue taxation system. The election of 1914 had for its issues the new tariff law and the record of the President. The Democrats were successful in retaining their majorities in Congress, but they were reduced in the House, the alignment being Democrats 232, Republicans 194, and Progressives 7. In the Senate the number of Democrats was increased to 53 and the opposition reduced to 43. The War greatly increased the export trade, especially in foodstuffs and munitions. Nearly all of this went to the Allies, since German shipping had been practically driven from the sea. To meet the demand for more shipping, the President introduced in December, 1914, a request for a Ship Purchase Bill. The proposition evoked such opposition that the Republicans, in February, 1915, in a prolonged filibuster in which they were aided by seven Democrats, defeated it. In this the President suffered his first serious defeat in Congress.

It was only natural that the United States should be drawn into the vortex of the War long before she became a participant. As the leading neutral, the exigencies of war were bound to affect her rights on the high seas. The situation was very similar to that just preceding the War of 1812. Before the War had lasted very long, intricate complications developed with both Germany and Great Britain. Only a slight sketch of these complications will be given here. (For details, see WAR, DIPLOMACY OF THE.) To Germany Secretary Bryan sent a note declaring that the United States would hold her to "strict accountability," and to Great Britain a firm protest against the prevention of legitimate American trade by means of illegal blockade, interference with mail, and vexatious delays in prize proceedings. Deep irritation had been caused by the destruction of the steamer *Gulflight* by a German submarine and by the seizure of the *Wilhelmina* and *Dacia* by Great Britain and France. The United States, however, was horrified when the *Lusitania*, on May 7, 1915, was torpedoed without warning and more than 1000 persons, including 114 Americans, lost their lives. On May 13 Wilson sent to Germany a strong note demanding a disavowal of the act and indemnity for the violation of American rights, and stating that the United States stood firmly on the ground that Americans had the right to travel on merchant ships of belligerent nationality. Relations between the two countries reached the breaking-point, and many expected and desired war. A large party developed, urging military preparation to meet complications which might involve it in war. Attention was directed toward the large number of Americans of German birth and descent who thought that the United States should preserve true neutrality by prohibiting the export of munitions, which because of the control of the sea went to the Allies exclusively. They emphasized the trade restrictions of Great Britain and alleged that Germany was being deprived of food for its civil population. Notes were interchanged, and the tone of the American notes became more insistent, until on September 1 Germany declared that liners were not to be sunk without warning. Despite the fact that the cases of the *Nebraskan* and the *Arabic*, disavowed on October 5, had arisen and depended on separate negotiations, this announcement was hailed as a Wilson victory. There remained the necessity for Germany to disavow the sinking of the *Lusitania* and to indemnify American citizens. Wilson's position in the correspondence had

caused the resignation of Secretary Bryan (June), who thought that his ideas might lead to war and who urged that Americans should be warned to remain off passenger ships of the warring nations. In the meanwhile the indignation among German sympathizers respecting the supply of munitions to the Allies led to many plans for interfering with this supply by fomenting labor disturbances. Plots were formed and executed involving the explosion of bombs in factories and on steamships. Organized and unorganized labor was tampered with. It was established that the Austrian Ambassador, Dumba, was implicated, and his recall was demanded on Sept 9, 1915 Attachés Boy-Ed and Von Papen of the German Embassy had a similar fate on December 3.

During the short session of Congress an immigration bill was adopted (1915), with a literacy test included, which the President vetoed. In June, 1915, the Supreme Court rendered two important decisions: against the government in the dissolution suit against the Steel Trust, and, secondly, that the grandfather clauses of the Oklahoma and Maryland constitutions were void In December, 1915, the President's message was almost wholly devoted to the championship of military preparedness, although the year before he had opposed those who would turn America into an armed camp At the opening of 1916, the question of preparedness appeared the supreme issue in American politics. In February, 1916, Secretary of War Garrison resigned because he could not agree with President Wilson on the question of national defense He was succeeded by Newton D Baker (q v) of Cleveland, Ohio. In December, 1915, the sinking of the *Persia* in the Mediterranean Sea again brought the controversy over submarine warfare to the fore. While negotiations were pending over this incident the channel boat *Sussex* was torpedoed with a loss of more than 100 lives This aroused considerable comment inasmuch as the *Sussex* was strictly a passenger vessel and unarmed. The question of arming merchantmen for defense presented a serious problem A resolution warning Americans not to sail on armed merchantmen failed to pass both Houses of Congress, indicating that the President was to have a free hand in carrying on foreign affairs. On Apr. 14, 1916, the United States government demanded that a submarine warfare, as it affected neutrals, be abandoned under a penalty of a break in diplomatic relations. For the German reply see WAR, DIPLOMACY OF THE.

Election of 1916. In 1916 Charles E Hughes and Woodrow Wilson were the candidates nominated for the presidency by the Republican and Democratic conventions respectively. Charles W. Fairbanks and Thomas R. Marshall were the vice-presidential nominees An element of the Progressive party nominated Theodore Roosevelt for president, but he declined the nomination and heartily supported Hughes during the campaign Wilson was reelected by an extremely small margin, and the issue was in doubt for several days It was decided only by his success in winning the electoral vote in California The electoral vote stood 277 for Wilson, 254 for Hughes. The popular vote was 9,128,837 for Wilson, 8,536,380 for Hughes. The surprising thing about this election was the fact that Wilson was able to be elected without carrying New York or any of the large eastern States. The result in Congress was to increase the Republican membership in both houses considerably. In the House 217 Republicans were elected, 212 Democrats, and 6 from other parties. In the Senate the Democrats retained their majority, which was cut from 14 to 12.

The War Again. Throughout 1916 the United States was brought nearer to war with Germany. The German submarine *U-53* entered Newport harbor on Oct. 7, 1916, and after delivering mail for the German Embassy, it departed Within the next two days it had sunk one Dutch, one Norwegian, and three British ships within sight of the American coast. The submarine escaped unharmed. The President made efforts during December, 1916, and January, 1917, to bring about a condition among the combatant nations which would lead to peace, he endeavored to secure from both sides a statement of terms on which the War could be honorably concluded. (See WAR, DIPLOMACY OF THE.) Following closely on these efforts, Germany, embarking on a ruthless submarine warfare, declared that all merchant ships found in a forbidden zone would be sunk after Feb 1, 1917, without warning. (See WAR, DIPLOMACY OF THE) President Wilson addressed both Houses of Congress on February 3 and declared that he had directed the Secretary of State to announce to the German Ambassador that all diplomatic relations between the two governments were severed and that the American Ambassador had been recalled from Berlin. The President further declared that he hoped that Germany would not actually embark on the ruthless submarine warfare and that only overt acts on her part would convince him that she would do so There followed a period during which the President waited for such overt acts. In the meantime the government undertook whatever measures were possible looking toward war. Congress attempted on February 26 to give President Wilson authority to supply guns and ammunition to American merchant ships, but the bill was defeated by a filibuster in the Senate. German submarine warfare was carried on with great ferocity, and Allied and American vessels were sunk. Congress was called in special session on Apr. 2, 1917, and the President made an address in which he summarized the offenses of Germany against the United States government and recommended that Congress declare that the course of the German government was nothing less than war against the government and people of the United States A resolution declaring the existence of a state of war was passed by both Houses and signed by the President on April 6.

The Mexican Note. Fuel was added to the rising anti-German feeling in the country by the publication on March 1, on the authority of Secretary of State Lansing, of a note from Germany to Mexico. It said in part: "On the first of February we intend to begin submarine warfare unrestricted In spite of this it is our intention to endeavor to keep neutral the United States of America. If this is not successful, we propose an alliance on the following basis with Mexico: that we shall make war together and together make peace. . . . It is understood that Mexico is to reconquer the lost territory in New Mexico, Texas, and Arizona. The President of Mexico, on his own initiative, should communicate with Japan, suggesting adherence

at once to this plan. At the same time offer to mediate between Germany and Japan." Needless to say, this note amazed and angered the entire country. Japan hastened to affirm in no uncertain tones that she had absolutely nothing to do with the whole affair.

Participation by the United States in the War. Prompt action followed President Wilson's signature of the war resolution. All American ships at foreign stations and the governors and military posts of American insular possessions were notified by wireless of the declaration of war Orders were issued by the Navy department for the mobilization of the fleet, and the naval reserve was called to the colors. The navy at once proceeded to seize all radio stations in the country. Every German and Austrian vessel in the harbors of the country and its possessions were seized. There were 91 of these, aggregating 630,000 gross tonnage. On April 15, the President issued "a call to service" in which he appealed especially to the agricultural and industrial workers of the country to devote their utmost efforts to providing and equipping the armies in Europe He said: "We must supply abundant food not only for our armies and our seamen, but also for a large part of the nations with whom we have made common cause, in whose support and by whose sides we shall be fighting.

"We must supply ships by the hundreds out of the shipyards to carry to the other side of the sea, submarines or no submarines, what will every day be needed there, and abundant materials out of our fields and our mines and our factories with which not only to clothe and equip our own forces on land and sea, but also to clothe and support our people, for whom the gallant fellows under arms can no longer work; to help clothe and equip the armies with which we are cooperating in Europe, and to keep the looms and factories there in raw material: coal to keep the fires going in ships at sea and in the furnaces of hundreds of factories across the sea; steel out of which to make arms and ammunition both here and there; rails for worn-out railways back of the fighting fronts; locomotives and rolling-stock to take the place of those every day going to pieces; mules, horses, cattle for labor and for military service; everything with which the people of England and France and Italy and Russia have usually supplied themselves, but cannot now afford the men and materials or the machinery to make."

War Preparations by the Army and Navy Long before the declaration of war the United States government was engaged in putting its physical forces into first-class condition. On March 25, an executive order was issued, increasing the enlisted personnel of the navy to 87,000 men; on March 26, another order was issued, to increase the Marine Corps to 17,400 men. Immediately after the declaration of war the naval militia, naval reserve, and the Coast Guard passed under the control of the Navy Department. Plans for the mobilization of the army went forward just as rapidly as those for the navy. Before war was declared several National Guard units were called out to do police duty at bridges, etc. The War Department announced that 26 camps, with a capacity of 25,000 men, would be established throughout the country for military instruction to civilians.

Council of National Defense. The economic side of the war was put in the hands of the Council of National Defense, which consisted of the members of the President's cabinet and a civilian advisory committee made up of businessmen and leaders of industry. Numerous boards were appointed, consisting of groups of experts, who were to organize war activities along special lines. The Food Board was placed in the charge of Herbert C. Hoover (q.v.), executive head of the Belgian Relief Commission. This board was to take such measures as would conserve the food supplies of the United States, and at the same time, as far as possible, it was to supply the needs of the Allies. It also dealt with questions of food shortages, distributions, mobilization of agricultural resources, price control, and waste. In November, 1917, it held a "conservation" week, and thousands of families received conservation display cards showing that they would observe "wheatless and meatless" days to aid the government. Other important boards were also instituted. A committee of five was appointed to direct the operations of American railways, which were taken over by the government on Dec. 28, 1917 (see RAILROADS). A General Munitions Board had charge of supplying munitions and equipment to the army and of adjusting the question of whether the government needed a man more in the industrial or military field. This board was later superseded by the War Industries Board The Economy Board was organized to take care of the commercial interests of the country and to purchase raw materials for the government The Medical Board was formed by many prominent physicians to mobilize and organize the medical men and resources of the country. The Federal Shipping Board was one of the most important organizations established. Its problem was to defeat the submarine by building a vast fleet to transport the American army and great quantities of supplies to Europe. It was organized as a $50,000,000 corporation with Colonel Goethals as general manager. The efficiency of this board was marred by continual wranglings over the nature of the vessels to be built. The result was several changes of personnel without apparent harmony of action. Another important board was the Aircraft Board Congress appropriated $640,000,000 for the aërial service, and every one confidently expected that America would take the lead in supplying machines of all types. In September, 1917, a glowing account of the new Liberty motor was given to the public. It was a false hope, however, and it was many months before the engine was perfected; as a matter of actual fact most of the machines used at the front were of foreign make. (See AERONAUTICS.) Congress made strenuous efforts to prosecute the war effectively. Sums of money undreamed of before were appropriated, and many all-embracing war measures, such as the Daylight Saving Law, Espionage Act, Food Act, Fuel Act, Selective Draft Act, etc., were enacted. The people of the country also contributed millions of dollars to volunteer organizations, such as the Young Men's Christian Association, the Young Women's Christian Association, the Salvation Army, the Red Cross, and several others. (For an account of their war services, see the articles on these organizations.) Thousands of businessmen gave up their private interests and worked for the government for a nominal wage.

Enemy Aliens. At the outbreak of the War,

there were approximately 5,000,000 enemy aliens in the United States. An official proclamation was issued, forbidding any enemy alien from remaining or residing "within half a mile of any governmental fort, factory, reservation, base of supplies, or any land used for war purposes," without a permit. Owing to the activities of pro-German sympathizers, President Wilson in November, 1917, ordered all enemy aliens to register and gave the Attorney General power to establish forbidden zones. An enemy property custodian was appointed by President Wilson, with the purpose of seizing all property held by enemy aliens in the United States and of holding it in trust until the close of the War. The total cost of the administration of the property was borne by the businesses themselves, which were taken over by A. Mitchell Palmer, the Alien Enemy Property Custodian. As each enemy-owned enterprise was seized, an effort was made to convert its products to the use of the government in the War. As a result, Palmer said: "when the Armistice was signed, the alien property custodian was supplying the government with magnetos for airplanes and automobile motors, with cloth to make uniforms for the soldiers and dyes with which the cloth was dyed, with medicines, surgical instruments and dressings, with musical instruments, with ball bearings, telescopes, optical instruments, with cocoanut charcoal for the making of gas masks, with glycerine for the making of high explosives and a large number of other and varied products. In some instances the enemy-owned corporations under the alien property custodian's supervision were running 100 per cent of their capacity on government business." More than $700,000,000 of enemy property was taken over by the custodian.

The Draft Act. In the President's message to Congress on Apr. 2, 1917, he submitted the project of raising a national army by conscription. There was tremendous opposition to this, but after a month's debate the President's idea prevailed, and on May 18, 1917, the selective conscription act was passed June 5 was set aside as the day on which all males who had reached their 21st but not their 31st birthday were to register for military service; 9,659,382 men registered. This included aliens. The law authorized the President to appoint a local exemption board for each county and one for each 30,000 population in cities of 30,000 or more. The exemption boards were to be made up of civilians only. Those specifically exempted by the law were Federal and State officials and members of religious sects who had conscientious scruples against war. The President was authorized to exempt "persons engaged in industries, including agriculture, found to be necessary to the maintenance of the military establishments or the effective operation of military forces or . . . the national interest during the emergency." The cards of registrants were numbered in a red-ink serial up to the total number in the district. Alphabetical arrangements were forbidden. Then the numbers were drawn at Washington and the men were called according to the drawing, which took place on July 20. The men were medically examined and those who were physically fit and not exempted were sent to some one of the 16 military cantonments constructed for the training of new recruits; 687,000 were called in this first draft. After this draft was completed, the system of selection was changed (November, 1917). All the remaining registrants were divided into five classes, according to liability for military service. Those in the first class were to be called first, those in the second next, and so on. During 1918 three registration days were set aside on which the various classes of men were to register. What virtually amounted to a second selective draft act was approved by President Wilson on Aug 31, 1918 It provided for the registration of all males between the ages of 18 and 45, with the exception of those who had already registered or who were in the military or naval service of the United States. Approximately 13,000,000 registered on Sept. 12, 1918. Provost Marshal General Crowder announced that the selectives had been classified into five groups. A summary of this classification follows:

Class I: (1) single man without dependent relatives; (2) married man (or widower) with children, who habitually fails to support his family; (3) married man dependent on wife for support, (4) married man (or widower) with children, not usefully engaged, family supported by income independent of his labor; (5) men not included in this or other classes, (6) unskilled laborers

Class II. (1) married man or father of motherless children usefully engaged, but family has sufficient income apart from his daily labor to afford reasonable adequate support during his absence; (2) married man, no children, wife can support herself decently and without hardships, (3) skilled farm laborer engaged in necessary industrial enterprise; (4) skilled industrial laborer engaged in necessary agricultural enterprise

Class III: (1) man with foster children dependent on daily labor for support, (2) man with aged, in firm, or invalid parents or grandparents dependent on labor for support, (3) man with brothers or sisters incompetent to support themselves, dependent on daily labor for support, (4) county or municipal officers, (5) fireman or policeman, (6) necessary artificer or workman in arsenals, armories, and navy yards; (7) necessary customhouse clerk; (8) person necessary in transmission of mails; (9) necessary employee in service of United States, (10) highly specialized administrative expert; (11) technical or mechanical expert in industrial enterprise, (12) highly specialized agricultural expert in agricultural bureau of State or nation; (13) assistant or associate manager of necessary industrial enterprise; (14) assistant or associate manager of necessary agricultural enterprise.

Class IV: (1) married man with wife and (or) children (or widower with children), dependent on daily labor for support and no other reasonable adequate support available, (2) marine in sea service of merchants or citizens in the United States; (3) head of necessary industrial enterprises; (4) head of necessary agricultural enterprise.

Class V: (1) officer of State or the United States; (2) regularly or duly ordained ministers; (3) student of divinity; (4) person in military or naval service, (5) alien; (6) alien enemy; (7) person morally unfit, (8) person permanently physically or mentally unfit; (9) licensed pilot.

In a decision handed down by the United States Supreme Court on Jan. 8, 1918, the constitutionality of the Selective Service Act was upheld See ARMIES; MENTAL MEASUREMENT.

Financing the War. The United States government determined to raise the money necessary for the conduct of the war by three methods: (1) loans, (2) revenue under existing taxation, (3) new taxation. Five loans were floated during the course of the War. The first four were called Liberty Loans and the fifth the Victory Loan. The First Liberty Loan books were opened May 14, 1917, and closed June 15. Two billion dollars' worth of 3½ per cent convertible gold bonds were offered. More than 4,000,000 people bought bonds, and the offer was oversubscribed by more than 50 per cent, necessitating a pro rata arrangement for all those who had purchased more than $10,000. A second loan of $3,000,000,000 was

offered Oct. 1, 1917, bearing 4 per cent interest. Ten million persons offered $4,617,532,300. The Treasury accepted half of the excess The Third Liberty Loan was offered on Apr. 6, 1918. It called for $3,000,000,000 at 4¼ per cent. More than 18,000,000 persons offered $4,176,516,850. The Fourth Liberty Loan called for $6,000,000,000 at 4¼ per cent. More than 21,000,000 subscribers offered $6,989,047,000. The fifth or Victory Loan called for $4,500,000,000, and the rate of interest was fixed at 4¾ per cent. More than 12,000,000 people subscribed $5,249,908,300. For the tax measures passed to help finance the War, see TAXATION IN THE UNITED STATES and FINANCE AND BANKING.

Missions from Abroad. From time to time throughout the War, missions from foreign nations visited the United States to cement the ties of friendship and to make plans to cooperate and carry on the War more efficiently. A British mission headed by Arthur James Balfour (q.v.) was the first to arrive (April, 1917). It was closely followed by a French mission headed by René Viviani (q.v.) They were hailed everywhere. Subsequently missions from Italy, Belgium, Russia, Rumania, and Japan arrived and were cordially received throughout the United States.

Relations with Austria-Hungary. Although Austria-Hungary severed diplomatic relations after the break with Germany, the United States did not immediately declare war. Partly as an aid to Italian morale, war was declared on Dec. 7, 1917. Among the reasons given by President Wilson were the sinking of American vessels by Austrian submarines and the unneutral actions of Dumba, the Austrian ambassador. See AUSTRIA-HUNGARY, *History.*

Peace and After. On Nov. 18, 1918, President Wilson announced that he would attend the Paris Peace Conference in person. He named as peace delegates Robert Lansing, Secretary of State; Henry White, a Republican, formerly ambassador to France, Edward M. House, and Gen. Tasker H. Bliss (q.v.) The President was received in Paris with great enthusiasm, and prior to the meeting of the peace conference he made visits to Great Britain and Italy, where he was hailed as the savior of the world. It should be mentioned that President Wilson and his party received a considerable political setback in the elections held in the United States just six days prior to the signing of the Armistice. Despite a personal appeal by the President to return a Democratic majority, the Republicans carried both houses of Congress and were successful in a majority of the State elections. The President's chief concern at the peace conference was the preparation of the covenant of the League of Nations, and he gave his utmost efforts to this object. After the first draft of the covenant had been prepared, he returned to the United States on Feb. 24, 1919, for a brief visit. There had already developed in Congress, especially in the Senate, a pronounced opposition to the terms of the covenant. This opposition was chiefly centred on Article X, which pledged the signatory powers "to preserve as against external aggression the territory of all the States in the League." President Wilson during his stay in the United States made several addresses in which he defended the covenant. He then returned to Paris. When the Treaty of Versailles was signed on June 28, 1919, the President at once returned to the United States. For a complete discussion of the peace conference and the various treaties which followed the War, see PEACE CONFERENCE AND TREATIES. See also LEAGUE OF NATIONS. For the controversy over what Germany should pay, see REPARATIONS.

Political interest in the United States centred in the deliberations on the peace treaty in the Senate. The many problems of reconstruction, such as the absorption of the millions of soldiers and sailors and laborers who were engaged in war industries, the question of the tariff (q.v.), prohibition (q.v.), woman suffrage (q.v.), finances, and the readjustment of the relationship between the various branches of the Federal government, were all allowed to slumber while the Democrats and Republicans fought over the League of Nations issue. The only bright spot in the controversy was the passage of one real piece of constructive legislation, the Esch-Cummins Bill. This provided for the return of the railroads to private operation and management. For the provisions of this bill, see RAILROADS. The Senate Committee on Foreign Relations having considered the treaty, it was introduced in the Senate on Sept. 28, 1918. There had been added 38 amendments and 4 reservations. The first of these gave the United States the right to withdraw from the League of Nations after due notice had been given. The second freed the United States from any obligation to carry out Article X, noted above. The third reservation provided that the United States should have the power to decide what questions came within domestic jurisdiction. In the fourth reservation the United States declined to submit for arbitration and inquiry any questions dependent on or relating to the Monroe Doctrine. The President had previously, on the advice of ex-President Taft and others, inserted in the League covenant a declaration that the Monroe Doctrine continued to be in force. In the face of the outspoken hostility of the Senate, President Wilson determined to appeal directly to the people in behalf of the League. Consequently he started on a nation-wide speaking tour on September 3 On September 26 he was seized by an apoplectic stroke and was compelled to abandon his tour and to remain in seclusion for months under the care of physicians. He never recovered from this breakdown.

After a long debate in the Senate in which much bitterness developed and 14 revised amendments were introduced, the treaty was defeated with the Lodge reservations by a vote of 55 to 39 on November 19. The treaty was reintroduced in the next session of Congress and was again decisively defeated by a vote of 49 to 35. On Apr. 30, 1920, Senator Knox introduced in the Senate a resolution providing for a declaration of peace with Germany. This resolution was adopted by both Houses but was vetoed by the President. Although there was an evident and ever-increasing desire to end the deadlock over the treaty with some form of compromise, both sides were finally compelled to leave the question to a "solemn referendum" of the people in the Presidential election of 1920. In the debate in the Senate, the leaders of the fight for ratification were Senators Swanson of Virginia and Hitchcock of Nebraska. The chief opponents of the ratification were Lodge of Massachusetts, Borah of Idaho, and Johnson of California. Robert Lansing (q.v.), Secretary of

State, resigned on Feb. 13, 1920, as a result of severe criticism by the President of his action in summoning the cabinet in session during the illness of the President. He was succeeded by Bainbridge Colby (q.v.).

Election of 1920. The Republican candidates for the nomination prior to the convention were Gen. Leonard Wood, Governor Lowden of Illinois, Senator Hiram Johnson of California, and Herbert Hoover. The leading Democratic candidates were William G. McAdoo and Gov. James M. Cox of Ohio. The Republican national convention met in Chicago on June 8. The forces of General Wood and Governor Lowden were evenly matched, but both were made unavailable by the disclosures of huge campaign funds which were injudiciously spent in some cases. On June 12, Senator Warren G. Harding (q.v.) was nominated for the presidency, and Calvin C. Coolidge (q.v.) was selected as vice-presidential candidate. At the Democratic convention which met at San Francisco on June 28, Governor Cox (q.v.) was nominated for president and Franklin D. Roosevelt (q.v.) as his running-mate. The campaign which followed was exceedingly aggressive, especially on the side of Cox, who, touring the country, made speeches in defense of the League of Nations in practically every State. Senator Harding remained at home, where from day to day he addressed delegations. The Republicans for the most part ignored the League of Nations and directed their attacks against the administration of the President. In the election in November, Harding and Coolidge received 16,181,289 popular votes, against 9,141,753 for Cox and Roosevelt. The electoral vote was 404 to 127. The nineteenth amendment, providing for woman suffrage (q.v.), had been adopted prior to the election, and the women for the first time participated in the election of a president. This accounts for the large popular vote cast.

Administration of Harding and Coolidge. President Harding was inaugurated on Mar. 4, 1921. He at once announced the members of his cabinet as follows: Secretary of State, Charles E. Hughes of New York; Secretary of the Treasury, Andrew W. Mellon of Pennsylvania; Secretary of War, John W Weeks of Massachusetts; Secretary of the Navy, Edwin C. Denby of Michigan, Secretary of the Interior, Albert B. Fall of New Mexico; Postmaster General, Will H Hays of Indiana; Attorney General, Harry M. Daugherty of Ohio; Secretary of Agriculture, Henry C. Wallace of Iowa; Secretary of Commerce, Herbert Hoover of California; and Secretary of Labor, James J. Davis of Pennsylvania. On March 23 the President issued a call for a special session of the new 67th Congress, for May 11, 1921. Congress at once took up the consideration of measures looking toward economic and financial reconstruction. An immigration bill, which limited the immigrants of any nationality during the fiscal year to three per cent of the number of that nationality in the United States at the Census of 1910, was passed. For further details and later changes in the immigration law, see IMMIGRATION. An emergency tariff bill was passed and approved by the President on May 27. For the provisions of this measure and the subsequent Fordney-McCumber Act, see TARIFF IN THE UNITED STATES. A budget law was also enacted. See FINANCE AND BANKING. The appropriations for the army and navy were radically cut down, and by the terms of the Army bill the army was limited to 150,000. See ARMIES. For changes in the tax laws, see TAXATION IN THE UNITED STATES.

Peace with Germany. The Senate passed on April 30 a measure which, previously offered by Senator Knox, declared the war between the United States and the Central Powers at an end, and repealed the declaration of war. This was followed by the preparation and ratification of a peace treaty with Germany. By the terms of this treaty the United States is not bound by any of the provisions of the Versailles Treaty which relate to the League of Nations. It reserves to the United States whatever favorable concessions are made by Germany to the Allied powers. The treaty was signed by Germany and the United States on July 2, 1921, and ratifications were exchanged in November of the same year.

Washington Conference. The details of the disarmament agreement and the settlement of the problems of the Pacific will be found under the title WASHINGTON CONFERENCE.

Industrial Unrest. The latter half of 1922 and part of 1923 were periods of industrial unrest. A general strike of the coal miners in both the anthracite and bituminous fields, threatening for months, was declared in the bituminous fields on Apr. 1, 1922, at the expiration of the two-year contracts between the miners and the operators. Work ceased in the anthracite mines a few months later. Serious disorders were prevalent The situation was the subject of remedial legislation in Congress. (See COAL; STRIKES AND LOCKOUTS.) No less serious than the coal strike was a general strike of the shopmen in all the railroads of the country which was declared on July 1, 1923. See RAILROADS; STRIKES AND LOCKOUTS.

Foreign Relations During the period, affairs in Europe seemed to go from bad to worse. The foreign policy of the Harding administration was to keep aloof. The American troops were gradually withdrawn from Europe, and when France and Belgium in January, 1923, seized the Ruhr (q.v.), the remaining American troops were withdrawn from the occupied zone. The question of the debt owed by foreign countries to the United States was vexatious. There was much propaganda for the canceling of these debts, but the majority opinion seemed to favor their collection. Early in 1923, a British financial mission, headed by Stanley Baldwin, came to the United States and successfully negotiated for the payment of the British debt. (See FINANCE AND BANKING.) On Feb. 24, 1923, President Harding sent the Senate a message asking for participation by the United States in the International Court of Justice erected at The Hague by the League of Nations. President Harding emphatically stated, however, that he intended no obligations under the League of Nations covenant.

Coolidge in Office. In June, 1923, President Harding (q.v.) started on a trip through the West and Alaska. At Seattle he became very ill and died at San Francisco on August 2. Calvin Coolidge (q.v.) was sworn into office early in the morning of the next day and immediately assumed the presidential duties. In his first message to Congress, Coolidge favored the World Court but opposed the League of Nations; he favored reduction of taxation and opposed the bonus. The League of Nations issue

was raised again in November, 1923, when Woodrow Wilson (q.v.) in a radio message deplored the "shameful fact" of the United States' withdrawal from all "responsible part in the administration of peace." This was Wilson's last public address. In January, 1924, he became critically ill and died on February 3.

Investigations and Scandals. Unfortunately for him, President Coolidge inherited a series of scandals which involved men holding prominent positions. The resignation of Albert B Fall (q.v.) as Secretary of the Interior was followed by an investigation of the leasing of the oil fields by the Navy and Interior Departments. President Coolidge was advised by Attorney General Daugherty to appoint counsel from both parties to investigate and to prosecute any one guilty of irregularities or criminal action in connection with the leases. Consequently President Coolidge, in a statement made on Jan 27, 1924, said: "Counsel will be instructed to prosecute these cases in the court so that if there is any guilt the guilty persons will be punished; if there is any civil liability it will be enforced; if there is any fraud it will be revealed; and if there are any contracts which are illegal they will be canceled" The oil scandal arose from the turning-over of public oil reserves in California and Wyoming to the E. L. Doheny (q.v.) and H. F. Sinclair (q v.) interests by Secretary Fall. This had been preceded by a transfer of the control of the oil fields from the Navy Department to the Interior Department. On investigation it was discovered that Fall had been the recipient of a $100,000 "loan" from Doheny. His testimony relative to this "loan" was rambling and unsatisfactory. He and Sinclair were subsequently indicted by a Federal grand jury. The name of William G. McAdoo was drawn into the controversy when it was shown that his law firm received a large retaining-fee from the oil interests shortly after he resigned from the office of Secretary of the Treasury. This played a prominent part in his failure to receive the Democratic nomination in 1924. Franklin K. Lane was another former cabinet official employed by the oil interests. Senator Pomerene and Mr. Roberts were appointed by President Coolidge as special counsel to investigate and prosecute the oil frauds. Secretaries Denby and Daugherty were compelled to resign. They were succeeded by Curtis D. Wilbur (q.v.) and Harlan Stone (q.v.).

Another amazing and serious scandal arose in connection with the administration of the United States War Veterans' Bureau. A Senatorial investigation committee reported that the Bureau should be completely reorganized. It had failed miserably to provide for disabled veterans, and the efficiency of the Bureau had been impaired by corruption, inefficiency, extravagance, political pressure, etc. The former director, Col. Charles R. Forbes, and James Thompson, a contractor, were indicted by a Federal grand jury on charges of bribery and corruption in connection with the award of contracts for building veteran hospitals.

Presidential Conventions, 1924. The Republican convention met on June 10, 1924, at Cleveland, Ohio. The "keynote" address was made by Theodore Burton of Ohio. The platform adopted on June 12 was preferred to a platform submitted by Senator La Follette. The platform continued the policy of aloofness in foreign affairs, although it approved the World Court idea. It also provided for the collection of foreign debts, the continuance of the high protective tariff, and other planks too numerous to mention. The question of the Ku Klux Klan (q.v.) was completely ignored. The nominations were easily disposed of. Calvin Coolidge was nominated on the first ballot for the presidency, and Gen Charles G. Dawes (q.v.) was nominated on the third ballot for the vice presidency. Governor Lowden (q v.) of Illinois was nominated on the second ballot but refused to run.

The Democratic convention, opening in New York City on June 24, lasted until July 10, 1924. It was the longest in the history of the country. This is accounted for by the inability of the delegates to reach a decision on the presidential nominee until the 103d ballot. The two most prominent candidates were William G. McAdoo (q v.) and Alfred E. Smith (q.v.) Owing to the exigencies of the two-thirds and unit rules, neither was able to obtain the nomination, although each was able to check the other On the 103d ballot John W. Davis (q.v.) was nominated. Governor Bryan (q.v.) of Nebraska was nominated for the vice presidency on the first ballot. Although a tremendous effort was made to incorporate a plank denouncing the Ku Klux Klan (q.v.), the result was a colorless plank, so indefinite as to mean nothing A similar plank was incorporated with regard to the League of Nations.

A third party appeared in the field when Senators La Follette (q.v.) and Wheeler (q v.) were nominated by a convention in Cleveland in July, 1924 This party was endorsed by the executive council of the American Federation of Labor

Presidential Election. Coolidge and Dawes were elected, November 4, by a substantial majority.

UNITED STATES MILITARY ACADEMY. A government institution at West Point, N. Y., for the practical and theoretical training of cadets for the military service of the United States, opened in 1802. Through an act of Congress in May, 1916, the maximum number of cadets permitted to be enrolled in the academy was raised to 1334 by the appointment of one additional cadet from each congressional district, additional cadets from the United States at large, and from the ranks of the enlisted men in the regular army and the national guard who are between the ages of 19 and 22, and have served not less than one year. Under this act the enrollment reached its highest mark, 1262, in 1921, and stood at 1225 in 1923–24, as compared with 661 in 1914. A plan was adopted in 1916 admitting applicants on certificate from accredited schools and colleges as well as by examinations. This applied to mental qualifications only. During the War the entire schedule was shortened to furnish officers for the service more quickly, and two classes were graduated before their normal time in 1918. The maximum age for admission to the academy was extended in 1920 from 22 to 24 years for men who served in the armed forces of the United States during the War. A new cadet hospital was practically completed in 1923. A new schedule of studies went into effect Jan. 1, 1924. The superintendents and commandants during the decade were as follows: Col. Clarence P Townsley, 1914–16; Col. John Biddle, 1916–17; Col Samuel E. Tillman, 1917–

18; Brig.-Gen. Douglas MacArthur, 1919–22; Brig.-Gen. Fred W. Sladen, 1922–

UNITED STATES NAVAL ACADEMY. A school for the training of naval cadets at Annapolis, Md., founded in 1845. The United States Naval Academy during the period from 1914 to 1924 underwent the greatest change in its history The student body was more than trebled by the Act of Congress of Feb. 15, 1916, increasing the number of midshipmen from two to three, the Act of Mar. 4, 1917, permitting the Secretary of the Navy to appoint 100 midshipmen from the enlisted force of the navy; the Act of Apr. 25, 1917, increasing the number of appointments to four, and the Act of July 11, 1919, permitting an increase in the number of appointments of midshipmen to five for each senator and congressman. An act approved Mar. 4, 1917, authorized the President of the United States, at his discretion, to reduce the course of instruction at the Naval Academy from four to three years (operative during the War), which permitted midshipmen to graduate after having completed a three-year course.

During the period of the War, while the Naval Academy was working at its full operative strength, a large number of ensigns from the enlisted personnel and reserve force were given an intensive course, and of this number more than 1200 were given certificates of graduation and assumed duties as officers in active service. During the above period a great change was made in the course of instruction. Physical requirements were increased. There was also introduced during this period the method of accepting certificates from colleges and high schools for admission to the Naval Academy in lieu of mental entrance examinations. The scope of the course was greatly extended and the entrance requirements correspondingly increased, until they were perhaps as difficult as those of any college in the country.

The Regiment of Midshipmen in 1923–24—nearly 2500—was the largest in history. Superintendent, Rear-Admiral Henry B Wilson.

UNITED STATES STEEL CORPORATION. See TRUSTS.

UNIVERSALISTS. Universalism has been defined as the doctrine or belief that it is the purpose of God to save every member of the human race from sin Thus it is claimed that Universalism is as old as Christianity, but the Universalist denomination is of modern origin, and is confined mostly to the American continent. The General Convention has jurisdiction over the ecclesiastical organizations of the church The membership of the denomination increased from 51,716 (estimated) in 1913 to 59,050 in 1923, the number of churches decreased from 709 to 651, and the number of ministers from 702 to 575. The number of pupils in the Sunday schools increased from 30,000 to 38,442. The commission on social service carried on a campaign to interest ministers, divinity students, and members of church clubs and societies in its work. In 1919, a great drive was launched to reëstablish the church more firmly and raise $1,000,000 to carry on its work. With the receipts from this drive, new mission churches were established in the South and West, new buildings were built in Japan for church, school and residence purposes, and a better organization and more perfect supervision of mission work was made possible. The General Sunday School Association, the religious education department of the church organized at the beginning of the period, carried on a notable work. The Women's National Missionary Association increased its home and foreign missionary work, and purchased the birthplace of Clara Barton, a loyal Universalist, for use as a shrine and in some form of social service work. The General Convention established the department of social welfare on a permanent basis with a full-time director who aided the churches to make the most of their opportunities in this line of work. A movement was under way in 1924 to build a Universalist National Memorial Church in Washington, D. C., to rebuild the destroyed church in Tokyo, Japan, and at the same time erect a Christian home for students in that city. A Ministers' Pension Fund was also established which was eventually to provide for the needs of aged ministers. In addition, the regular budget of the Convention was greatly increased to provide for the continuation of the work started by the drive funds. In celebration of the one hundred and fiftieth anniversary of the foundation of the denomination, the Murray Anniversary Crusade for membership was carried on in 1920, and was continued thereafter with renewed emphasis and scope under the name of the Christ Crusade The Universalist Comrades, an organization for men, was established in 1919 to aid the larger projects of the denomination.

UNIVERSITIES AND COLLEGES. A total of 670 universities, colleges and professional schools reported to the United States Bureau of Education for the school year 1919–20. These institutions enrolled 521,754 students. Of these, 38,398 men and 20,911 women were in preparatory departments; 212,405 men and 128,677 women in collegiate departments; 9837 men and 5775 women in graduate departments; 53,295 men and 3836 women in professional departments; and 27,533 men and 38,326 women were registered as unclassified or special students. The public institutions enrolled 134,007 men and 61,869 women, and the private institutions 200,219 men and 125,659 women.

The schools of theology enrolled 7216 students; the schools of law, 20,992 students; the schools of medicine, 14,242 students; the schools of dentistry, 8809 students; the schools of pharmacy, 5026 students; and the schools of veterinary medicine, 908 students. There were 94,838 students who attended summer schools, and 83,100 students were registered for extension and correspondence courses

The figures for attendance in 1919–20 were much larger than those for 1918. The increase for total numbers of students was 39 per cent. It was evident that the increases after 1920 were not as great. Prof Raymond Walters of Swarthmore College collected detailed reports of attendance from 30 typical universities and general reports from 151 leading universities and colleges. He reported in *School and Society* for Feb. 16, 1924, that "the 1923 advance over 1922 in full-time regular students in 134 of these institutions which reported both last year and this, was 3 per cent; the increase of 1922 over 1921 in 123 institutions had been 2 per cent. In grand total enrollment the 1923 gain over 1922 was 6 per cent, as compared with 14 per cent for 1922 over 1921. These percentages are markedly smaller than the percentages of

1919 to 1921 increases. Nevertheless, even at the diminished rate, the numerical gain this year at some of the larger state universities exceeds what used to be the total enrollment of the old-time New England college" The enrollments of students in some of the institutions reached astonishing numbers. The 10 institutions having the largest enrollments of full-time, part-time and summer-session students for 1922–23 were: Columbia, 28,861 students; California, 23,139; College of the City of New York, 17,055; Pennsylvania, 14,632; New York University, 14,385; Minnesota, 12,322; Chicago, 12,191; Michigan, 11,162; Wisconsin, 11,088; and Illinois, 10,557. The University of California also reported 11,767 extension students. If these are added to the number in residence the institution was dealing with 34,906 students.

In the summer schools for 1923, Columbia with 12,675 students ranked first. The University of California was second with 10,258 students. The next schools in order of size were: third, Chicago, 6375; fourth, College of the City of New York, 5457; fifth, Wisconsin, 4710; sixth, Minnesota, 4540; seventh, Virginia, 3129; eighth, Michigan, 3054; ninth, Colorado, 2888; tenth, Texas, 2658.

Degrees. In 1920, the universities and colleges conferred 23,272 baccalaureate degrees on men and 15,280 on women. Graduate degrees were conferred on 3457 men and 1396 women. Included in the graduate degrees were 439 Ph.D. degrees conferred on men and 93 on women. The schools of theology conferred 588 degrees; the schools of law, 3273; the schools of medicine, 2806; schools of dentistry, 865; schools of pharmacy, 1023; and the schools of veterinary medicine, 219. A total of 989 honorary degrees were conferred.

Property. It was estimated that in 1920 the universities, colleges and professional schools owned grounds worth $110,555,552; buildings worth $355,733,981; dormitories worth $69,393,142; and library and equipment worth $110,847,727. The productive funds were $556,350,140.

Receipts. The total receipts of the universities, colleges and technological schools for 1919–20 were $240,141,994, of which $50,906,752 was for increase of endowment. About 26 per cent of the income was derived from student fees. The per cent of income derived from student fees had not changed materially since 1900, when it was 27.5 per cent. The per cent of income derived from productive funds in 1890 was 28 2 per cent; in 1900, it was 17.3 per cent; in 1910, it was 13.9 per cent; while in 1920, it was only 10.9 per cent. States and cities supplied about 22 per cent of the funds; the Federal government about 5 per cent; while private benefactions contributed about 27 per cent of the receipts of these institutions. The income per student in 1900 was $145; in 1910, $258 and in 1920, $363. The amount of productive funds per student had not increased much since 1900, when it was $843. In 1910, it was $946 and in 1920, $1066. The average value of all property per student, exclusive of productive funds, was $986 in 1900; $1215 in 1910; and $1239 in 1920. The value of the properties of these institutions barely kept pace with the increase in students.

Gifts and Benefactions. For the year 1919–20, a total of 88 universities, colleges, and professional schools reported gifts above $100,000, making an aggregate of $54,734,197. The total amount reported by all of the institutions was $67,417,156. This was nearly twice the amount reported for any previous year. Since 1871, the first year for which statistics are available, at least $900,000,000 had been given to education. In the latter years large sums were given for medical education. Columbia received more than $12,000,000, and Johns Hopkins and Vanderbilt University at Nashville, Tenn, each more than $8,000,000 for medical education, while the University of Rochester had $9,000,000 available for the establishment of a medical school. Several other institutions received smaller amounts for the same purpose. The General Education Board, the Carnegie Corporation and the Rockefeller Foundation exerted large influence on medical education and each was generous with its gifts.

Academic Freedom. Various cases of alleged breach of academic freedom agitated college administrators and faculties during this decade. In some institutions professors were dismissed because of utterances or acts outside of their classrooms. One of the most serious difficulties occurred in Columbia University when Dr. James McKeen Cattell was dismissed from the chair of psychology which he had held for a period of 26 years. The immediate cause of Dr. Cattell's dismissal was certain letters that he had written to members of Congress urging them to oppose the sending of conscripts to Europe. Following Dr. Cattell's dismissal, Professor Beard resigned as an expression of disapproval of the attitude of the trustees He said: "I am convinced that while I remain in the pay of the trustees of Columbia University I cannot do effectively my humble part in sustaining public opinion in support of the just war on the German Empire or take a position of independence in the days of reconstruction that are to follow. For this reason I herewith tender my resignation as professor of politics" Professor Cattell carried his case into the courts where a financial settlement was eventually reached.

Later the students and faculty of Clark University were involved in a controversy which arose because of President Atwood's refusal to let Mr. Scott Nearing lecture before a voluntary group of students. The faculty was divided in its opinion regarding the propriety of the president's action. The student body also took sides and for a time the matter received pronounced consideration in the public press, where opinion was again divided.

The enforced resignation of Alexander Meiklejohn as president of Amherst College, and the issues which led to this action on the part of the trustees, attracted widespread interest and were regarded by the press as significant of the educational, financial and administrative problems of the American college. President Meiklejohn went to Amherst in 1912 from Brown University, with a special programme to modernize the curriculum, develop courses in history, social science and political economy and to emphasize the unity of the educational process. It was generally admitted that he had raised the intellectual standards of the college to a high plane by creating an eagerness for learning and promoting a spirit of inquiry among his students. That the issues in the controversy were those of conservatism versus liberalism were emphatically denied by the

trustees. Two factions seem to have brought strong pressure to bear upon the board for his dismissal: the faculty and alumni. With the students, he was almost wholly successful. When the question of his removal was mooted, a committee of the graduating class interviewed the trustees in his behalf and when his tenure was ended, thirteen declined to receive their degrees. The trustees seem to have been won to the merits of his plan of education and to have supported it for a time, retreating at last in the face of opposition and expediency. With his faculty, President Meiklejohn was not so successful, it being said that two-thirds of its members were opposed to him. The majority of younger members were his followers. The causes for disunity in the faculty were attributed by some to his peculiar temperament and methods of administration in securing curricular changes; he was accused of misrepresentation of their views to the trustees and attacked for an alleged radical policy of retirement, removal and appointment. The president had the hearty support of the younger alumni, but the older and more influential graduates were against him and for various reasons. He was accused of being a pacifist, he was held responsible for an anti-religious spirit among the students; he was regarded as advocating Bolshevist principles; and to his denunciation of exaggerated interest in intercollegiate sports and the corrupting influences of professionalism were traced recent failures of the college's athletic teams. Other influences which it is thought were brought to bear upon the trustees were the mishandling of his personal finances and maladministration of affairs of the college in general. At the commencement meeting the trustees informed the president it was considered madvisable for him to continue as administrative head of the college and his resignation was requested, tendered and accepted. He was offered a professorship of logic and metaphysics but declined

President Lowell in one of his reports holds that the professor's classroom utterances on his own subjects "ought to be absolutely free." The instructor should also be free to publish the results of research, provided they are in scholarly form. The instructor is not, however, at liberty to consider in his classroom subjects that do not relate to his specialty. President Lowell believes that it is unwise for an institution to attempt to assume responsibility for the actions and utterances of instructors outside their own classrooms. He says, "There is no middle ground. Either the university assumes full responsibility for permitting its professors to express certain opinions in public, or it assumes no responsibility whatever, and leaves them to be dealt with like other citizens by the public authorities according to the laws of the land." The position taken by President Lowell was probably a fair statement of the attitude held in most institutions in the year 1924.

One effect of the difficulties relating to the freedom of college and university professors was the establishment of an association known as the American Association of University Professors. The meeting called for the purpose of organizing this association was held in New York City in 1915. Over 250 were in attendance. The permanent chairman, Prof. John Dewey, in an introductory address set forth the purposes of the proposed association. He said: "We are in a period of intense and rapid growth of higher education. No minister of public education controls the growth; there is no common educational legislature to discuss and decide its proper course; no single tribunal to which moot questions may be brought. There are not even long-established traditions to guide the expansive growth. Whatever unity is found is due to the pressure of like needs, the influence of institutional imitation and rivalry, and to informal exchange of experience and ideas. These methods have accomplished great things. Within almost a single generation our higher education has undergone a transformation amounting to a revolution. And I venture to say that, in spite of the deficiencies we so freely deplore, no country has at any time accomplished more in the same number of years. . . . The need of a voluntary organization is the greater because of certain facts in the history of the American university. The rapid growth already referred to has occurred under a machinery designed for very different conditions. We are doing our educational work under methods of control developed decades ago, before anything like the existing type of university was thought of. Our official methods of fixing fundamental educational policy as well as of recruiting, appointing, promoting, and dismissing teachers, are an inheritance from bygone conditions. Their lack of adaptation to the present situation is due not to sinister intent, but to the fact that they are a heritage from colonial days and provincial habits. The wonder is not that there is so much restlessness and friction, but that there is not more. A system inherently absurd in the present situation has been made workable because of the reasonableness and good will of the governors on one side and, even more, of the governed on the other. Let me add that I can think of nothing so well calculated to lift discussions of educational defects and possibilities from the plane of emotion to that of intelligence as the existence of a truly representative body of professors." Newspaper reports had frequently asserted that the purpose of the association was to safeguard the cause of academic freedom. Professor Dewey maintained that cases of infringement upon the rights of instructors were "too rare to demand or even suggest the formation of an association. Existing learned societies are already disposed to deal with cases of infringement as they may come to light The existence of publicly recognized and enforced standards would tend almost automatically to protect the freedom of the individual and to secure institutions against this abuse." The Association held annual meetings and its committees investigated and reported upon difficulties in which various members of the Association were interested.

Admission Requirements. The great increase in the number of students seeking admission to college led college administrators to consider the possibility of a wiser selection of students. There was some experimentation and a large amount of discussion in reference to determining who should go to college. One group of college administrators took the position that in view of the limitations that are necessary the benefits of college and university education should be given to those who possess superior intellectual capacities. They advocate the elimination from college of the mediocre. Dartmouth College, for example, endeavored to make

intellectual capacity indispensable. In addition to this, however, candidates for admission must show positive quality and character with range of interest and must demonstrate their ability in school activities. The occupations of the parents and the location of their homes also formed part of the basis for selection. There were other college administrators who held that the mediocre have also a right to higher education. They emphasized better teaching in college as a cure for many of the difficulties that had arisen in connection with the mediocre. Committees representing college and university administrators financed by the Commonwealth Fund were studying different aspects of college administration with a view to ascertaining whether there should be changes in the organization of instruction. They raised the question as to whether four years of academic training, followed by several years of professional training, were actually required for the profession of dentistry and some of the other professions. When completed, the findings of this committee were expected to be of great importance in settling many of the problems that relate to admission of students.

Some form of intelligence testing was in use in a large number of institutions. Among the membership of the Association of American Colleges, 115 institutions, or 42.2 per cent of the total membership, reported in 1924 that tests were being used; 62 institutions, or 25.6 per cent of the total membership, reported that they were not used and had not been used. Seven institutions, or 2.6 per cent, reported that they had been used in the past but had been discontinued. Forty-eight of the institutions used the tests for the purpose of giving educational advice; 28 for the purpose of giving vocational advice; while 19 institutions used them in connection with admission to college.

The validity of mental tests in so far as they affect the selection and grading of students in colleges and universities had not received sufficient attention to become established. Brown University had for a series of years made very careful studies of mental testing in its student body. Those in charge of the work were among the most competent psychologists of the country. Tests were carried through a period of four years beginning with the class in its freshman year and ending with them as seniors. The late Stephen S. Colvin, who conducted the investigation, presented the following conclusions in an article appearing in the *Educational Review:*

"1. The term 'general intelligence' still awaits final definition. In the light of our present knowledge we are justified in assuming that it designates an innate learning capacity, which, however, can be developed only through learning. This means that it is the province and the duty of the schools to develop that capacity to its highest degree, and in those directions in which it may be most completely and helpfully realized. To recognize the limitations and the lines of direction of learning ability is not to assume an attitude of fatalism in regard to groups of individuals. Indeed it is equally fatalistic to act on the assumption that all men are born free and equal

"2. There is no reasonable doubt that the present intelligence tests do indicate to a fair degree native ability to learn. When employed with due caution they can be used to determine grading, promotion, and elimination. They are valuable in indicating the probable success of pupils in school and students in college. However, they alone are not sufficient to guide the teacher and administrator. In the first place, the present intelligence tests are not perfect instruments for measuring innate mentality. They frequently measure much more; at times they measure much less. Again, school success is determined by many factors other than intelligence. Not only do character qualities, temperamental tendencies, habits, and ideals of work, play a large part in school achievement, but good teaching has an important rôle to play as well. While you cannot make a silk purse out of a sow's ear it has been found possible (so a recent report states) to make a very good substitute.

"3. The testing movement is open at present to various dangers. It is in a critical stage, and although I am confident it will 'muddle through,' it needs to observe due caution and employ some of the intelligence that it seeks to discover. Its friends are too frequently overextravagant in their claims They have taken advanced ground too rapidly and have not sufficiently cleared up the positions earlier occupied. Its foes, or rather its critics, thus find vantage points for counterattacks. They see its exaggerations and its absurdities, and they fail to take account of its fundamental strength and the impregnable character of its ultimate lines of defense. The impressive results already secured by intelligence testing, since Binet with the insight of genius first gave to the world his scale of 1905, cannot be gainsaid. They are facts, sometimes wrongly interpreted, frequently misunderstood, and still lacking final and complete formulations, but they are facts that cannot be ignored, above all they are facts that can be applied and do work, if one has the insight to apply them, and the patience to use them in a really efficient manner

"4. Before intelligence testing can establish itself firmly and permanently as a factor in our scheme of education, various things must be accomplished. In the first place, intelligence scales must be perfected and improved. They must contain elements that appeal to other abilities than those conditioned largely by verbal knowledge and fluency. There must be developed tests that measure fundamental thinking ability and rational power. Tests must be given to the same individual not once, but several times, and they must have a still better technique of scoring and administration than has yet been worked out. Further and more searching statistical methods must be adopted and applied. In addition, tests to determine qualities of character and temperament must be developed Purposes and ideals must be discovered and measured But all of these things will in themselves be of little avail if also there is not an emphasis on the methods and aims of teaching, if there is not the personal touch between teacher and pupil, and if there is not insight, sympathy, and a modicum of common sense."

American University Union in Europe. This union, maintained by 50 American universities and colleges, acts as a clearing house of student efforts for Europe and America. A report by Prof. Paul Van Dyke, of Princeton, director of the Continental Division, gave the following summary of the assistance given to students:

"For the calendar year beginning Mar. 15, 1921, the total reached 1348 students, representing 174 American educational institutions and 46 States and the District of Columbia. These students were distributed among 49 different French institutions, including 16 of the 17 provincial universities and a wide range of other representative institutions. Equally significant is the fact that the service of the Union is now fairly evenly divided between women and men students. Of the total, 632 were women and 716 men."

American-Scandinavian Foundation. This foundation established traveling fellowships of the value of at least one thousand dollars to be awarded to students, men and women, for technological research and humanistic study in the universities of Sweden, Denmark and Norway.

American Field Service Fellowships for French Universities. The Society for American Field Service Fellowships for French Universities offers fellowships in French universities. These fellowships are awarded after open competition among graduates of American colleges and "other suitably qualified candidates." They are for the purpose of encouraging advanced study and research in French

universities. The fellowships, of the annual value of $1200, are granted for one year and are renewable for a second year. They may be awarded in any one of a considerable number of fields. The successful candidates are required to matriculate in a French university for the following session. Applicants must be citizens of the United States between 20 and 30 years of age and come within one of the following classifications: (1) graduates of a college requiring four years of study for a degree, based on 14 units of high-school work; (2) graduates of a professional school requiring three years of study for a degree; (3) if not qualified in either of these ways, must be 24 years of age and have spent five years in an industrial establishment requiring technical skill.

UNRUH, FRITZ VON (?–). A German writer, born at Oranien. His attitude toward militarism aroused much comment. He is the author of the plays *Offiziere* (1910); *Stürme* (1914), and *Prinz Louis Ferdinand von Preussen* (1914); a volume of verse, *Vor der Entscheidung* (1915); and a story founded on his experiences at the front, *Opfergang* (1915), translated into French as *Verdun*. He also wrote *Ein Geschlecht* (1916), *Platz* (1920), and *Rosengarten* (1923), plays which continue his independent line of thought.

UNTERMEYER, LOUIS (1885–). An American poet and journalist (see VOL. XXII). The fifth edition of his *Challenge*, which was first published in 1914, appeared in 1920. Among his other productions since 1914 were: —*And Other Poets*, parodies (1916); *These Times* (1916); *Translations from the Poems of Heinrich Heine* (1917); *Including Horace*, translations and parodies (1919); *The New Adam* (1920); *Heavens, a Book of Burlesques* (1922). He edited: *Modern British Poetry* (1920); *Modern American Poetry* (1921); *Poems of Anna Wickham* (1921).

UNTERMEYER, SAMUEL (1858–). An American lawyer (see VOL. XXII). In 1916 and for several years following he was a member of the United States section of the International High Commission. He was special adviser to the government on the interpretation of income tax and war emergency tax laws and in 1922 was counsel for a legislative committee investigating the building situation in New York City.

UPSON, RALPH HAZLETT (1888–). An aeronautical engineer, born in New York City, who started lighter-than-air machine training for the United States Navy in 1914. He designed the first improved kite balloon in 1915 and developed lighter-than-air construction at Goodyear, principally kite balloons and navy airships 1917. He started the Wingfoot Lake Flying School in 1917 and flew the first navy coast patrol ship from Chicago to Akron in demonstration flight 1917. He won the National Balloon Race in 1919 and in 1921. During 1918-19 he was a member of the Navy design mission in Europe. He wrote many articles on aëronautical subjects.

URANIUM. See RADIUM.

URBAN GOVERNMENT AND POPULATION. See MUNICIPAL GOVERNMENT.

URUGUAY. The smallest of the South American republics, with an area of 72,180 square miles and an estimated population (Dec. 31, 1923) of 1,603,000. This was a gain of 53.7 per cent over the census figure of 1908, with an annual increase of 3 6 per cent. The density increased from 12.9 per square mile in 1908 to 20.7 in 1920. Montevideo, the capital, had 418,000 inhabitants in 1923 as against 291,465 in 1908. Other large cities were: Paysandu, 30,000; Salto, 30,000; Mercedes, 25,000. For the five years 1916–20, total immigration was 870,460; total emigration, 817,319. Immigrants, chiefly seasonal agricultural laborers, came from Spain, Italy, Brazil, England, France, and Germany. In 1923, 1600 such laborers entered. Education made much progress in the period 1914–24. The registration during the school year 1922–23 was 118,102 in the 1036 primary schools, as compared with 91,746 in the 976 schools of 1913. Adult schools numbered 65 in 1922 and were attended by 6533 pupils. Vocational training, in particular, was spreading. The University of Montevideo in 1922 had 1615 students. By the constitution of 1919, state and church were separated.

Industry and Trade. Under the spur of an enlightened government policy economic activity showed great advances A national agricultural college was formed, immigration was officially encouraged, and money was set aside annually, beginning with 1913, to furnish free seed to farmers. The area devoted to agriculture increased from 1,961,515 acres in 1908 to 2,681,613 in 1922. Production of wheat, corn, oats, and linseed, in particular, showed an increase. Still, 20 per cent of the total imports continued to be food products, and cattle-raising remained the leading pursuit, animals and animal products making up 95 per cent of the country's exports. In 1916 there were 7,802,442 head of cattle, 554,871 horses, 11,472,852 sheep, 16,663 mules, 12,218 goats, and 303,949 pigs. The packing industry was rapidly being developed, and by 1922 upward of 25 plants were devoting themselves to chilling, salting, and canning meats. In 1921 there were altogether 3704 industrial establishments with 36,872 workmen. The state's interest in industrial affairs in the period was evidenced by the passage of a child labor law, the regulation of hours in industry, the creation of a national insurance bank (1912), an old-age pension law (1919), etc. The Uruguayan quarries were becoming important, and granite, marble, and agate were being produced and exported. The foreign trade for the period 1912–23 showed a consistent advance until 1920, when the world-wide depression affected Uruguay too. Imports and exports for typical years were in thousands of gold pesos, 1 peso being equal to $1.034.

	1913	1919	1920	1922	1923
Imports	50,352	43,202	50,590	43,036	55,200 (Estimated)
Exports	68,496	147,251	80,751	77,458	100 786

Principal imports in 1923, in order of value, were foodstuffs, fuel, hardware, and textiles; principal exports, meat and extracts, wool, hides, agricultural produce, and live animals. By 1923, evidences were perceptible of a considerable recovery from the depression of 1920–22, when Uruguayan cattle were a drug on the market. During this period it was necessary to curb the import trade, and the domestic strain

was marked. The year 1924 saw a favorable agricultural outlook, while the packing plants were once more working to capacity. The trade figures indicate the change. In connection with the table it is necessary to note that import figures are official tariff values and represented less than half the actual values. Figures should therefore be multiplied by 2.25. From 1920 on, the trade balance was thus adverse. During the decade, the United States advanced to the forefront as the most important country in Uruguay's trade. Proportions in value by countries of origin of Uruguayan imports for 1921 were: Argentina, 13.6 per cent; Brazil, 13.8; Great Britain, 17.8; the United States, 26.5; Germany, 7.1; France, 4.7. Proportions in value by countries of destination of Uruguayan exports were: Argentina, 4.3 per cent; Brazil, 3; Great Britain, 25; the United States, 27.3; Germany, 16.7; France, 9.9. In 1923, imports from the United States were $15,077,188 and exports to it were $21,811,424. The carrying trade was carried on almost exclusively in British bottoms, and the British net tonnage surpassed the combined tonnage of American, Italian, French, German, Dutch, and Spanish ships. By 1923, two-thirds of the American shipments to Uruguay were being handled in American bottoms.

Finance. The 1922–23 budget balanced at 39,654,254 pesos; the 1923–24 called for expenditures of more than 43,000,000 pesos, anticipating a deficit of 5,000,000 pesos. The 1914 receipts were 36,597,360 pesos; expenditures, 36,516,877. Deficits were frequent during the period, that of 1921–22 being 7,000,000 pesos, and as much in 1922–23. On Dec. 31, 1922, the internal debt was 47,509,387 pesos (15,620,423 in 1913); foreign debt, 128,851,536 (118,487,935 in 1913); internal debt, 2,243,000 (2,590,500 in 1913); total, 178,603,923 pesos. On Nov. 30, 1923, the debt had risen to 187,145,068 pesos. Payments on foreign debts, suspended during the War, were resumed in 1923. Notes in circulation on Oct. 31, 1923, totaled 61,687,823 pesos with a gold reserve of 55,990,646 in all banks. The notes more than doubled those of eight years before, but the gold reserve was almost five times as large. Exchange figures were: par value of gold peso, $1.04; average rate in 1922, 123 pesos to $100.

Communications. In 1923 there were 1650 miles of railway, of which 125 miles were state-owned; the remainder was financed by British capital. There were some 700 miles of navigable waterways, largely on the Uruguay and Plate Rivers.

History. The country's prosperity continued unhampered by internal dissension under the administrations of Feliciano Vieira (1915–19) and Baltasar Brum (1919–23). The sympathies of the people were with the Allies, and on Oct. 6, 1917, following the lead of the United States and Argentina, Uruguay broke relations with Germany. The most important internal event of the decade 1914–24 was the installation of the new federal constitution (Mar. 1, 1919). By the new instrument, the executive power was divided between the president, popularly chosen for four years, who controlled the departments of the interior, foreign affairs, army, and navy, and a National Administrative Commission of nine popularly elected for six years, which controlled the departments of finance, education and industry, and public works. Minority representation was assured, based on plural voting. Congress retained the legislative power, elected the Supreme Court, passed on treaties, and was vested with the right of interpreting the constitution. Cabinet members might present bills as in England. Church and state were separated, and woman suffrage was provided for, subject to acceptance by a two-thirds majority of each house. Local autonomy was granted the 19 departments, each of which had its local government board and representative assembly. Under Presidents Brum and José Serrato, elected in 1923, progress was made in education and public works, and friendship with the United States was cemented by an increasing number of advanced students sent to American colleges. In December, 1920, United States Secretary of State Colby visited Uruguay.

UTAH. Utah is the tenth State in size (84,990 square miles) and the fortieth in population; capital, Salt Lake City. The population increased from 373,351 in 1910 to 449,396 in 1920, a gain of 20.4 per cent. The white population increased from 366,583 to 441,901. The Indian population decreased from 3123 to 2711; Chinese, from 1305 to 1137; while the Japanese increased from 2110 to 2956. The number of negroes rose from 1144 to 1446. The native white population showed an increase from 303,190 to 385,446, while the foreign-born white decreased from 63,393 to 56,455. Both urban and rural populations mounted: The former from 172,934 to 215,584; the latter from 200,417 to 233,812. The growth of the principal cities was as follows: Salt Lake City (q.v.), 92,777 in 1910 to 118,110 in 1920, Ogden, 25,580 to 32,804; Provo, 8925 to 10,303.

Agriculture. Agriculture made substantial progress in the decade 1910–20. While the population increased 20.4 per cent, the number of farms in the State increased 18.4 per cent (from 21,676 to 25,662); the total acreage in farms from 3,397,699 to 5,050,410, or 48.6 per cent; and the improved land in farms from 1,368,211 acres to 1,715,380, or 25.4 per cent. The percentage of the total area used for agricultural purposes in 1910 was 6.5 per cent, and in 1920, 9.6 per cent. The percentage of farm land improved, in 1910, was 40.3; in 1920, 34. The total value of farm property showed an apparent increase, from $150,795,201 to $311,274,728; the average value per farm, from $6957 to $12,130, or 74.4 per cent. In interpreting these values and all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 25,662 farms in 1920, 22,579 were operated by owners, 296 by managers, and 2787 by tenants. The comparative figures for 1910 were 19,762, 194, and 1720. White farmers in 1920 numbered 25,248, of whom 21,276 were native, 3972 foreign born. There were 414 colored farmers, of whom 209 were Indians. In 1910 there were 21,400 white farmers: 15,948 native; 5452 foreign born. Farms free from mortgage in 1920 numbered 10,756, compared with 15,131 in 1910. Those under mortgage in 1920 were 9916, compared with 4492 in 1910, reflecting the adverse conditions after the war. The number of dairy cows in 1920 was 80,801, compared with 75,810 in 1910; "beef cows,"

228,953, compared with 185,174; sheep, 1,691,795, compared with 1,670,800. The area under irrigation in 1909 was 999,410 acres; in 1919 the irrigated acreage was 1,371,651. The estimated production of the principal farm crops in 1923 was as follows: corn, 900,000 bushels; spring wheat, 3,510,000 bushels; winter wheat, 2,945,000 bushels; oats, 3,638,000 bushels; barley, 716,000 bushels; potatoes, 2,935,000 bushels; hay, 1,374,000 tons; sugar beets, 941,000 short tons. Comparative figures, for 1913, are: corn, 340,000 bushels; wheat, 6,420,000; oats, 4,140,000; barley, 1,155,000; potatoes, 3,600,000; and hay, 909,000 tons. The apple crop in 1909 amounted to 350,023 bushels; in 1919, to 759,696. The production of peaches increased from 143,237 bushels in 1909 to 883,950 bushels in 1919.

Mining. Utah produces large amounts of minerals, among which the chief are coal, silver, lead, and copper, coal being the most important. The progress of the mining industry is indicated by the table. In the total production of copper, Utah ranks fourth, being surpassed only by Arizona, Montana and Michigan. In production of silver Utah is first among the States. (By the terms of the Pittman Act of 1918, silver was valued at $1 an ounce.) The State also produces gold to the value of about $2,000,000 a year; as well as zinc, clay products, iron ore, and uranium and vanadium ores. The total value of the mineral products in 1921 was $40,595,872, compared with $76,536,657 in 1920; $64,165,525 in 1919; $105,785,474 in 1918, and $45 636,198 in 1914.

PRODUCTION OF COAL, COPPER, LEAD, AND SILVER IN UTAH

Year	Coal Net tons	Copper Pounds	Lead Pounds	Silver Fine Ounces
1914	3,103,036	152,034,002	171,323,137	11,154,916
1915	3,108,715	187,671,188	. . . . .	. . . . .
1916	3,567,428	240,275,222	201,490,075	13,253,037
1917	4,125,230	246,674,153	. . . . .	. . . . .
1918	5,136,825	227,169,630	167,008,224	13,455,597
1920	6,005,199	116,931,238	140,838,113	13,106,976
1921	4,078,784	[a] 30,891,403	89,187,269	. . . . .
1922	.	97,193,850	. . .	17,271,100

[a] Decreased production due chiefly to business depression.

Manufactures. Although Utah is not one of the chief manufacturing States, it has industries of great importance, chiefly related to the smelting and refining of metals. There were, in 1920, three cities in the State with more than 10,000 inhabitants. These contained 35.9 per cent of the total population, and in 1919 reported 33 8 per cent of the value of the State's manufactured products. There were in the State, 749 manufacturing establishments in 1909; 1109 in 1914; and 1160 in 1919. Persons engaged in manufacture numbered 14,133, 17,126, and 23,107; the capital invested amounted to $52,626,640, $71,843,168, and $140,785,034, in those years The value of manufactured products amounted to $61,989,277 in 1909; to $87,112,360 in 1914; and to $156,933,071 in 1919. The increase in value of products was in great measure due to the change in industrial conditions brought about by the War, and cannot be taken as an index of the increase in manufactures between 1914 and 1919; but the increase in number of persons employed clearly indicates growth in the State's manufacturing activities. Lead smelting is the most important industry in point of value of product, with a value, in 1909, of $13,170,000; in 1914, $21,752,000; and in 1919, $27,518,000. The manufacture of beet sugar is second in this respect. Statistics previous to 1919 are not available; but the figure for that year was $27,518,000. In 1919, Utah ranked fourth among the States in value of product for this industry. The principal manufacturing cities are Salt Lake City and Ogden. There were, in Salt Lake City, 245 manufacturing establishments in 1909, with a product valued at $13,351,000; 366 in 1914, with $16,663,000; and 415 in 1919, with $33,357,000. In Ogden, in 1909, there were 68 establishments, with a product valued at $3713; 110 in 1914, with $6,014,000; and 128 in 1919, with $18,150,000.

Education. The educational system of Utah has always been among the best and most efficiently administered State systems. The Legislature has been diligent in passing necessary legislation, and during the period 1913–23 many steps were taken toward further improvement. Among the important measures passed was one providing for the appointment of a person to act as State high-school supervisor and also as supervisor of vocational education. While in other States it is common for the director of vocational education to be free and quite independent of the direction of the high-school director, it is believed in Utah that the single appointment should have a tendency to coördinate the vocational with the regular work of the high school, making all phases of high-school education fit as perfectly as possible into a unified whole. The Legislature of 1921 made it possible for the State Board of Education to appoint a State primary supervisor, which greatly improved the work of the teachers and the schools. The Legislature of 1917 accepted the provisions of the Federal Smith-Hughes Law, designating the State Board of Education as the State board for vocational education; and under this law agricultural, trade, and industrial education, home economics, and teacher training were being carried on with excellent results. The compulsory education law of the State compels attendance in school until the age of 18, unless the high-school course has been completed. The total enrollment in the six lower elementary school grades in 1923 was 81,501; in the junior high schools, 29,128; in the senior high schools 8335—a total enrollment in all schools of 119,034. The average daily attendance in 1913 was 92,139. The total disbursement for educational purposes in 1921–22 was $12,039,749. The percentage of illiteracy in the State decreased from 3.1 in 1910 to 2.5 in 1920: among the native white population from 0.7 to 0.5 per cent; among the foreign-born, from 5.9 to 6.5; among the Negro, from 5.3 to 5.

Finance. For finance, see STATE FINANCES.

Political and Other Events. Political control of Utah in the decade 1914–24 changed twice. At the end of the period it had returned to the Republican party, except for a Democrat who had been elected United States Senator in 1916 and who retained his seat in the 1922 elections. In the elections of 1914, Senator Smoot was a successful candidate for reëlection on the Republican ticket, and one Representative was elected by the same party; Democrats and Progressives together elected a Representative from the first Utah district, to succeed a Republican. In 1915 the Federal government sent Gen. Hugh L. Scott to Utah to adjust a situa-

tion which threatened to start an uprising of the Piute Indians. Conditions peculiar to an "open range" country were brought to a head by the alleged murder of a Mexican by an Indian and an attempt to arrest the Indian. In 1916 the Democrats swept the State; they elected practically all county officers, the entire State ticket, headed by Simon Bamberger for governor, the two Representatives in Congress, and William H. King as United States Senator. Senator King succeeded Senator George Sutherland, now Justice of the Supreme Court of the United States. In the presidential voting of this year, President Wilson received 84,025 votes; Charles E. Hughes, 54,136. State elections were again held in 1920. The Republicans again came into power and elected their candidate for governor, Charles R. Mabey, said to be the first veteran of the War to hold the office of chief executive in any State. Senator Smoot was reëlected. In the presidential election, Warren G. Harding received 81,555 votes; James M. Cox, 50,639. In 1922 Senator King, Democrat, was reëlected to the Senate, although the State generally went Republican, and both Republican Congressmen were reëlected. The Republican State convention held in May, 1924, pledged the 11 delegates of the State to the national convention to President Coolidge.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature of 1915 enacted a State-wide prohibition law; this, however, was vetoed by the governor. A second law was enacted, modeled after the Webb-Kenyon law and enforcing heavy penalties for its infraction. In 1917 the Legislature created a State budget system, passed a workmen's compensation act and a cold storage act, created a public utilities commission, passed a corrupt practices act and an initiative and referendum act, and amended various laws relating to the State government. It also passed a stringent State-wide prohibition law, which went into effect in August, 1917. An amendment providing for constitutional prohibition was proposed by the Legislature and was voted into the constitution by the people in the State election of 1919. The Legislature of 1919 passed statutes defining and punishing criminal syndicalism and sabotage and created a State securities commission. In 1921 the Legislature passed a long series of bills with the common purpose of remodeling the State government and increasing its efficiency. In 1923 laws were passed allowing suspension of sentence on the conviction of any crime or offense in which suspension appeared to the court compatible with the public interest, the defendant in such a case to be put on probation. A measure was also passed to facilitate coöperative marketing of agricultural products, and provisions were made for creating associations for this purpose.

UTAH, UNIVERSITY OF. A coeducational State institution at Salt Lake City, Utah, founded in 1850. The student enrollment increased from 944 in 1913–14 to 2500 (estimated) in 1923–24, the faculty increased from 80 to 171 members and the library from 38,757 volumes to 71,107 bound volumes and 29,107 pamphlets. The income of the university during the same period was increased from $250,000 to $563,500. James McGregor of Terre Haute, Ind., gave $50,000 in 1918 to endow the Schools of Mines and Engineering, and in the following year a building for the Medical School, a dining hall, Stewart Hall and an observatory were built. John A. Widtsoe, LL.D., succeeded J. T Kingsbury, Ph.D., D.Sc., as president in 1916, and was succeeded in turn by George Thomas, Ph.D., in 1921.

UTICA. A city of New York. The population increased 26 per cent from 74,419 in 1910 to 94,156 in 1920 and to 103,457 by estimate of the Bureau of the Census for 1923. With the opening of the New York State Barge Canal, the old Erie Canal fell into disuse, and in 1921 the city built a conduit for water and a roadway over the site of the canal, thus eliminating the old bridges on the main streets. The cost of the work was about $150,000. The Marcy division of the Utica State Hospital for the Insane was under construction in 1924, of which several units of buildings were completed It was to cost the State more than $10,000,000 by the time it was finished. The park system of the city was expanded during the period, at a large outlay.

V

VACUUM TUBES. See RADIO TELEGRAPHY.

VAIL, THEODORE NEWTON (1845–1920). An American capitalist (see VOL XXII). When the telegraph and telephone systems were taken over by the government in 1918, the Postmaster General appointed him as adviser, and when private operation was resumed in 1919, he was made chairman of the board of directors of the American Telephone and Telegraph Company. He died in Baltimore in 1920, leaving an estate of about $2,000,000

VALENTINER, WILHELM R (1880–). A German art historian (see VOL. XXII). In Germany at the outbreak of the War, he enlisted in the army and took part in the entire struggle On the entry of the United States into the War he resigned his position as curator of decorative art in the Metropolitan Museum of New York City Following the War he frequently visited the United States and became European adviser to the Detroit Museum. He wrote catalogues of important American collections, such as the Johnson and Widener in Philadelphia and that of Henry Goldman in New York (1922). His most important recent work is *Rembrandt van Rijn: Wiederfundene Gemalde* (Stuttgart, 1921).

VALONA. See ALBANIA.

VANDERBILT, CORNELIUS, III (1873–). An American capitalist, born in New York City, and educated at Yale University. He was a director in many important financial institutions in New York and elsewhere. He was for many years connected with the State Militia of New York and in 1917 was commissioned colonel in command of the 102d United States Engineers, with which regiment he served in France. In 1918 he was commissioned brigadier-general in the National Army and later brigadier-general in the Officers Reserve Corps.

VANDERBILT UNIVERSITY. A coeducational institution at Nashville, Tenn., founded in 1873. The student enrollment increased from 1112 in 1914 to 1300 in 1923–24. The number of members in the faculty was likewise increased during the decade from 125 to 150, and the library from 53,000 to 83,000 volumes. A million dollars was added to the endowment in 1918, of which $725,000 came from the Vanderbilt family and the General Education Board. In 1919 the General Education Board gave $4,000,000 for the School of Medicine, and in 1921 an additional appropriation of $1,500,000 was made by the General Education Board and a like amount by the Carnegie Corporation. These gifts were for the purpose of building a new medical plant on the main campus of the university and for reorganizing the School of Medicine. Building operations under this arrangement were begun in 1923, to be completed in 1925. James H. Kirkland, Ph.D., LL.D., succeeded Henry B. Brown as chancellor in 1916.

VANDERLIP, FRANK ARTHUR (1864–). An American financier and writer (see VOL. XXIII). During the War he was chairman of the War Savings Committee. In 1920 he visited Japan and on his return wrote many articles in regard to Japanese-American relations. Also in 1920, his book, *What Happened to Europe*, appeared. In 1924 he organized the Citizens' Federal Research Bureau to investigate graft in government circles and took out a $1,000,000 insurance policy on his life in its favor.

VAN DOREN, CARL (1885–). An American editor and author, born at Hope, Ill., and educated at the University of Illinois and Columbia University. After several years on the faculty of the University of Illinois, he was appointed instructor in English at Columbia in 1911 and became assistant professor in 1914 and associate in English in 1916. From that year to 1919 he was headmaster of the Brearley School and in 1919 became literary editor of *The Nation*. Later he joined the staff of *The Century Magazine* Besides editing selections from the works of American writers, he wrote *The Life of Thomas Love Peacock* (1911), *The American Novel* (1921); and *Contemporary American Novelists* (1922); *The Roving Critic* (1923); *Many Minds* (1924).

VAN DYKE, HENRY (1852–). An American author and diplomat (see VOL. XXIII). He resigned his post as United States Minister to the Netherlands and Luxemburg in 1917, and when America entered the War he served as a chaplain in the Navy. His later books include *Fighting for Peace* (1917); *The Red Flower* (1917); *The Valley of Vision* (1919); *Golden Stars* (1919); and *Camp Fires and Guide Posts* (1921); *Companionable Books* (1922).

VAN DYKE, JOHN CHARLES (1856–). An American art historian (see VOL. XXIII). After 1914 he published a large number of critical handbooks of the great European galleries, with original and stimulating comments on the paintings. His publications include also *American Painting and Its Tradition* (1919) and *Rembrandt and His School* (1923). In the latter he endeavors to prove that only about 50 of the thousand pictures which he claims are ascribed to Rembrandt are genuine; the remainder, according to his theory, are by pupils of Rembrandt. For example, of the many Rembrandts in the Metropolitan Museum, New York City, not one is genuine, Van Dyke believes. This book made a great sensation, but its conclusions were not generally accepted.

VANE, SUTTON (?–). An English dramatist. During the War he served in Egypt, was shell-shocked, and was invalided home in 1917. After producing several unsuccessful plays he wrote, in 1923, *Outward Bound*. For this he hired a small playhouse, painted the scenery himself, and engaged a fine company of actors on a coöperative basis, with his wife

in the principal rôle. The initial cost was only $600, but success was instant and complete. The play was produced both in London and New York during 1924.

VAN GORDON, CYRENA (1893–). An American dramatic mezzo-soprano, born at Camden, Ohio. After completing her studies under Louise Dotti at the Cincinnati College of Music, she made her début with the Chicago Opera Association as Amneris in *Aida* (Nov. 23, 1913) with such success that she was engaged as a regular member. She then became one of the principal stars of the company. A splendid singer and superb actress, she is equally convincing in German, French, and Italian rôles. Her Wagnerian repertoire is especially varied, including Venus, Ortrud, Brangäne, Erda, Flosshilde, Fricka, and Brünnhilde (*Walkure*). In 1912 she married Dr. Shirley B. Munns.

VAN HOOGSTRATEN, WILLEM (1880–). A Dutch conductor, born at Utrecht. For six years he studied the violin under Eldering at the Cologne Conservatory, at the same time playing in the Gürzenich Orchestra under such conductors as Steinbach, Nikisch, and Mahler. After further study under O. Ševčik at Prague he began his career as a virtuoso, making tours of Germany. A most successful début as conductor, in Hamburg, was followed by appearances as guest conductor in other German cities, in Sweden, and in Holland From 1914 to 1917 he was conductor of the Städtisches Orchester in Crefeld, where he also formed a trio with his wife, Elly Ney (q.v.), whom he had married in 1911, and Fritz Reiss ('cello). At his American début with the Philharmonic Society (New York, Jan. 2, 1922), in an all-Brahms programme, he made a deep impression, which was even heightened at his second concert two weeks later. As a result he was engaged to conduct the second half of the society's summer concerts at the Stadium of the College of the City of New York in 1922, when his brilliant performances attracted record audiences. The following summer, as sole conductor of the series, he repeated his triumphs. In the fall of 1923 he appeared as regular conductor of the winter series, succeeding Stransky, and alternating with Mengelberg (q.v.).

VAN LOON, HENDRIK WILLEM (1882–). An American author and lecturer, born at Rotterdam, Holland, and educated at Cornell, Harvard, and Munich Universities. During the revolution in Russia in 1906 he went to Moscow, St. Petersburg, and Warsaw as war correspondent. He lectured on history at several universities in the United States from 1911 to 1914. When the War broke out he went to Belgium and reported the siege of Antwerp for the Associated Press. The Germans expelled him from Belgium in December, 1914. He lectured on modern European history at Cornell during 1915 and 1916 and later accepted the chair of history at Antioch College. He wrote: *The Fall of the Dutch Republic* (1913); *The Rise of the Dutch Kingdom* (1915); *The Golden Book of the Dutch Navigators* (1916); *A Short History of Discovery* (1918); *Ancient Man* (1920); *The Story of Mankind* (1921); *The Story of the Bible* (1923).

VAN PELT, JOHN VREDENBURG (1874–). An American architect, born at New Orleans. He studied art and technical education in Paris and from 1897 to 1900 was assistant professor of architecture at Cornell University. After several years spent in travel abroad he became professor of design and dean of the College of Architecture in 1902, but resigned two years later. After 1904 he practiced in New York. From 1904 to 1913, he was associate director of the Atelier of Columbia University, and from 1914 to 1917, professor of architecture at the University of Pennsylvania. He received many medals for the excellence of his designs and plans and was the author of *Essentials of Composition as Applied to Art* (1902).

VAN'T HOFF ISOCHORE. See CHEMISTRY, PHYSICAL.

VAN VECHTEN, CARL (1870–). An American author, born at Cedar Rapids, Iowa, and educated at the University of Chicago. He became assistant musical critic of the New York *Times* in 1906 and that newspaper's Paris correspondent in 1908. He edited the programme notes of the Symphony Society of New York (1910–11) and was dramatic critic for the New York *Press* (1913–14). He wrote: *Music After the Great War* (1915); *Music and Bad Manners* (1916); *Interpreters and Interpretations* (1917); *The Merry-Go-Round* (1918); *The Music of Spain* (1918); *In the Garret* (1920); *A Letter by Morgan Lewis Fitch* (1920); *Interpreters* (1920); *The Tiger in the House* (1920); *Lord of the Housetops* (1921); *Peter Whiffle, His Life and Works* (1922); *The Blind Bow-Boy* (1923); *The Tattooed Countess* (1924).

VAN VLIET, CORNELIUS (1886–). An American 'cellist, born at Rotterdam in Holland At the age of six he received his first instruction on the piano and the violin from his father In 1895 he began to study the 'cello with O. Eberle in Rotterdam and later continued with J. Mossel in Amsterdam. In 1901 he joined the Concertgebouw Orchestra in Amsterdam In 1903 he was solo 'cellist of the Leipzig Philharmonic Orchestra, in 1904 of the Prague Philharmonic Orchestra, and in 1905 of the Helsingfors Symphony Orchestra. He also taught in Helsingfors, at the conservatory. From 1905 to 1908 he was solo 'cellist of the Kaim Orchestra in Munich and in 1908–11, of the Royal Opera in Vienna. In 1911 he came to America on a concert tour. From 1912 to 1919 he was solo 'cellist of the Minneapolis Symphony Orchestra and a member of the Minneapolis Trio He then moved to New York, where in 1921 he became solo 'cellist of the Philharmonic Society, jointly with Leo Schulz. In 1919 he formed with Scipione Guidi (violin) and Clarence Adler (piano) the New York Trio.

VAQUEZ, HENRI (1860–). One of the leading physicians of France, known especially in connection with diseases of the heart, circulation, and blood. Several years after his graduation from the University of Paris he described a new disease of the blood, polycythemia, known also as Vaquez's disease. One of his earliest publications was *Hygiène des Maladies du Cœur.* With the exception of his *Précis de Thérapeutique* (1907), all his major works have been concerned with heart disease: *Les Arythmiés* (1911); *Le Cœur et l'Aorte,* on radiology of the heart, in collaboration with Bordet (1913); *Radiologie des Vaisseaux de la Base du Cœur,* also with Bordet (1920); *Maladies du Cœur* (1921); *Appareil Circulatoire,* in collaboration (1922). His work on radiology of the heart also appeared in English translation. Vaquez is edi-

tor of the periodical *Archives des Maladies du Cœur.*

VARIATION. See HEREDITY.

VASSAR COLLEGE. A nonsectarian institution for women at Poughkeepsie, N. Y., founded in 1861. The student enrollment in 1914 was 1120 as compared with 1146 in 1923–24, the faculty numbered 121 at the beginning of the decade and 154 at the end, the library was increased from 86,000 to 127,078 volumes, and the productive funds of the college from $1,655,257 to $5,143,081. New admission requirements were set in 1919 to take the place of the old method of admission by certificate from approved schools and colleges. The new requirements took the form of comprehensive examinations in four general subjects as well as a satisfactory school record of the candidate, and could be replaced at will by the old examinations in individual subjects. James W. Taylor resigned from the presidency in 1914, and was succeeded by Henry Noble McCracken, Ph.D.

VATICAN. See ROMAN CATHOLIC CHURCH.

VAUGHN, SAMUEL JESSE (1877–). An American educator, born in Elkton, Mo., and educated at Drury College, Mo., and the University of Chicago. He was director of industrial education at several schools in Illinois until 1921, when he was chosen president of Hardin College. In 1914 he was editor of the *Industrial Arts Magazine.* During the War he served in the Sanitary Corps. He is the author of *Printing and Bookbinding for Schools* (1912) and *Content and Methods of the Industrial Arts* (1922). He lectured much on educational, social and economic problems.

VEATCH, ARTHUR CLIFFORD (1878–). An American geologist, born at Evansville, Ind., and educated at Indiana, Cornell, and Wisconsin Universities. Meanwhile he taught mathematics and physical geography at the Rockport (Ind.) High School, and was assistant State Geologist of Louisiana (1898–1900). In 1902 he became assistant geologist with the United States Geological Survey and from 1906 to 1910 held the rank of geologist, after which he was chief geologist of the General Asphalt Company for a year. He then accepted control of the foreign petroleum developments of S. Pearson and Sons of London. During 1919 he became connected with the Sinclair Consolidated Oil Corporation, in charge of the exploration department. He is a member of the American Institute of Mining and Metallurgical Engineers, on whose petroleum committee he served after 1919, and in 1921 he became chairman of its subcommittee on foreign oil policy. In addition to numerous articles and reports he is the author of *Quito to Bogota* (1917).

VEBLEN, THORSTEIN B. (?–) An American economist (see VOL. XXIII). In 1918 he came to New York City as a teacher at the New School for Social Research. Among his later publications are: *An Inquiry into the Nature of Peace and the Terms of Its Perpetuation* (1917); *The Higher Learning in America* (1918); *The Vested Interests* (1919); *The Place of Science in Modern Civilization and Other Papers* (1920); *The Engineer and the Price System* (1921).

VENETIA JULIA. See FIUME-ADRIATIC CONTROVERSY

VENEZUELA. A republic on the north coast of South America with an estimated area of 393,976 square miles. The census of December, 1920, gave the population as 2,411,952, an increase of only 88,425 or 3.8 per cent over the official census of 1910. Gains from immigration were negligible; in the three years 1919–22, for instance, the arrivals were 33,697 and the departures 33,914. Populations of the important towns in 1920 were: Caracas, the capital, 92,212; Maracaibo, 46,706; Valencia, 29,466; Barquisimeto, 23,943; San Cristobal, 21,385. After 1913 great administrative activity in the field of education was evident; in 1914 primary education was made free and compulsory; in 1915 vocational and art schools were provided for; in 1916 schools of pharmacy and dentistry were established. At Caracas, the Central University was reopened in 1922 after a lapse of 10 years.

Industry. Agricultural, pastoral, and woodland products remained the leading factors in the country's economic life. Coffee was first in importance, with some 500,000 acres under cultivation in 1922 on 25,000 plantations, with an average annual production of 69,000,000 kilos valued at $30,000,000. The annual production of cocoa was about 20,000 metric tons; of sugar about 60,000. Cattle, sheep, and goat raising remained important, and in the years 1915–22 the herds and flocks showed increases. The live stock in 1922 was estimated at 2,800,000 steers, 115,000 sheep, 2,150,000 goats, 168,000 horses, 255,000 mules and asses, and 500,000 pigs. Gold, petroleum, copper, salt, and asphalt were the leading mineral resources. From leases, etc., the government derived an annual revenue of some 3,400,000 bolivars in royalties. In later years petroleum was mined in increasing quantities. The oil wells, principally in the Maracaibo district, were worked by American and British interests In 1919, production was 45,000 metric tons; in 1920, 69,539; in 1921, 218,146; in 1922, 285,673. Something of Venezuela's progress during the period 1914–24 may be adduced from export values for typical years:

	Values in United States Currency			
	1913	1919	1920	1921
Coffee	$16,196,657	$29,225,714	$12,698,246	$12,373,552
Cacao	4,854,734	7,543,708	6,731,685	3,972,348
Balata	2,032,868	1,255,365	1,669,730	988,504
Hides	1,439,179	2,742,847	1,478,880	200,000
Total exports	$29,483,789	$49,922,959	$32,934,322	$25,777,057
Total imports	18,030,103	34,208,047	58,330,369	18,433,114

Imports from the United States in 1914 were valued at $6,082,000; in 1923 they were worth $11,918,570. Proportions of the export value by countries of destination for 1913 and 1921 were: the United States, 28 and 40 per cent; Great Britain, 7 and 10 per cent; Germany, 19 and 4; France, 34 and 10; Spain, 5 and 11; the Netherlands, 3 and 20. Proportions of import value by countries of origin for 1913 and 1921 were: the United States, 40 and 55 per

cent; Great Britain, 22 and 16; Germany, 14 and 4; France, 5 and 8; Spain, 4 and 3; the Netherlands, 10 and 5; Italy, 3 and 2.

Finance. Government finances in the period 1914–24 steadily improved, revenues showing surpluses over expenditures for all the years except four. In 1914 revenues were 67,414,974 bolivars; expenditures, 72,278,987 The 1923–24 budget balanced at 62,845,000 bolivars. The condition of the debt also became more favorable. In January, 1914, the internal debt amounted to 61,607,179 bolivars In December, 1923, it had been reduced to 41,603,245 bolivars. Similarly, in 1914 the foreign debt was 114,-853,071 bolivars; in 1923, 67,122,880. Amortizations and cancellations effected during the 15 years between January, 1909, and December, 1923, had been 126,232,740 bolivars. On Apr. 15, 1923, the Treasury reserves amounted to 48,000,000 bolivars. In 1922 notes in circulation were 39,085,000 bolivars.

Communications. In 1922, 661 miles of railway were in operation, a gain of 121 miles over 1914. The greatest activity was manifested in road building. In 1915 and 1916 plans were made for the construction of two great highways, the Gran Carretera Oriental (626 miles) and the Gran Carretera Occidental (540 miles), and the work was immediately begun. In 1923 extensions of these roads were announced.

Defense. By a law promulgated in 1920, service in the army was made compulsory for two years in the active forces and up to the age of 45 in the reserve.

History. After 1914, internal affairs remained orderly. The chief concerns of the government were the readjustments necessary to meet war conditions. Venezuela maintained her neutrality throughout the War and on Mar. 3, 1920, joined the League of Nations. Gen. Juan Vicente Gómez continued as president, holding the office uninterruptedly since 1909, although for a time he relinquished the post to a provisional president to act as commander-in-chief. In 1922 he was reëlected for the next seven years' term. The long-standing boundary dispute with Colombia was, as a result of a convention signed in 1916, first submitted to the Swiss President as arbiter, and then to the Swiss Federal Council. On Mar. 24, 1922, it was announced that a decision had been reached, although the terms were not made public by 1924. On June 30, 1923, the first vice president of the republic, Juan C. Gómez, brother of the president, was murdered in the palace at Caracas, as a protest against the nepotism practiced by the administration. On the other hand, in justification of the Gómez régime, it was pointed out that the country remained peaceful, foreign capital in the oil fields was steadily being invested, the public debt was reduced, and the bolivar consistently remained at par As for the debt, the figures indicated that the diplomatic debt of 1905, which amounted to £5,229,700 originally, had been reduced to £2,794,380 by 1922

VENIZELOS, ELEUTHERIOS (1864–). A Greek statesman (see VOL. XXIII). In 1916 he established a so-called Provisional Government of National Defense at Saloniki and gathered a volunteer army of 60,000 men. His government was recognized by England, France, and Russia, and when Constantine was dethroned, Venizelos returned to Athens, took control of Greece, and declared war against Germany and her allies (1917). He represented Greece at the Peace Conference, where he achieved brilliant results for his country, but an attempt was made on his life. In the fall elections (1920) he was overwhelmingly defeated; this was attributed to German propaganda. He came to the United States in 1921. Urged to return to Greece, he demanded the abdication of Constantine as a condition. He finally arrived in Athens in January, 1924. He favored a plebiscite on the question of a monarchy or republic, formed a cabinet, and was named president of the National Assembly. Ill health compelled him to decline the premiership of the new republic, but it had his hearty support.

VENTILATION OF TUNNELS. See TUNNELS.

VERBRUGGHEN, HENRI (1874–) A British conductor, born at Brussels. He studied the violin under Hubay and Ysaye at the Conservatoire there (1887–92). In 1893 he became a violinist in the Scottish Orchestra at Glasgow, played a season in the Lamoureux Orchestra in Paris (1894–5), and returned to his former post in Glasgow. During the summers of 1895–97 he was concertmaster and assistant conductor of Rivière's Orchestra in Llandudno, Wales, and in 1898–1902, conductor of the summer concerts at Colwyn. In 1903 he settled in Glasgow as concertmaster of the Scottish Orchestra and director of the orchestral and chamber music classes at the Athenæum; in 1911 he assumed also the conductorship of the Glasgow Choral Union. In 1903 he founded, with J. Cullen, D Nichols, and J. Messeas, his own string quartet, which soon became famous. In 1915 he moved to Sydney, Australia, where he organized the National Conservatory and founded the State Orchestra, with which he gave regular series of symphony concerts in Sydney, Melbourne, Brisbane, and Adelaide, besides making an annual tour of New Zealand, thus totaling about 150 concerts a year. In 1918 he visited the United States, primarily for the purpose of studying American methods of instruction. He appeared successfully as guest conductor of some of the great American orchestras. In 1921 he returned to conduct several concerts of the Minneapolis Symphony Orchestra, of which he was appointed regular conductor in 1922.

VERDUN, BATTLES OF. See WAR IN EUROPE, *Western Front.*

VERMONT. Vermont is the forty-second State in size (9564 square miles) and the forty-fourth in population; capital, Montpelier. Vermont is one of the few States which showed a decrease in population in the decade 1910–20, when the population fell from 355,956 to 352,-428, a loss of 1 per cent. The white population decreased from 354,298 to 351,817; the negro, from 1621 to 572. The number of native whites rose from 304,437 to 307,291; foreign-born whites decreased from 49,861 to 44,526. The urban population mounted from 98,917 to 109,976, while the rural population fell from 257,039 to 242,452. The only important cities are Burlington and Rutland. The former increased from 20,468 in 1910 to 22,779 in 1920, and the latter from 13,954 to 14,954.

Agriculture. In common with the other New England States, Vermont showed a considerable falling-off in all phases of agriculture of the decade 1910–20. While the population of the State decreased 1 per cent in the decade

1910–20, the rural population decreased from 77 9 per cent in 1900, 72.2 per cent in 1910, to 68.8 per cent in 1920. The number of farms decreased 11.1 per cent (from 32,709 to 29,075); the acreage in farms, from 4,663,577 to 4,235,811, or 9.2 per cent. The improved land in farms, however, increased from 1,633,965 to 1,691,595 acres, or 3.5 per cent. The percentage of total land area used for agricultural purposes decreased from 79.9 in 1910 to 72.5 in 1920; the percentage of farm land improved increased from 35 to 39.9 per cent. The total value of farm property showed an apparent increase, from $145,399,728 to $222,736,020 or 53.2 per cent; the average value per farm, from $4445 to $7661. In interpreting these values and indeed all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 29,075 farms in 1920, 25,121 were operated by owners, 568 by managers, and 3386 by tenants. The corresponding figures for 1910 were 28,065; 636, and 4008. White farmers in 1920 numbered 29,047, of whom 25,280 were native and 3767 foreign-born. White farmers in 1910 numbered 32,689: 28,968 native, and 3721 foreign-born. Farms free from mortgage in 1920 numbered 12,132; those under mortgage, 12,225. In 1910 farms free from mortgage numbered 14,851; those under mortgage, 13,140. The number of dairy cows in 1920 was 345,643, as compared with 265,483 in 1910, and reflecting the increased attention given to dairying. "Beef cows" numbered 4242, as compared with 27,612; sheep, 62,756, as compared with 84,360. The estimated production of the principal farm crops in 1923 was as follows: corn, 3,157,000 bushels; spring wheat, 184,000; oats, 3,101,000; barley, 310,000; potatoes, 3,031,000: hay, 1,331,000 tons, and apples, 784,000 bushels. Comparative figures for 1913 are: corn, 1,665,000 bushels; oats, 3,081,000; barley, 384,000; potatoes, 3,175,000; and hay, 1,280,000 tons.

Mining. Vermont has no metal mining; the only mineral products of importance are stone, slate, lime, and talc. In the production of stone in 1920, it ranked third, surpassed only by Pennsylvania and Ohio. In 1914 the value of the stone produced was $6,635,477; 1916, $5,729,676. 1918, $5,505,895; 1920, $10,065,759; 1921, $7,322,843. The total value of the mineral products of the State in 1921 was $10,650,213, compared with $15,008,894 in 1920; $11,728,052 in 1919; $9,158,945 in 1918; and $8,665,867 in 1914.

Manufactures. Although Vermont is one of the smallest States in population and area, it has considerable industrial importance. There were in the State in 1920 three cities with more than 10,000 inhabitants. These contained 13.5 per cent of the total population and in 1919 reported 20.6 per cent of the State's manufactured products. There were in the State, in 1909, 1958 manufacturing establishments; in 1914, 1772; and in 1919, 1790. Persons engaged in manufacture numbered 38,580, 37,217, and 38,845; and the capital invested amounted to $73,470,107, $70,846,775, and $134,314,391, in those years. The value of manufactured products was $68,309,824 in 1909; $76,990,974 in 1914; and $168,108,072 in 1919. The large increase in value of products from 1914 to 1919 was largely due to the change in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the period.

Marble and stone work is first among the industries in value of product. This amounted in 1909 to $12,395,000; 1914, $12,605,000; and 1919, $17,426,000 Woolen and worsted goods rank second in this respect, with $4,497,000 in 1909; $4,635,000 in 1914; and $17,426,000 in 1919. The manufacture of paper and wood pulp, in third place, amounted in 1909 to $3,902,000; 1914, $4,776,000; and 1919, $10,863,000. Butter, cheese, and condensed milk were fourth in value: $8,112,000 in 1909; $8,696,000 in 1914; and $18,539,000 in 1919 The most important manufacturing cities are Barre, Burlington, and Rutland.

Education. Educational development in Vermont in the decade 1914–24 was marked by many important legislative and administrative measures. Especial attention was given to the training of teachers High school training or normal courses, established throughout the State in 1912, were opened to high school seniors or graduates, and have graduated nearly 2500 elementary teachers. The Legislature of 1921 enacted a new law under which the State Board of Education established three two-year teacher-training or normal courses, at the University of Vermont and Castleton and Lyndon Institutes. A director of teacher training was employed and special efforts were made to enroll a large number of prospective teachers; over 420 students were entered in all courses in that year, as compared with 280 in the year preceding. In 1922 the standard of admission for all classes was raised to high school graduation. The growth in number of trained teachers had been very encouraging. The Legislature of 1923 changed the law relating to the supervision of schools in several important particulars. The local support of schools increased greatly during the decade. Special efforts were made to improve rural school conditions: to better the quality of supervision, training of teachers, buildings, and the health and physical vigor of the children. Vocational work was carried on under the provisions of the Smith-Hughes Act after 1917. The total enrollment in the public schools in 1913 was 64,825; in 1922 it was 63,439. In the high schools in the latter year there were enrolled 9748 pupils, and the total expenditure for schools was $4,014,747. The percentage of illiteracy in the State decreased from 4.6 in 1910 to 3.8 in 1920; in the native white population, from 0.9 to 0 6 per cent; in the foreign-born white, from 15.4 to 16.4; in the negro, from 13.3 to 7.7.

Finance. For finance, see STATE FINANCES.

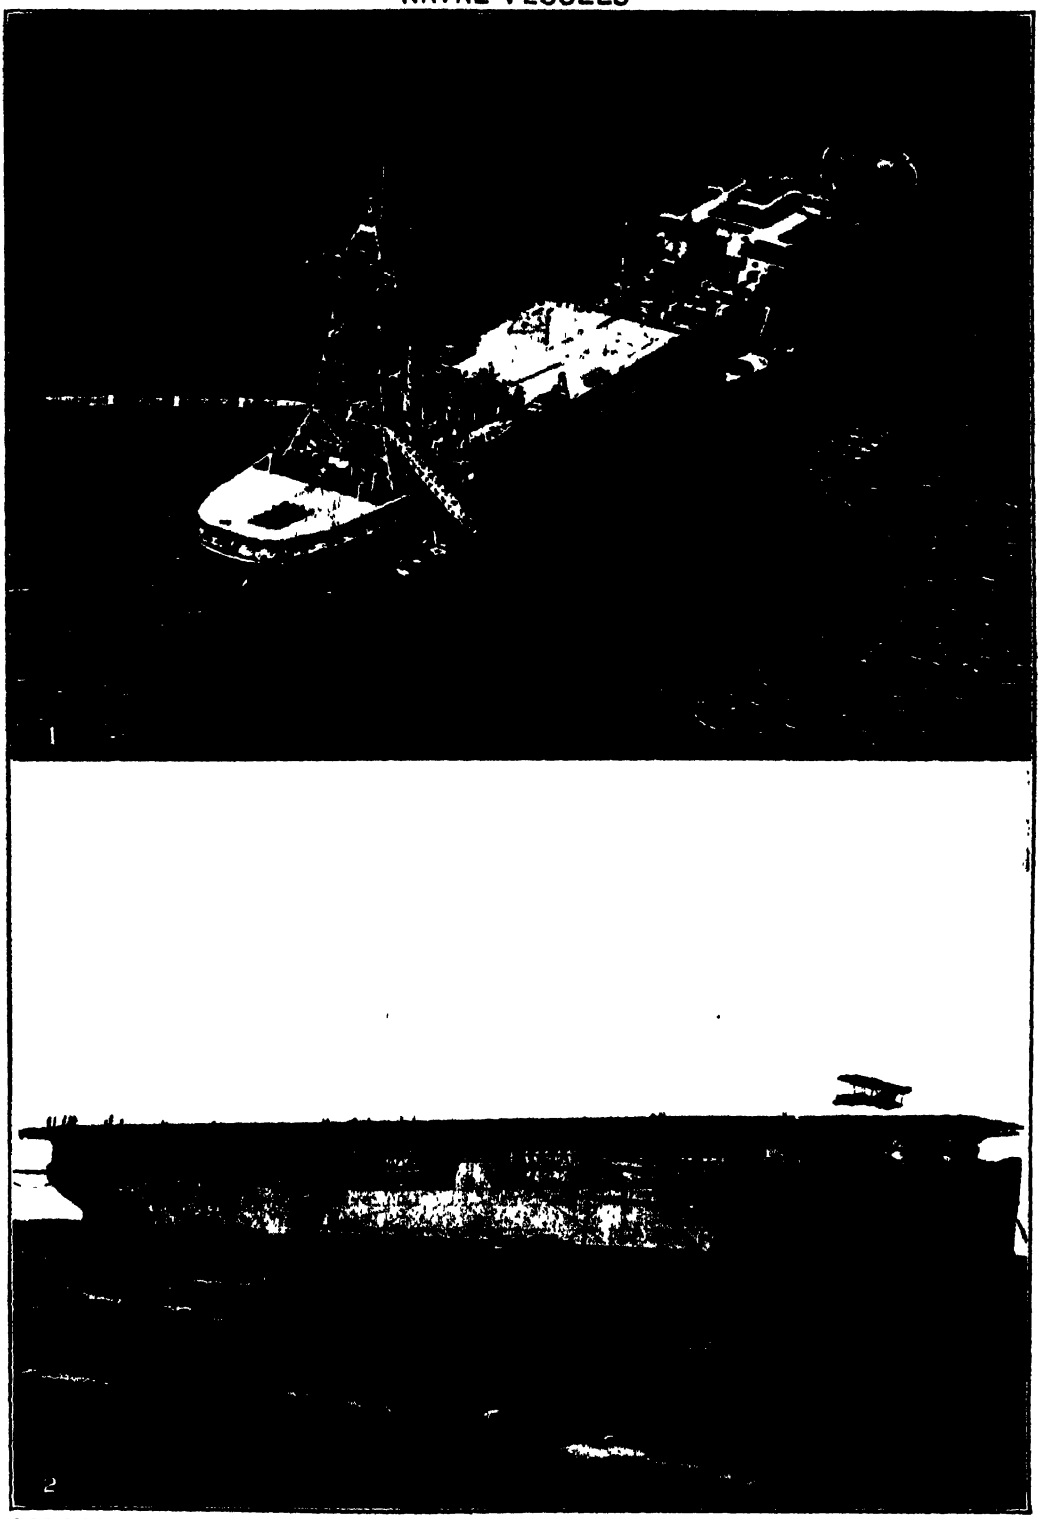
Political and Other Events. The State, always steadily Republican, remained in the political control of that party in the decade 1914–24. In 1914 elections were held for governor, United States Senator, and Representative in Congress. Senator Dillingham was reëlected, and C. W. Gates, Republican candidate, was elected governor. The Republicans also elected a majority of the members of the State Legislature. During this year a commission carried on a survey of the educational system. In accordance with the constitutional amendment adopted by the people, the State courts were reorganized. In 1916 Horace F. Graham, Republican candidate for governor, was elected, to-

gether with the entire State ticket. At this election a prohibition amendment was defeated, while an amendment providing for a direct primary law was adopted Carroll S. Page was reëlected to the United States Senate. By the amended State constitution, the elections formerly held in September were held in November of this year for the first time. In the presidential voting of this year, Charles E Hughes received 40,250 votes; President Wilson, 22,708. By the purchase of an additional tract of 200 acres of land on the east side of Mt. Mansfield, the Mansfield State Forest was increased, in April, 1916, to a total area of 5000 acres. In 1918 a Republican candidate for governor, P. W. Clement, was elected. In the elections of 1920, James Hartness, Republican candidate for governor, was elected, and Senator Dillingham was reelected to the Senate. In the presidential voting of this year, Warren G. Harding received 68,212 votes; James M Cox, 20,919 Redfield Proctor, Republican candidate, was elected governor in 1922, and Frank L. Greene, Republican, was elected to the United States Senate. Senator Page was not a candidate for reelection. Governor Proctor was inaugurated on Jan 4, 1923. In his inaugural address he advocated the abolition of the State Board of Control and the consolidation of the various departments. Senator Dillingham died in 1923, and Porter H. Dale, Representative in Congress, was elected to succeed him on November 6 of that year.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. In 1915 the State Senate passed a measure extending the franchise to women in towns and city elections and for presidential electors. This was defeated in the House. The Legislature voted to submit to the people a prohibition law at the election of 1916. This law, as noted above, was defeated. The Legislature, in 1917, repealed the prohibition act of 1915. Amendments were made to the child labor laws, and an accounting system in the administration of State business was created. Women taxpayers over 21 years of age were permitted to vote in town meetings The Legislature of 1919 legalized absentee voting and passed several acts for the relief of agriculture, including provision for a farm census. A teachers' retiring system was established, and the laws relating to corporations, banks, common carriers, and insurance companies were amended. A measure was passed forbidding the display of the red flag in public except under certain conditions. In 1921 provision was made for planning commissions in cities, towns, and villages. A direct primary law was amended; presidential primary laws were repealed; provision was made for the regulation of workmen's compensation insurance, and it was provided that no person should be debarred from public service on account of sex. A measure was also passed proposing to give women equal suffrage rights with men

VERMONT, UNIVERSITY OF. A coeducational State institution at Burlington, Vt., founded in 1791. The student enrollment increased rapidly from approximately 600 in 1914 to 1157 in the year 1923–24, with 554 in the summer session of 1923, the faculty rose from 100 to 152, and the library from 90,000 to 115,000 volumes The income was correspondingly increased during the period, from $210,000 to $477,155, and the productive funds from $943,423 in 1916 to $1,092,014 in 1923–24. Guy Winfred Bailey, LL.D., succeeded Guy Potter Benton, D.D., LL.D., as president in 1919.

VERSAILLES, PEACE OF. See PEACE CONFERENCE AND TREATIES.



VESSEL, NAVAL. The general effect on naval shipbuilding of the Five-power Pact for the Limitation of Armaments was shown by an increase in number of vessels in those classes of which the total tonnage was unlimited, while the new ships were nearly all of the maximum size permitted. Japan, especially, increased the number of her cruisers, submarines, and destroyers, while Japan, France, and Great Britain were planning to build light cruisers of the maximum size permitted, 10,000 tons. France and Italy were building large flotilla leaders, and both, particularly the former, were adding to their destroyer flotillas. The United States Navy Department asked Congress for additional cruisers and large submarines. In the following notes the types of naval vessels existing in 1924 are briefly described.

Aircraft Carriers. These were designed not only to transport aircraft and aircraft supplies but to furnish a long, broad deck, clear of obstructions, from which airplanes and seaplanes could take off and on which airplanes and seaplanes fitted with landing-gear could make a landing Aircraft tenders of less than 10,000 tons were not classed as carriers by the Five-power Pact, which defined carriers as vessels, not capital ships, of over 10,000 and less than 27,000 tons, the maximum size allowed. The landing and taking-off deck is a light deck 7 to 30 feet above the ordinary upper deck. In some late designs it was somewhat broader than the beam of the vessel, especially at bow and stern, and was absolutely clear of all obstruction to the free passage of planes All masts, derricks, and smoke pipes were carried up at the sides of the vessels, and these were hinged so that they might be folded down to allow airplane wings to extend beyond the edge of the deck when the weather made landing difficult The design of aircraft carriers and tenders in 1924 was still in its infancy, and improvements in many directions were anticipated.

Armored Cruiser. This is a type of war vessel which was obsolete, although many were in existence in 1914. It was designed to meet and destroy the protected cruisers of the enemy In addition to light armor (3 to 8 inches) it carried heavier guns than most protected cruisers and had at least equal speed The battle cruiser is its development in one direction and the large light cruiser in another.

Armored Ship. Any ship carrying armor, but especially one carrying heavy armor, was known as an armored ship. See *Battleship, Battle Cruiser, Armored Cruiser, Monitor,* etc.

Battle Cruiser. The battle cruiser differs from a battleship only in having a much higher speed and much thinner armor. The guns of the main battery are of the same calibre and power but may be fewer in number. Great Britain and Japan are the only countries possessing battle cruisers at present. In accordance with the terms of the Five-power Pact, the United States scrapped six of this type which were under construction, and Germany lost all of hers by the terms of the Treaty of Versailles. While battle cruisers were found exceedingly useful in the War, it is doubtful if any will be built for many years, as the Five-power Naval Pact so limited the number of capital

ships, i.e. battleships and battle cruisers, that very little tonnage could be spared for the purpose.

Battleship. A battleship is a war vessel possessing the greatest offensive and the greatest defensive power, especially the former, which can be given to a ship without rendering inadequate such other necessary attributes as speed, habitability, seaworthiness, etc. Existing battleships may find new enemies which are too strong for them. Their design must then be so changed as to enable them to meet and conquer each new enemy or to render its attack comparatively innocuous. The "wooden walls" of the early nineteenth century put on armor to defend themselves against the increasing power of the gun and the explosive shell. Later types were fitted with numerous water-tight compartments, underwater armor, and the "bulge" or cellular belt, in order to meet the growing menace of the torpedo and the submarine mine; and to meet the torpedo carrier, surface, air, or submarine, a numerous battery of guns of moderate calibre was mounted. Further protection was derived from accompanying vessels, the light cruiser and the destroyer. Battleships, with other surface and submarine vessels, are now called on to meet bombing attack from the air; they must have armored upper decks and strong batteries of anti-aircraft guns and must be defended in the air by accompanying aircraft as they are defended on the water by cruisers and destroyers. The only battleships designed and laid down since the danger of aircraft bombing was fully gaged were the British ships, *Nelson* and *Rodney*. They are of 35,000 tons, the greatest size permitted by the Five-power Pact, and their design will be studied with interest by other powers. (See NAVIES OF THE WORLD, *Great Britain*.) A ship of premier force, capable of taking its place in the line of battle in a fleet action, is known as a capital ship. According to present classification, capital ships are either battleships or battle cruisers. The Five-power Naval Pact defined a capital ship as a vessel, not an aircraft carrier, with a displacement over 10,000 standard tons, or carrying a gun of a calibre in excess of 8 inches. No capital ship of more than 35,000 standard tons may be constructed by one of the signatory powers.

Cruiser. Cruisers are of four types: battle cruisers, armored cruisers, protected cruisers, and light cruisers. Armored cruisers, already described, and protected cruisers are obsolete. the latter derived its name from an armor deck covering the machinery and other vital parts; it was flat amidships but inclined downward at the sides at an angle about 40°, the lower edge reaching the side at 5 to 8 feet below water. Light cruisers are a development of the protected cruiser type. The distinguishing characteristic is very high speed. All have waterline belts of thin armor, 3 to 5 inches thick, and some later designs have part or all of the main battery guns in lightly armored turrets. Under the terms of the Five-power Pact, light cruisers cannot have a displacement in excess of 10,000 tons or guns of a greater calibre than 8 inches. Nearly all the light cruisers designed since the Washington Conference are of 10,000 tons and carry 8-inch guns. Smaller light cruisers will doubtless be built, and if the displacement is less than 7000 tons, most of the guns are likely to be of a calibre below 8 inches. See NAVIES OF THE WORLD, *France* and *Japan*.

Destroyer. Vessels of this type were originally designed to drive off or destroy torpedo boats, hence the name. The small torpedo boat is now obsolete, but the destroyer has succeeded to its functions and in addition has become the greatest protector of large vessels against submarine attack. The latest types of destroyers are from 1200 to 1500 tons with a maximum speed of 34 to 36 knots, 6 torpedo tubes, 4 guns of 4-inch to 5-inch calibre, and 1 or 2 anti-aircraft guns. See NAVIES OF THE WORLD, *France* and *Japan*.

Flotilla Leader. An enlarged destroyer designed to act as flagboat for the commanding officer of a destroyer flotilla. The displacement is from 1500 to 2500 tons. The maximum sea speed is usually slightly greater than that of the destroyers of their flotillas and the battery about 50 per cent more powerful. See NAVIES OF THE WORLD, *France*.

Fuel Ship. Fuel ships were formerly colliers. They are now oil-tankers. In addition to fuel oil they usually carry lubricating oil, cotton waste, and other engineering supplies which are bulky and much used. On account of its long distance from possible enemies, the United States has more naval fuel ships than any other country.

Hospital Ship. A vessel especially fitted for the care and transportation of the sick and wounded is known as a hospital ship. During the War dozens of such ships were needed, and passenger ships were refitted and adapted to the service.

Mine-Layer. Mine-layers are of all sizes and kinds, from small launches to vessels of 5000 tons or more. Large mine-layers carry their main supply on the lower decks or in the holds. The main operating deck is fitted with fore and aft tracks or trolleys on which the mines are placed when hoisted from below and from which they are dropped after being carried to the stern. Just before launching, the safety device is removed or set for service. The mine is still inoperative and will not explode until anchored in place, when the remaining safety fittings are automatically released. During the War a large number of mines were planted by mine-laying submarines which carried them in inclined tubes extending from the deck completely through the hull and bottom. By using submarine mine-layers, mines could be planted where the use of a surface vessel would have been impossible. See MINE, SUBMARINE.

Mine-Sweeper. As mines are usually anchored so as to be held 12 feet or more below the surface, it is highly desirable that mine-sweepers should draw less than 12 feet of water, 3 or 4 feet less if practicable. The great German mine-laying campaign, begun at once on the declaration of war and continued to the Armistice, found the British without mine-sweepers. Fortunately the steam trawlers, used so extensively in the British fisheries, were very efficient sweepers when they were fitted with proper appliances and their officers and crews had received suitable training. They continued to form the greater part of the mine-sweeping fleet; at the end of the War, out of 726 sweepers in service, 412 were trawlers, 110 were destroyers or vessels built as mine-sweepers, 52 were small paddle steamers, 142 were drifters, and 10 were sweepers of the "Dance" type. The danger of sweeping is shown by the fact that

214 sweepers were sunk or very seriously damaged. The boats (about 100 in number) which were specially built for sweeping were of 750 to 800 tons with a draft of 7 feet and had about 16 knots speed; one-third were paddle steamers, and the others had twin screws. These vessels, with the destroyers, formed the fast minesweepers. Sweeping was effected by a wire cable, 500 yards long, whose ends were carried by sweepers. This often exploded the mine or parted its mooring rope; if neither happened, bombs or depth charges were dropped on it. In 1915, the paravane (q.v.) appeared, and this was followed by the later type with cable-cutting jaws. Mines rising to the surface after the cutting of their cables were destroyed by gunfire.

Monitors. The monitors built during the War were shallow-draft armored vessels of moderate speed, used chiefly on the Belgian coast. Most of them had a single turret and carried guns of 6- to 15-inch calibre. Although styled monitors, they all had rather high freeboard; all were fitted with antitorpedo "bulges" on their sides. The Italians used enormous raft-line structures for defense of their army's right flank. Each of these carried a turret mounting heavy guns.

Patrol Boats. Probably 2000 of these were used by the Allies alone. They were of every conceivable type of small craft, yachts, motor boats, old torpedo boats, small destroyers, and boats built for the service. Of the latter were the *P* boats of Great Britain and the Ford boats built in the United States. Both types were about 600 tons. None of the Ford boats was completed in time for active service abroad. The fast motor boats were commonly called submarine chasers.

Q Ships. These were decoy ships. Small and old merchant steamers, sailing vessels, gunboats, etc., were transformed into inoffensive-looking craft apparently employed in coastal traffic or trade with Norway. All sorts of expedients were used to entice submarines within easy range, one of which was for part of the ship's force called the "panic party" to abandon ship ostentatiously when the submarine opened fire. If the latter approached close enough, the guns were uncovered and fire opened. Many *U* boats were sunk by *Q* ships, and many *Q* ships were sunk by their adversaries.

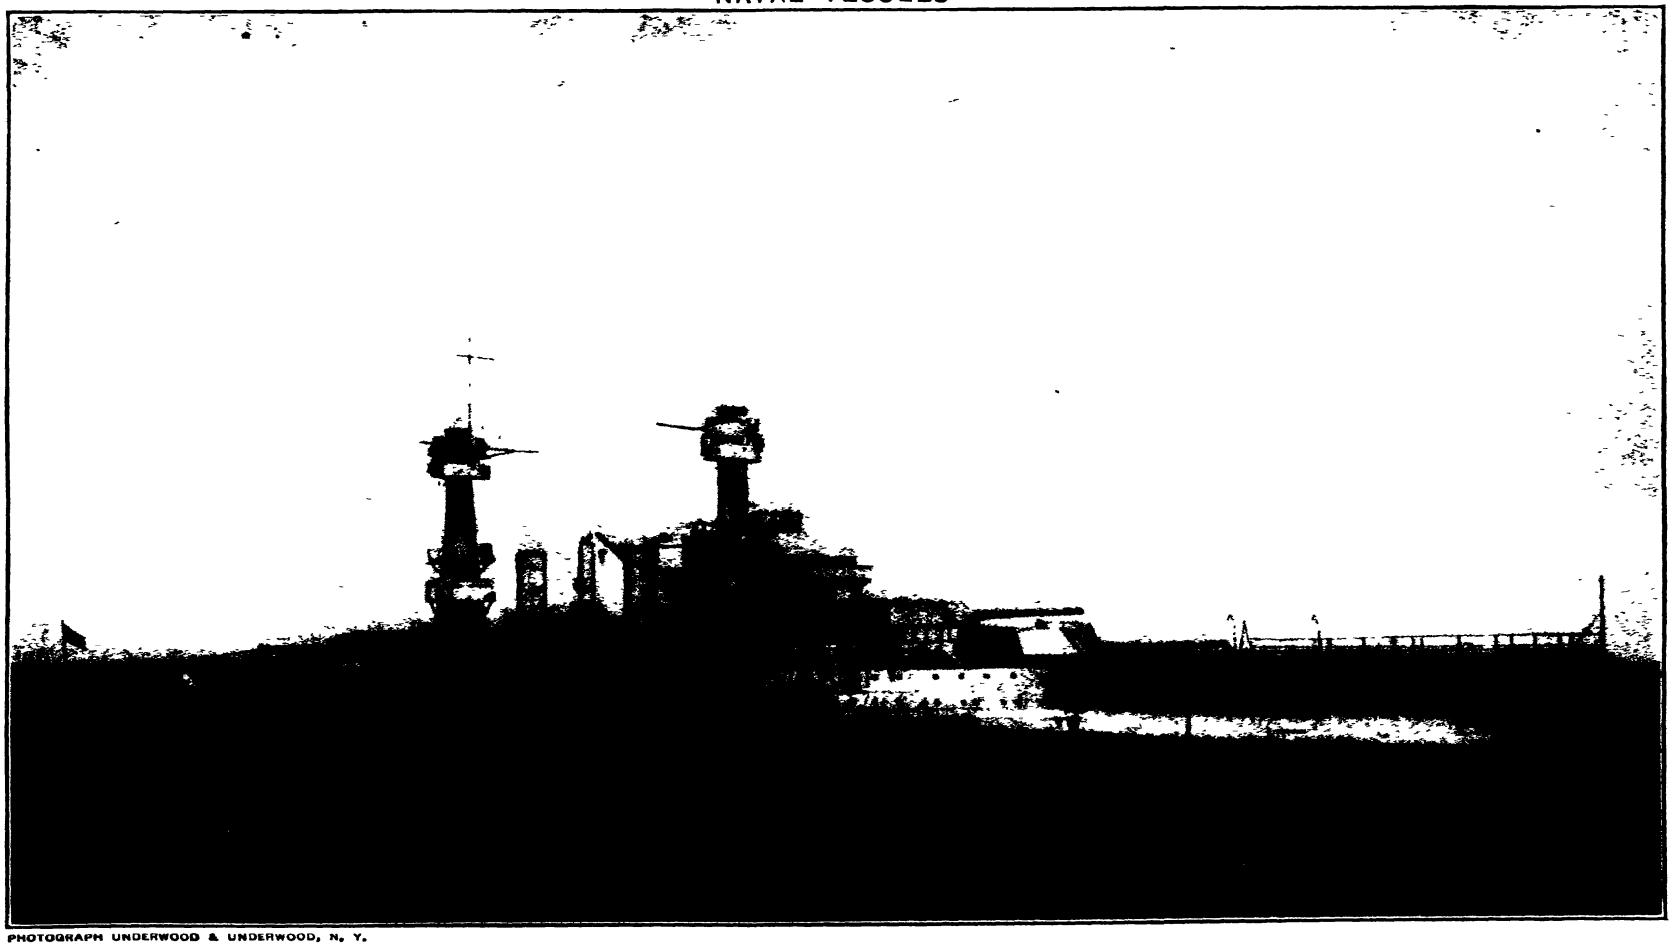
Repair Ships. These are vessels fitted as floating workshops, with all kinds of tools and appliances for the repair of vessels which are far away from their bases As the naval operations of the War were mostly confined to the small North Sea area, few of these were necessary.

Submarines. Vessels of the submarine type were greatly improved during the War. As the Allied naval forces were enormously more powerful than their enemies in regard to surface vessels, it was chiefly by means of submarines that Germany could carry on offensive naval war. The early successes against war vessels and the launching of the campaigns against merchant shipping gave great impetus to German submarine building. The constant use and consequent testing of boats and fittings naturally led to the elimination of defects and the steady development of types and appliances. The German boats were of six classes: the *Deutschland* type, about 1900 tons; cruiser type, about 2700 tons; ocean-going type, of 750 to 1000 tons; coast-defense (*UB*) type, of 250 to 500 tons; mine-layer (*UC*) type, of several sizes; and harbor (*UR*) type. Most of the boats were ocean-going, although the *UB* and *UC* boats were numerous. The British submarines were of six or seven distinct types; the *V* class boats of 460 tons were the smallest built during the War, and the *K* class were the largest. The boats of the classes *E* (800 tons), *H* (500 tons), and *L* (1070 tons) were most numerous; the three boats of the *M* class carried a 12-inch gun each. The *X1*, largest of all submarines, was completed in 1923. It is an experimental boat with a surface displacement of 2780 tons and a submerged displacement of 3500 tons. See NAVIES OF THE WORLD, *Great Britain*.

Submarine Chaser. See *Patrol Boat*, above.

Supply Ships. These vessels are of the cargo type and are fitted as refrigerator ships, general supply ships, and ammunition ships.

Tenders. These are vessels designed to accompany aircraft, destroyers, submarines, etc., and to act as a movable base of supplies, repairs, etc.



Torpedo Boat. A small, fast boat designed to use torpedoes in the attack of large vessels. The torpedo boat and the destroyer are small craft of the same general type. In the 1890's, torpedo boats were of less than 200 tons and very numerous. In 1893, the British navy built the *Havock* and *Hornet* of 240 tons to defend vessels against torpedo boats by attacking the latter. They were therefore styled torpedo-boat destroyers Besides having greater displacement, they carried 6-pounder and 12-pounder guns, while torpedo boats mostly carried 3-pounders. After that time the destroyer gradually grew in size and took on other functions. A few torpedo boats for harbor and smooth water service were built in recent years, but the type is almost obsolete. Old destroyers of less than 1000 tons came to be often classed as torpedo boats.

Transport. A vessel fitted for the transportation of troops, animals, or supplies. No nation possessed many of these; therefore, in times of war, merchant vessels had to be used and altered to adapt them to the service The American (formerly German) passenger steamer *Leviathan*, after fitting as a transport, carried 10,000 officers and men on each trip, in addition to her own complement.

U Boat. A name applied to German submarine boats because they were officially designated by a number preceded by the letter U, as *U125*. The "U" is an abbreviation of *unterseе* ('under water'). See *Submarines*, above.

VETERANS' BUREAU. See AGRICULTURAL EDUCATION; UNITED STATES, *History*.

VETERINARY MEDICINE. A gradual rise in the educational standards of this profession resulted in the requirement of four years' high school education or its equivalent for the class entering in the fall of 1919 and thereafter for the accrediting of a veterinary college and the eligibility of its graduates for United States government service. The requirements for admission to Civil Service examination for the government service were raised so that after the fall of 1917 a fourth year of study at a veterinary college, with an increased number of hours, was required. The conditions attending upon the War brought a great decrease in the number of students enrolled at

UNITED STATES BATTLESHIP "MARYLAND"

Displacement, 32,630 tons Speed, 21 knots Battery, eight 16 inch guns

veterinary colleges. With the close of the War the attendance increased somewhat but later declined, in part because of the increased educational requirements. These conditions resulted in the discontinuance of several colleges, and by 1923 there were but 15 accredited colleges in the United States, with a total student enrollment 738. Among those which gave way to State-supported schools were some of the oldest and best known institutions.

Foot-and-Mouth Disease. This disease of live stock, particularly of cattle and swine, has, because of its epizoötic nature, continued to be one of those most dreaded by the live-stock interests. Three countries, Canada, Australia, and New Zealand, have been entirely free from it for many years; others, including the United States, Great Britain, and Sweden, have been visited by it from time to time and have applied the slaughter stamping-out policy, as the British Dominions mentioned and Norway would if they were to be invaded. They prohibit the entry of live stock or apply drastic quarantine laws against the entry of diseased animals. Other countries where it is present deal with the disease by isolating infected stocks, regulating live-stock movement within their boundaries, and quarantining the animals they import; or they let the disease take its course without interference. Denmark and Holland periodically freed themselves from the disease, but became reinfected from neighboring countries.

Seven outbreaks have taken place in the United States, in 1870, 1880, 1884, 1902, 1908, 1914, and 1924. That of 1914 was by far the most serious, extending into 21 States and the District of Columbia, and necessitating an expenditure of over $5,500,000. The animals slaughtered at this time included 69,742 cattle, 73,574 swine, 8742 sheep, and 99 goats, with a total appraised value of $5,243,138.55. The first three crises were caused by the importation of infected animals, the fourth and fifth by the importation of contaminated cowpox vaccine virus, the sixth by materials contaminated through contact with leather or leather products imported from a foreign country in which the disease occurred, and the last, in California, was supposed to have originated in the feeding of pigs with garbage from steamships arriving from foreign ports In England, where the disease has appeared from time to time, investigations indicate that the infection is introduced by birds migrating from the continent, or is air borne In eradication work in England 70,000 cattle, 25,000 sheep, and 34,000 hogs were slaughtered up to the middle of 1924 in an effort to eradicate it.

Bovine Tuberculosis Eradication. In his annual report for 1916, the United States Secretary of Agriculture called attention to the wide dissemination of tuberculosis of farm animals, pointing out that it may be transmitted to man and is the source of annual losses in the United States estimated at more than $25,000,000. He outlined undertakings leading to its eradication, and asked for an appropriation of $75,000 to inaugurate the work. Congress responded with allotments for its investigation and eradication amounting to $300,000, of which $132,618 was expended. Offices were at once opened at several points in the country, and cooperative work commenced with the view to eradicating the disease from purebred herds and the establishment of accredited herds. In December, 1917, rules and methods were adopted, the plan followed being to test cattle with tuberculin, to eliminate any reacting animal, usually by slaughter, to repeat the test at prescribed intervals, and to list as tuberculosis-free accredited herds all which successfully pass two annual or three semi-annual tests, official certificates being issued to the owners of such herds. In 1918 Congress provided for the payment of one-third of the difference between the appraised and salvage value of the slaughtered animals, no payment by the Federal Government to be more than $25 for a grade animal or more than $50 for any purebred animal. Increased appropriations for the work were made by Congress from year to year until 1922, when the annual appropriation had reached $2,877,600, a large proportion of which was for payment of indemnities. By 1922 the cooperative eradication work had been extended to include all the 48 States and the Territories of Alaska and Hawaii. By that year (1922) the widespread demonstration of the possibility of freeing individual herds from the disease had resulted in an increased confidence in the area clean-up method, 23 States having joined in the movement, and more than 150 counties had completed or were in the process of testing all of their cattle, and nearly 300 more were making arrangements to begin the work. In the year 1923, 50 entire counties eradicated the disease from their herds, raising the total to 81. In that year there were 28,526 herds, containing 615,156 cattle, officially accredited as free from the disease, and there were 400,000 additional herds, containing some 4,500,000 cattle, under supervision, with unfilled applications on file for testing nearly 1,000,000 additional cattle. Similar eradication work was taken up by the Canadian government in 1919.

Rinderpest. This highly contagious and most fatal of the many diseases to which cattle are susceptible, and which has followed on the heels of European wars, appeared in 1920 and spread through Poland, causing a great loss. It was introduced into Belgium in July, 1920, with Brahman cattle from India, and spread into several provinces in Belgium and into northern France before it could be checked. A limited outbreak which occurred at Sao Paulo, Brazil, in March, 1921, the first upon the American continent, was eradicated in about three months.

Texas Fever and Tick Eradication. At the close of the fiscal year on June 30, 1913, the work in progress since 1906 had resulted in the clearing and release from quarantine of some 193,000 square miles of tick-infested territory. In the period following, which closed June 30, 1922, some 330,000 square miles were cleared, making a total of 72 per cent of the entire infested area of 729,852 square miles. The amounts appropriated each year by Congress for this work were increased from $325,000 in 1913 to $660,000 in 1923. Of the 975 counties in 15 States quarantined on July 1, 1906, 695 had been released by the end of 1923, leaving 280 counties under quarantine at that time. Up to the close of 1923, five States had succeeded in eradicating the tick and were out of quarantine. These were California, Kentucky, Missouri, South Carolina, and Tennessee.

Hog Cholera. This affection was estimated by the Federal Government in 1923 to cause a mortality of 4.05 per cent, a large reduction from the preceding year, and to be responsible

for about 80 per cent of all hogs lost by disease. In that year 2,564,837 hogs, valued at $29,393,032, were destroyed by it. Control work was commenced by the Federal Department of Agriculture in 1913 under an appropriation by Congress of $75,000, which was increased in amount from year to year until in 1919 the sum of $641,045 was made available for investigation, demonstration, education, and control work. The work has consisted in the making of surveys, production and use of serum on hogs on infected and exposed farms, sanitation and quarantine work, and organization of farmers to coöperate with the State and Federal authorities. Studies of a disease known as "hog flu," which has appeared and caused large losses in the hog-raising States, have shown that it is not related in any way to hog cholera.

Dourine. The occurrence of this disease of the horse, due to *Trypanosoma equiperdum*, necessitated eradication work by the Federal Department of Agriculture under annual appropriations by Congress, varying from $45,000 to $97,800. The work was pressed with great vigor in some seven States, resulting in its complete eradication from Iowa, Nebraska, North Dakota, and Montana.

Infectious Abortion. The importance of this insidious disease of cattle, horses, swine, and sheep is second only to tuberculosis, causing as it does the loss of the offspring, a decrease in the flow of milk, and possibly permanent sterility. In the cow and sow the disease is caused by a microorganism known as *bacillus* (or *bacterium*) *abortus*, which was first described by B. Bang, a European veterinarian. In the mare it is caused by an organism described by investigators at the Kentucky Experiment Station as *bacillus abortivo-equinus*.

Bacillary White Diarrhea of Chicks. This disease was discovered in 1909 to be due to a bacterium, which was described as *bacterium pullorum*. A rapid advance in the knowledge of the pathology and in control of the disease followed, and accredited white diarrhea-free breeding flocks were established in several States through use of the macroscopic agglutination test.

Malta Fever. The occurrence of this affection of the goat, which is transmissible to man, was first reported to occur in the United States in 1911, when the disease was discovered to be endemic among goats in southwest Texas. During the summer of 1922 an outbreak took place in Phoenix, Ariz., the first to occur in a city in the United States, in which more than 30 human cases were positively diagnosed.

Rabies. A serious wave of rabies infection among wild animals, particularly coyotes, in the northwestern United States, which caused a large loss of live stock, led to an appropriation by Congress for effective control work by the Department of Agriculture.

Epizoötic Lymphangitis. This disease was introduced into France with horses from North Africa during the War, and became one of the most important diseases with which the army veterinarian had to deal.

Botulism and Forage Poisoning. Investigations have shown that *bacillus botulinus* is probably the cause of much of the loss among horses and mules resulting from forage poisoning and also is a cause of limberneck in chickens. See BOTULISM.

Parasitology. Equine piroplasmosis due to *piroplasma equi* was discovered for the first time on the American continent in 1913, it being found to be endemic among native horses in the interior of Panama. *Cysticercus ovis*, the intermediate stage of a dog tapeworm (*tænia ovis*), was shown in 1913 to be the cause of tapeworm cysts, or measles, in mutton, and of common occurrence in sheep in the western United States. Tapeworm cysts in beef carcasses were found in 1914 to be destroyed by an exposure for six hours to a temperature of 12 ° to 15 ° F. Important studies of Manson's eye worm of chickens were reported from Hawaii. Studies of *trichinella spiralis* have shown that the larvæ in pork die after an exposure to a temperature of 131° F. gradually attained, and this is held to be the thermal death point. Refrigeration at a temperature of 5° F. for a period of 20 days was found in 1915 to destroy it in pork. *Habronema muscæ* was discovered in 1913 to be transmitted by the house fly. The kidney worm was found to parasitize nearly 50 per cent of the native dogs on the Island of Luzon. It was shown in 1915 that larvæ of the ox warble enter the host by penetrating the skin. The intermediate or cysticercoid stage of the tapeworm *choanotænia infundibuliformis* of chickens was found in 1916 to occur in the common house fly. It was demonstrated in 1918 that *ascaris lumbricoides* of man and swine has a direct life cycle, and that no intermediate host is required. The embryos hatch out in the alimentary tract, migrate to the lungs and other organs, and cause pneumonia of pigs, the symptoms of which are commonly known as thumps. Carbon tetrachloride was found in 1921 to be highly efficacious in the removal of hookworms from dogs and foxes, ascarids from dogs, and large strongyles from horses.

Necrology. Among the many prominent veterinarians who passed away during the decade 1914–24 were Dr. Daniel E. Salmon, 1914; Dr. A. D. Melvin, 1917; Dr. Alexander F. Liautard, 1918; Dr. James Law, 1921; Dr. E. W. Hoar, 1921; and Dr. John G. Rutherford, 1923.

Journals. In 1915 the *American Veterinary Review*, the oldest veterinary journal published in America, having completed its 47th Volume, became the *Journal of the American Veterinary Medical Association* and was edited by the Secretary of that Association. In 1920 the name of the *American Journal of Veterinary Medicine* was changed to *Veterinary Medicine. The North American Veterinarian* and the *Canadian Veterinary Record*, a quarterly journal, both commenced publication in 1920.

VICTOR EMMANUEL III. See ITALY, *History*.

VICTORIA. A state of the Commonwealth of Australia, in the southeastern part of the continent. Area, 87,884 square miles; population in 1911, 1,315,551; in 1922, 1,570,640; annual average increase, 1.54 per cent. Melbourne, the capital and largest city, including its suburbs, had 795,000 inhabitants in 1921 (591,830 in 1911). In 1921 about three-fifths of the total population was urban. Farming continued to occupy a leading place in the state's activities. Wheat, hay, oats, barley, and potatoes were the most important crops. Pastoral pursuits followed next in importance. The wool output in 1919–20 was 132,847,000 pounds; in 1920–21, 90,250,000, as compared with the 1913–

14 output of 106,833,000 pounds. The total mineral production in 1921 was £1,490,935 as compared with £2,344,744 in 1913. The gold yield steadily dropped; the output was worth only £443,938 in 1921 (£1,847,475 in 1913). In 1920–21, 140,743 employees were engaged in manufacturing (118,744 in 1913). Values for production in 1920–21 were: agricultural, £25,-190,350; pastoral and dairying, £24,816,620; mining, £1,607,645; forest, £1,954,750; miscellaneous, £5,159,996; total, £58,729,361; manufacturing value added £38,330,232. Imports overseas in 1913 were valued at £24,387,073; in 1921–22, £34,616,775. Exports for the same years were £17,835,395 and £34,704,850. Leading exports were gold, wool, cereals, and meats. In 1921, there were 4332 miles of railway open (3747 in 1914). Government accounts showed: revenues for 1912–13 and for 1921–22, £10,287,-285 and £19,287,000; expenditures for the same years, £10,258,081 and £19,247,000. Public works continued to account for the increased public debt. In 1912–13 the debt amounted to £62,776,-724; in 1923 it had increased to £114,568,597. Unlike the other states, Victoria was the seat of Australian Conservatism, her large agricultural population making for a desired stability.

VICTORY LOAN. See UNITED STATES, *History*

VIEBIG, CLARA (1860–). A popular German novelist (see VOL. XXIII). She is the author of *Mutter und Frauen* (1918), *Eine Handvoll Erde* (1920), and *Tochter der Hekuba* (1922)

VIENNA. A province of the Republic of Austria. Area, 107 square miles; population, census of 1923, 1,863,783. See AUSTRIAN REPUBLIC.

VIERNE, LOUIS-VICTOR-JULES ((1870–). A French organist and composer, born at Poitiers. He studied the organ under Franck and Widor at the Paris Conservatoire and graduated in 1894 as winner of the first prize. In 1900 he became organist at Notre Dame in Paris and professor of organ at the Schola Cantorum. Numerous recitals in Paris and tours of France, Switzerland, the Netherlands, England, Spain, and Portugal established his reputation as one of the greatest living masters of the organ. He wrote a symphony and *Suite Bourguignonne* for orchestra; *Praxinoe, Princesse d'Egypte* for soli, female chorus, and orchestra; *Messe Solennelle* for chorus and orchestra; a string quartet, a violin sonata and a 'cello sonata; four organ symphonies and numerous other works for organ; sacred music; piano numbers, and songs.

VILLA, FRANCISCO (PANCHO) (1868–1923). A Mexican revolutionary general, born in the state of Durango, the son of half-breed parents of the peon class. He grew up without education and became a bold and skillful leader of bandits and cattle thieves. He joined the revolutionists against Diaz in 1910 and was captured by General Huerta, but he escaped into Texas. Returning to Mexico, he raised a force of some 35,000 men to assist General Carranza against Huerta. After the defeat of Huerta, Villa quarreled with Carranza, and with the help of Zapata he caused Carranza to flee from Mexico City. In March, 1916, raiding Columbus, N. M., he killed 17 Americans and wounded seven. This was the cause of the American expedition, under General Pershing, to capture Villa "dead or alive." Although overtaken at Guerrere and seriously wounded, Villa made his escape. After that his power declined, and on his promise to settle down as a peaceful citizen, the Federals gave him $2,000,000 for himself and his men, a small farm for each man, and a ranch for himself. His assassination near Parrel in Mexico on July 20, 1923, was attributed to the vengeance of a family some of whose members he had killed.

VILLAMOR, IGNACIO (1863–). A Philipine jurist, born at Banguad, P. I., and educated at San Juan de Letram College at Manila, and in the law department of the University of Santo Tomas. From 1902 to 1906 he was Judge of the Sixth Judicial District of the Philippine Islands and was Attorney General from 1907 to 1913. He served as Secretary of State in 1913–14 and from that year until 1918 was president of the University of the Philippines. In 1920 he was appointed Associate Justice of the Supreme Court of the Philippine Islands. He was the author of several books on law administration in the Philippines.

VILNA DISTRICT. This region, the northern zone of that long corridor which the Poles claimed as their rightful eastern boundary, was the scene of a long dispute between Poland and Lithuania which was not settled until the line finally drawn by the Council of Ambassadors on Mar. 15, 1923, gave the district to Poland. Lying between Grodno on the south and Dvinsk on the north, with the city of Vilna at its centre, and possessing the important Warsaw-Vilna-Dvinsk railway section, the territory has an area of some 6000 square miles and a population put at 1,300,000. Of this, according to the Polish estimates, Poles totaled 25 per cent, although the prewar census had put the figure at only 10 per cent. Besides Lithuanians, there were also to be found here White Russians, Jews, and Germans, and the racial and nationalistic loyalties of this diverse population made the demarcation of a just line practically impossible. At the Peace Conference an attempt was made to cut the Gordian knot with the so-called Curzon line which kept almost rigorously to the confines of Congress Poland and left the Vilna district to Lithuania (accepted by the Supreme Council, December, 1919), but the settlement was deemed inadequate by almost all the Allies, including France and the United States, and was never observed by Poland. The spectre of Bolshevism largely aided the Polish purposes. Posing as the champion of oppressed peoples and as the rampart on the east of western ideals, although completely disregarding the desires of the peoples involved and the vaunted principles of self-determination, Poland pushed into the disputed region and effectively occupied it. Not only was the hostility of the Lithuanians awakened, for they regarded the town of Vilna as the centre of their nationalistic aspirations; but the Russians were equally aroused. Here was the reason for the perplexing events of 1920. Early in 1920 Poles massed against the Red armies, took Dvinsk, entered Vilna on April 20, and then pushed triumphantly across White Russia and captured Kiev on May 8. This was the high water mark of Polish success and was followed by equally notable defeats. With the Poles in full retreat by July the Supreme Council hastened to take action. The Spa Conference suggested that the Poles retire behind the Curzon Line and broached the question of a general conference. But noth-

ing came of it, and the Russian advance continued Meanwhile Lithuanians had reëntered Vilna and on July 12, a Russo-Lithuanian treaty ceded the disputed district to the Lithuanian government. By the end of July the Russians were threatening Warsaw; in another two months so bewildering were the reverses, the Poles had turned about, routed the Russian armies, and passed beyond Grodno, Brest-Litovsk, Kovel, and Luck. Vilna was again theirs The attempt of the League of Nations Council to take a hand in the dispute proved a failure, for while on October 7 a League commission fixed a neutral zone leading to the city of Vilna and along a line running about forty miles north and south (the Suwalki agreement), two days later General Zeligowski, at the head of a Polish irregular force, entered the city and claimed it for Poland. On Oct 12, 1920, by the Treaty of Riga, Russia recognized Polish claims to the whole disputed zone on the east of Poland, including Vilna and stretching so far south as to take in the whole of East Galicia. The Poles took possession of Vilna at once and held a plebiscite in the city in January, 1922; this, proving favorable to Poland, was followed by the seating of the Vilna delegates in the Polish parliament. All this, of course, was against the bitter but futile protests of Lithuania. As late as February, 1923, there was fighting between the Lithuanian and Polish troops for the possession of the southern portion of the Suwalki zone of the west, lying between Grodno and Vilna, and again the Poles were triumphant. Thus the Poles had met with success in almost all their purposes in the east, and only a legal sanction was necessary to make their occupation final. This came on Mar. 15, 1923, when the eastern boundary fixed by the Council of Ambassadors was made to follow the Treaty of Riga line on the east and to include the whole Vilna district on the northeast. Lithuania refused to accept the ruling and every indication pointed to the continuance of a Lithuanian irredentism in the district.

Kresy. By this name the Poles designate the portion of the eastern corridor lying between Vilna and East Galicia and east of the Curzon Line. Claimed by both Poland and Russia, it, too, was finally ceded to Poland in March, 1923. Made up of part of White Russia and the Ukraine, with an area of some 43,000 square miles, this border region seated a population of some 3,700,000, of whom according to the Poles, 32 per cent were Polish, while the pre-war Russian census showed a Polish population of only 6 per cent. This region was affected by all the happenings that influenced the fortunes of Vilna It lay beyond the Curzon line; it was won, lost, and won again by the Poles in their operations against the Red armies in 1920; it was yielded up to Poland by Russia as the result of the Riga Treaty; and finally in March, 1923, it was included in the Polish state by the decision of the Council of Ambassadors. With their customary despatch and with a complete disregard of the desires of the large racial minority living here, Polish officials proceeded to nationalize the annexed territory The Polish language was substituted for the Russian; Polish peasants were colonized; the administrative centres, in order to break the alien influence, were moved from such large cities as Grodno to cities of secondary importance like Bialystok and Novogrodek, the latter without even a railway connection. But the "Kresy" looked to Moscow as Vilna did to Kovno, and in spite of the fact that Soviet Russia, after October, 1920, made no attempt to regain these lost provinces, there was every reason for believing that the settlement had too many artificial elements in it to be lasting. The danger zones in the Polish system included almost half its 1924 area, i.e. Vilna, "Kresy," East Galicia (q.v.), and Upper Silesia (q.v.), where there were large irredentist groups in whom Germany and Russia could not help being interested; and that such an arrangement presaged grave consequences for the peace of Europe only an optimist could deny

VINCENT, Edgar First Baron D'Abernon. See Abernon, Edgar Vincent D'.

VINOGRADOFF, Sir Paul (1854–1925). An English jurist and educator (see Vol. XXIII). He lectured at the University of Calcutta in 1913–14 and at the University of Leyden in 1921. From 1914 to 1917 he was editor of the Russian section of the *Social and Economic History of the War* published by the Carnegie Endowment Fund Other later books include *Outlines of Historical Jurisprudence* (vol. i, 1920; vol. ii, 1922).

VIRGINIA. Virginia is the thirty-third State in size (42,627 square miles), and the twentieth in population; capital, Richmond The population increased from 2,061,612 in 1910 to 2,309,187 in 1920, a gain of 12 per cent. The white population increased from 1,389,809 to 1,617,909; negro, from 671,096 to 690,017; native white, from 1,363,181 to 1,587,124; and foreign-born white, from 26,628 to 30,785. Both urban and rural populations rose during the decade, the former from 476,529 to 673,984 and the latter from 1,585,083 to 1,635,203. The growth of the principal cities was as follows: Richmond (q.v.), 1910, 127,628; 1920, 171,667; Norfolk (q.v.), 67,452 to 115,777; Portsmouth, 33,190 to 54,387; Roanoke, 34,874 to 50,842.

Agriculture. Although Virginia is one of the minor cotton-producing States, a comparatively large area is devoted to its cultivation, and the production of cotton did not suffer so much during the decade 1914–24 from the ravages of the boll weevil and other destructive insects as in the States farther south The weevil did not reach the State until 1922 and on account of the cold of the winters was not expected to be a serious menace. A comparison of the acreage and production for several years indicates that the production of cotton was, with the exception of one or two years, comparatively stable. In 1913 the acreage was 47,000 and the production 23,000 bales; in 1915, 34,000 and 16,000; 1918, 44,000 and 25,000; 1920, 42,000 and 22,000; 1922, 53,000 and 25,000. The estimated production for 1923 was 27,000 bales

While the population of the State increased 12 per cent in the decade 1910–20, the number of farms increased only 1.2 per cent (from 184,018 to 186,242). The total acreage in farms, moreover, decreased from 19,495,636 to 18,561,112, or 4.8 per cent; and the improved land in farms from 9,870,058 to 9,460,492 acres or 4.1 per cent. The total value of farm property apparently increased 91.4 per cent in the decade, from $625,065,383 to $1,196,555,772; the average value per farm, from $3397 to $6425. In interpreting these values and indeed all comparative values in the decade 1914–24, the in-

flation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. The percentage of the total area in farms decreased from 75.7 in 1910 to 72 in 1920, while the percentage of improved land in farms decreased from 38.3 to 36.7 per cent. Of the 1910 total of 186,242 farms, 136,363 were operated by owners, 2134 by managers, and 47,745 by tenants. The comparative figures for 1910 were 133,664, 1625, and 48,729. In 1920 there were 138,456 white and 47,786 colored farmers; in 1910, 135,904 white and 48,114 colored. Farms free from mortgage in 1920 numbered 98,470; those under mortgage, 24,331. In 1910 there were 111,474 farms free from mortgage, and 21,182 mortgaged. The total number of cattle in 1920 was 909,795, of which 509,305 were dairy cattle. In 1910 cattle numbered 859,067, and dairy cattle 356,284 Sheep, in 1920, numbered 342,367, compared with 804,873 in 1910; hogs, 941,308, compared with 797,635. The estimated production of the principal farm products in 1923 was as follows: corn, 52,695,000 bushels; wheat, 11,145,000; oats, 3,370,000; barley, 227,000; potatoes, 12,938,000; sweet potatoes, 5,236,000; tobacco, 123,363,000 pounds, and hay, 791,000 tons. For cotton, see above. Comparative figures for 1913 are: corn, 51,480,000 bushels; wheat, 10,608,000; oats, 4,192,000; barley, 286,000; potatoes, 9,870,000; hay, 952,000 tons; and tobacco, 154,000,000 pounds.

Mining. The chief mineral products of the State are coal, clay products, cement, and stone. Of these, coal is by far the most important. The progress of coal mining in the decade is indicated by the following production figures: 1914, 7,959,535 net tons; 1915, 8,122,596; 1916, 9,707,474; 1917, 10,087,091; 1918, 10,289,808; 1920, 11,378,606; 1921, 7,492,378; and 1922, 10,491,174. The value of the clay products averaged between $2,000,000 and $3,000,000 annually. The State also produces iron ore, sand and gravel, and gypsum. The total value of mineral products in 1921 was $32,810,842, compared with $69,161,247 in 1920; $36,799,407 in 1919; $37,639,368 in 1918; and $16,400,347 in 1914.

Manufactures. Virginia showed considerable increase in manufacturing after 1909. In 1920 there were 11 cities having more than 10,000 inhabitants. These formed 23.8 per cent of the total population and in 1919 produced 52.2 per cent of the value of the State's manufactured products. In 1909 there were in the State 5685 manufacturing establishments; in 1914, 5508; and in 1919, 5603. Persons engaged in manufacture numbered 120,797, 118,109, and 139,178; and the capital invested amounted to $216,392,388, $261,561,288, and $463,644,498, in those years The value of the manufactured product amounted to $219,793,868 in 1909; $264,039,041 in 1914; and $643,511,621 in 1919. The increase in value of products in 1914–19 was largely due to the change in industrial conditions brought about by the War and cannot properly be used to measure the growth of manufactures during the period; but the increase in number of wage earners clearly indicates a decided growth in the manufacturing activities of the State. The first industry in point of value of products is the manufacture of tobacco. This, in 1909, amounted in value to $25,385,000; in 1914, to $30,096,000, and in 1919, to $78,350,000 Lumber and timber products rank second in point of value, with $35,855,000 in 1909; $32,449,000 in 1914; and $56,394,000 in 1919. The chief manufacturing city was Richmond. In 1909 there were here 380 manufacturing establishments, with a product valued at $47,358,000; in 1914, 466 with $62,491,000; and in 1919, 550 with $156,724,000.

Education. The progress of education in Virginia was marked by important steps in the decade 1914–24. The Legislature, especially in the latter part of that period, passed several important laws which greatly assisted the administration of the school system. The Assembly of 1922 enacted three important educational bills, covering compulsory education, the county unit system of school administration, and the adoption and distribution of textbooks. The compulsory education law was greatly superior to that previously in force. The county unit law became effective in September, 1922. Negro education is a problem in Virginia as in other southern States, but in this phase of education also there was progress. Twenty-three county training schools were being maintained for negroes, and from the Julius Rosenwald fund, nearly 160 public schools had been built for colored people. Vocational work under the Smith-Hughes Law was established in 1917–18, including vocational agriculture, vocational home economics, and trade and industrial education In 1922–23, 53 of the 100 counties of the State were provided with training in vocational agriculture The work in trade and industrial education, which was meeting with considerable success, was intended to serve pupils enrolled in public schools, those already engaged in industry, who could give a part of their time to industrial class work, and others. Notable progress was also made in the programme of health and physical education. Approximately 75 per cent of the pupils in the schools received physical inspection under the general direction of the State Board of Health and the State Board of Education in 1922–23. The total school enrollment in the State increased from 474,210 in 1915 to 562,998 in 1923. The city enrollment in the latter year was 118,638; county, 440,360; total in white schools, 390,458; and total in schools for negroes, 155,577. The total disbursement for school purposes in 1923 was $23,634,398. The percentage of illiteracy in the State decreased from 17 9 in 1910 to 13 5 in 1920· in the native white population, from 9.4 to 7.1 per cent; in the foreign-born white, from 9.3 to 7.5; and in the negro, from 37.1 to 29.3.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The Democratic party continued in the control of the State in the decade 1914–24. State elections in Virginia are held in the odd years, quadrennially. Elections were held in 1914 for Representatives in Congress. The Democrats were successful in all districts except one. At this election a measure providing for State-wide prohibition was adopted by the people. In 1916 elections were held for United States Senator, and Senator Claude A. Swanson was reëlected. In the presidential voting in this year, President Wilson received 102,824 votes; Charles E. Hughes, 49,256. On Mar. 1, 1916, the prohibition law went into effect. A new law also went into effect providing for the removal of public officials for failure to enforce any statute. In

1917 the Democratic candidate for governor, Westmoreland Davis, was elected. Senator Martin was reelected in 1918. He died in 1920, and Carter Glass, Secretary of the Treasury, was appointed to fill out his unexpired term. In the presidential voting of this year, J. M Cox received 141,670 votes; W G. Harding, 87,458. The Democratic candidate for governor, E. Lee Trinkle, was elected in 1921, and in 1922 Senator Swanson was reëlected. At this election the voters defeated a proposal for a constitutional convention. In 1923 the battlefield of Yorktown was selected by the Secretary of War as a proposed national park. The government already owned 10 acres on this site, and it was proposed to purchase 1180 acres more Within the limits of the proposed park are the old American and British breastworks, still largely intact.

Legislation. The most important measures enacted in the decade 1914–24 are noted below. The House of Delegates, on Mar. 11, 1914, rejected the woman suffrage amendment. The Legislature of 1918 passed measures regulating the practice of women at law. A general prohibition law was passed, and a commission was appointed to study the educational system of the State. Laws regulating the labor of women and children were amended, and an elaborate measure was enacted relating to safety in industry. A new workmen's compensation law was also passed. In 1919 the Legislature rejected the woman suffrage amendment. At this session the Legislature passed a law providing for a budget In 1920 the Legislature established an agricultural experiment station, appointed a commission to study the condition of the blind, regulated the fire insurance business, and extended the powers of building and loan associations. In 1922 the Legislature amended the laws relating to labor and the workmen's compensation law and passed a motion picture censorship bill. In 1923 a special session of the Legislature was held This passed a series of acts relating to highways and motor vehicles and enacted a measure designed to prevent the operation of "rings" among bidders for State work. During the regular session of 1924, the Legislature passed an act regulating more rigidly the operations of the Virginia Pilot Association, which, up to that time, had been a powerful political factor in the State Numerous drastic provisions were also added to the State prohibition laws.

VIRGINIA, UNIVERSITY OF. An institution at Charlottesville, Va., founded in 1819. The student enrollment, including the summer quarter, for the scholastic year 1913–14, was 2138, as compared with 4559 in 1923–24. The faculty in 1914 comprised 51 professors, 22 instructors, and 30 assistants, a total of 103; in 1924, 91 professors, 40 instructors, and 77 assistants, a total of 208. During this decade the institution received from Paul Goodloe McIntire $200,000 to found a School of Commerce and Business Administration; $150,000 to found a School of Art, now known as the McIntire School of Fine Arts; $70,000 for an amphitheatre and outdoor organ; $50,000, to which other donors have added $115,000, for two wings to the hospital; and from John B. Cobb $118,000 for the Cobb Chemical Building and Laboratory, besides $300,000 for a new gymnasium from students, alumni, and others, and many gifts of smaller sums for scholarships, etc. The library contained 123,000 volumes in 1924. President, Edwin Anderson Alderman.

VIRGIN ISLANDS. An American dependency in the West Indies, consisting chiefly of the islands of St. Thomas, St. Croix, and St. John's Total area, 132 square miles. The United States took possession of these islands, following their purchase from Denmark for the sum of $25,000,000, on Mar. 31, 1917. At that time the population was approximately 27,000 In 1920 the population showed a decrease of some 1000. Of the total population, 80 per cent were negroes, 13 per cent of mixed race, and 7 per cent whites.

Production. Agriculture was formerly the chief industry of the islands, but since the abolition of slavery the laboring-classes showed a tendency to concentrate about the ports. Some 70,000 acres were devoted to agriculture in 1917 In 1920 there were 430 farms, 102 worked by white farmers and 270 by negroes. Sugar cane is the chief product. In 1917, about 9000 acres were devoted to sugar cane; its product was valued at about $440,000. The total value of farm products in that year amounted to $3,706,911. Other products were vegetables, cotton, fruits, and nuts. The value of all crops in 1917 was $522,606.

Commerce. The value of the Virgin Islands lies in their geographic location and their exceptional harbor facilities rather than in their commercial and agricultural interests. The chief exports are sugar, hides, skins, and cabinet woods. Prior to the enactment of the United States prohibition amendment, there was a large export of rum, and the cutting off of this source of revenue had a very serious effect on the economic condition of the islands. Exports to the United States in 1917 were valued at $1,259,607. In 1922–23 they had fallen to $743,463 Imports from the United States in 1917 amounted to $1,416,342 and in 1922–23 to $1,564,342.

Education. Education was compulsory The total enrollment in the public schools of the islands was 3201 on June 30, 1923. Junior high schools were established and night schools opened in several of the larger towns. Manual training schools also were established.

Transportation and Communication. Regular transportation was maintained between the islands and New York City. Each municipality had a post office, cable office, and telephone system. The naval station at St. Thomas had a powerful radio station. There was also a naval station in the island of St. Croix.

History. The islands were administered by the United States Navy Department, the governors for the period being Rear-Adml. James H. Oliver (1917–19), Rear-Adml. Joseph W Oman (1919–21), Capt. Sumner E. W. Kittelle (1921–23), Capt. H H. Hough (1923), Capt. Philip Williams (1923–). By the Organic Act of Mar. 3, 1917, the United States Congress vested all military, civil, and judicial powers in a governor appointed by the President and continued in force the Danish code under which the islands had been governed. Citizenship was held by males over 25 possessing an annual income of 1500 francs. Criticism was frequent in the United States on the despotic character of the American administration. It was charged that Americans, unlike their Danish predecessors, refused to fraternize with the negroes, that free speech was being suppressed and local lead-

ers proceeded against summarily, and that the continuance of the Danish code deprived the great majority of the exercise of the ballot. On another ground, there were complaints in many quarters that the American officials were doing nothing to aid the economic development of the islands.

VITAL STATISTICS. The movement of population during the decade 1914–24 was temporarily perturbed by the years of war and pestilence, 1914–19. After this period the birth and death rates became stabilized, but further confusion resulted from the formation of new states, and no figures are available for Russia, the Balkans, Greece, and some of the new national states of Europe. Few figures can be furnished for Asia, Africa, South America, or Latin North America.

Deaths. The gross death rate is available for the regions to be enumerated, but the figures possess very limited value; for infant mortality, as well as deaths by ages and sex, are not separately given, and there are no means for determining the reasons for the great disparities of mortality in different countries. Under a similar civilization, the death rate of Chile is nearly double that of Argentina; the mortality of Scotland is sensibly higher than that of England and Wales. The death rate is notably higher in France than in Germany and Great Britain and much higher in Spain than in Italy Complete figures for any of the more recent years cannot be supplied, for in some of the countries no data have been compiled since 1920; others cover 1921, and a few extend to 1922. In most of the statistics the population on which the death rate per 1000 is computed is only an estimate. Hence the percentages are only approximations. The lowest figures are supplied by New Zealand, with a death rate between 8 and 9 per 1000 inhabitants, and Australia with 9.1; at the other extreme stands Chile with more than 34. Other very low figures are furnished by Holland and Denmark, with 11 each. England and Wales show slightly below 13, which is about the rate in Belgium, while Switzerland has between 13 and 14, and the death rate for the whole of Canada was 13.74 for the year 1921. Germany shows a mortality of 15, which agrees with that of Scotland and Finland. The figure for Italy is 16; that for France, slightly below 18. Austria and Argentina have about 18.

Death rates above 20 are shown by Spain with 21 and Japan with 23. Figures available for tropical countries are not numerous. Dutch Guiana gives 22, while Costa Rica has about 20 and Ceylon 31. Further figures could be supplied, but as already stated, the lessons of these crude statistics are not obvious. They may be contrasted profitably, however, with death rates in the United States for 1922. The general mortality of the registration area of the United States for that year was 11.8. Idaho has the lowest rate (8.1) and is therefore comparable with New Zealand, while the States with highest death rate were Maine and Vermont, with 14.7 each. These crude figures do not represent the actual mortality, and if the deaths are adjusted to allow for sex, age, etc. it would be found that Nebraska with 9.1 is the healthiest State, while Colorado with 13.5 has the highest death rate.

Age and Sex. The United States issues two sets of mortality figures, one termed "crude" and the other "adjusted" by reason of its corrections for age and sex groups. Separate figures for sex and age, aside from infant mortality, are not supplied. In other countries only crude figures appear to be given, with the occasional exception of infant mortality.

Infant Mortality. Figures under this head are difficult to obtain. In Great Britain it was announced in 1923 that the infant mortality had dropped from the 1903 figure of 133 per 1000 to 77 per 1000. In the United States the death rate during the first year of life was in 1924 about 76 for the entire registration area; it varies from 127 in South Carolina (1921) to 50 in Oregon cities (1921). Even this low figure has been surpassed in New Zealand, where a minimum of 45 deaths per 1000 was attained in 1919. These figures of infant mortality vary, some reports including and others excluding stillbirths, but in general the figures apply only to live births. The superior figures in certain countries are due in part to natural conditions but very largely to intensive child-welfare campaigns.

Births. Figures on births and excess of births over deaths are found in the same frequency as death reports. A few of these follow. Argentina in 1920 had 276,000 births, an excess of nearly 130,000 over the deaths; the rate was about 32 per 1000. In Australia the surplus of births over deaths in 1921 was 82,117; the birth rate, about 33. The surplus in Austria was 21,000; the birth rate, about 21. In the whole of Canada the surplus for 1921 was about 135,000; the rate, between 29 and 30. In France in the same year the excess of births was 117,000, and the birth rate agreed with that of Austria. By contrast, the surplus of births in Germany for the same year was nearly 700,000; the rate was over 26. In Great Britain the surplus in England and Wales for 1922 was 294,000; in Scotland, 43,000; and in Ireland (1921), 27,000. The birth rate for England and Wales was over 25; that of Scotland, 23; and that of Ireland, over 24. In Italy the surplus was over 461,000; the birth rate, about 28. The surplus and birth rate signify little in the absence of data covering infant mortality, which commonly varies directly with the birth rate. The general birth rate of the United States for 1922 was 22.7, which represented quite a falling off from the preceding year, when it was 24.3. The surplus of births over deaths was 720,000. The highest birth rate was in Wyoming cities with 34 4; lowest, in rural Washington (17.3). Japan has a high birth rate, about 35, but its surplus was not correspondingly large in comparison with Germany; the latter had almost as large an excess, with a much lower birth rate

Marriages. This subject is of some special interest in connection with the decimation of the peoples of the warring countries. In France the anticipated increase in the marriage rate reached its high mark in 1920 with 623,869 and fell in the next year to 456,221. The number of German marriages in 1921 was 729,809; figures for the years immediately preceding are not available. In England and Wales the number of marriages for 1922 was 299,630. In 1920 it had been 379,568, and in 1919 the figure was 369,007. The figures of the Department of Commerce of the United States do not appear to take cognizance of the number or rate of marriages per annum but bulletins which cover

the married state are occasionally released and one of these issued in 1922 gave the status of the married and single for 1920. Of 36,900,663 males over 15 years of age, 21,849,266 were married, and 1,758,308 were widowers, while 235,285 were divorced. Of 35,177,515 females over the age of 15, 21,318,933 were married at the time; 3,917,625 were widows, and 273,304 were divorced. The number of single males over 15 was 12,967,565; single females, 9,616,902. The number on whom information could not be obtained concerning the married state was 110,240 males and 50,751 females. The largest proportion of married men was found in Mississippi and Arkansas and the smallest in Nevada, percentages varying between 62 8 and 45.9.

Birth Control. Does birth control tend to lower the number of births and birth rate? The only evidence thus far is supplied by Holland and gives a negative answer. In 1921 the excess of births over deaths was 112,544 and the birth rate 28, which is high for a state with high civilization; in some years this rate was even higher. In 1916 it was 31. See BIRTH CONTROL

VITAMINE, OR VITAMINES Since their discovery in 1909, the vitamines have never been isolated. Because of their occurrence in yeast, a substance long reputed to have medicinal properties, vitamines, or rather yeast, was urged vigorously by yeast manufacturers as a universal panacea This manufactured craze apparently ran its course and subsided. The subject of vitamine remained of absorbing interest, and many monographs have appeared on the subject. Originally, as discussed under FOOD AND NUTRITION, there were three of these bodies, absence of any one of which from the diet was known to entail the development of a so-called deficiency disease If the water-soluble or B vitamine is lacking, the disease beri-beri develops, and if the fat-soluble or A vitamine is deficient, a peculiar affection of the eyes results. Both these affections are little known in America and Europe If on the other hand the C vitamine is missing, scurvy develops; in civilized, temperate-zone countries it is prone to attack young children. It is, however, easily prevented and cured by the use of fresh fruits, fruit juices, and tomatoes. It was learned during the War that famine conditions do not necessarily lead to the development of these deficiency diseases, because the cheapest and commonest foods usually contain sufficient vitamine; the only real danger lies in the use of a monotonous diet, such as peeled rice or preserved foods. Deprivation of vitamine in the growing child would in theory mean death or stunting, but as a matter of fact the only deficiency disease actually and constantly encountered is infantile scurvy The original number of vitamines has recently been increased by a fourth, the absence of which from the diet may perhaps, in conjunction with other factors, be a cause of rickets. (See RICKETS.) In May, 1924, Prof. Walter H. Eddy of Columbia University announced the isolation in pure state of Vitamine D, a study of which reveals its identity with a substance known as Wildier's Bios, a sort of forerunner of the vitamines, which dropped out of sight after their discovery. See also DIET; SCURVY; SECRETIONS, INTERNAL.

VITTADINI, FRANCO (1884–). An Italian composer, born at Pavia. Having received his first musical instruction in his native city and in Lodi, he entered the Conservatorio Giuseppe Verdi in Milan, where his teachers were Andreoli (piano), Balli (harmony), and Ferroni (composition). He became more widely known through his opera, *Anima Allegra* (Rome, 1921; New York, 1923), the text of which Illica had originally written for Puccini. Two other operas, *Marc di Tiberiade* and *Sirenetta*, had not yet been produced in 1924. He also wrote a considerable amount of church music

VIVIANI, RENÉ (1863–1925). A French statesman (see VOL. XXIII). He was prime minister of France when the War broke out, and resigned in October, 1915, afterward becoming minister of justice in Briand's cabinet and later holding the same office in the cabinet headed by Ribot He visited the United States twice, first in 1917 as the head of the French Commission sent for the purpose of influencing the American people to help in the War, and the second time in 1921, when it was reported that he had come to advise the United States to join the League of Nations, but he stated that it was merely a "courtesy visit." In 1920 he was appointed French delegate to the League of Nations.

VOCATIONAL EDUCATION. See EDUCATION IN THE UNITED STATES.

VOCATIONAL REHABILITATION. See AGRICULTURAL EDUCATION

VOLK, DOUGLAS (1858–). An American painter (see VOL. XXIII). He painted several important war portraits, including those of General Pershing, King Albert, and Lloyd George, in the National Gallery, Washington (1921). In 1915-16 he received the Beck Gold Medal of the Pennsylvania Academy and a gold medal from the National Arts Club, New York City. His powerful portrait of Lincoln (1923) was acquired by the Albright Art Gallery, Buffalo, N. Y.

VOLKELT, JOHANNES IMMANUEL (1848–). A German philosophical writer (see VOL. XXIII). He published, after 1914, *Gewisshert und Wahrheit* (1918), *Religion und Schule* (1918); and *Das Aesthetische Bewusstsein* (1920).

VOLSTEAD, ANDREW J. (1860–). An American public official, born in Goodhue County, Minn., and educated at St. Olaf's College and Decorah Institute In 1884 he was admitted to the bar and practiced law at Granite Falls, Minn He was for 14 years county attorney of Yellow Medicine County. In 1903 he was elected to Congress and was successively re-elected until 1922, when he was defeated. He was the author of the Volstead Act for the enforcement of the Federal prohibition amendment. See PROHIBITION.

VOLUNTEERS OF AMERICA. A Christian, philanthropic, benevolent organization, under the presidency of Gen. Ballington Booth. It was incorporated in 1896 While its government is modeled on the United States Army, yet its rules and regulations are made by the Grand Field Council composed of officers of and above the rank of major. The Volunteers of America is established in more than 100 of the principal centres of America. Some idea of the scope and polity of the Volunteers may be gleaned from the report of its 1920–24 work. Volunteer philanthropic homes and institutions provided 801,511 free lodgings and 1,361,619

lodgings paid for in cash and by work, a total of 2,163,130 lodgings. During this term 1,105,986 meals were paid for in cash and by employment, and 2,416,848 were given free, a total of 3,522,834 meals. Assistance was given 208,529 persons and families in desperate circumstances, apart from the aid just mentioned. Employment was found for nearly 90,000 persons, many of whom were practically stranded; 386,610 garments and pairs of shoes were provided for the very poor and needy. In addition, 196,553 families were assisted in connection with the Volunteer missions. The Fresh Air Camps received 160,768 mothers and children, and many hundreds of children remained in these health-giving surroundings for two or three weeks at a time. There was a marked increase during the holiday and Christmas seasons in the work among the destitute; hundreds of thousands of special dinners and provisions were sent into the homes of families who would otherwise have spent cheerless holiday seasons.

The attendance at the Volunteer services reached 4,308,211; at outdoor services it numbered 9,797,562, making a total congregation of 14,105,773. During this period it is estimated that over 10,000 prisoners returning to freedom from the State prisons were helped to a new chance in life Over 100,000 men within the walls of State prisons have become members of the Volunteer Prison League since its inauguration by Mrs Ballington Booth. During the War, 326 of the commanding officers of the Volunteers, together with their associate workers, were sent to the front. These volunteered in different capacities, some with the Red Cross, some with the Young Men's Christian Association, some as chaplains, and others for work in canteens. A number of the most efficient surgeons from the Volunteer Hospital in New York saw service overseas, and so did many nurses. In the United States, Volunteer Service Clubs were organized, providing entertainment, reading- and writing-rooms, sleeping accommodations, baths, etc. The *Volunteer Gazette* is the official organ, and national headquarters are maintained in the Volunteers' own building in New York City.

VORARLBERG. A province of the Republic of Austria. Its area was 1004.6 square miles. Its population in 1910 was 145,408; in 1923, 139,968. See AUSTRIAN REPUBLIC; SWITZERLAND.

VORONOFF, SERGE (?–). A French surgeon who divides with Steinach and Lydston such credit as lies in the introduction of grafting of the sexual glands with the aim of rejuvenating the senile and presenile invalid. He is a graduate of the University of Paris and visiting surgeon to the Russian Hospital in that city. He also is director of experimental surgery in the physiological station of the Collège de France and of the biological laboratory of the Ecole des Hautes Etudes. He has published four works on gland grafting: *Vivre; Etudes des Moyens de Relever l'Energie Vitale* (1920), translated into English by Mme. Voronoff, *La Glande Génitale Male,* in collaboration with Retterer (1921); *Greffes Testiculaires* (1923), and *Quarante-trois Greffes du Singe à l'Homme* (1924). See SECRETIONS, INTERNAL.

VORSE, MARY HEATON (MRS. ROBERT MINOR) (?–). An American author born in New York City, and educated abroad. Her most successful book was *The Prestons* (1918), picturing American family life. Her other works include: *The Breaking In of a Yachtsman's Wife* (1908); *The Very Little Person* (1911); *The Autobiography of an Elderly Woman* (1911); *The Heart's Country* (1913); *I've Come to Stay* (1919); *Growing Up* (1920); and *Men and Steel* (1921).

VOUGHT, CHANCE MILTON (1888–). An American consulting engineer, born in New York City, and educated in New York and at the University of Pennsylvania. He was an active pilot (1911–17) and designed and constructed the *PLV* biplane, Mayo biplane, Simplex three-place flying-boat, Wright model *V* military biplane, Wright-Hispano flying-boat, Vought *VE7* standardized military training biplane, *VE8* single-seated pursuit plane, *VE10* short-hull flying-boat *VE7SE*, Navy standard ship's turret plane, *VE9* advanced training airplane, and *VE11* special pursuit single-seater (1910–21) During the War he was consulting engineer of the Bureau of Aircraft Production at Washington.

W

WABASH COLLEGE. A college for young men at Crawfordsville, Ind., founded in 1832 The student enrollment increased from 329 in 1914 to 496 in 1923, the faculty from 16 to 27 members and the library from 50,000 to 61,000 volumes. The endowment increased from $725,000 to $1,200,000, and in 1923 the income of the college was $110,000. President, George Lewes Macintosh.

WADE, LEIGH (1896–) An American airman, born at Cassopolis, Mich He was for a time with the Royal Flying Corps at Toronto, Canada. In 1918–19 he was at headquarters of the technical section of the Air Service in Paris (France); later he was test pilot at McCook Field. In 1921 he was pilot on the White Mountain photographic mission and in 1924 one of the pilots of the American round-the-world flight. His plane was put out of action on the flight between the Orkney Islands and Iceland after completing 19,000 miles of the trip.

WADSWORTH, JAMES WOLCOTT, JR (1877–). An American legislator (see VOL XXIII). He was elected to the United States Senate from New York State in 1914 and was reëlected in 1920 for the term ending 1927. In the Senate he was chairman of the Military Affairs Committee and a member of the Committees on Foreign Relations, Library, and Elections.

WAGES. Nominal wages have increased markedly in all countries since 1914, whether comparison is based on wage rates or actual earnings As far as can be determined from available statistical data, the relative increase has been especially great in the case of wages of unskilled workers and has made their remuneration in most countries more nearly like that of skilled workers than before the War. Among skilled workers there has been considerable variation in the rate and amount of increase in wages; the increase was at first most noticeable in the wages of war workers, and not until later in the wages of those in the building and other trades where production was not actively stimulated until the postwar period In the United States the changes shown in the table in the union scale of wages and hours are shown

Year	Rate of wages per hour	Full-time hours per week	Rate of wages per week, full-time
1913	100	100	100
1914	102	100	102
1915	103	99	102
1916	107	99	106
1917	114	98	112
1918	133	97	130
1919	155	95	148
1920	199	94	189
1921	205	94	193
1922	193	94	183
1923	211	94	199

in the index numbers of the United States Bureau of Labor Statistics; these indexes are based on some 5000 quotations of the union scale in operation on May 15 of each year, in 12 groups of trades and occupations in 66 cities, and they are weighted according to the number of workers in the trades.

Within this same period the average earnings of factory workers in New York State varied as follows, according to the index number of the New York State Industrial Commission; the base here was the average earnings in June, 1914.

Year	Average earnings
1914	98
1915	101
1916	114
1917	129
1918	160
1919	185
1920	222
1921	203
1922	197
1923	214

Obviously, an index number showing changes in wage rates will not reveal differences in total wages from overtime work, unemployment, and underemployment, and corrections for such differences have to be made before the index number can be used to show changes in "real wages." Such corrections are not necessary in an index number based on earnings, but the irregular increases in the wages of different types of employees late in the decade 1914–24 bring quite different results in the data as combined in an index number according to the type of workers included, a large proportion of unskilled workers making the index number show a large relative increase since 1914, and vice versa. If, however, comparison is made between these and other indexes for wage changes in the United States, and the index of the cost of living (see COST OF LIVING), it is found that for most workers, no matter what type of wage figures are used, the cost of living increased more rapidly than wages through 1920; the exception was unskilled workers and certain war workers whose "real wages" as well as actual wages began to increase in 1917 and 1918. After 1920 the cost of living decreased more rapidly than wages, so as to give most workers increased purchasing power in comparison with 1914 Similar trends are shown by the wage statistics in Great Britain and also in other countries where there is sufficient information on both wages and living costs to warrant attempting to determine changes in "real wages."

An interesting computation of "real wage" index numbers with and without allowing for unemployment is given in *Bulletin No. 2* of Series N of the International Labor Office (Geneva), entitled *Methods of Statistics of Wages and Hours of Labor* (December, 1923).

The figures are from the Australian Commonwealth Bureau of Census and Statistics, and the general method is that in use in Australia. the cost of providing the items listed in a quantity budget for a family of specified size. See articles on European countries for discussions

Date	Full time weekly wage rate index	Percentage of unemployed	Weekly wage rates index numbers (*Calc from cols. I and II*)	(*Recalc. 1911 = 100*)	Cost of living index number	Real wage index number (*Full-time*)	(*Allowing for unemployment*)
	I	II	III	IV	V	VI	VII
1911. . .	100	4 7	95.3	100	100	100	100
1914	108 5	11.0	96 6	101.4	114.0	95.2	88.9
1917 ..	125 2	7.4	115 9	121 6	131.8	95 0	92.3
1920... ...	175.2	7 8	161 5	169 5	178 5	98 2	95 0
1921	184.4	9 5	166 9	175 1	169 7	108 7	103.2

This table also illustrates the danger of drawing wrong conclusions about the improvement in the wage conditions of the working classes, if comparison is made only with reference to the rather unsatisfactory economic conditions prevailing in 1914. Even in comparison with earlier periods, however, it seems to be indicated that wages, especially at the minimum levels, had in 1924 a higher purchasing power, making possible the maintenance of a somewhat higher standard of living That many wages were still below the amount necessary for the maintenance of a satisfactory standard of living is plainly evident from a comparison of 1924 wages with the amounts estimated in various quantity budgets as essential for the maintenance of such a standard.

Because of the frequency of wage changes toward the end of the decade, much attention was given to the best means of securing fair and equitable adjustments During the time of rapidly increasing prices, wages were often increased in accordance with changes in a cost-of-living index number, the increase occurring automatically in some instances with any change of an agreed number of points in the index number, while in other instances each change was a matter of special agreement between employer and employee Quantity budgets were also used frequently as the basis for wage determinations, and emphasis was placed on the importance of considering the cost of maintaining a specified standard of living under specified conditions rather than depending entirely on data showing the increased cost of maintaining a standard which might or might not have been adequate at an earlier period Probably the most significant and permanent changes in methods of wage determination followed the war-time emphasis on uniform standards for wages for similar employment throughout large areas, thus breaking down earlier standards which created many minor variations in different localities and different industries not justified under existing economic conditions. Another important change in attitude came also from the emphasis on "payment for results" in connection with wage determination, engendered by the bonuses and other special systems of extra remuneration for production above a specified amount, and apparently entering into discussions of wages to an increasing extent. A new development in several European countries was the payment of a "family wage," i e. special rates to married men and sometimes an extra grant for each child. Such a system was also strongly advocated in Australia as preferable to a rate for all men workers which assumes the necessity of the support of a family, as has been customary in wage decisions related to of wage tendencies abroad. See also the articles LABOR ARBITRATION; LABOR LEGISLATION; RAILWAYS.

WAGSTAFF, BLANCHE SHOEMAKER (1888–). An American author, born in New York City, and educated at the Brearley School and Miss Spence's School in New York. During the War she acted as chairman of the National Woman's Service League and assisted in the War Camp Community Service and other organizations. Her writings include *Song of Youth*, poems (1906), *Woven of Dreams*, poems (1907); *Atys* (1909), *Alkestis*, a Greek drama staged at the Hudson Theatre in New York City (1911); *Eris*, a drama (1913); *Narcissus* (1917); *Book of Love* (1917); *Leaves in the Wind*, poems (1920)

WAHABITES. See ARABIA; PAN-ISLAMISM

WAHL, ADALBERT EMIL AUGUST (1871–). A German historian (see VOL. XXIII). In 1914 he published *Beitrage zur Geschichte der Konfliktszeit*, and in 1920, *Vom Bismarck der Siebziger Jahre.*

WAINWRIGHT, JONATHAN MAYHEW (1864–). An American lawyer, born in New York City, and educated at Columbia University and its law school. In 1886 he was admitted to the bar and has since been in practice in New York City During 1902–08 he was a member of the New York Assembly, and during 1909–13, of the New York Senate In 1921 he was appointed by President Harding Assistant Secretary of War, a post which he resigned in 1923 when he was elected a Congressman from the 25th New York District During the War he was a division inspector with the rank of lieutenant-colonel in the 27th Division and served throughout the entire war in the United States, France, and Belgium, and was not mustered out until March, 1919. The United States conferred on him the Distinguished Service Medal He also received the Legion of Honor from France and the Croix de Guerre with palm from Belgium.

WALES. See GREAT BRITAIN.

WALKER, STUART (?–). An American playwright, born at Augusta, Ky., and educated at the University of Cincinnati. He was play reader, actor, and stage manager for David Belasco (1909–14) and in 1914 became stage director for Jessie Bonstelle. He became an independent producer in 1915 and directed the Repertory Company in Indianapolis from 1917 to 1921. He was the originator of the Portmanteau Theatre and wrote: *Portmanteau Plays* (*The Trimplet, Nevertheless, The Medicine Show, Six Who Pass While the Lentils Boil*, 1917) and *More Portmanteau*

Plays (*The Lady of the Weeping Willow Tree, The Very Naked Boy, Jonathan Makes a Wish,* 1919).

WALKER, WILLIAM HULTZ (1869–). An American chemist (see VOL. XXIII). He was lieutenant-colonel in the National Army during the War, chief of the Chemical Service Section, and later a colonel in the United States Army in charge of the Gas Offense Division. In 1919 he was awarded the Distinguished Service Medal.

WALLACE, HENRY CANTWELL (1866–1925). An American public official, born at Rock Island, Ill, and educated at the Iowa State College of Agriculture. He engaged in farming in Iowa from 1887 to 1891, taught for a while in the Iowa State College of Agriculture, and was associated editorially with *The Creamery Gazette, Farm and Dairy* (1893–95), and *Wallace's Farmer* (1895–). During the War he was a member of numerous organizations such as the National War Work Council of the Young Men's Christian Association. In 1921 President Harding appointed him Secretary of Agriculture. His work in the department was considered highly satisfactory.

WALLACHIA. See RUMANIA.

WALLIN, J(OHN) E(DWARD) WALLACE (1876–). An American psychologist, born in Page County, Iowa, and educated at Yale University. He began teaching psychology at Clark University in 1901, went to the University of Michigan in 1902, and from 1903 to 1906 was demonstrator in experimental psychology at Princeton University. The Mellon Institute engaged him as psychologist on smoke investigation (1912–13), and in 1921 he was made director of the bureau of special education at Miami University. His writings include: *Researches on the Rhythm of Speech* (1902); *Optical Illusions of Reversible Perspective* (1905); *Experimental Studies of Mental Defectives* (1912); *The Mental Health of the School Child* (1914); *Measurement of Mental Traits in Normal and Epileptic School Children* (1923).

WALPOLE, HUGH (SEYMOUR) (1884–). An English novelist (see VOL. XXIII). He served with the Russian Red Cross during 1914–16. His later publications include: *The Golden Scarecrow* (1915); *The Dark Forest* (1916); *Joseph Conrad* (1916); *The Green Mirror* (1918); *The Secret City* (1919); *Jeremy* (1919); *The Captives* (1920); *The Thirteen Travellers* (1921), *The Young Enchanted* (1922), *The Cathedral* (1922); *Jeremy and Hamlet* (1923), and many stories and articles in magazines.

WALSH, JAMES JOSEPH (1865–). An American physician and author (see VOL. XXIII). Dr Walsh has written a number of books since the War on his favorite subjects of medical history and biography, psychotherapy, and the accomplishments of the Roman Catholic scientists. These comprise *Health through Will Power* (1919); *History of Medicine in New York* (1919), *Mediæval Medicine* (1920); *Religion and Health* (1920), and *Cures: the Story of Cures that Fail* (1923)

WALSH, THOMAS JOSEPH (1873–). An American Roman Catholic bishop, born at Parker's Landing, Butler Co., Pa. He studied at the College and Seminary of St. Bonaventure and in Rome, and was ordained to the Roman Catholic priesthood in 1900. He served as assistant director at St. Joseph's Cathedral in Buffalo until 1900, and from that year until 1915 he was private secretary to Bishops Quigley and Colton. He also acted as chancellor of the diocese. From 1915 to 1918 he was director of St. Joseph's old Cathedral in Buffalo. He was consecrated bishop of the diocese of Trenton, N. J., in 1918.

WALTER, BRUNO (1876–). A German conductor, born in Berlin. He was trained at Stern's Conservatory, where his teachers were Ehrlich, Bussler, and Radecke. After short periods as conductor in Cologne, Hamburg, Breslau, Presburg, Riga, and Berlin he rose rapidly to a position of preeminence through his brilliant work at the Hofoper in Vienna (1901–13). In 1914–22 he was Hofkapellmeister and Generalmusikdirektor in Munich, succeeding Felix Mottl. He made extensive tours as a guest conductor and in 1923 visited the United States, where his appearances with the New York Symphony Society and the Boston, Minneapolis, and Detroit Symphony Orchestras made a profound impression. His compositions include two symphonies; *Das Siegesfest* for soli, chorus, and orchestra; a piano quintet; a piano trio; a string quartet, and a violin sonata.

WALTER, HERBERT EUGENE (1867–). An American zoologist, born at Burke, Vt., and educated at Bates College, Brown and Harvard Universities, and at Freiburg He was an instructor in biology in the Chicago high schools (1894–1904); assistant at Harvard (1904–06); assistant professor (1906–13) and associate professor of biology (1913–) at Brown University; and instructor in field zoology (1906–17), and assistant director (1917–) at Cold Spring Harbor. He published *The Human Skeleton* (1918) and *Genetics*, 2d ed (1923).

WALTON, JOHN CALLOWAY (?–). A governor of Oklahoma. He was elected in November, 1922. His inauguration on Jan. 11, 1923, was distinguished by an immense barbecue. He immediately began a bitter fight against the Ku Klux Klan, which he charged with Statewide floggings, riots, and crimes. On his suppression of newspapers opposed to him, the editors of the State issued an appeal to the nation They accused the Governor of usurpation of power and attempting to nullify the State constitution. The Legislature also opposed him, and in order to carry his measures he proclaimed martial law and called out 100,000 men to enforce it. The reign of martial law ended October, 1923, and on October 23, the Governor was suspended by the State Senate On the following November 20 he was removed from office by impeachment.

WANAMAKER, (LEWIS) RODMAN (?–). An American merchant, son of John Wanamaker He graduated from Princeton in 1886 and was from that time associated in business with his father as vice president of the John Wanamaker stores in New York and Philadelphia. He was also a director and official of many financial institutions. For several years he was consul general at Philadelphia for Paraguay and other South American countries. He financed three expeditions to the West to study Indian life and presented several art collections to Princeton University. During the War he served as chairman of the Mayor's Committee in New York to Welcome Homecoming Troops and was also chairman of the Mayor's Committee on Public Welfare and of the Committee on the Reception of Distinguished

Guests. He received decorations from several foreign countries. Following the death of his father in 1922, he became head of the Wanamaker business.

WAR, DIPLOMACY OF THE. War has been defined as the last resort of diplomacy; it is also true that diplomacy is the handmaid of warfare. Diplomatic manœuvres, that is to say, are necessary to support armies and navies, and the inverted maxim, "In time of war prepare for peace," is truer than in its original form The magnitude of the World War, its long duration, the number of belligerents, and its far-flung consequences necessitated diplomacy on a scale almost spectacular, and contrary to the experiences after previous conflicts, the world has hardly had to wait at all for a tolerably adequate diplomatic history of the period 1914 to 1918. Even during the War itself, parliaments held secret sessions in order that executives might quiet the alarms of the legislative representatives not only as to military situations, but as to diplomatic policies. Following the peace settlement, all sorts of disclosures were made, in official collections of diplomatic documents published by Foreign Offices; in memoirs by diplomats and generals who were concerned about their own reputations and wished to increase their incomes by large royalties; and in the revelations of the Russian revolutionary governments which were anxious to discredit the secret diplomacy of Europe and to strengthen their own argument that modern parliamentary institutions are bankrupt.

Elaborate efforts were made during the War to bring neutrals into the conflict. Discussions were carried on between the members of each group of powers involved as to their war aims and peace terms. Territories in the possession of the enemy were allocated in secret treaties at the same time that there was a brave show of appealing to the people in order to persuade them to accept the ideals and aims which, in public, statesmen professed to be fighting for. Negotiations for peace were conducted while the military situation was stable, and neither group of powers approached exhaustion. Some of these negotiations have been adequately disclosed. Other informal conferences and whispered words were more vital to the world than speeches. In some such cases the pertinent facts have only been meagrely hinted. But it is certain that in the future the question whether peace was missed and whether the War could have been ended before 1918 will be debated as violently as the question of the responsibility for the outbreak of hostilities in August, 1914. Some declarations of war were made without negotiation but were nevertheless slightly delayed. Austria declared war on Serbia July 28 but remained at peace with Russia until August 6. France and Great Britain declared war on Austria on August 10 and 12, but until August 27 Austria was in peaceable relations with Belgium so far as a formal declaration was concerned. Turkey, Japan, and Italy at first remained neutral. They began hostilities later, after mature deliberation. At first, the other Balkan states too were not directly affected. Both the Central Powers and the Entente made strenuous efforts to win over these neutrals or at least to keep them from joining the other side.

Japan. The Anglo-Japanese Alliance, the terms of which were known, seemed to make Japanese support of England inevitable. When hostilities began, the British Ambassador to Japan asked Baron Kato, the Japanese Foreign Minister, whether Japan would aid England The Cabinet Council was at once summoned, and the next day (Aug. 4, 1914) the Ambassador was told that Japan would not evade her responsibilities Three days later the British Ambassador told Baron Kato that the situation had developed in such a manner as to require Japan's immediate entrance The same day Premier Okuma called a meeting of the Genro, "the elder statesmen," and at this conference, it was said, Japan's policy was "definitely formulated" (Kawakami, *Japan in World Politics*, p. 256; New York, 1917). But on August 12 Marquis Okuma still talked of Japan's desire for peace and of the possibility of its being gratified. Japan issued an ultimatum to Germany on August 15, demanding the recession of Shantung, the dismantling of the Tsing Tau forts, and the departure of German warships from Chinese waters. A favorable answer to this ultimatum might have served to keep Japan out of the War, and in view of this possibility the phrase "in accordance with her obligations under the Anglo-Japanese treaty," which was used in the ultimatum, seems rather misleading. Germany rejected the demands, and war was declared. But Montenegro was brought in automatically by the attack on Serbia; the Russian threat against Austria determined Germany's position; the implication of Russia made France's course inevitable, so binding were the European alliances considered. On the other hand, Great Britain's entanglement only required an ultimatum by Japan to Germany, and Japan entered the War three weeks late. The delay had far-flung consequences, such as "the bombardment of Madras, the sinking of a new Blue Funnel liner with £1,000,000 worth of rubber in the Arabian Sea, the annihilation of Sir Reginald Craddock's squadron, with its gallant crews, and the Battle of the Falkland Islands." The Japanese Parliament was summoned in special session Sept. 3–9, 1914, to give its formal authorization for the expenses already incurred for the Tsing Tau expedition and to sign a blank check for additional outlays.

Turkey. The next power to come in was Turkey. There was no hope that the Young Turks would support the Entente, but on the other hand, there seemed a chance that war could be avoided with a power which had always considered one of its interests to be the maintenance of the Turkish Empire. England made promises. If Turkey would remain neutral, the status of Egypt would not be altered; the Entente would protect Turkish independence; the Capitulations would be abolished; and George V expressed to the Sultan his personal regret that Great Britain had commandeered (August 3) two battleships which were being built in England for Turkey. But on August 1 a treaty had been signed between Germany and Turkey. The latter was guaranteed territorial integrity against Russia Mobilization proceeded, and on October 28 Turkey began naval operations. Three days later Russia declared war. Great Britain annexed Cyprus, and on December 17 she proclaimed a protectorate over Egypt But the political effects of Turkish hostilities were much greater than these. The full participation of India was assured. Mes-

opotamia, Palestine, Syria, and Arabia became side shows for the main tent on the European front. In respect of Entente war aims, the entrance of Turkey was of tremendous importance. Russia saw the possibility of realizing her ambitions. As early as November, 1914, she was informed that she might have the Straits. On Mar. 4, 1915, Sazonoff demanded Constantinople, the western coast of the Bosphorus, the Marmora, and the Dardanelles; part of Thrace; the coast of Asia Minor between the Bosporus and the river Sakaria; and islands in the Sea of Marmora. France and Great Britain agreed in general, if their own claims were satisfied; and thus there began a long series of demands and counterdemands for compensations and satisfactions, which were embodied in the Secret Treaties. These agreements were of a piece with the *Realpolitik* against which the Entente professed to be fighting; the secret ambitions were quite inconsistent with the war aims which were publicly professed. They were, moreover, ambitions which had extremely bad effects in the Balkans. In the eyes of Greece, Bulgaria, and Rumania, Turkey might really stand for Balkan independence. The Entente protection of "small nations" apparently was applicable only to Belgium. The little states of the Balkans were to be devoured by Russia.

Italy. The resources of the Entente were greatly increased six months later when Italy entered the War She had declared her neutrality on Aug. 1, 1914, on the ground that intervention was not demanded by the terms of the Triple Alliance. Vienna, pressed by Berlin, had consented to cede the Trentino and the west bank of the Isonzo. Concessions had also been promised in Trieste and Albania. But these were not sufficient. There was much Italian sympathy for Belgium and Serbia. Sonnino saw that he could make the Central Powers and the Entente bid against each other. Prince von Bülow was called from retirement and was sent to the scene of his former diplomacy to lend his efforts to keeping Italy neutral. Burian succeeded Berchtold as Austrian Foreign Minister, and the concessions were slightly increased. But Sonnino feared both a Teutonic and Jugo-Slav dominance in the Adriatic; one of these results seemed inevitable whether the Entente lost or won, and if the War ended in a draw, the veteran Italian statesmen believed that more could be expected from the Entente, whose statesmen were continually increasing their demands. France and Russia considered the Italian claims exorbitant. The latter particularly objected to the sacrifice of Serbian designs on the eastern coast of the Adriatic. But the diplomacy which looked to the resettlement of Europe was so universally selfish that the Powers could hardly object, when their own interests were not involved, to selfishness in each other. The situation on the western front, moreover, operated in favor of Italy. The Allies were repulsed at Neuve Chapelle and Ypres; the shortage of high explosives was becoming known. Consequently the Entente and Italy on Apr. 26, 1915, signed the Treaty of London. It promised Italy, in addition to the Austrian sacrifices, the southern Tirol to the Brenner Pass, Gorizia, Trieste, Istria, and northern Dalmatia.

Ribot is said to have remarked after a conference with the Italian representatives: "We are lucky that they didn't take our clothes away from us." In return for the high price paid by the Entente, Italy promised to begin hostilities within a month and to prosecute them with all her resources. She pledged herself also to sign the Declaration of London of Sept. 5, 1914, by which the Allies promised that they would not make peace separately.* Adhesion was not given until Nov. 30, 1915, although the Triple Alliance was denounced on May 3 and war was declared on Austria on May 23. Italy was technically at peace with Germany until Aug. 27, 1916. The terms of her entrance, furthermore, pledged the Allies to support Italy in preventing the Pope from acting to bring about peace or to settle any questions arising from the war. The only excuse for the treaty was "the familiar plea of necessity," according to Professor Gooch. "Though it increased the material strength of the Grand Alliance, it diminished its moral authority; and Serbia learned within a week of the pact which had disposed of Jugo-Slav territory behind her back." "The French and ourselves were fighting for our lives on the western front," Mr. Asquith said in apology; "and the treaty represented the terms on which Italy was prepared to join forces."

Bulgaria. Greece, Bulgaria, and Rumania now began to be drawn into the conflict. Immediately after the outbreak of the War, Venizelos promised that if the Entente would guarantee Greece against a Bulgarian attack, he would assist them in the event of Turkey's joining the Central Powers. King Constantine on the other hand announced that he would not attack Germany's allies before they attacked him. In December, 1914, the Entente offered South Albania, with the exception of Valona, and in January, 1915, Smyrna, in return for Greek intervention. Venizelos urged that an army corps be sent to Gallipoli; Constantine seemed to be willing. But he changed his mind on the advice of his General Staff, another example of the supremacy of military authorities over the politicians; and Venizelos resigned

Meanwhile the Allies had been negotiating unsuccessfully for Bulgaria. Noel Buxton, an authority on the Balkans, told Sir Edward Grey early in August, 1914, that armed neutrality might be secured from Bulgaria by a revision of the Treaty of Bucharest and a loan. Sazonoff urged that Bulgaria be given territory in Macedonia, for her position was important. The Central Powers would get full benefit from the Turkish Alliance only if they were joined by Bulgaria. On the other hand if the Entente succeeded in luring Ferdinand, communication with Russia from the Mediterranean would be secured, and Turkey would be cut off. In 1915, when Russia suffered severe defeats in Poland and Galicia and the attack on the Dardanelles proved unsuccessful, the Entente saw that they must offer Bulgaria real compensations. On August 23, under pressure from the Entente, the Serbian *Skuptshina* consented to territorial "sacrifices indispensable for the preservation of the vital interests of her people"; but it was too late. Serbia, indeed, wished to attack Bulgaria; but this, in the opinion of the Entente, would absolve Greece from her treaty obligation to go to the support of Serbia if the latter were attacked by Bulgaria. Ferdinand had by now decided that the Central Powers would win, and he wished to be one of the victors. In

September a military convention was signed. Germany and Austria promised to send 12 divisions against Serbia. Belgrade was entered on October 9, and two days later the Bulgarians crossed the frontier. Venizelos, in office again, promptly asked Great Britain to send 150,000 men and proposed that Greece fulfill her obligations under the treaty with Serbia. Even though Great Britain offered Cyprus for Greek intervention, Constantine determined to maintain neutrality and dismissed Venizelos. Serbia regretted that she had not been permitted to attack two months before; she was in a desperate position and without the support of Greece. Allied diplomacy in the Balkans had certainly failed; Sir Edward Carson resigned from the British cabinet in protest, and Sir Edward Grey may have been correct but was hardly reassuring when he said in a speech on October 14 that diplomacy could succeed only if supported by striking military successes.

Rumania. A year later Rumania, the fifth Balkan state to forsake neutrality, added her forces to those of the Allies after two years' flirtation. Rumania was bound to the Central Powers by a treaty concluded in 1883, but when the Kaiser and the Austrian Emperor promised to assist in obtaining Bessarabia for Rumania if she would join, King Carol discovered that he would not be permitted to fulfill his pledges. In September, 1914, Rumania signed treaties with Russia and Italy and promised benevolent neutrality. In January, 1915, a British loan was negotiated; in February the Italian agreement was renewed. When Italy left the Triple Alliance in May, 1915, Rumania announced her territorial demands, but they were too high. A year later Brusiloff's smashing blow on Austria led Germany to press for concessions to Rumania as the price of her continued neutrality, but Burian refused to yield. Again the Western Front forced the Allies to engage in the Balkan auction. On August 18, a secret treaty gave Rumania the Banat, Transylvania, and the Bukovina to the Pruth—one of the most indefensible ethnical arrangements of the war. Rumania declared war on August 28, but the time was unfortunately chosen. Military secrets had been betrayed; Rumania disregarded Entente advice in attacking Transylvania instead of Bulgaria, although from her own standpoint there was some justification for this policy; the Entente underestimated the forces that Germany could spare; Russian support was meagre and ineffective. Rumania was crushed.

The United States. Immediately on the outbreak of the War, the use of sea power by Great Britain and Germany raised controversies with neutrals, particularly the United States. German commerce was practically driven from the seas, and the United States began to discuss questions of international law relating to British restrictions on American commerce with Germany, and the ever-increasing American trade in munitions, practically all of which went to the Allies. The United States' professed willingness to sell to Germany was only a gesture, since the British navy determined the identity of the purchasers. A war zone was declared by Great Britain on Oct. 13, 1914, when an Admiralty announcement said that His Majesty's government had authorized a mine-laying policy in certain areas and that it would be dangerous for ships to cross these limits. Three weeks later notice was given that "the whole of the North Sea must be considered a military area." Ships were warned that they would "be exposed to the gravest danger from mines which it has been necessary to lay." Against this action the United States entered no protest, but England's command of the seas enabled her to afford pilots to American ships and to reduce to a minimum the possibility of disaster so far as the mines laid by her were concerned. The German "war zone" decree which marked the beginning of the controversy with the United States was of a more sinister character.

Submarine Warfare.—Late in 1914 Admiral von Tirpitz said that the submarine would be used to sink merchant vessels in British waters, but the rules of international law enumerating the exceptional cases in which prizes might be destroyed, the safety of passengers and crew always being a sine quâ non, were so definite, and the considerations of humanity so potent, that such a method of warfare seemed highly improbable. On Feb. 4, 1915, Germany issued a proclamation declaring "the waters surrounding Great Britain and Ireland, including the whole English Channel," to be a "war zone," and threatening the destruction of "every enemy merchant ship in the said war zone . . . without its being always possible to avert the danger" to passengers and crews. Neutral ships were also given a warning. This proclamation was justified as a retaliatory measure for Great Britain's interferences with German trade. Later (March, 1916) the ground of defense was shifted, and it was claimed that the use of the submarine against merchant vessels could not be illegal, because, the weapon being a new one, there were no rules on the subject. Against this announcement the United States, with other neutrals, protested vigorously. There was sent to Germany the celebrated "strict accountability" note of Feb 10, 1915. Then followed a discussion of points of international law. Germany threw out the hint that if the Allies could be persuaded to adhere to the Declaration of London, she might withdraw her submarine and war zone order, and it is likely that at any time during the War she would have been willing to make this concession if permitted to import foodstuffs and if the trade in munitions between the United States and the Allies had ceased. Accordingly Secretary of State Bryan sent on February 20 to Great Britain and Germany identical communications, asking for mutual concessions so that an international modus operandi might be achieved which would not be fraught with such menaces to neutrals. No agreement proved possible.

The Lusitania.—American rights were first infringed by Germany on Mar. 28, 1915, when the British steamer *Falaba* was sunk by a German submarine, and an American citizen was drowned. On May 1 the American vessel *Gulflight* was torpedoed by a submarine, and three American citizens met their death. Finally, on May 7, the *Lusitania* was sunk without warning, and more than 100 American citizens lost their lives. Before a protest could be made, two communications were received from Germany. The first expressed "deepest sympathy at the loss of lives on board the *Lusitania*" but maintained that the responsibility rested with the British government, which, through its plan of starving the civilian population of Germany, had forced Germany to resort

to retaliatory measures. The practice of arming British vessels made it impossible to treat them as merchant ships; and Germany regretted that Americans felt "more inclined to trust to English promises than to pay attention to warnings from the German side." In the second communication Germany explained that instructions had been issued to avoid attacks on neutral ships, and that in the event of an unfortunate accident regret would be expressed and damages afforded. On May 13 the United States sent Germany the first of a long series of notes. The legal questions were argued; the German excuses were answered, and the United States promised that it would not "omit any word or act necessary to the performance of its sacred duty of maintaining the rights of the United States and its citizens and of safeguarding their free exercise and enjoyment." Whether the *Lusitania* was armed, the principles of humanity involved, and the justification of the submarine warfare as a reprisal for England's extensions of international law were argued. Against the English orders in council to extend contraband lists and to intercept shipments destined for neutrals because of a possible ultimate German destination, the United States was protesting at the same time that it carried on the submarine controversy with Germany. As Ambassador Page's letters and Count Bernstorff's despatches showed, President Wilson would have made these protests stronger if the German infractions of international law, causing loss of life, had not always kept American public opinion from being singly concerned with interferences with trade.

While the *Lusitania* case was being argued, the American steamer *Nebraskan* was torpedoed off the coast of Ireland; several Americans on the British steamer *Armenian* lost their lives on June 28; two Americans were killed when the *Arabic*, bound for New York and hence carrying no contraband, was torpedoed without warning on August 19. Finally, on September 1, Ambassador Bernstorff gave this pledge: "Liners will not be sunk by our submarines without warning and without safety of the lives of noncombatants, provided that the liners do not try to escape or offer resistance."

Trade in Munitions.—The *détente* resulting from this was used for a discussion of the trade in munitions, which had grown to large proportions. Germany's record in the past as an exporter of munitions and her controversy over submarines made it inadvisable for her to protest; so in June the Austro-Hungarian government sent the United States a strong note against the continued trade in munitions. Secretary Lansing answered on August 12 with an able argument covering all phases of the question, but by this time the American attitude was being influenced by considerations other than international law. Impeccable legality was supported by sympathy with the Allies. The invasion of Belgium, the *Lusitania* and other sinkings, the alleged atrocities, and Germany's evasive answers to Wilson's submarine notes, all helped to determine the American position.

Austria-Hungary now entered the submarine controversy. The Italian liner *Ancona*, bound from Naples to New York, was torpedoed in the Mediterranean without warning, and American lives were lost. After several interchanges, Germany's ally accepted the principle that "hostile private ships, insofar as they do not flee or offer resistance, may not be destroyed without the persons on board having been placed in safety." But satisfaction with the theoretical agreement was short-lived. Three other passenger steamers were sunk in the Mediterranean, and Count Bernstorff, on Jan. 7, 1916, came to the fore with renewed pledges. Ships would be destroyed "only after passengers and crew have been accorded safety." Now the controversy shifted again, this time to the question of armed merchantmen. In the early part of 1916, Italian and British ships were armed on account of the ruthless submarine warfare which was being waged in the Mediterranean. On Jan. 18, 1916, Secretary Lansing proposed that the practice of arming vessels be abolished. His object was to have such vessels considered as auxiliary craft, to keep Americans off them, and to have a clearer case against Germany if submarines sank unarmed vessels and caused loss of lives. This proposal was unanimously rejected by the Entente Allies, who insisted that arming ships was justified by international law. Figures announced later by the British Admiralty showed that more than 75 per cent of all armed vessels escaped destruction by submarines, while of the unarmed only 24 per cent escaped when attacked. Germany took advantage of the proposals made by Lansing and announced that after March 1 all armed merchantmen would be sunk without warning. The diplomatic position of the United States had been weakened, and discussion of the matter began in Congress, where a resolution was introduced warning Americans to keep off armed merchant ships of belligerent nationality. The Administration interfered, and the resolution was tabled. But another element had been introduced into the submarine controversy.

Sinkings continued throughout 1916. An outstanding outrage was the case of the Channel steamer *Sussex*, an unarmed passenger boat, which was sunk without warning on March 24. After six weeks of talk, Germany declared that the submarine commander had made a mistake; his judgment of the character of the vessel had been too hurried, and it followed therefore that "the assurance given to the American government in accordance with which passenger vessels were not to be attacked without warning has not been adhered to in the present case" Sinkings in the next few months did not specifically involve American rights. On November 6, the *Arabia* was torpedoed in the Mediterranean without warning; all the 450 passengers were saved. Six Americans had been killed on October 30. The two cases were coupled in Wilson's protests to Germany. The British admiralty announced that from May 5, the date of Germany's *Sussex* pledge, to October 28, 22 British merchant ships had been torpedoed without warning, and 131 noncombatants had lost their lives.

In spite of these cases, there was a feeling that Germany was standing by her pledges, barring unfortunate accidents or enthusiastic commanders' exceeding their instructions. There was a public discussion of the possibility of peace (December, 1916), but on Jan. 31, 1917, came the thunderbolt of Germany's decree of unrestricted submarine warfare. The "illegal measures" of Germany's enemies were to be met by "forcibly preventing after Feb. 1, 1917, in a zone around Great Britain, France, Italy, and in the eastern Mediterranean all navigation.

that of neutrals included, from and to England, and from and to France, etc. All ships met within that zone will be sunk."

"Overt Acts."—President Wilson announced his policy on February 3 in an address to the two houses of Congress in joint session. He quoted the solemn warning of his *Sussex* note, that unless Germany immediately abandoned her use of submarines contrary to international law and "the universally recognized dictates of humanity," the United States would sever diplomatic relations, and the German pledge in reply, that vessels would not be sunk in the war zone "without warning and without saving human lives, unless these ships attempt to escape or offer resistance." Ambassador Bernstorff had therefore been given his passports; Ambassador Gerard had been recalled. Only "actual overt acts" would make Wilson believe that the German government would go through with its plan, but if "American ships and American lives should in fact be sacrificed by their naval commanders in heedless contravention of the just and reasonable understandings of international law and the obvious dictates of humanity, I shall take the liberty of coming again before the Congress to ask that authority be given me to use any means that may be necessary for the protection of our seamen and our people in the prosecution of their peaceful and legitimate errands on the high seas."

Armed Neutrality.—President Wilson did not have to wait long for "overt acts" Two American vessels were sunk, and an attack on the French steamer *Athos* caused the death of an American missionary. More serious was the virtual embargo on the mails and shipments of various sorts to Europe With no protective measures decided on by the Wilson administration, American vessels were fearful of braving the submarine menace. At the end of three weeks it seemed clear that the threat of Wilson's address to Congress in breaking off diplomatic relations would have no effect, and so on February 26 he again addressed Congress, this time to ask for the authority which he deemed necessary to safeguard the rights of the United States. He desired "armed neutrality, which we shall know how to maintain and for which there is abundant American precedent." He was not "contemplating war or any steps that need lead to it." He asked for authority "to supply our merchant ships with defensive arms" A measure was immediately prepared by the Foreign Relations Committee and introduced in the Senate to carry out President Wilson's policy of armed neutrality. The resolution passed the House on March 1 by an overwhelming vote, but the rules of the Senate which failed to limit debate permitted a "group of willful men," in the Wilson phrase, to filibuster and prevent action before the time set for the Congress to come to an end On March 9 Wilson issued a proclamation calling Congress in special session for April 16; the reason assigned was the necessity for a great variety of emergency legislation, but preparations for armed neutrality went on without legislative authorization. An old statute was relied on, and on March 12 it was announced that the United States had determined "to place upon all American merchant vessels sailing through the barred areas an armed guard." Meanwhile Germany continued to commit "overt acts." The *Laconia* was sunk on February 25, and two American lives were lost. On March 12 the American steamship *Algonquin* was sunk, and 14 American members of the crew had to spend 26 hours in open boats. On March 19 the sinking of three American ships was announced. There were others also. These sinkings showed that armed neutrality was inadequate. On March 21 the President summoned Congress for special session on April 2, "to receive a communication by the Executive on grave questions of national policy which should be immediately taken under consideration"; steps were at once taken to mobilize the country for the prosecution of a war. It was practically a foregone conclusion that President Wilson intended to ask Congress to declare the existence of a state of war. The pretense of armed neutrality was anomalous and inadequate.

Entry into the War.—Four days after the President's address, both Houses of Congress passed the joint resolution formally recognizing the state of war which had been forced on the United States. It was the fifth formal declaration of a war with a foreign power. "We have no selfish ends to serve," said Mr. Wilson in his address. "We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make." The United States, at least, was not brought into the conflict by secret treaties.

Other Neutral States. In his message to Congress on February 3, President Wilson took it for granted "that all other neutral governments will take the same course" of breaking off diplomatic relations This was not the case with European states, but the Latin American countries did follow the lead of the United States. Cuba and Panama joined the United States on April 7 and 8. Brazil broke off diplomatic relations on April 11 and declared war on October 26. Intercourse with Germany was also severed by Bolivia (April 13), Guatemala (April 27), Honduras (May 17), Nicaragua (May 19), Haiti (June 15), Costa Rica (September 23), Peru (October 6), Uruguay (October 7), and Ecuador (December 9). The Argentine, Chile, and Venezuela remained more or less neutral. Liberia declared war on August 7 and China on August 14. Siam entered the conflict on July 22. Others which came in in 1918 were: Costa Rica (May 23), Guatemala (April 22), Haiti (July 15), Honduras (July 19), and Nicaragua (May 24).

Greece also came in, but because of Allied pressure rather than on account of the submarine warfare. Venizelos had been dismissed in October, 1915, and from then until May, 1916, Constantine, strongly pro-German in his sympathies, tried to be a monarch who governed as well as reigned. He desired premiers of his way of thinking and called to the office Zaimis and then Skoloudis. In May, with the consent of Constantine, the Greek commanders allowed the Bulgarian troops to occupy Fort Rupel, the key to the Struma Valley. In August, Seres and Kavalla were also surrendered to the Bulgarians and the Greek troops were interned in Germany. Venizelos intervened. He established at Saloniki a provisional government which was recognized by the Allies, and he declared war on Bulgaria. The authority of the King was repudiated by Crete, Samos, and other islands, but the mainland remained under his control. Both Italy and Russia were reluctant

to have the Allies intervene drastically. Italy feared the rivalry of a Greece made strong under Venizelos, and Russia, on dynastic grounds, objected to the deposition of Constantine. In June, 1917, after the Russian revolution, the Entente at last intervened. Constantine was removed and sent to Switzerland. Venizelos returned to Athens, and on June 30 Greece broke off diplomatic relations with Germany and Austria.

The Secret Treaties. In order to get Italy and Rumania into the War and to arrange for a division of the spoils in the event of victory, the Entente entered into a series of secret treaties which were hardly consistent with their publicly professed war aims. Some of these treaties have already been referred to in discussing the negotiations which the Allies carried on in order to oppose to Germany a united diplomatic front. The secret agreements were so important, during the War and particularly at the Peace Conference, that they should be enumerated here. Most of them saw the light after the Bolshevik revolution. In publishing the documents which were found in the Russian Foreign Office, Trotsky said that "secret diplomacy is a necessary weapon in the hands of a propertied minority, which is compelled to deceive the majority in order to make the latter obey its interests." He declared that "the Russian people, as well as the peoples of Europe and of the whole world, must know the documentary truth about those plots which were hatched in secret by financiers and industrialists, together with their parliamentary and diplomatic agents."

The more important agreements were the following:

(1) Anglo-French agreement on Togoland, Sept. 13, 1914, and Kamerun, 1916.

(2) The Anglo French Russian agreement of Mar. 20, 1915, regarding Constantinople, the Straits, Persia, and oil. Britain consented to the annexation by Russia of the Straits and Constantinople in return for a similarly benevolent attitude on Russia's part toward the political aspirations of Britain in other parts

(3) The pledge to Italy (the Treaty of London, Apr 26, 1915) regarding the territories she should receive: the Trentino, the Southern Tirol, Trieste, Gorizia and Gradisca, Istria, Dalmatia, islands off the Dalmatian coast, northern Dalmatia, 12 islands off the coast of Asia Minor, a share in the partition of Asiatic Turkey, an addition to her colonial territory in Africa, and a share in the war indemnity. The treaty contemplated cutting Austria-Hungary off from the sea.

(4) The Russo-French agreement of Apr. 26, 1916, regarding the partition of Asiatic Turkey; Britain to obtain southern Mesopotamia, with Bagdad and two ports in Syria, France to obtain Syria, the Adana vilayet, and western Kurdistan, Russia to obtain Trebizond, Ezerum, Bitlis, Van, and territory in southern Kurdistan

(5) The Sykes-Picot (Anglo-French) agreement of May 9, 1916, regarding the partition of Asiatic Turkey.

(6) The Rumanian treaty (Aug 18, 1916) regarding the partition of Austria-Hungary. Rumania was to receive Transylvania up to the river Theiss, the Bukovina up to the river Pruth, and the Banat.

(7) The Franco-Russian agreement of February-March, 1917, regarding Alsace-Lorraine, the Saar Basin, the left bank of the Rhine, and Russia's western frontier. France recognized "Russia's complete liberty in establishing her western frontiers."

(8) The pledges to Japan, February–March, 1917, regarding German possessions in the Far East. This treaty was imperfectly known before the Peace Conference.

(9) The St Jean de Maurienne Agreement, April, 1917, regarding Italy's prospective share in Asiatic Turkey. Italy was given complete possession of nearly the entire southern half of Anatolia, including the cities of Adalia, Konia, and Smyrna, together with a "zone of influence" northeast of Smyrna.

It is difficult if not impossible to reconcile these secret treaties with the public war aims of the Entente Allies. Certainly the agreements were inconsistent with the promise that the Turkish portions of the Ottoman Empire should have "a secure sovereignty," and with the more general pledge of "free, open-minded, and absolutely impartial adjustment of all colonial claims, based on a strict observance" of the principle that "the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined." The Russian archives were opened just about the time that Wilson was announcing his famous Fourteen Points. Not the least curious feature of the preparedness which was being attempted for the Peace Conference was Wilson's apparent ignorance of both the fact and the contents of these secret agreements. They were published in England in the *Manchester Guardian* and in the United States in the *New York Evening Post*, which said that if there was "one man who has profited by the publication of the secret documents given out by the Russians" it was Woodrow Wilson. Ray Stannard Baker's volumes on Wilson at the Peace Conference make it clear that he was inadequately informed, and, indeed, Wilson confessed as much in his conference with the Senate Committee on Foreign Relations when the Treaty of Versailles was under discussion Had he known in advance of the Conference of the existence of the secret agreements, it is possible that there would have been some cancelation of them. Allied dependence in the summer of 1918 on the United States for money and men was so great that selfish territorial aspirations would have been sacrificed. The safety of the state would have been a more pressing consideration than territorial aggrandizement in the event of a victory at that moment quite uncertain.

Peace Feelers. The historian of the future will have to deal minutely with the question whether the War in Europe could have been brought to an end sooner than Nov. 11, 1918. He will have to consider whether the statesmen, for refusing to agree to an earlier settlement, must not suffer greater condemnation than the generals who at particular moments were found wanting. The verdict to be rendered will be influenced by the hypnotic effect which a sweeping victory has on those who witness it and which it will always have on the historians who discuss it. Consequently, it is natural to expect that German historians will be chiefly interested in the problem. Indeed, one of the first acts of the Reichstag was to appoint a commission to determine whether peace was missed at the time of President Wilson's proposals in the autumn of 1916. The speeches of statesmen for the period 1916–18 and the published correspondence cover 250 closely printed pages (G. Lowes Dickinson, *Documents and Statements Relating to Peace Proposals and War Aims [December, 1916–November, 1918]*, New York, 1919), and this collection does not include revelations which have since been made in various quarters. These secret discussions were by all odds the most important. The historian will surely say that the public pronouncements, apart from Wilson's speeches and a half dozen flashes from other Allied voices, were hasty, insincere, artificial, and forced. Rarely did they rise to the dignity and elevation which would have been worthy of the great issues involved, and which, indeed, were due the millions risking their lives.

Wilson's Attempts.—On Aug. 5, 1914, President Wilson made his first attempt at mediation. He sent an identical message to Emperor William of Germany, Emperor Francis Joseph of Austria-Hungary, Emperor Nicholas of Russia, King George of Great Britain, and President Poincaré of France. He said: "As official head of one of the powers signatory to The Hague Convention, I feel it to be my privilege and my duty, under Article III of that Convention, to say to you in a spirit of most earnest friendship that I should welcome an opportunity to act in the interest of European peace, either now or at any other time that might be thought more suitable, as an occasion to serve you and all concerned in a way that would afford me lasting cause for gratitude and happiness." The belligerents made only formal acknowledgment of this offer. After the German retreat from the Marne, President Wilson, on unofficial suggestions by Count Bernstorff, had Ambassador Gerard sound out the German Chancellor, who replied that since the War had been "forced" on Germany, the President should first appeal to the Entente. Colonel House went abroad for the President during the winter 1914–15 and on his return reported that the moment for peace had not yet come. On June 2, 1915, in discussing the *Lusitania*, President Wilson told Bernstorff that if Germany would give up the use of submarines, he could persuade the English cabinet to agree to abandon the attempt to starve Germany, and he "hoped that this would be the beginning of peace action on a great scale." In January, 1916, Colonel House again went to Europe. He found the chief opposition to peace in Paris and a certain willingness in Berlin and London. Many discussions were held between Bernstorff and Colonel House, in New York City, in order to avoid the publicity which White House conferences would have entailed. "House told me," Bernstorff later reported, "that Wilson no longer had the power to oblige England to obey the practices of international law [this was just after the *Sussex* affair]; American trade was so intimately tied up with the Entente that Wilson could not possibly disturb these trade relations without evoking a terrific storm. On the other hand, he was in a position to obtain a peace without victory, and he intended to do so as soon as an opportunity offered itself. But seeing that such a step would now be universally called pro-German in America, he could only do it when public opinion about relations with Germany had somewhat calmed down. He proposed a pause and hoped without fail to be able to make a beginning of peace mediation toward the end of the summer." Rumania entered the War; the Entente became more certain of victory; and intervention was deferred.

Meanwhile, Bethmann-Hollweg had been thinking of the possibility of peace discussions. Paléologue's memoirs record evidences of approaches, some probably unauthorized, from Berlin, Darmstadt, and Vienna. Russia also had taken soundings. In October, 1916, the Emperor transmitted through Ambassador Gerard a memorandum to the effect that he was willing to entertain a peace offer, but the approaching presidential election caused a delay. Bernstorff endeavored to delay the German overture until Wilson could act, but on Dec. 12, 1916, a few days after the fall of Bucharest, Bethmann-Hollweg issued a note which said that the resistance of the Central Powers could not be broken but that animated "by the desire to stem the flow of blood and to bring the horrors of war to an end, the four allied Powers propose to enter even now into peace negotiations." On December 18 President Wilson issued his famous appeal for peace. He was "somewhat embarrassed to offer it at this particular time, because it may now seem to have been prompted by the recent overtures of the Central Powers. It is in fact in no way associated with them in its origin." To the popular mind this was difficult to believe, but it was true. As Bernstorff later told the Reichstag investigating committee, "the peace note which Wilson despatched on December 18 had been composed as far back as the middle of November but had been thrust by Wilson into his writing-table, because another wave of anti-German feeling swept through the country on account of the Belgian deportations. Colonel House told me that the peace offer which was already drawn up by the middle of November was not sent off by Wilson because he could not be responsible for it in the state of public feeling." On November 24 Bernstorff had telegraphed: "Wilson has commissioned Colonel House to tell me in the strictest confidence that he would undertake an effort for peace as soon as possible, presumably between now and the New Year. But meanwhile he made it a condition that we should discuss peace as little as possible, and that we should allow no new submarine controversies to spring up, in order to prevent a premature refusal by our enemies."

Allied Sentiment.—All the Allies vigorously denounced the German offer as an attempt to divide them. The general feeling was well expressed by the British note: "To enter, on the invitation of Germany proclaiming herself victorious, without any knowledge of the proposals she has to make, into a conference, is to put our heads into a noose." On December 25, while waiting for the Allied reply to her proposal, Germany made an answer to President Wilson's appeal for a definition of war aims and peace terms. The note said nothing at all about terms; it proposed instead "an immediate meeting of delegates of the belligerent states at some neutral place." When the German reply was received, Bernstorff "telegraphed that Lansing had begged him at any rate to communicate our peace terms to him in confidence." The Allies, however, seized the opportunity which President Wilson's appeal offered them. They had not as yet drawn up any coherent programme. They had divided up the spoils in the secret treaties, but their public pronouncements had been general and not particular. The Allied reply pledged wholehearted support of "a League of Nations to ensure peace and justice throughout the world" and then went on to enumerate the essential elements of a satisfactory settlement: the restoration of Belgium, Serbia, and Montenegro, with compensation; the evacuation of French, Russian, and Rumanian territories, with reparation; the liberation of Italians, Slavs, Rumanians, and Czecho-Slovaks from foreign control; the expulsion of Turkey from Europe, and the restitution of provinces previously torn from the Allies by force and against the wishes of their inhabitants.

German Conditions.—On Jan. 11, 1917, Germany and Austria sent notes to the neutral

states declaring that the Entente must bear the responsibility for continuing the bloodshed. Meanwhile preparations were proceeding in Germany for unrestricted submarine warfare; Wilson made his famous "peace without victory" speech to the American Senate (Jan. 22, 1917) and pressed Germany for a statement of her conditions. According to Bernstorff, President Wilson was quite hopeful of the successful outcome of the negotiations. The German Ambassador reported to his government on Jan. 27, 1917, that "Wilson was convinced that he would be able to bring about both peace conferences" and that the Entente note was a bluff. The Chancellor, in a frantic effort to win the race from the military leaders who were insisting on submarines rather than peace talk, did telegraph some terms on January 29. He refused to allow them to be published, "for they would look like weakness." But the documents printed in the report of the Reichstag committee show that the military leaders were not modest in the demands which they proposed to make of the Allies, and it was they, rather than Bethmann-Hollweg, who really governed Germany The Chancellor, before he could even talk to Baron Burian about Austria's terms, had to obtain the consent of the General Field Marshal and the Emperor. The terms discussed included the annexation of Courland and Lithuania; the retention of Briey and Longwy; the return of the colonies with the exception of Kaiochow, the Carolines, and the Marianna Islands, and in compensation therefor the acquisition of the Congo State or a part of it; the indemnification of Germans living abroad, and the incorporation of Luxemburg into the German Empire. In January the Emperor became even more severe and said that the German war aims must be recast. He was then unwilling to allow King Albert to return to Belgium and declared that the coast of Flanders must belong to Germany. But it was too late. Germany would have to fight for these results on the battlefield rather than in the conference room The U-boat campaign could not be postponed; 21 boats had left for their stations and could not be communicated with. The submarine was to bring the United States into the War, and "force without limit" instead of "peace without victory" was thereafter to be Wilson's hope.

The Year 1917.—Meanwhile peace discussions were beginning in another quarter, and they continued through 1917. The time was not unfavorable, and the public manœuvres furnished a not inappropriate screen for the backstairs pourparlers. In July the Reichstag passed its famous "majority resolution" calling for "a peace of understanding and the permanent reconciliation of the peoples." Bethmann-Hollweg had resigned in favor of Michaelis, who in turn was to be replaced in October by Hertling and a semiparliamentary combination which accepted the Reichstag's programme. August found the Pope publicly appealing for peace; Count Czernin made speeches emphasizing disarmament; Russia was demanding a discussion of war aims; the Socialists in the belligerent countries were attempting meetings, and even a Conservative like Lord Lansdowne cried out to stop the slaughter and save European civilization. During the summer of 1917 the morale of France was at its lowest point, and Caporetto, Byng's failure at Cambrai, and the Bolshevik revolution were hardly encouraging to the Allies. President Wilson seemed to be willing that, while no compromise could be made with Prussia, the Allied cause should be strengthened by a diplomatic offensive which might affect the peoples of the Central Powers; and since Austria-Hungary was obviously war-weary, he and Lloyd George thought of the possibility of a separate peace. Any agreement with Germany at this time would have meant Prussian hegemony in the East; the Allies needed no proofs of this, even before Brest-Litovsk. Hence there was an effective veto on an "unclean" peace, and a military offensive on the western front, however horrible and uncertain, was not too high a stake to risk for the defeat of Germany's eastern ambitions.

The Austrian Attempts—This, in brief, was the situation when Austria sued for peace. Emperor Karl, on coming to the throne in November, 1916, had expressed his desire to end the conflict and had called attention to the fact that he had had no share in its beginning. The emissary now employed was Prince Sixtus of Bourbon, the brother of Empress Zita In January the Prince learned from his mother in Switzerland that the Emperor was ready for a secret armistice with Russia and that he was also willing for the restoration of Alsace-Lorraine and the creation of a Jugo-Slav kingdom. In March the Prince, going to negotiate with Poincaré, took with him an autographed letter from the Emperor. The dossier of the Prince has now been published, and it is a document of great interest, both in the facts which it discloses and in the revelations which it makes concerning the mental attitudes of the statesmen who during the War had peace or a continuance of the conflict within their discretion. They consulted no one. It appears from the dossier that Lloyd George, with whom the Prince had several interviews, was sincerely anxious to deflect Austria but was hampered by obligations toward France, Italy, and Russia. President Poincaré, on the other hand, was almost willing to abandon Italy. "France's interest," he declared, "is not only to maintain Austria, but to aggrandize her at the expense of Germany." In a later interview he was almost willing to desert Poland and Rumania; too much had been promised the smaller allies. Ribot appears always to have been a bitter-ender, but if there had been complete willingness on the part of England and France, Italy would have proved a stumblingblock. Sonnino, in Lloyd George's phrase, was "obstinate, difficult, and troublesome." Austria did not propose sufficient territorial concessions to satisfy Italy. Austria's position, indeed, was hopeless. Defeat would mean her dissolution, and victory would mean complete German dominance. Russia and the United States were only imperfectly informed of these transactions. It seems possible that if the decision had rested with Poincaré and Lloyd George, Germany in the spring of 1917 might have found herself separated from her Allies. Austria and France, from time to time, continued their discussions, through meetings between Count Revertera and Count Armand in Switzerland.

The Pope's Efforts.—Other unpublished conversations are alluded to in the Prince Sixtus document. Mention is made of one between Bulgaria and England, one between Austria and Italy, and several between Austria and Russia. On Aug. 14, 1917, the Pope issued a peace note,

to which President Wilson replied that the rulers of Germany could not be trusted. At the same time the Vatican was making private efforts; it did secure Germany's consent to the restoration of Belgium, but the German government took the position that conversations were possible only if the conflict ended in a draw.

Germany.—Meanwhile, also, Germany herself was "feeling out" France. Proposals were made in June and August by Baron Lancken, the political director of the German government in Brussels, that Briand, who was in Ribot's cabinet, should go to Switzerland to meet Lancken or even the German Chancellor himself. The territorial suggestions were not dissimilar to those in the Sixtus negotiation. Austrian territory, Trieste and Trentino, was to be ceded to Italy, just as in the Sixtus attempt Austria was free with Alsace-Lorraine. Germany, according to Briand's later explanation in the Chamber, was willing to discuss the restoration and even compensation of Belgium and was willing to compromise on Alsace-Lorraine. Briand asked permission to meet Lancken, and in this he was supported by Belgium and Rumania; but Ribot refused. Briand then asked that the Allies be consulted, and to this Ribot consented, but Briand later expressed his opinion that the proposals were presented in such a way that their rejection was probable. President Wilson and Kerensky were informed only after the incident had been concluded. In the following month there was a new French Cabinet; Painlevé became Prime Minister, with Ribot as Minister for Foreign Affairs There was a secret session of the Chamber of Deputies at which Briand revealed the proposals made by Germany and assailed Ribot for his rejection of them without further investigation. Ribot was forced to resign. Villalobar, the Spanish Minister at Brussels, inquired in London as to the British attitude toward the integrity of Germany, indemnities, and economic boycotts. A conference of Allied ministers agreed that this was another attempt to separate them. In January, 1918, the Allies' aims were more explicitly defined in Wilson's Fourteen Points as well as speeches by Lloyd George. Discussions behind the scenes still proceeded. General Smuts and Count Mensdorff met secretly in Switzerland; Armand and Revertera met again; the Bavarian Törring-Jettenback and the Belgian Minister at Bern saw each other, and the King of Denmark asked Germany for her terms.

Final Austrian Attempt.—One other overture demands special mention, since, in the opinion of R. W. Seton-Watson, a leading authority on eastern European politics, it alone had any serious prospect of success. In February, 1918, the late Professor Lammasch, known to Americans for his service on The Hague Court and his connection with the Carnegie Endowment for International Peace, made a direct appeal to Washington in the name of Emperor Karl. President Wilson was asked to make a pronouncement that the United States regarded Germany and Austria-Hungary in different lights, and that Austria-Hungary would receive favorable terms if she granted her subject nationalities autonomy. The speech was made to Congress on Feb. 11, 1918. "Count Czernin," said President Wilson, "seems to see the fundamental elements of peace with clear eyes and does not seek to obscure them." Lammasch then introduced an autonomy bill in the Austrian Herrenhaus, but he was bitterly attacked. Germany got wind of the scheme and the Austrian deflection was checked.

Most of the disclosures made up to 1924 as to these peace feelers appeared in private memoirs. One motive for publication has been to accuse various personalities of their responsibilty for continuing the struggle, and both the source and the tendencious character of the documents invalidate them as trustworthy evidence for the judgment of Allied statesmen. It would seem as if the time had come for the complete disclosure of every manœuvre and gesture for peace. If full disclosures are much longer withheld, the suspicion may develop that the Allied governments have something to conceal. If, on the other hand, the bar to peace was always the attitude of the German government, then publication would be to the advantage of the Allies. In either case, it is a striking fact that so few men had the decision of peace in their hands, subject to no check except a vague and on occasion controllable public opinion. The diplomats of the Allied democracies were no less secret and autocratic than those of the Central Powers.

War Aims. Late in 1917 and early in 1918 the increasing war-weariness, the knowledge of the imperialistic character of the Allied Secret Treaties, and the failure of the peace moves to hasten the end of the War, quickened the impatience of the Allied peoples. This attitude manifested itself in the statement of war aims incorporated in the British Labor Memorandum of December, 1917. Founded on Wilson's precept that "the world must be made safe for democracy," and taking a stand categorically against a war for conquest, the Labor statement called for the establishment of a League of Nations, restoration of Belgium, self-determination for Alsace-Lorraine and the Italian peoples in the Dual Monarchy, civil and political liberties for the Jews, the reorganization of the Balkans, and recognition of the national claims of the Czecho-Slovaks and the Jugo-Slavs. This was followed by the speech of Lloyd George on Jan. 5, 1918, which accepted the Labor position in substance. The following specific items are interesting to note. The Allies were not fighting against the German people and were not seeking to destroy or disrupt the German people or Germany; they were not fighting to destroy Austria-Hungary or to seize Constantinople and Thrace, "which are predominantly Turkish in race." But it was President Wilson's famous speech of January 8, before Congress, that overshadowed all other such statements. This contained the Fourteen Points that served as the basis for the German Armistice. These points were:

I. Open covenants of peace, openly arrived at; after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view.

II. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

III. The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

IV Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

V. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined.

VI. The evacuation of all Russian territory, and such a settlement of all questions affecting Russia as will secure the best and freest cooperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy, and assure her of a sincere welcome into the society of free nations under institutions of her own choosing; and, more than a welcome, assistance also of every kind that she may need and may herself desire. The treatment accorded Russia by her sister nations in the months to come will be the acid test of their good will, of their comprehension of her needs as distinguished from their own interests, and of their intelligent and unselfish sympathy.

VII. Belgium, the whole world will agree, must be evacuated and restored without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

VIII. All French territory should be freed and the invaded portions restored; and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which has unsettled the peace of the world for nearly 50 years, should be righted, in order that peace may once more be made secure in the interest of all.

IX. A readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality

X. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development

XI. Rumania, Serbia, and Montenegro should be evacuated, occupied territories restored, Serbia accorded free and secure access to the sea, and the relations of the several Balkan states to one another determined by friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan states should be entered into.

XII. The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees

XIII. An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

XIV. A general association of nations must be formed, under specific covenants, for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike

On Jan. 25, 1918, Count von Hertling for Germany and Count Czernin for Austria-Hungary disavowed any imperialistic designs; but the conduct of the German Military Headquarters at the Brest-Litovsk negotiations once more indicated that the fair promises of German statesmen were to be lightly regarded. On February 11, President Wilson set forth, in a reply to the above speeches, "Four Principles" on the acceptance of which a discussion of the terms of peace would be possible. These were, in brief: (1) each part of the final settlement to be based on the essential justice of that particular case; (2) people and provinces not to be bartered from one sovereignty to another as if they were chattels; (3) every territorial settlement to be made in the interest of the populations concerned; (4) national aspirations to be satisfied to the utmost without introduction or perpetuation of elements of discord. On July 4, another speech added to the theoretical character of the Wilson conception of a just peace. Here, President Wilson laid down "Four Ends" which "can be put into a single sentence. What we seek is the reign of law, based upon the consent of the governed and sustained by the organized opinion of mankind." Finally, on September 27, there came these "Five Particulars" to round out finally the Wilsonian principles:

I. The impartial justice meted out must involve no discrimination between those to whom we wished to be just and those to whom we did not wish to be just.

II. No special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all.

III. There can be no leagues or alliances or special covenants and understandings within the general and common family of the League of Nations

IV And, more specifically, there can be no special selfish economic combinations within the League, and no employment of any form of economic boycott or exclusion, except as the power of economic penalty, by exclusion from the markets of the world, may be vested in the League of Nations itself as a means of discipline and control.

V All international agreements and treaties of every kind must be made known in their entirety to the rest of the world.

On October 4 a German peace note, despatched to President Wilson, accepted the Fourteen Points as the basis of a peace; on October 7, an Austro-Hungarian note agreed to the principles adumbrated in the Fourteen Points, the Four Principles, and the Five Particulars The rest of the world, too, looked on these lofty utterances as the only possible elements of the creation of a just and enduring settlement.

Russia. The intervention of the United States and the Russian revolution marked the turning-point of the War In a way the two events were complementary, but on the other hand they also served to neutralize each other Russian participation in the fight against "autocracy" had always been an anomaly; the régime of the Czar was the most autocratic in Europe. The Russian revolution, with the ensuing war-weariness and a separate peace, would have robbed the Entente of victory but for aid from America. The revolution occurred three weeks before the United States declared war The new government announced that its object was "to establish a durable peace on the basis of the rights of nations to decide their own destinies." There was a turn to the Left in the latter part of May, and Kerensky, who came to power, appealed to the Allies for a restatement of their war aims. Little moral assistance was given him, but it was indispensable if Kerensky was to make concessions to the growing power of the Soviets and at the same time remain loyal to the Entente. The Allied leaders, moreover, were hostile to the idea of a labor conference at Stockholm to discuss the possibilities of peace; Lloyd George was willing, but his colleagues disagreed. Kerensky was able to spur his southern armies to one offensive, but its strength was shortlived. In November Kerensky was overthrown by the Bolsheviks. Lenine became president of the Council of People's Commissars, and his first aim was to make peace An armistice with Germany was signed on December 3, and negotiations began at Brest-Litovsk on December 22. Germany insisted on retaining her conquests of Russian territory, she claimed that Lithuania, Courland, Poland and Esthonia desired separation from Russia.

Trotsky, who was Russian foreign minister, denounced this action and maintained that "self-determination" should be allowed the populations affected. On March 3 the peace was signed, and it was ratified a fortnight later by the Congress of Soviets. By the agreement Germany promised not to send troops from the Eastern to the Western Front, but she ignored this pledge. An offensive on the West was her chief purpose in securing the peace. The defection of Russia thus made possible the operations which began in March, 1918. It also contributed to a redefinition of the war aims of the Entente, an action which should have been taken while Kerensky was in power. Peace with Rumania was signed on May 7.

Bulgaria and Turkey. There was little discussion of politics or diplomacy during the summer of 1917. The issue of the War was being determined by Ludendorff's great offensive. (See WAR IN EUROPE, *Eastern Front*) German defeat was foreshadowed by Foch's counteroffensive which began on July 18. Two months later peace began to be discussed. On September 15 Austria issued an appeal for the verbal discussion of peace. President Wilson replied that his terms had already been stated in the Fourteen Points and that a conference was impossible. Ten days later Bulgaria collapsed. Before the month was out the Turkish army in northern Mesopotamia surrendered; an armistice was signed, and the Straits were opened to the Allies.

The Armistices. Austria-Hungary, meanwhile, was having internal troubles. At different times during the summer of 1918, France, Great Britain, and the United States recognized the belligerency or independence of the Czecho-Slovaks, and thereafter the Slav deputies in the Austrian Reichsrat openly defied the government. In the event of Allied victory, the Jugo-Slavian, Italian, and Rumanian parts of Austria-Hungary were, by treaties and engagements, already negotiated to Serbia, Italy, and Rumania respectively. The Bulgarian surrender was the beginning of the end. At the opening of the Austrian Reichsrat three days later, Prime Minister Hussarek delivered a pathetically ludicrous address about "setting" the Austrian "house in order" and "considering and solving the problem of autonomy for the different nationalities." Mere autonomy within the Dual Monarchy was now hopelessly anachronous. The Monarchy was doomed, as were its coequal parts, the Empire and the Kingdom. On October 4, Germany, Austria-Hungary, and Turkey offered to negotiate peace on the basis of President Wilson's Fourteen Points and subsequent addresses. On October 8 Wilson asked the German Chancellor whether he was "speaking merely for the constituted authorities of the Empire." By wholly ignoring the Austro-Hungarian government he clearly indicated that he regarded that government as incompetent to speak for its peoples. Thereupon a panicky attempt was made to create a coalition cabinet which would be somewhat representative of the various nationalities. The Czechs and other nationalities refused to be led into such a trap. There were also evidences that Hungary was ready to scuttle the sinking Austrian ship in the hope of appearing herself in the guise of a submerged and oppressed nationality.

President Wilson's note of October 18 in effect demanded as a condition for the negotiation of peace the independence of the Czecho-Slovaks and Jugo-Slavs. On the same day, the Czecho-Slovak National Council, sitting in Paris, declared the independence of Czecho-Slovakia and constituted itself the provisional government of the country. The German members of the Austrian *Abgeordnetenhaus*, realizing that the end was at hand and ignoring both the Dual Monarchy and the Austrian Empire, constituted themselves a provisional national assembly to represent the German-Austrian people at the peace table. Meanwhile there had been a change of government in Germany. Prince Max of Baden had been appointed Chancellor and his cabinet included representatives of labor. On October 8 Wilson asked three questions: Did Germany accept the terms of the Fourteen Points and subsequent addresses? Would troops be withdrawn from invaded territory? Did the Chancellor speak merely for the Imperial authorities who had so far conducted the War? Further interchanges were necessary before Germany answered these questions to Wilson's satisfaction, and on October 23 he transmitted the correspondence to the Allies. Ludendorff resigned on October 27, and the German retreat became almost a rout. On November 4 the Allies announced that they were willing to make peace on the basis of the Fourteen Points and the principles enunciated in subsequent addresses of Wilson. They reserved complete freedom of action in respect of the interpretation to be given the phrase "freedom of the seas," and they understood by the "restoration" of the invaded territories "compensation for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea, and from the air." A republic was proclaimed in Germany; the Kaiser abdicated on November 9, and two days later the Armistice was accepted. Wilson's speeches were to form the basis of the peace terms to be agreed on at the Paris Conference, but there, they were to give way frequently to the secret treaties. See PEACE CONFERENCE AND TREATIES; WAR IN EUROPE

WAR CASUALTIES. The loss of human life was greater in the War of 1914–18 than in any previous conflict recorded by history. Almost twice as many men were killed as in all the wars from 1790 to 1913 inclusive. Among the major belligerents, Germany and Russia suffered the greatest loss in men killed and wounded, but in proportion to population, France paid an even heavier toll than Germany. That the Allies collectively suffered so much more heavily than the Central Powers was due to the fact that at least during the early stages of the War, the Central Powers were much better equipped with machine guns and artillery, whereas Russia, the heaviest Allied loser, sent her men into battle ill-equipped, often without artillery support and sometimes without ammunition. The table on page 1386 gives the best available figures for military casualties. In a few cases, notably for Turkey and Russia, only approximate estimates can be given. The figures given in the column headed "Wounded" do not indicate the number of different individuals wounded, since many individuals were wounded several times and hence were repeatedly listed as casualties. A fairly high percentage, however, of wound casualties resulted in permanent and serious injury. In the case of France, for example, the *mutilés* or war-cripples numbered

740,000. If France be taken as typical, it is obvious that the number of men killed, permanently crippled, or permanently injured by gas, must be well over 12,000,000.

Country	Men mobilized	Killed and died [a]	Wounded	Prisoners and missing	Total casualties	Casualties in percentage of total mobilized
Russia	12,000,000	1,700,000	4,950,000	2,500,000	9,150,000	76.3
France	8,410,000	1,357,800	4,266,000	537,000	6,160,800	73.3
British Empire	8,904,467	908,371	2,090,212	191,652	3,190 235	35.8
Italy	5,615,000	650,000	947,000	600,000	2,197,000	39.1

[a] Includes deaths from all causes, in army.
[b] Includes marines serving with army.
[c] Includes 14 500 "died of wounds."

endanger the heterogeneous Austrian dominions. Consequently the work of the Congress of Vienna was an effort to establish the status quo ante bellum. As a result of its endeavors, there were many violations of the principle of nationality Revolutionary periods, following one another during the nineteenth century, endeavored to undo the work of the Congress. Some of these were successful. For example, Belgium was separated from Holland, and Venetia and other Italian-speaking sections were taken away from Austria and joined to the newly-created Italian kingdom. At the close of the nineteenth century, however, several situations remained which clearly violated the principle of national sovereignty. Alsace and Lorraine, although not an inheritance of the French Revolution, clearly represented a violation of the above-mentioned principle. The newly-created German Empire annexed these provinces for reasons partly economic and partly political. French aggression following the battle of Jena, and the rich coal and iron mines in the region, were the fundamental reasons for annexation The French people were constantly aware of the challenge to regain these lost provinces, and Bismarck used the French attitude as justification of his programme of huge military armaments in Germany.

Nowhere else in Europe was the problem of nationality so acute during the nineteenth and early twentieth centuries as in Austria-Hungary. The very existence of the Austro-Hungarian monarchy was a constant challenge to the principle of nationality. Logically carried out, this principle would mean the disappearance of Austria-Hungary and the distribution of its territories among the surrounding nations, or the creation of new ones. The appreciation of this fact made the Austrian authorities apprehensive of all nationalist movements and especially of that of the southern Slavs, in Serbia, Montenegro, Bosnia, etc. As will be seen, it was the outgrowth of one of these movements that led to the outbreak of the War. The Balkan states presented a peculiarly vexing problem in the realization of the principle of nationality. The intricate mixture of racial groups in this region made it an almost hopeless

WAR FINANCING, AMERICAN. See FINANCE AND BANKING, *War Banking and Finance.*

WAR IN EUROPE. On June 28, 1914, the Austrian heir apparent, Archduke Francis Ferdinand (see VOL. IX), and his wife were assassinated at Sarajevo, the capital of Bosnia This set in motion a train of events which culminated in the terrible catastrophe of the War. It is clear, however, that this crime was not the real cause of the tremendous struggle which many of the statesmen and diplomats of Europe had anticipated and which all had feared for many years The underlying causes of this tremendous struggle reach far back into the past and cannot be reduced to any simple formula. Some knowledge of the important political and economic forces shaping the history of Europe during the past century is necessary. Among the many and complex influences suggested as causes of the War, three forces appear to have contributed most directly to the critical situation of Europe in 1914 These were (1) the clashing of national interests and ideals, (2) the maintenance of a system of military alliances, and (3) the economic rivalry among the nations of Europe.

National Antagonisms. Viewed broadly, the political history of Europe in the nineteenth century divides into two movements inherited from the French Revolution and Napoleonic era: (1) the growth of democracy, and (2) the realization of national liberty. When the diplomats of the great powers met at the Congress of Vienna, 1814-1815, to readjust the map of Europe, many expressed the hope that the Congress would be guided in its work by these two principles Unfortunately they were ignored whenever it was necessary to do so in order to satisfy the dynastic and personal influences which dominated the Congress In the first place these principles were anathema to the reactionaries, and in the second place Metternich, the ultraconservative Austrian Chancellor who dominated the Congress, realized that encouragement of the national principle would

task to arrange geographical boundaries to correspond with national lines. The problem was complicated, moreover, by the clashing of the interests of the great European powers, especially Austria and Russia, in this territory. The condition of chronic disorder and strife in this region during the nineteenth century was a source of almost constant concern to the diplomats of the great European states. While the triumph of the ideal of nationality did much to advance European civilization, it was not an unmixed blessing. Too often national patriotism became a fetish. Love of one's country meant a lack of appreciation or a contempt for the people of other countries, a feeling that the *Kultur* of one's country was not only different from but distinctly superior to that of any other country. From this it naturally followed that it was a laudable ambition to wish to impose one's superior civilization on an inferior people From this developed the inevitable antagonism of national interests which dominated European politics during the nineteenth century. In its extreme form this national spirit found expression in movements to unite various related ethnic and racial groups into one political group Such movements were more or less prominent in Germany, Russia, and the Balkan states, under the names of Pan-Germanism, Pan-Slavism, Pan-Serbianism, etc. It is doubtful whether any of these movements had passed beyond the state of vague aspirations held by a comparatively small group of people. As contributing causes of the War, the Pan-Slavic and Pan-Serbian movements were of some importance. The growth of such propaganda was a source of concern to Austria-Hungary, with its large Slavic population. In Germany, although the movement was limited to a comparatively small group, it was very active. Prominent historians, scientists, and philosophers expounded its views, while numerous societies were formed to advance German ideas of culture and civilization throughout the civilized world.

Military Alliances. One of the chief results of the prevalent spirit of intense nationalism was the feeling that it was necessary to defend it with huge armaments. Everywhere the doctrine of military preparedness was advocated, and it bore fruit in the tremendous standing armies and huge navies of the different European countries. It led also to the grouping of the great European powers into two hostile military alliances. The rise of Germany and Italy between 1860 and 1870 seriously disturbed the old European Concert formed at the Congress of Vienna. Bismarck was the guiding spirit in the formation of the first alliance. In order to isolate France he strove to unite Austria, Russia, and Germany. Russia soon withdrew because of inability to get along with Austria. Bismarck then bound Germany and Austria closer together, and in 1882 Italy joined the agreement, thereby forming the Triple Alliance. This was an unnatural alliance for Italy, inasmuch as her interests and Austria's were almost diametrically opposed both in Italia Irredenta and in the Balkans. France had checkmated Italy in Tunis, however, and this, with her support of the temporal power of the Pope, during the period of the Italian struggle for unity, led Italy to make this unnatural and, as later events proved, impossible alliance. It was not to be expected that the other powers of Europe would view this Triple Alliance without concern. France and Russia formed a Dual Alliance (1895), and finally Great Britain, aroused by the threatening naval policy of Germany, abandoned her policy of "splendid isolation" and joined with France and Russia to form a second diplomatic group known as the Triple Entente. Largely through the efforts of Sir Edward Grey, *misunderstandings* among these three were cleared up and a "diplomatic group" established. The precise nature of this understanding was indefinite; no treaty agreement specified its scope. The formation of these two rival groups created a situation in Europe where every disturbance of the political or military status quo brought on a crisis. After 1905, Europe passed through several such crises, each one increasing the tension among the great powers and making the maintenance of peace more difficult.

The first crisis came in 1905, over the situation in Morocco. France in her negotiations with England had been granted a free hand in Morocco, and was engaged at this time in penetrating the country economically and politically. Germany considered this an opportune moment to assert herself and get a "place in the sun." She had definitely abandoned the Bismarck policy of indifference to colonial expansion and had determined to acquire colonies either in unclaimed territory or by taking those already under the sovereignty of another power. On Mar 21, 1905, the German Emperor, while on a voyage to Constantinople, disembarked at Tangier and encouraged the Sultan to reject the scheme of reforms proposed by France. He also succeeded in forcing France to submit the whole Moroccan question to a conference of the powers held at Algeciras in January, 1906. France won a distinct diplomatic victory when England strongly supported her and Italy refused to support her ally. One phase of Germany's policy of colonial and commercial expansion contemplated the extension of Teutonic commercial and political interests in the Balkans and Turkey. In this *Drang nach Osten*, Germany, in conjunction with Austria, hoped to create a great economic if not political sphere of influence, extending through the Balkans to Constantinople and thence through Turkey in Asia to the Persian Gulf. German engineers and German capitalists began to develop Turkish resources. German military officials trained the Turkish forces. In July, 1908, a revolution led by the Young Turks broke out in Constantinople. Taking advantage of this situation, Bulgaria annexed eastern Rumelia and declared her complete independence of Turkey. Austria annexed Bosnia and Herzegovina. Although Italy and Serbia were aroused by this action, Germany stood by her ally, and Russia was too weakened by the Russo-Japanese War to do more than protest feebly. The Teutonic allies had scored a distinct diplomatic success and another European crisis was passed. In 1911, a second Moroccan crisis brought war dangerously near. This was the so-called Agadir incident. It resulted in a compromise by which Germany recognized France's predominant interest in Morocco in return for 100,000 square miles of territory in the French Congo. The same year witnessed the Turco-Italian War, during which Germany was compelled to stand by and permit her protégé, Turkey, to be despoiled by her ally, Italy.

The Turco-Italian War was followed by a widespread upheaval in the Balkans. The Greeks, Bulgarians, Montenegrins, and Serbs, strongly resenting the attempt of the Young Turks to Ottomanize them, patched up their differences and organized the Balkan League. Despite the desire of the large powers to maintain the status quo in the Balkans, the League declared war on Turkey in October, 1912, and defeated her. A second Balkan war followed a dispute over the division of the spoils. Serbia, Greece, and Montenegro combined against Bulgaria and Rumania, and Turkey sided with them. The intervention of the great powers resulted in the establishment of an autonomous Albania under the kingship of Prince William of Wied. Germany and Austria were keenly disappointed as a result of the Balkan wars Turkey had been practically driven from Europe, and the strengthening of the Balkan states and Russian influence in the peninsula checked the plans of Austria to reach the Ægean Sea at Saloniki. Germany's answer to her virtual defeat in the Balkans was the introduction of the Army Bill of 1913, which added 136,000 men and officers to the peace footing of the army. France replied by increasing her military service from two to three years Russia, Austria-Hungary, and even the smaller nations of Europe caught the contagious army fever and either increased the peace footing of their armies or spent huge sums in further military preparations. Germany constructed strategic railways leading up to the Belgian frontier, and Russia projected construction of railways that would facilitate mobilization against Germany. A veritable panic was created in the spring of 1914 by the charges and countercharges appearing in the press of the various interested countries.

Economic Causes. At the close of the eighteenth century there occurred in Europe a complete transformation of industrial conditions, known as the industrial revolution. England was the first country to feel the effects of this change. In time, the industrial revolution reached other countries: France in the period after 1830, the United States in the period after the Civil War, and Germany after 1880. The great industrial interests in these countries began to compete with those of England for the control of the markets of the world. England had the advantage of having vast colonial possessions which might serve both as a market for her manufactured products and as a field for the investment of surplus capital in the development of their natural resources. France and the United States, to a lesser degree, also enjoyed this advantage. Germany, on the other hand, because of her later appearance as a world power, was practically without colonial possessions of any potential power She felt that her industrial development was being hampered through no fault of her own but simply because the best parts of the world had been appropriated by others. Despite this unfavorable position in colonial affairs, Germany prospered commercially and industrially to a marvelous degree. By German apologists for the War, Great Britain is bitterly accused of envying German prosperity and of welcoming the War as an opportunity to crush German industrial and commercial activity. On the other hand, Germany is accused of waging war for economic aggrandizement Two factors worked together to weld the many petty German states into a united nation. One was the army and the other the industrial capitalists. After the Franco-Prussian War, these two groups demanded a protective tariff. The army class, composed almost entirely of landholding aristocrats, demanded a high tariff on farm products and a protective tariff on manufactured articles. Both groups desired to stifle competition in the home market. The tariff adopted in 1879 had far-reaching results. It led to distrust on the part of Russia and Germany for each other In 1904, a 10-year reciprocity agreement was signed, whereby each country made certain reductions in its tariff duties. The Russians felt that the Germans had got the best of the bargain. In 1914, as the date approached for the renewal or modification of the treaty, fear was expressed in the German press lest Russia's improved army would enable her to demand more favorable terms In this fashion the desire of each nation to tax foreign imports and at the same time to obtain free admission of its own products into foreign countries stimulated militarism and provoked war-like sentiments among the powers. The United Kingdom adhered to its free trade policy and with few exceptions admitted the products of all lands on equal footing The British self-governing colonies, however, had adopted protection.

Whether because of the protective tariff wall or because of other causes, the business interests of the Empire prospered mightily. By 1912, British foreign commerce excelled the German by about $1,300,000,000; but German commerce had trebled itself since 1883, while British commerce had not quite doubled. The German government derived rich revenues from the customs duties on an expanding commerce, and viewed with satisfaction the prodigious increase in wealth and population (population increased from 41,000,000 to 66,000,000 between 1871 and 1912) which furnished men and money for an ever-growing army. The landowning and industrial classes considered the army a protection and insurance for their interests. In one respect, however, the German business community was dissatisfied. The German merchant marine, although it had rapidly expanded, was still four times outweighed by British shipping. Great Britain's superiority was ascribed to her earlier economic development, to the fact that Germany had very little Atlantic seacoast and to the superiority of the British navy. Germany, therefore, set herself to overcome these handicaps. Undoubtedly many German businessmen desired the overthrow of the British naval power and the acquisition of an Atlantic seaport such as Ostend in Belgium. Desires just as strong were urging Russia on to Constantinople and the southern Baltic, Serbia on to the Adriatic, and Austria-Hungary on to Saloniki.

In the carving out of a colonial empire, the interests of the industrial and commercial classes also clashed. In the last quarter of the nineteenth century certain groups of businessmen awoke to the opportunities which the vast uncivilized areas of Africa and Oceania offered for the sale of cheap cotton goods, cheap liquors, and other manufactures, for the highly remunerative investment of money in the construction of railways, the development of mines and the traffic in rubber, ivory and oil. King Leopold of Belgium, one of the first to realize the opportunity, acquired control of the Congo region in the heart of Africa. France carved out a

mighty colonial empire, and Great Britain added to hers. Germany, a belated arrival in the field, was permitted, even encouraged by the British government, to acquire territories in Africa; but when Germany challenged the French in Morocco and appeared envious of the British and French possessions, the prospect of a war for world empire began to fill Europe with uneasy forebodings. Concessions as well as colonies were contended for by German, French and British capitalists. For example, when, in 1914, Bulgaria, in return for a loan, arranged to concede to German capitalists valuable railway and mining privileges in Bulgaria, a rival bid was unsuccessfully made by the French. The financing of the Bagdad railroad occasioned considerable rivalry among France, Germany and Great Britain until an agreement was reached Each nation raised an envious outcry when a competing nation secured for itself some new economic plum. In 1914, German interests maintained that they were being outstripped by the other powers; that the English were greedily helping themselves to the oil product of Persia and striving to secure the oil fields of Latin America; that the French capitalists were securing new railway contracts in China, in Russia, and in Greece.

Of all economic interests inimical to peace, the most dangerous was the arms-manufacturing business. In Germany, the Krupps were accused of stirring up hostility between France and Germany in order to obtain larger orders for arms Every army bill, every dreadnought meant profits for the armament firms. The Balkan wars were fought with weapons forged in Germany and France. English firms—Armstrong and Vickers and Witworth—were engaged to build an ordnance factory in Russia and to construct battleships for Spain, for Brazil, for Turkey. For the armament manufacturers of all nations, the War was a golden opportunity.

Finally a word may be added regarding the banking interests and the War. The panic and consternation in financial circles at the outbreak of the War have been cited as conclusive proof that capital did not want the War. While there is doubtless much truth in this reasoning, the fact must not be overlooked that in panics large fortunes are won as well as lost. The huge war loans, moreover, offered unexampled opportunities for financial speculation.

OUTBREAK OF THE WAR AND NEUTRAL NATIONS

The assassination of the Archduke Francis Ferdinand on June 28, 1914, was followed, on July 23, by the presentation of a note to Serbia by Count Berchtold, the Austro-Hungarian Foreign Minister. The note began by recalling the declaration made by Serbia on Mar. 31, 1909, wherein Serbia recognized the fait accompli regarding Bosnia and agreed to renounce any attitude of protest or opposition to the annexation of Bosnia to Austria. The Austrian note then went on to complain that Serbia had not lived up to this undertaking, and had made it necessary for Austria to take action to protect herself against the Pan-Serbian propaganda. Austria insisted that Serbia should make an official and public condemnation of this propaganda and express regret at its consequences The note then submitted 10 specific demands and required an answer from Serbia within 48 hours of the presentation of the note. These demands required that Serbia should suppress every publication that excited hatred of the Dual Monarchy; that the Serbian government dissolve certain societies accused of fomenting the propaganda hostile to Austria; that teachers guilty of instigating hatred of Austria be dismissed and that objectionable matter in the textbooks be eliminated; that Serbia dismiss from her army and governmental employ all officers and officials found taking part in the propaganda; that Serbia accept the collaboration of agents of the Austro-Hungarian government in suppression of the subversive movement against Austria; that Austro-Hungarian representatives be allowed to take part in the investigation of persons in Serbia accused of complicity in the murder of the Archduke; that Serbia take action against two specified officials who were accused of complicity in the crime at Sarajevo; that Serbia take effective measures to stop the smuggling of arms and ammunition across her border; and, finally, that Serbia give explanation of the expressions of hostility toward Austria-Hungary on the part of certain high Serbian officials.

The publication of this note immediately aroused great apprehension in the chancellories of the European powers. It was clear that Europe was confronted by another serious crisis. The first move of Sir Edward Grey, the British Foreign Minister, was to urge on Austria-Hungary the necessity of extending the time limit of the ultimatum. M. Sazonov, the Russian Foreign Minister, strongly supported him in this. Austria flatly refused any extension of time and they then turned their efforts toward the persuasion of Serbia to accept, as far as possible, the demands made by Austria.

The Serbian Reply. The Serbian reply was handed to the Austrian minister on July 25, only two minutes before the expiration of the time limit. Most of the Austrian demands were granted with slight verbal changes. There were two points, however, with which Serbia did not comply: (1) To the demand that Serbia accept the collaboration of agents of the Austrian government in the suppression of the subversive movement directed against the territorial integrity of the Dual Monarchy, Serbia replied that she did not understand exactly the meaning of the demand but that she was ready to accept such collaboration as should conform to the principles of international law and criminal procedure. (The Austrian rejoinder stated that it was not a question of international law but of the exercise of police powers which could be settled by agreement between the parties concerned.) (2) The demand made by Austria that Austrian officials be permitted to take part in the investigation relating to the judicial proceeding in Serbia against persons involved in the Serajevo crime, the Serbian government would not concede, on the ground that such action would violate the Serbian constitution. (The Austrian rejoinder accused the Serbian government of deliberately misrepresenting the Austrian demand, which contemplated simply a participation in the preliminary investigation to the judicial proceedings.) Finally, the Serbian government agreed, in case the Austrian government should find the reply unsatisfactory, to submit the disputed questions to The Hague tribunal or the Great Powers for decision. Austria considered Serbia's reply entirely unsatisfactory. This meant war unless

some unforeseen action of the Great Powers checked it.

The Russian Ambassador to Vienna stated on July 24 that "any action taken by Austria to humiliate Serbia could not leave Russia indifferent." Russia felt that the crushing of Serbia would reduce her to a vassal state of Austria, and that this would imperil the balance of power in the Balkans. In view of this situation the Russian Foreign Minister stated that Russia would mobilize against Austria on the day that the Austrian army crossed the Serbian frontier. This determined attitude rendered futile any efforts the other powers might make to localize the struggle. Germany's position was fairly well defined by repeated statements that it was Austria's affair but, if any other power interfered, her interests were vitally affected. On July 26, Sir Edward Grey suggested a conference of the representatives of the four powers, England, France, Germany and Italy, for the purpose of discovering an issue which would prevent complications between Austria and Russia. To this suggestion France and Italy agreed; Germany, however, declined to fall in with this plan. The German Foreign Minister stated that "a conference such as Sir Edward Grey suggested would amount to a court of arbitration and could not, in his opinion, be called together except at the request of Austria and Russia," and furthermore, that he did not think it (the conference) would be effective, because such a conference would, in his opinion, have had the appearance of an Areopagus consisting of two powers of each group sitting in judgment upon the two remaining powers.

Direct negotiations between Russia and Austria were unsuccessful, Austria refusing to consider a modification of her ultimatum to Serbia. Further efforts on the part of England to have Germany propose some formula which would be acceptable proved unavailing, and on July 28, 1914, Austria declared war on Serbia. This action on the part of Austria appears explicable on one of two grounds. Either she was convinced that Russia was bluffing and would back down, as she did in 1908, or else Austria was prepared, deliberately, to precipitate a European war.

Germany and Russia. Russia had continuously maintained that the fate of Serbia was of great concern to herself, and as a result of the Serbian note she declared partial mobilization against Austria. These military preparations caused frantic efforts on the part of the various governments to prevent a general European conflagration. On July 29, Sir Edward Grey urged that "the German government should suggest any method by which the influence of the four powers could be used to prevent war between Austria and Russia." Italy and France agreed. Germany agreed to the extent of urging Austria to renew her negotiations with Russia. At the same time, Russia was to prepare a formula that would be satisfactory to herself. This was done, but it was entirely unsatisfactory to Austria and Germany. Sir Edward Grey brought additional pressure to bear upon Germany. Germany, on her part, brought pressure to bear on Austria to agree to discuss with Russia the terms of the Austrian ultimatum, and at the last moment, on July 31, Austria agreed to do so. This slender hope of avoiding a world-wide catastrophe was nullified by the demand made by Germany that Russia should cease her military preparations and demobolize her army. Russia made no reply to this ultimatum and at 5 P.M. on August 1, the Russian government was notified that Germany considered a state of war existed between the two countries.

Germany and France. At the same time that Germany presented the ultimatum to Russia, a communication was sent to France informing her of Germany's action and asking what attitude France would take in the event of war between Germany and Russia. An answer was demanded within 18 hours. To this demand the French Premier replied on August 1 that "France would take such action as her interests might require" Despite this unsatisfactory answer the German Ambassador did not leave Paris until August 3. In the meantime, charges and countercharges were made by the French and German authorities that warlike moves had been made on the frontier.

Great Britain and Germany. From the first it was evident that the question of England's attitude in the face of the great European crisis was of the most vital importance. Russia and France continually urged upon her the necessity of coming out definitely and stating that she would firmly support her allies. Sir Edward Grey refused to do this, arguing that he could accomplish more as a mediator. Germany fully appreciated the importance of keeping Great Britain neutral if possible The German Chancellor requested that Sir Edward Grey formulate conditions on which Great Britain would remain neutral. This was declined with the statement, "We must keep our hands free." The British government, therefore, up to the very last day of European peace, refused either to bind herself to come to the aid of France and Russia or to remain neutral. Great Britain's complete entrance into the war came about as a result of the violation of Belgian neutrality, although partial intervention was brought about when, on August 2, Sir Edward Grey informed the French government that the British fleet would protect the northern coast of France from any attack by the German fleet. On July 31, Grey telegraphed the British ambassadors at Paris and Berlin to request the French and German governments to state whether they were prepared to respect the neutrality of Belgium so long as no other power violated it. France replied affirmatively but Germany evaded a direct answer On August 2, the German Minister presented to the German Foreign Minister an ultimatum which stated that Germany had "reliable information . . . of the intention of France to march through Belgian territory," that it was "an imperative duty for the preservation of Germany to forestall this attack." Germany agreed to evacuate Belgian territory as soon as the war was over and to indemnify Belgium for all damages if she would maintain an attitude of "friendly neutrality." In case of refusal, Germany stated, Belgium would be considered as an enemy and the question would be left "to a decision of arms." Belgium refused and called upon the signatories of the Treaty of 1839 to carry out the guarantee of Belgian neutrality. In response to this request, Sir Edward Grey, on Aug. 4, 1914, sent an ultimatum to Germany demanding a satisfactory reply to the request that Belgian neutrality be respected and requiring an answer by midnight of the same day.

Upon Germany's refusal to give such a guarantee, Great Britain declared war on Germany. Despite Germany's efforts to justify the invasion of Belgium on other grounds, to the impartial observer it would appear that Germany's justification must rest entirely on the ground of military necessity. In passing, it might be stated that notes taken by the German Ambassador to London during this critical period, Prince Lichnowsky, were published early in 1918 and caused a sensation in the press of the belligerent powers by their revelation of the friendly attitude of England and her desire to maintain peace in the period just preceding the War.

Italy's Position. At the outbreak of the War, Italy found herself in a most trying position. To Germany and Austria she was bound by the defensive treaty of the Triple Alliance. Her position as a member of this alliance had, from the beginning, been unnatural, largely because of her aspirations in Trieste, the Trentino and the Balkans. In practically all the crises of the twentieth century, Italy stood aloof from her allies. When war broke out in 1914, Italy declared that she would remain neutral. During the next 10 months a struggle went on throughout the entire country between the neutralists and the interventionists. Despite efforts on the part of Germany and Austria to satisfy Italy's demands on the Adriatic, Italy declared war against her former allies on May 24, 1915. See ITALY, *History*.

Japan's Position. Japan's entrance into the War was due to her treaty of alliance with Great Britain. This treaty (1902) largely came about as the result of the loss of the fruits of the Chinese-Japanese War at the hands of Germany, France and Russia. Actuated by motives of revenge for this humiliation as well as by a determination to carry out her obligations to Great Britain, Japan declared war on Germany on Aug. 23, 1914. See JAPAN, *History*.

Turkey. Germanic influence had for a number of years prior to the outbreak of the War been predominant in Turkey. It was natural, therefore, that Turkish sympathies should be with the Teutonic allies. Turkey hesitated, at first, to make common cause with Germany, because of her exposed position and the fact that the two Balkan wars had left her exhausted, but events soon forced her to show her hand, and when, on October 29, the *Breslau*, a German warship which had taken refuge in Turkish waters, bombarded the Russian Black Sea port of Theodosia, Russia broke off diplomatic relations. This action was followed by France and England's declaring war on Turkey on Nov. 5, 1914. See TURKEY, *History*.

Balkan States. Serbia and Montenegro were involved in the War from the first, the latter coming to the aid of the former within two weeks after Austria's declaration of war. The Triple Alliance and the Triple Entente were keenly desirous of obtaining the aid of Bulgaria, Greece and Rumania. In October, 1915, Bulgaria threw in her lot with the Teutonic Allies, frankly stating that the proposals made by them were more alluring than others and expressing the belief that they were going to win the war. (See BULGARIA, *History*.) In Greece, conflicting influences and interests complicated the situation. The King (Constantine) was pro-German, while the Premier, Venizelos, was pro-Ally. The King was strong enough, in the beginning, to thwart the attempts of the Entente to have Greece enter the War on the Allied side. In June, 1917, he was compelled to abdicate and turn the government over to his second son, Alexander. Shortly after this (July 2) the Greek government declared war against Bulgaria and Germany. For the rapidly changing vicissitudes of the Greek government during this period see GREECE, *History*. In Rumania the situation was very similar to that in Bulgaria. The reigning house was pro-German while the majority of the people were pro-French and Italian. The Premier, Bratianu, advocated a policy of waiting, with the intention of entering the war at the proper time, when the greatest reward could be obtained by the least fighting. This policy was continued until Apr. 28, 1916, when the Rumanian Minister at Vienna presented a note to the Austro-Hungarian Foreign Minister which said that Rumania considered herself at war with Austria-Hungary since 9 o'clock the previous evening. See RUMANIA, *History*.

Portugal. Portugal was bound by a treaty of alliance with Great Britain, and, at the outbreak of the War, said she was willing to live up to her obligations whenever Great Britain saw fit. In February, 1916, she seized some German vessels in her harbors, and on Mar. 8, 1916, Germany declared war on her, giving this seizure as the cause. See PORTUGAL, *History*.

The United States. As the largest and most important of the neutral powers at the outbreak of the War, the United States was sure to be vitally affected. As the champion of smaller neutral nations and as the source of vast quantities of war supplies, it was only natural that the attempt to maintain strict neutrality was a trying one. The problem was made more difficult by the attitude of groups of persons in this country whose sympathies were with one or the other of the belligerents in Europe. From time to time, the American government was involved in important discussions with the European powers. The more important of these were, Blockade and Neutral Trade, Interference with Mail, the Sinking of the *Lusitania*, the Mexico Note, and Submarine Warfare and the War Zone. Chiefly as a result of the controversy with Germany over this last subject, the United States declared war against her on Apr. 6, 1917. Shortly after the United States declared war, the following states either severed diplomatic relations with Germany or declared war on her: Cuba, Panama, Costa Rica, Guatemala, Nicaragua, Honduras, Haiti, Brazil, Liberia, Siam and China (qq.v.). For the relations to the war of countries not mentioned in this section, see section *History*, and the articles treating those countries. For convenience, the following dates for the declarations of war are given:

CENTRAL POWERS

Austria against Serbia—July 28, 1914.
Austria against Russia—Aug. 6, 1914.
Austria against Montenegro—Aug 9, 1914.
Austria against Japan—Aug. 27, 1914.
Austria against Belgium—Aug. 28, 1914.
Bulgaria against Serbia—Oct 14, 1915.
Germany against Russia—Aug. 1, 1914.
Germany against France—Aug. 3, 1914.
Germany against Belgium—Aug 4, 1914.
Germany against Portugal—Mar 9, 1916.
Germany against Rumania—Sept 14, 1916.
Turkey against the Allies—Nov. 23, 1914.
Turkey against Rumania—Aug. 29, 1916.

ENTENTE ALLIES

Brazil against Germany—Oct. 26, 1917.
China against Austria and Germany—Aug. 14, 1917.

Costa Rica against Germany—May 24, 1918.
Cuba against Germany—Apr. 7, 1917.
France against Germany—Aug 3, 1914
France against Austria—Aug 13, 1914.
France against Turkey—Nov 5, 1914.
France against Bulgaria—Oct. 16, 1915.
Great Britain against Germany—Aug 4, 1914
Great Britain against Austria—Aug. 13, 1914.
Great Britain against Turkey—Nov 5, 1914
Great Britain against Bulgaria—Oct. 15, 1914.
Greece (provisional government) against Germany and Bulgaria—Nov 28, 1916
Greece (Alexander's government) against Germany and Bulgaria—July 2, 1917
Guatemala against Germany—Apr 23, 1918
Haiti against Germany—July 15, 1918
Honduras against Germany—July 19, 1918.
Italy against Austria—May 24, 1915
Italy against Turkey—Aug. 21, 1915.
Italy against Bulgaria—Oct. 19, 1915.
Italy against Germany—Aug 28, 1916.
Japan against Germany—Aug. 23, 1914
Liberia against Germany—Aug. 4, 1917
Montenegro against Germany—Aug 9, 1914.
Nicaragua against Germany—May 7, 1918.
Panama against Germany—Apr. 7, 1917
Panama against Austria—Dec. 10, 1917
Portugal against Germany—Nov. 23, 1914.
(Passed resolutions authorizing military intervention as treaty ally of Great Britain)
Portugal against Germany—May 19, 1915
(Military aid granted)
Rumania against Austria—Aug 27, 1916
(Allies of Austria also considered it a declaration against them)
Russia against Turkey—Nov 3, 1914
Russia against Bulgaria—Oct. 19, 1915.
San Marino against Austria—May 24 1915
Serbia against Germany—Aug 6 1914
Serbia against Turkey—Dec. 2, 1914.
Serbia against Bulgaria—Oct 19, 1915
Siam against Germany and Austria—July 22, 1917
The Hedjaz (Arabia) against Central Powers—June 9, 1916.
United States against Germany—Apr 6, 1917
United States against Austria—Dec 7, 1917.

New Evidence Concerning the Outbreak of the War. During 1924, a controversy arose concerning new evidence which had come to light since 1919, regarding the outbreak of the War. Usually two or three generations elapse after the close of a war before all the material concerning it comes to light. In this war, however, the overthrow of the governments of Russia, Germany, and Austria-Hungary, and the seizure of documents from the archives of Belgium by the invading Germans, gave many important documents to a waiting world long before they would have appeared in the course of normal events. Added to these have been numerous memoirs and autobiographies which are, of course, of relative value only, but yet shed some light on the diplomatic exchanges just preceding the world conflagration. The new governments which succeeded in the three abovementioned countries were anti-militarist to a large degree, and unhesitantly published any material that would tend to further their aims. When the archives of France, Great Britain, Italy, and the United States are made public, a true history of the month or so preceding the War may be written.

Various interpretations have been placed upon the newly-published documents, although every one agrees practically that they do not alter the fundamental underlying causes of the War, but do, according to one school, led by Prof. Harry Elmer Barnes of Smith College, virtually change all previous notions concerning the placing of the blame for the outbreak of the War; in fact, they deny the truth of the statement, incorporated in the Versailles Treaty, which fixes the responsibility for the War on Germany and her allies. Professor Barnes goes so far as to assess the blame for the outbreak of the War in a graduated manner upon the following countries: Austria, Russia, France, Germany, and England. Belgium was completely exonerated, Italy was only slightly responsible, and it was claimed that the United States was duped into entering a war concerning which she knew little, if anything. Needless to say many eminent authorities disagreed with the conclusion of this school.

MILITARY OPERATIONS

General Considerations. The War that broke out in July, 1914, involved three continents and the seven seas. Beginning with the declaration of war on Serbia by the Austro-Hungarian Empire, in a few days it spread to involve Germany, France and Russia. With the announced invasion of Belgium by the German armies, Belgium and Great Britain took up arms. Military operations began on three European fronts—the Western or Franco-Belgian, the Eastern or Russian, and the Southern or Serbian. Turkey next entered the War toward the close of 1914. In May, 1915, Italy joined the Allies and a new front of operations opened on the Austro-Italian frontier. In November of that year Bulgaria joined the Central Powers, the Serbians were driven from their country and a new front of operations was established on the Greek frontier north of Saloniki. In August, 1916, Rumania joined the Allies and a new front was established on the Rumano-Hungarian-Bulgarian frontier. The conquest of the German colonies in China, South Africa, and the islands of the sea began soon after the outbreak of War. In 1916, Portugal joined the Allies and sent a corps to the Western front. In 1917, Greece and the United States joined the Allies; the troops of the former being employed on the Salonikan front and those of the latter mainly on the Western front

In this War, every known resource of mechanical ingenuity was drawn upon; old and forgotten methods of warfare were brought into play side by side with the most powerful modern artillery, while aëronautics and poisonous gases for the first time had occasion to show their worth The edifice of international law so painfully built up after centuries of struggle was toppled over as a thing of no account. Again it was demonstrated that, in a long war, the side with appreciatively greater resources in men and materials of war will win if the people, their governments and military commanders have sufficient courage to endure temporary defeats and discouragements.

In the space available, nothing but a statement of the principal facts can be attempted, but the nature of the struggle on the Western front calls for a word of two. When both forces simultaneously reached the Channel after the battle of the Marne, there began a siege over the whole front that gave the struggle in this theatre a character unique in military history. At certain places in the "line," 32 or more parallel lines of German trenches were constructed. Similar defenses existed on the Allied side. Frontal attacks became a necessity since flanks there were none, and yet these attacks for years proved failures because the experiences gained under the new conditions had not as yet led to such disposition of resources as would carry them to a decision. The most desperate efforts were made first by one side and then by the other to raise the siege, so to speak, by a concentration at some selected

point and thus break through to open warfare and end a situation that only a few years before would have seemed intolerable. It was not until the summer of 1918, after the Germans had made their last and greatest attempt and the Allies had been reinforced by the American troops, that a break-through was effected and the War brought to a close. On some of the other fronts, the phenomena of what might be called old fashioned warfare were more or less produced but in general there was a marked tendency to approximate to the conditions on the Western front.

A marked feature of this War was the so-called mobilization of industries. So great was the draft made on the industrial resources of the countries involved that the struggle, other conditions being equal, may be said to have resolved itself into a competition, each side striving to outstrip the other in supplies and munitions.

General Strategy. In a description of a war in which many fronts are involved, it is necessary to treat the operations on each front separately; but as these were parts of a general whole and as all were more or less related, it seems best to preface these descriptions by a short description of the operations as related to each other in time and in strategy.

Plans for a possible war between the Triple and Double Alliances were prepared long before the War by the coördinating staffs of the armies. These plans were revised from year to year to conform to new conditions. On both sides the plans contemplated offensive campaigns. That of the Triple Alliance provided for an invasion of France in which about nine-tenths of the German forces were to be employed, assisted by corps of the Italian army not required for the defense of the Franco-Italian frontier. A small fraction of the German army with the entire Austro-Hungarian army was to be employed on the Russian frontier. In order to avoid the delay that would be occasioned by a frontal attack on the French frontier fortresses that formed two strong barriers, Verdun-Toul and Epinal-Belfort, it was proposed to make the main thrust to the north through Belgium and Luxemburg and force the French to fight in the open country which forms the basins of the Oise, Marne and Seine rivers and their tributaries. It was assumed that the French, at the beginning of operations, would invade Lorraine from Epinal and Toul, a line along that frontier was therefore selected to be organized for defense and a part of the German force in the west was assigned to its defense. It was thought that this French force would soon be withdrawn to meet the attack from the north The invasion of Belgium would probably cause Belgium and Great Britain to declare war, but the Belgian army was not a strong one and Great Britain had only a small force that could be used in the first operations. It was hoped that in France such a decisive victory would be won as would compel France to sue for peace, in which case it was thought that the war would end. Should Russia continue the war, practically the whole German army would be available on that front. In August, 1914, however, it was known that Italy would not take part in the operations and Austria was already engaged in a war with Serbia, and could not at once employ her whole army against Russia. Confident that their plans for a decision in the west could be secured before Russia could appear in force in the east, the Germans declared war. It was not many days after the beginning of operations that the Germans realized that operations were not going as anticipated, in spite of their first victories, and that their flanking operations on both flanks had failed. Their western armies were weakened, (1) by the necessity of detaching troops to watch the Belgian army, which had wisely avoided risks in the open field and retired to the fortress of Antwerp, ready to attack the German communications; (2) by the necessity of detaching troops to invest a number of French fortifications which with their garrisons were left in their rear; and (3) by the necessity of sending troops from the West front to East Prussia where the Russians had invaded that province sooner than had been expected. The German plan was completely shattered by the unexpected battle of the Marne. From then to the close of the year, the Germans made a number of attempts to outflank the French line, but without success; and at the close of the year, the two armies lay behind intrenched lines extending from the Channel to Switzerland and open warfare was no longer possible for either side until the opposing line was penetrated on a very wide front.

The Franco-Russian plan proposed a simultaneous advance of the entire French army in the west and the Russian in the east to compel the Germans to divide their army into fractions each of which would be smaller than the Allied army opposing it. Long before the War, it had been noticed that the Germans were building detraining stations along the Belgian frontier. This indicated a German movement through Belgium, though it might be only a ruse After the formation of the Triple Entente, in view of a possible German movement through Belgium which would probably cause Great Britain to declare war, the coördinating staffs of France, Belgium and Great Britain made plans to meet this situation. However, the French military authorities could not count on the German invasion of Belgium, since it was possible that the Germans would advance directly over the Franco-German frontier. Their plan was, therefore, at the outbreak of the war, to move their troops to the Franco-German frontier but also to provide an alternative to meet the changed conditions caused by the German invasion of Belgium. The shifting of troops to meet the invasion of Belgium would necessarily delay the French offensive but it would be compensated for by its reinforcement by the Belgian and British armies. There was much discussion in France of this German invasion of Belgium, and opinion was divided as to whether the Germans would advance through southern Belgium only, avoiding the fortresses of Liége and Namur, or advance across the Meuse also on either side of Liége and attack the two fortresses. The French plans contemplated only an advance through southern Belgium and trusted that the two fortresses would hold out long enough to permit the French and British to go to the assistance of the Belgian army. In any case, the Belgian army was to avoid the risk of capture in the open field and take refuge in the fortress of Antwerp.

The Germans announced their intention of moving through Belgium immediately after declaring war on France and two days later were

at war also with Great Britain and Belgium. The French troops, therefore, were deployed along the frontier, according to the second plan. As soon as the troops were in position the French offensive began along the entire front but was shattered on the entire line except in upper Alsace, which was an unimportant front. The Belgian army took refuge in Antwerp and the British and French began a retreat from Belgium across the frontier in order to permit troops to be withdrawn from the French right, which was strong, to the left, which was weak, in order to resume the offensive. This favorable opportunity for resuming the offensive along the entire front did not occur until the armies were south of the Marne with the flanks resting on the fortresses of Verdun and Paris, when the battle of the Marne took place and the German armies were compelled to retreat. At first it was believed that the German armies would retire to the frontier but in a few days it was found that they had taken a strong position on the Aisne, which was extended eastward to the Meuse north of Verdun and could not be dislodged Then began the flanking operations that closed when the western flanks rested on the Channel. On the Eastern front just as the German armies were marching into Belgium, the great Russian offensive began and two strong armies advanced into East Prussia and four into Austria The small German force could not resist the advance and advised German Headquarters that it might be necessary to withdraw from East Prussia. However, under a new commander, in the battle of Tannenberg one of the Russian armies was decisively defeated with great loss and with the assistance of the corps sent from the west, the other was driven back across the frontier. In the Austrian province of Galicia the four Russian armies advanced slowly and steadily, overcoming all resistance; their crushing operations were likened by the press to those of a steam roller. Their cavalry was already threading its way through the passes of the Carpathians into Hungary when German Headquarters sent from the intrenched fronts in the west troops to assist the Austrians. The Russians had to cease their advance against the Austrians to meet the German advance in centre Poland. Here the lines swayed back and forth between the frontier and the Vistula River to the close of the year, when, as in the west, both armies were intrenched for the winter. On the Southern front the Austrians undertook two punitive expeditions into Serbia, both of which ended disastrously for the Austrians. The Serbians made no attempt to cross the frontier and thus operations on this front died out.

The first year had brought no decision. Both sides had experienced severe losses and had used up most of their reserve supplies of munitions; at its close the munitions problem assumed great importance It was a particularly serious one to Great Britain, who was faced by the necessity of raising and maintaining an army equal to that of France. The advantages of the interior position occupied by the Central Powers became apparent as soon as the lines were intrenched. Under cover of the intrenchments, reserves could be shifted rapidly from the Western to the Eastern frontier due to the fine railway system of Germany.

At the beginning of 1915, the Allies still had hopes that success could be secured through the great Russian armies and operations on the Western front were confined mostly to attacks here and there to prevent the Germans from sending troops from the west to the east. Only once did they make an attack with the hope of breaking through on a wide front. On the Eastern front the Germans found the situation far from satisfactory as the Austrian armies were greatly demoralized. To restore confidence, it was necessary to dislodge the Russians from their threatening position so that if necessary some of the troops could be returned to the Western front. In May, therefore, began the great drive in the east The Russian line was broken in the south and the Russian armies in Austrian Galicia were in full retreat. To check this disaster and draw troops from this front, the Allied Powers pursuaded Italy, who had been listening to the diplomats of both sides, to declare war against the Central Powers. War was declared on May 23 and the Italian armies were deployed on the Austro-Italian frontier. The Italian declaration of war did not have as great an effect as the Allies hoped Although the Austrians were compelled to detach troops to go to the new front, that front was already well intrenched and the drive against the Russians had gained such a momentum that it still went on. The Russians were driven back across the frontier and lost all their frontier fortresses on the Niemen, Narew, Vistula, and Bug Rivers. When the drive ceased about the middle of September, near the Baltic the Russians were behind the Duna River between Riga and Dunaburg. From Dunaburg the line ran straight south to the Dniester River. As soon as the armies ceased active operations, the line was intrenched. The Russians had experienced tremendous losses in men and munitions of war; the former could be readily replaced but not the latter because of the isolated position of Russia. The Russian army could again resume the offensive under favorable conditions but all hope that it would be the decisive factor in the War on the side of the Allies had to be abandoned. On the Italian front nothing worthy of note occurred during the year.

War between Turkey and the Allied powers was declared in November, 1914, and soon developed on four fronts. In Armenia, the Russian Caucasian army invaded Turkey in November to capture Erzerum. In December, it was defeated between Erzerum and the frontier and retired pursued by the Turkish eastern army. The Turks in turn were defeated in January and operations on this front ceased, as neither the Russians nor the Turks could spare forces from other fronts to reinforce these armies In Mesopotamia, in November, 1914, the British Indian government landed a force near the mouth of the Tigris River primarily to protect the oil fields in southwestern Persia. This force was gradually increased and slowly made its way up the Tigris River, meeting with slight resistance. In the latter part of September, it captured and occupied Kut. Bagdad was now only 100 miles distant and the temptation to effect its capture proved too much for the commanding officers of the Tigris Expeditionary Force. With a little more than a division, the attempt was made in November, but before the force reached Bagdad it was attacked by a superior Turkish force and in a few days found itself back in Kut invested by

the Turks. In the west in January, 1915, the Turks assembled a small army in southern Palestine for the purpose of crossing the Sinai Desert and the Suez Canal, possibly in the hope of raising an insurrection in Egypt That it ever got across the desert is a marvel in itself and would have been impossible except for the favorable condition of the desert wells. A few boatloads of troops actually got across the canal The army was unable to maintain itself along the canal and retired leaving detachments to guard the scattered wells.

The most important operations in Turkey in 1915 were those connected with the ill-fated Gallipoli Expedition. The opening of the Turkish straits to secure communication with Russia and the destruction of the Turkish Black Sea fleet must have appeared as important strategic objectives as soon as Turkey entered the War. Whether this could be best effected by an attack of the defenses of the Dardanelles directly or obtained as a result of operations from a point on the Turkish coast farther south was not so clear There were also some who argued that a decision on the Western front was impossible for some time, as it would take time to solve the munitions problem and in the meantime it would be better to attack the Turkish armies and compel Turkey to make peace. Owing to the requests of both British and French commanders on the Western front for more troops, it was difficult to find troops for any new expedition In Egypt, however, were the Australian and New Zealand troops being trained for war, a division of Territorials from England and some troops from India. After the defeat of the Turkish desert expedition, these became available but as they were untried troops it was desirable to have at least one division of regulars. This was slated for France but, after the first great offensive of the British failed at Neuve Chapelle, it was decided to send the division to Turkey. The Dardanelles operations began with a naval attack to force the entrance, which failed. It was followed some time after by the landing of British and French forces (April 24) to capture the Gallipoli Peninsula. In the meantime the Turks had been warned and met both the landing of troops and the subsequent operations to capture the peninsula with such obstinate resistance that in November it was decided to abandon the project and withdraw the troops. Most of the British troops returned to Egypt and were later sent to other fronts The Allies had hoped that the Greek army would assist in the Gallipoli operations, but in this they were disappointed.

As soon as Turkey entered the War, Bulgaria occupied a very strategic position; it became even more important when the Allies landed at Gallipoli. If she joined the Allies and threatened Constantinople it would cause the Turks to reinforce that front and weaken their resistance at Gallipoli. It would cut Turkey from all communication with her two allies and might cause her prompt surrender. On the other hand, if she joined the Central Powers it would enable them to open direct communication through Serbia and Bulgaria with Turkey and give them the advantage of interior lines to all fronts. The diplomats of both sides therefore began a contest to win Bulgaria but in this contest the Allies were handicapped by the enmity between the Bulgarians and Serbians as a result of the Balkan War and by the successful campaign of the Central Powers in Russia. Bulgaria probably entered into a secret agreement to join the Central Powers in September, 1915, as the Germans and Austrians both withdrew troops from other fronts and in the latter part of that month each concentrated an army on the Serbian frontier. The two armies invaded Serbia early in October and were soon joined by the Bulgarians. It was all the Serbian commander could do to save his armies, which he did by crossing the mountains in winter and reaching the Adriatic with sorely depleted ranks. On the island of Corfu the Serbian army was reorganized.

To protect the Serbian retreat, which it was hoped could be effected in the direction of Saloniki, both British and French landed forces at that point where they began the construction of a great intrenched camp. The armies of the Central Powers did not cross the Greek frontier and shortly thereafter most of the German and Austrian divisions were withdrawn from Bulgaria. The international railway through Serbia to Constantinople was put in operation.

The operations of 1915 had increased the number of fronts and the number of countries engaged in the War but had brought no important decision on any front. During 1915, the British force on the Western front was greatly increased and was able to relieve the French on a much wider front. At the close of the year the British had three armies on this front, each composed of three corps, each stronger than a French corps. This permitted the French to withdraw some of their armies and place them in reserve.

The Allied plan for the Western, Eastern and Italian fronts for 1916 was to remain on the defensive until the Russian army could be reorganized and then assume the offensive simultaneously on all fronts. Rumania had until now remained neutral but in this year promised to declare war on Austria and invade Hungary as soon as her armies were ready. Before she acted, however, the Allies were to begin an offensive from Saloniki and thus keep the Bulgarian forces on that front. In this offensive the Allies again counted on securing the assistance of the Greek army. In Turkey the Russians promised to renew the invasion of Armenia and thus assist the British in their operations to rescue the British force invested in Kut. Some of these plans had to be modified, as the Central Powers took the initiative this year.

The Germans planned to remain on the defensive on the Eastern front and again assume the offensive in the west. Their drive this time was against the fortress of Verdun whose capture would have an important effect on the morale of the French nation. The Austrians were requested to remain on the defensive on both the Russian and the Italian fronts, but they would not consent to this and planned an offensive campaign against the Italians from the Trent region. In Turkey the principal operation planned was the capture of the British force in Kut. On other fronts the Turks were to remain on the defensive.

The Verdun offensive, which developed into a great offensive on both sides of the Meuse and from first to last employed a very large fraction of both the German and French forces in the west, failed in its purpose although the Germans almost reached the town. It lasted from the middle of February until the middle of July.

While it was in progress, a fourth British army took its position in line to enable French troops to go to Verdun. In May the Austrian offensive in Italy took place and the Austrians advanced from the Trentino and almost reached their objective, which was the Italian plain in the rear of the Italian armies on the Isonzo. Knowing that to raise this attacking force the Austrians must have withdrawn troops from the Russian front, the Allies requested Russia to attack the Austrians on their front. The Russians attacked on a broad front and the Austrian line immediately gave way, and the Russian advanced about 40 miles on a front 80 miles. To check the Russian advance, German and even Turkish troops were sent to the Austrian front and the Austrians were obliged to send back troops from the Trentino.

It was while the Russians were still advancing that the British and French made their great offensive in the west—the Somme drive—to relieve the pressure on Verdun, assist the Russians and Italians, and also prepare for the entrance of Rumania into the War by keeping the German forces employed. This great offensive began July 1 and lasted into November. It enabled the French to make counterattacks in the Verdun sector in October and December and recover a part of the territory captured by the Germans in the first half of the year. The Russian offensive enabled the Italians to advance along the Isonzo and capture the town of Goritza in August.

In the intrenched camp of Saloniki, there were assembled the reorganized Serbian army, a number of British and French divisions and a Russian division. This force was placed under a French commander, Serrail, and about August 1 he began the offensive which was to precede the declaration of war by Rumania. Again the Allies requested the assistance of the Greek government, which was refused; and lest the Greek army should prove a menace in their rear, the Allies forced the Greek government to demobilize its army. The fact that the Allied armies at Saloniki were in Greek territory and Greece was still neutral made a complicated situation. The offensive began August 1 and continued until November. The Rumanians expected the advance to be into Bulgaria but in this direction the Allies made no headway. They did, however, penetrate Serbia and recapture Monastir.

Rumania declared war August 27; at this time the Western front was ablaze with the Somme drive in the north and the Italian offensive in the south and the Central Powers could withdraw no troops from those fronts. On the other hand, the operations on the Russian front had subsided and the Saloniki drive had made no appreciable effect on that front. The Central Powers, therefore, were able to assemble two armies under German commanders to meet the new offensive; one formed of German, Bulgarian and Turkish troops was assembled in Bulgaria and another of German and Austrian troops in Hungary. At first the Rumanians swept over the mountains into Transylvania but they had to be recalled when the hostile army penetrated Rumania south of the Danube River from Bulgaria. The other hostile army then penetrated the mountains and reached the Rumanian plain from the north and the two armies united in front of the Rumanian capital, Bucharest. The Central Powers were able to drive the Rumanians out of southern Rumania but aided by Russian troops the Rumanians were able to hold eastern Rumania. Operations in Rumania ceased at the end of the year.

In Armenia the Russian armies crossed the frontier and in succession captured Erzerum, Trebizond and Erzingan; a further advance into a mountainous country without railways proved impossible and the advance stopped about the middle of the year. At this time the Turks were busily engaged farther south with the British forces on the Tigris. After the fall of Kut in the last of April, active operations on the Tigris ceased until the close of the year, which enabled the Turks to turn their attention to the Russians, whom they compelled to evacuate a part of the territory in their possession. The British government was dissatisfied with the conduct of affairs on the Tigris by the Indian government and they were transferred to the Imperial General Staff. Troops were sent to this section from Egypt and efforts were made to rescue the British troops in Kut. All attempts made during the first part of 1916 failed and on April 29 the garrison surrendered. British prestige could not allow the situation to end in this manner, so during the remainder of the year preparations were made for an advance on Bagdad as soon as winter came and the weather was favorable. On the desert front, the British troops occupied posts on the east bank of the Suez Canal and began the construction of a railway along the coast in preparation for an invasion of Palestine. The Turks made several futile attempts to interfere with railway construction but the work went steadily on and at the close of the year was within 15 miles of El Arish, the Turkish frontier post.

In 1916, in spite of elaborate preparations and combinations there had been no decision on any front. The Allies had been reinforced by Rumania and Portugal but only one corps of the latter country was sent to the Western front, where it was attached to a British army. For the Allies the situation in the east was very unsatisfactory and French officers were sent to reorganize the Rumanian army. In June, 1916, Lord Kitchener started for Russia to study the situation there but was lost at sea. Of the Central Powers, Turkey had about reached the end of her resources and Austria was rapidly approaching the same state. In all the Central states there was a feeling of depression due to the length of the War and to the realization of the superiority of the Allies in men, wealth and resources. The blockade was daily becoming more oppressive. No longer confident of winning on land, German Headquarters decided to win at sea by an unrestricted war by its U-boats on all vessels, hostile and neutral bringing supplies to Allied ports. On land the operations were to be defensive primarily.

In 1916, the British army reached its maximum strength and now the Allies were superior both in artillery and aircraft. The condition of the Turkish and Austrian armies was known and the Allies confidently expected to end the war in 1917 although it was known that no great effort could be expected from Russia or Rumania. On all other fronts a vigorous offensive was planned. To forestall the Germans and take advantage of the wedge driven in the German line by the Somme drive, an at-

tack was to begin early in the year. This salient was to be the centre of attack, which was to be extended far north by the British and to the east as far as Reims by the French. It was confidently believed a break-through would result. As in 1916, the Germans secured the initiative, not, however, by an attack but by a retreat. About the middle of March, on the entire front from the vicinity of Arras to that of Soissons, they fell back to a new line selected and intrenched that winter, which at one point was 25 miles behind their original line. As they retreated they destroyed everything of military value to the Allies and blocked all the roads. This retreat strengthened the German position by shortening the line to be held. As it would take some time for the Allied armies on the front that had been evacuated to make preparations for a new attack, it was decided to make a British attack to the north and a French attack to the east. The British attack met with considerable success but was not a break-through; the French attack was repulsed. The French commander had been so confident of success and had promised so much that his repulse had a serious effect on the morale of the French army. The morale was restored by two successful attacks under a new commander in August and September on small fronts. During the remainder of the year, the British engaged in two other offensives, one east of Ypres and the other at Cambrai, in which ground was gained but no decision was secured

In Russia, conditions both in the government and the army were becoming more chaotic The Czar abdicated and the Kerensky government came into power Of the armies, only the southern group remained a fairly disciplined army and with these the Russians assumed the offensive in July; at first successful, under counterattacks they quickly crumbled and for the first time in the War retired behind the border on that front In the north the Germans captured Riga. When the Kerensky government fell in December an armistice was declared on that front.

The Italians fought with great vigor and with considerable success until the end of September, when, due to heavy losses, offensive operations closed From the point of view of the Central Powers the situation seemed so desperate that a German army was sent to this front. With this army as the spear point a counter-offensive was begun in October, the Italian line was pierced and the Italians were compelled to retreat until they reached the Piave River far in the rear. Here they were reinforced by French and British troops and the retreat was stopped.

Practically nothing was done on the Saloniki front during the year. In June, the Allies compelled the King of Greece to leave the country; the government was reorganized and in July declared war on the Central Powers. The remainder of the year was spent in reorganizing the Greek Army and bringing it to the Salonikan front.

Practically nothing was accomplished on the Rumanian front and when in December the Russians agreed to an armistice with the Central Powers the Rumanian government was obliged to do the same.

The greatest Allied successes of the year were gained by the British in Turkey. The campaign in Mesopotamia began in December, 1916, and in the latter part of February the Turks were manœuvred out of Kut with its strong defenses and retired on Bagdad. The British followed and entered Bagdad, March 11. The British now consolidated their hold by occupying the country for a considerable distance around Bagdad. On the desert front, the British reached Rafa with their railroad and troops early in 1917. Their objective now was the Turkish frontier position of Gaza, upon which they made two unsuccessful attacks in March and April. The advance was then postponed until the end of October. The Turks were now manœuvred out of this position and retreated rapidly northward followed by the British. Jaffa was evacuated by the Turks on November 15 and Jerusalem on December 9 In Turkey, resistance was practically broken and the end was in sight.

Although there had been no decisive events on any front save that of Turkey, the War was nearer its end than any one anticipated—the U-boat warfare failed to secure decisive results, but had caused the United States to declare war. The entrance of the United States in the War produced immediately a tremendous effect on all the countries engaged in it. With the enormous resources of this country in men and materials added to their own, the Allies were sure to win The only question in doubt was when the Americans would be ready.

For the year 1918, the Allies proposed to remain on the defensive on the Western front until the Americans were ready to take the field in sufficient force. On the Italian front it was necessary to remain on the defensive until the Italian Army was reorganized On the Salonikan front and in Palestine the offensive was to be resumed as soon as practicable.

The Central Powers could not remain on the defensive. Failing to win the war by U-boat operations, they were obliged to again try it on land. Little could be expected of the Bulgarians or Turks, who were necessarily on the defensive, but as the Russians and Rumanians were no longer at war the troops on these fronts could be greatly reduced and thus a striking force could be assembled by the Germans and Austrians on the Western and Italian fronts.

The Germans had been preparing for this last offensive during the winter as they wished to launch it as early in the year as possible. They attacked on the Western front and in succession three great wedges were driven in the Allied lines, but the lines were not actually broken. All attempts to connect or extend the areas gained in these attacks failed. The successive attacks lasted from the middle of March to the middle of July. Then began the Allied counterattacks and by the middle of September the Germans were practically back in their original lines with greatly shattered forces. The final campaign began towards the end of the month and ended with the Armistice, November 11.

The Austrians made their great attack on the Piave May 15–22 and met with a repulse. After this they were completely discouraged and when the Italians made a counterattack on October 24 they offered little resistance, as they realized that the War was practically over; Bulgaria had surrendered and the German armies were in retreat.

The advance from Saloniki began September 14 and here too the Bulgarians offered little

resistance as they realized that with the Germans in retreat the War was practically lost. On September 30, war was over on this front.

In Turkey, the British Palestine army was not able to undertake offensive operations until the latter part of September because during the first months of the year it was necessary to develop the railways and secure supplies. Then in April, to meet the German attacks in the west, a large number of troops were withdrawn from this front and sent to reinforce the British armies in France; they were replaced by Indian troops from Mesopotamia and other points. The advance was begun in the latter part of September and in a few days the Turkish armies in front were either captured or dispersed. The Turkish armistice was signed October 30.

See also the articles AFRICA; ARABIA; PERSIA; etc., for accounts of special phases of the War.

THE WESTERN FRONT

Mobilization and Concentration. For operations on the Western front, Germany mobilized 35 active and reserve army corps, 4 cavalry corps and 25 Landwehr brigades for field service besides a number of divisions assigned to the defense of her western fortresses. The field troops were organized into seven armies, all of whom were to be on her western frontier on August 16 ready for active operations.

	Army corps	Landwehr brigades
I Army—von Kluck	7	3
II Army—von Bulow	6	2
III Army—von Hausen	4	1
IV Army—Crown Prince Wurtemberg	5	1
V Army—Crown Prince Germany	5	5
VI Army—Crown Prince Bavaria	5	6
VII Army—von Heeringen	3	7

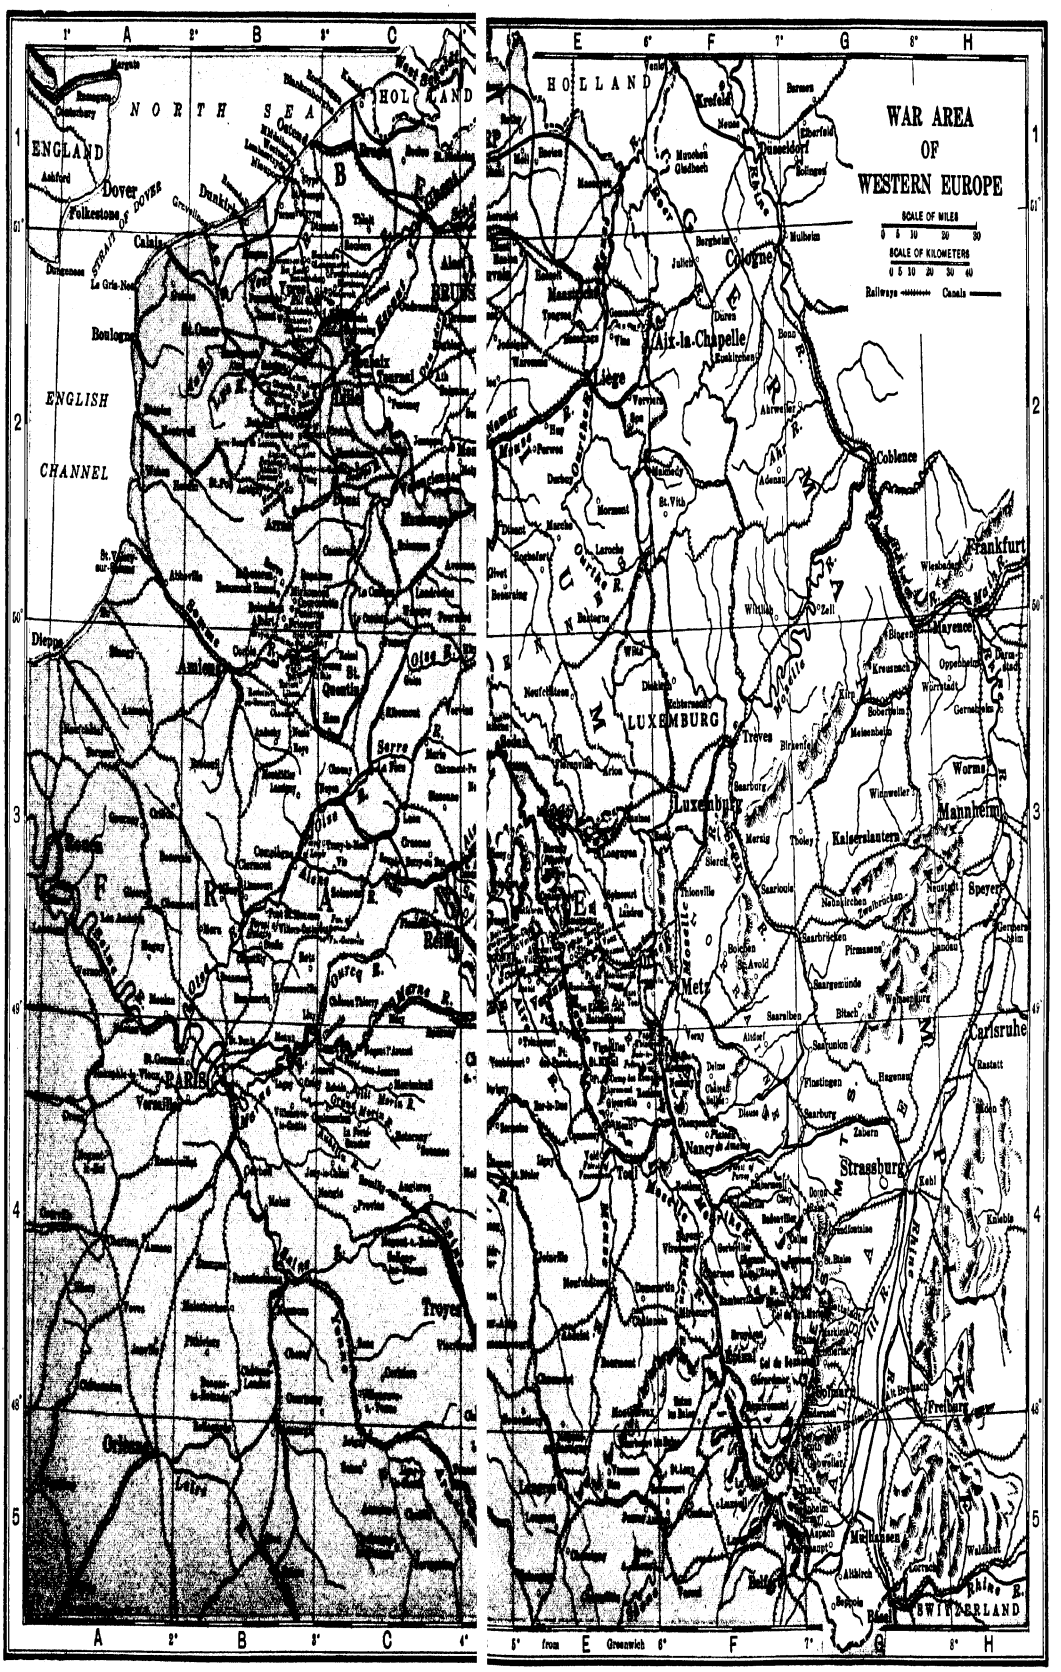
During the preliminary operations, the four cavalry corps were under German Headquarters but later were assigned to the armies: 1st to II army, 2d to I army, 3d to VI army and 4th to V army.

The I and II armies were to invade Belgium and cross the Meuse River between the Holland frontier and Namur. The III, IV and V armies were to cross southern Belgium and Luxemburg and reach the Meuse River between Namur and Verdun. The VI and VII armies were to occupy an intrenched position along the French frontier south of Metz to meet any French advance into Lorraine. To the II army was assigned the task of capturing the fortress of Liége and to the II and III armies that of Namur. To the I army was assigned the task of dealing with the Belgian army and outflanking the French and British armies.

Belgium mobilized her six divisions and sent one to defend Liége and another to defend Namur. From the others she formed a small field army.

France mobilized her 21 active corps, a colonial corps, 25 reserve divisions, 10 cavalry divisions, and several Territorial divisions. The active corps were organized into five armies:

	Army corps	Cavalry divisions
I Army—Dubail	5	2
II Army—Castelnau	5	2
III Army—Ruffey	4	1
IV Army—Langle de Cary	5	1
V Army—Lanrezac	3	1



Three cavalry divisions were formed into a separate corps—Sordet—subject to the orders of the French commander-in-chief, Joffre. Some of the reserve divisions were assigned to the armies and the others to the frontier fortresses and to the defense of Paris.

The I army covered the frontier from Belfort to the north of Epinal; four of its corps were on the left ready to invade Lorraine with the II army. The II army had four corps in front of Nancy and one in reserve. The III army was in front of Verdun ready to advance into Lorraine north of Metz. Between the II and III armies was a so-called VI army—Manoury—consisting of three or four reserve divisions designed to invest the fortress of Metz. The V army was on the Meuse River between Mézières and Verdun, guarding the flank of the III and ready to support it. The IV army formed a general reserve behind Verdun ready to support either the II or III army. The position of the armies was based on the possible concentration of the German armies on the Franco-German frontier. Should the Germans violate the neutrality of Belgium the plan provided for the movement of the V army northward into the angle between the Sambre and Meuse Rivers; the IV army was then to replace the V army on the Meuse between Mézières and Verdun.

Battles of the Frontier. It was Joffre's plan to assume the offensive as soon as his armies were in position. The I and II armies were ready on August 15, and having organized a VII army—Pau—from the corps and reserve divisions around Belfort, he ordered the VII, I and II armies to advance. The VII army met with slight resistance and advanced until recalled by the defeat of the I and II. These two armies advanced and on August 20 encountered an equal force of the VI and VII German armies occupying a strong position near the frontier. The French attack being repulsed the French armies retired slowly and took an equally strong position on the Meurthe and Mortagoe Rivers guarding the Charmes gap between Nancy and the Vosges Mountains. The Germans were unable to break the line and each army was practically engaged in holding the other until the battle of the Marne was over. The Germans then retired to an intrenched line near the frontier in order to release some of the corps. The battle was known as that of Lorraine or Charmes.

As soon as the IV French army was in position and had received further reinforcements, the III and IV armies were directed to cross the frontier into Luxemburg and southern Belgium and break up the German troops moving through that area. In the forest of Ardennes they encountered an equal force of the IV and V German armies, August 22, and here, too, the French were compelled to withdraw. This battle was known as that of Ardennes.

The V French army moved up in the angle of the Meuse and Sambre Rivers and posted one

corps along the Meuse and the other two along the Sambre. In this section the French cavalry corps had endeavored to ascertain the German forces east of the Meuse but was unable to penetrate the cavalry screen formed of the 1st and 4th German cavalry corps. The V army was reinforced by this cavalry corps, a corps from the II army, two divisions from Algiers and three reserve divisions. As soon as it received its reinforcements and the British army arrived on its left, it was to cross the Sambre River and attack the Germans there.

The British mobilized their so-called Expeditionary Force consisting of six divisions and a division of cavalry. Four of these divisions, the 1st and 2d army corps, with the cavalry were at once sent to France and detrained in the vicinity of the fortress of Maubeuge.

On this front the Germans secured the initiative and made the attack. Early in August troops of the II German army attempted to capture Liége by surprise. They did succeed in taking the town with its bridges but were obliged to reduce the surrounding forts with heavy artillery The last fort fell on the day the armies were ready to advance. On the 17th, the I and II armies moved out and on the 20th were on the line Brussels-Namur; the III army started for the Meuse south of Namur. One corps each of the II and III armies was assigned the task of investing this fortress while it was being reduced by artillery. The I and II armies were preceded by the 2d cavalry corps while the 1st covered the advance of the III army. When the III reached the Meuse the 1st cavalry corps was to move around Namur and join the II army The Belgian army offered no resistance to the advance but retired to Antwerp.

Before the V French army had received its reinforcements it was attacked by the II German army on August 22, and lost the line of the Sambre River, on the following day it was again attacked by the II and its rear threatened by the III which succeeded in forcing the Meuse in its rear There was nought to do but retreat, which began on the 24th. This battle is known as Charleroi.

While the II German army was advancing to the Sambre, the I army with its cavalry division was seeking the British army whose position was unknown While moving in a southwesterly direction from Brussels, British forces were discovered in the vicinity of Mons on August 22 but it was thought they were only outposts. As a matter of fact, however, the British army had come in position that day between the Scheldt and Sambre Rivers along the Condé-Mons canal. On the 23d, therefore, two of the German corps unexpectedly ran on the British main position and the battle of Mons began about noon. The British resisted stubbornly but were obliged to yield the canal near Mons and fall back to another position. That evening a third German corps appeared in their front.

Not wishing to be outflanked, that night the British commander, French, ordered his army to retire next day to a line running west from Maubeuge. On the 24th the Germans hoped for a decisive victory but the British successfully withdrew their army.

Joffre's Second Plan. On the night of August 24, Joffre realized that he had met defeat in the battles on the frontier and that he must retreat in order to save his armies of the left and centre. The British army was in danger of being outflanked and a dangerous gap was being opened between the V and IV armies due to the withdrawal of the V from the Meuse.

To renew the offensive a new army was needed on his left and this he proposed to form on the Somme River between Amiens and Péronne from troops drawn from the east. It was to be under the command of Manoury, who was to bring two of his divisions with him; the other troops were to be taken from the VII and III armies. The immediate problem was to delay the advance of the I German army until this new VI army could be formed. West of the British he had formed the VIII army—D'Amade—of four Territorial divisions of little value and to this army he now sent two reserve divisions from Paris. The British V, IV, and III armies were directed to fall back slowly to the line Péronne-Verdun. The 1st cavalry corps was detached from the V army and ordered to cover the left flank of the British army.

On the 25th, the British continued their retreat but due to the topographical features of the country the two corps were compelled to follow divergent lines and that night were widely separated. As the French cavalry had not yet reached his left, the British commander ordered both corps to continue the retreat the next day. The 1st corps—Haig—did so but the commander of the 2d corps—Smith Dorrien—decided to rest his corps as his rear guard reached camp late at night. He now had three divisions, as a fifth division of the Expeditionary Force joined him that day. As the I German army was pursuing rapidly there resulted the battle of Le Cateau. The British held their own for some time but as the German force was constantly increasing the British were ordered to retreat in the afternoon. To break off the engagement was a difficult operation attended with considerable loss and the British retreated in great confusion, but the Germans did not pursue as they too were worn out and their cavalry corps was held in check by the French cavalry corps that gained the flank of the British that afternoon. The British army next day continued its retreat until it crossed the Oise between La Fère and Noyon, where it was reorganized.

At this time German Headquarters at Coblenz made certain decisions that had a disastrous effect on the German operations on the Western front. Influenced probably by the optimistic reports of its army commanders in the west, it decided to send two corps from the west to East Prussia. As the two corps engaged in the investment of Namur, which was occupied on August 25, had not yet rejoined their armies, they were ordered to withdraw and entrain. A corps from the V army was also ordered back to Metz to be ready. As two corps had been left by the I army to observe the Belgians, the original invading force of 27 corps was reduced to 22. Of these 22, on August 27 the II army had to detach one and one-half corps to besiege Maubeuge, where the French had left a garrison of some 35,000 troops and the III army had to leave a division to invest Givet. Of these besieging troops only a half division rejoined before the battle of the Marne. A second decision was to give the commander of the I German army, who had been under the orders of the commander of the II army, an

independent command. On the morning after the battle of Le Cateau, therefore, the I army broke away from the II army and started in the direction of Péronne. By this move it prevented Joffre from forming his new VI army on the Somme but it prevented the I army from participating in force in a battle a few days later.

When the I army moved off it left the II army, now reduced to seven divisions and the 1st cavalry corps, to continue the pursuit of the V French and British armies although the V French army alone had 12 divisions. The retreat of the British army had been contrary to Joffre's plan and he now decided to make a counterattack with the V army to gain time and allow the British to recover. On the 27th, the V French army crossed the Oise and was ordered to halt and prepare for battle. The battle of St. Quentin-Guise was fought on the 29th and morning of the 30th. Although a drawn battle, the German II army barely escaped defeat and suffered severe losses. The German commander was obliged to call a division from his investing force at Maubeuge and for assistance from the nearest corps of the I army.

Meeting with no great resistance in his march to the Somme, von Kluck began to doubt the wisdom of his movement when on August 28 he received a new order from Headquarters. Joffre's retreat had deceived the German Headquarters and it was believed that the French left and centre had met with decisive defeat and were retreating on Paris The II army was therefore directed to move on Paris and the I toward the Seine west of Paris. Von Kluck, therefore, continued for two days more in that direction, meeting detachments of the new French army which avoided serious engagements but retired before him On the 29th he learned of the battle of St Quentin-Guise and on the 30th was informed that the French had retired and to gain decisive results it was desirable that the I army should act on their flank as the II needed a day's rest. Von Kluck now started to move in a southeasterly direction and informed German Headquarters, which gave its approval. He crossed the Oise and found the British still north of the Marne. He made preparations to attack them but they escaped across the river. Next he found that the V French army was just reaching the Marne and he attempted to interfere with its crossing

At this time he had no intention of crossing the Marne but on the night of September 2 he received a message from German Headquarters to the following effect:

> Desire of Supreme Command to force French in a southeasterly direction away from Paris. I army will follow II army en échelon and will protect the flank

As he was now at least a day's march in advance of the II army which was at least a day's march in rear of the V French army, his army was the only one that could act on the flank of the French but if he did so act he must disobey the order to follow the II army and also risk exposing the flank of the armies to an attack from Paris. On the following morning he learned that one of his corps had crossed the Marne at Château-Thierry and was engaged in battle. He had now to decide whether to withdraw the corps or go to its assistance. His flying corps reported the British retreating south of the Marne and no evidence of activity on the Paris front, so he decided to support his corps and crossed the Marne with four of his five corps and two of his three cavalry divisions.

Joffre's Third Plan. After the battle of St Quentin-Guise, Joffre was satisfied that his armies must retire still farther south before the offensive could be resumed. The limit was to be the Seine for the British and V French army and for the IV and III the Aube and Ornain with the flank resting on the fortified ridge east of the Meuse.

In retreating the IV French army had offered such resistance that the IV German army was compelled to call to its assistance the III German army, which prevented that army from assisting the II in the battle of St. Quentin-Guise. On the appearance of the III German army Joffre detached the left wing of the IV army and placed it under the command of Foch as the Foch Detachment; it later became the IX army In its retreat the front of the III army was shortened, which enabled Joffre to order one of its corps to Paris and a division to Foch Joffre also withdrew some of the cavalry divisions with the I and II armies and formed the 2d cavalry corps—de Mitry—between the V and British armies. The V army retreated to the Seine at Nogent, Foch toward the Aube, and the IV to the Ornain and the III between the Ornain and the Meuse

On the morning of September 5, von Kluck, who was still north of the Marne, received the following message from Headquarters·

> I and II armies will remain opposite the east front of Paris, the I army between the Oise and Marne the II between the Marne and Seine.

At that time four of his corps were on the south side of the Marne and would reach the Grand Morin between Coulommiers and Esternay that night In their front were the 1st and 2d German cavalry corps. The British and V French armies were apparently retreating along their front As there seemed to be no reason to break up the plans for the day, he decided to let the movements go on but to issue orders for the withdrawal of his army to the north side of the Marne the next day In the evening a staff officer from Headquarters came to see him and explained the general situation The III, IV, and V German armies were making slow progress southward and the I and II armies were to remain stationary until these armies advanced far enough to threaten the rear of the I and II French armies, cause them to retreat and thus permit the VI and VII German armies to advance. That night neither von Kluck, who had crossed the Marne that day, nor the German Headquarters had the slightest suspicion of a French counterattack, although it had already begun north of the Marne.

When the French armies began their retreat to the Marne, Galliéni was made military governor of Paris and the VI army was finally organized east of Paris. Galliéni kept himself informed of the movement of the I German army and communicated his knowledge to Joffre at his headquarters at Bar-sur-Aube, where the movements of the armies were carefully plotted. At 6 P.M. on the 4th of September it was known that von Kluck had crossed the Marne and reached the Petit Morin with three of his corps and that only one with a cavalry division was left in front of Paris. If he continued the advance on the morrow he would reach the Grand

Morin and his front would be stretched to nearly 50 miles. At last a favorable opportunity for a counterstroke had arrived. On the night of the 4th and morning of the 5th all the armies received their orders. They were briefly that the VI and British armies on either side of the Seine were to attack von Kluck's army from the west while the V army attacked it from the south. The IX army was to hold the II German army in check and protect the flank of the V army The IV and III armies were to attack the IV and V German armies, the III striking their flank. September 5 was to be spent in preparation and the attack was to be on the morning of the 6th. With his orders Joffre issued a stirring appeal to his troops:

"At the moment the battle begins upon which the safety of the country depends each one must make up his mind no longer to gaze to the rear Every effort must be centred on attacking the enemy and forcing him back An organization that finds itself unable to advance must hold the captured ground cost what it may and allow itself to be annihilated rather than retreat. Under the circumstances no weakness can be tolerated."

The orders were received with delight by officers and men who were tired of retreating before an enemy they felt they could face.

Battle of the Marne. Although not contemplated, the battle of the Marne really began on the afternoon of September 5, when the VI French army was moving into position and two of its reserve divisions unexpectedly encountered the corps that von Kluck had left in front of Paris. The reserves were repulsed but, the German cavalry discovering other troops advancing, the German corps retired during the night and took up a more favorable position some miles in the rear. Von Kluck was informed of this during the night but still did not anticipate a battle; however, he warned the nearest corps to go to the threatened front as soon as possible The battle of the Marne thus begun was fought continuously until the afternoon of the 9th, when the I, II and III German armies began their retreat. In front of the IV and V German armies it lasted some days longer. On the Paris front, in the battle of the Ourcq, between the VI French and I German armies, the lines swayed back and forward as new troops were thrown into the line on one side or the other. It was not until the 9th that von Kluck was able to bring up his last corps which had been fighting daily south of the Marne from the 3d to the 6th with the V French army and then had to march 50 miles to reach its place in line. It was in this battle that Galliéni used the Paris taxis to take newly arrived troops to a threatened position in the line.

The II German army found in its front the IX French army and on the right the V army. It called to its assistance a part of the III army and succeeded in forcing back the right wing of the IX army but its own right wing was forced back by the advance of the left of the V army. On the first day of the battle there was nothing in front of the British army except the 2d German cavalry corps; on the second day there was nothing in front of the left of the V French army and the 2d French cavalry corps but the 1st German cavalry corps. On the afternoon of the 8th, the advance of the V army forced the commander of the II German army to withdraw his right wing in order to rest his flank on the Marne. On the morning of the 9th, the British were seen advancing to the Marne between the two German armies and the commander of the II German army decided that the time had come to retreat in order to close the gap. This opinion he imparted to the staff officer from Headquarters who had remained with the armies. The II and III armies were authorized by the latter to begin the retreat that afternoon and he personally delivered the order to retreat to the chief of staff of the I army. Von Kluck was loath to retreat as he had just started an attack which was progressing satisfactorily but he could not continue if the II was retreating so he gave orders for the withdrawal. No decision was reached in the fight between the IV and V German armies and the III and IV French but the former were compelled to fall back when the II and III recrossed the Marne.

The battle of the Marne must be regarded as a significant defeat for the German armies as it completely shattered the plan on which the War was based. Flushed with success, having the initiative, opposed by troops supposedly dispirited by defeat after defeat during a long and exhausting retreat, the Germans found this check as unexpected as the French found it welcome. On the French side moral forces were developed, the intensity of which continued undiminished. The Germans, although not disabled, were compelled to meet an entirely unforeseen situation.

Battle of the Aisne. After the retreat from the Marne, the German armies ultimately halted and intrenched on a line which began south of Noyon on the Oise, followed the ridge north of the Aisne to the Reims-Laon road where it crossed the Argonne Forest and reached the Meuse north of Verdun On Sept. 10, 1914, Joffre issued an order for a coördinated pursuit of the retreating Germans. He believed that they planned to retire to the Meuse, but when the Aisne was reached every indication pointed to a halt on that river. The French and British crossed the Aisne west and east of Soissons respectively, but were unable to break the German line, which had been reinforced by a corps from Belgium and the besieging corps from Maubeuge which fell September 7.

First Battle of the Somme. When it became clear that the Germans could not be successfully dislodged from the Aisne, Joffre planned to outflank the Germans from the left bank of the Oise and force them to retreat from the Aisne. The greatest part of de Castelnau's II army was sent to the north of Paris to assist the left wing in carrying out this objective. The Germans, on their side, were determined to do the very thing the French were planning to do. They gathered reserve forces and, about September 20, a series of battles began around Lassigny and Roye, which were extended northward west of Péronne and ended with the left of Castelnau's army at Albert on the Ancre River. These battles lasted about 10 days, then the lines were stabilized. Bapaume, Noyon, Lassigny, Péronne and Chaulnes remained in the hands of the Germans but Castelnau succeeded in turning the continuation of the Aisne line northward instead of west along the Somme and therefore accomplished his object to some extent. The withdrawal of Castelnau's II army from Lorraine permitted the Germans to advance across the Moselle and capture the St. Mihiel salient, which they held

until they were dislodged by the Americans in 1918.

Battle of Arras. Castelnau's failure to outflank the Germans determined Joffre to make one more effort. This time he planned an advance through the valley of the Scarpe on either side of Arras in the direction of Douai. A new X army under General Maud'huy was organized for this purpose. General Foch was given the command of the group of French armies between the Oise and the English Channel. In the first week of October, Maud'huy's army advanced from Amiens and reached Arras, but found the Germans in front of it. He was unable to advance past this city. The French line was extended northward to the west of Lens, to the Lys River northwest of Lille. The Germans also extended their lines northward and occupied Lens and Lille. The lines became stabilized here and the second attempt to outflank the Germans failed.

British Operations South of the Lys River. In the latter part of September and early October, the British army was carefully removed from the vicinity of Soissons and railed up to the neighborhood of the English Channel where it would be closer to its base of supplies. After receiving reinforcements, including an Indian corps, the British, on Oct. 13, 1914, began to advance south of the Lys River. The advance stopped at Auber ridge about midway between Béthune and Lille. Another British corps advanced north of the Lys River and drove the German cavalry across the river. The British advanced as far as Armentières. The right was unable to advance on Lille and the left was unable to cross the Lys. Although severe fighting occurred in this region until the close of active operations for the year the lines were virtually stabilized by the 20th of October.

Battle of Flanders. The failure of the Allies to outflank the Germans was followed by an attempt on the part of the Germans to again outflank the Allies, and to secure if possible the Channel ports of Dunkirk and Calais. As a preliminary operation, it was decided to capture Antwerp. The siege began September 28; at first the Allies decided to attempt to hold it and British naval brigades were sent to reinforce the garrison; it was to be further reinforced by other British and French troops. In a few days, however, it became evident that it could not be held and preparations were made to withdraw the Belgian army to the west. The fortress fell on October 10 but the Belgian army retired in safety, its retreat being covered by a British division sent to Ghent from England. After the fall of Antwerp, German reserves were rushed to the Belgian front and established themselves on the Ostend-Courtrai line. The battle of Flanders was fought over such a long front that it really consisted of several detached battles rather than one large one. These several battles have been called the battle of the Yser, Dixmude, North of Ypres and South of Ypres.

The Battle of the Yser was largely fought by the Belgians. It started on the 18th of October when the 3d German reserve corps advanced to cross the river. The Belgians were strongly intrenched on the east bank of the river and their front was flanked by British monitors. The Germans did not reach the river until the 20th. On the night of the 21st, the Germans succeeded in bridging the river and by the 25th had two divisions across the river. The Belgians retired two miles to a railroad embankment where they were reinforced by a French division. On the 30th the Germans captured Ramscappelle on the railroad but were soon forced to withdraw when the Belgians flooded the terrain between the railroad and the river.

Dixmude was attacked by the Germans on the 20th of October but the attack was repulsed. On November 10, after a fierce bombardment of artillery and trench mortars the Germans finally captured the town. Its capture was of little importance, however, since the battle of Flanders was practically over.

North of Ypres, on October 19, the Germans fought their way across the Thourout-Roulers road checked by French cavalry until the main line held by French infantry was reached. Heavy fighting ensued up to November 10 but the Germans were unable to make any appreciable gain.

South of Ypres, the Germans advanced steadily but slowly until the 24th, when they were checked by the British. The attack was renewed on October 30 and November 1. These were critical days for the British army. It was attacked in force between the Menin road and the Lys River. The Messines and Wytschaete ridge was the objective of the German attacks. Messines was taken on October 31 and Wytschaete on November 1. The Germans felt that they had broken through the Allied lines. Strong French reinforcements were hastily brought up, however, and the final German attack on November 10 and 11 was repulsed all along the line with the exception of Dixmude, which fell into German hands. Minor operations continued until November 20, when the lines were consolidated for the winter. The battle of Flanders was now over and was the third serious check for the Germans on the Western front in 1914, the other two being the battles of Lorraine and the Marne.

Beginning of Trench Warfare. The conclusion of the battles of Flanders, Nov. 11, 1914, marks the beginning of what we may call the long siege of the armies over the whole line from the sea to the Swiss frontier. It was a time of ceaseless watching, of hardship and trial, of continuous fighting with neither side able to advance at the expense of the other. Local advantages gained first by one and then by the other adversary in no way affected the issue and indeed, as measured by the ground gained, would not be represented on an ordinary map. A word is perhaps not out of place in respect to the nature of the contest that now became the rule over the entire Western front. Trench warfare took the place of what now may be called old-fashioned operations in the open. Mining and countermining became the rule: the lines in reality were areas of parrallel trenches protected by networks of barbed wire so thickly interlaid and interwoven that only long sustained artillery fire could break them down in clearing the way for assault. The troops lived in and under the ground so that shrapnel, the ideal man-killing projectile against troops in the open, proved nearly useless and was replaced by the high-explosive shell, able to pierce overhead shelter and overwhelm the occupants. Operations degenerated into a struggle of wear and tear, attrition. So close did the lines draw to each other that antiquated methods

and weapons sprang into new life; hand grenades, knives, and even clubs, for close work. French mortars came into existence. Asphyxiating gases, in violation of The Hague Convention, were used. Artillery took a position of first importance, as was but natural in a state of siege warfare. The reason of this state of affairs is to be found, in part at least, in the air service, which made surprise well-nigh impossible and allowed time for the threatened side to make ample preparations to resist any impending movement, and which also increased the efficiency of artillery by enabling batteries to correct their fire, and by discovering and assigning targets invisible from the batteries themselves.

Operation of 1915. The year of 1915 on the Western front was spent by the Allies in testing the German line at various points, in an endeavor to break through and prevent German troops from being withdrawn from the Western front to reinforce the armies operating against Russia. The Germans remained on the defensive, making but a single attack.

The British attacked by two corps at Neuve Chapelle with a view of reaching the town of Lille. This attack was made in the month of March but resulted only in taking the German advance line with heavy loss to the attacking troops. This was followed in April by the German attack on Ypres, where clouds of chlorine gas were first employed. It was only a partial success as the Germans were unable to reach Ypres, which was held by the British. The attack thus initiated lasted a month but without further German success.

In May, there occurred a combined attack by the British and French along the front between Neuve Chapelle and Arras. The British attack was made by three corps at Festubert and resulted in an advance of 600 yards over a front of four miles. The French attack was made by seven corps on a 10-mile front north of Arras; at one point the French troops advanced two and a half miles but a break-through was not secured. The struggle on this front continued on through June. These attacks occurred shortly after the Germans began their great advance against Russia

In September, there were simultaneous attacks by the French and British on widely separated fronts. In the north the British attacked with three corps in combination with the French on the front where the French had attacked in May. The British objective was the mining town of Lens. The British almost attained their objective but were unable to hold it; they secured the neighboring town of Loos. The French on their right attacked with about seven corps, their objective being the ridge overlooking Lens, the Vimy ridge. They were, however, held up in the valley in front and succeeded only in taking the town of Souchez.

The great French attack in September, however, was made on a front of 15 miles in Champagne between Reims and the Argonne Forest. Here two armies were employed and the attack was preceded by a three days' bombardment by as heavy a force of artillery as the French could assemble. Under this fire the intricate system of trenches and wire entanglements became a perfect labyrinth through which it was impossible to advance in good order. As a result, the French were held up at the German second line some miles in rear where fresh troops had just arrived from the Russian front.

During the year, the French made various attempts to force the Germans to evacuate the St. Mihiel salient but they met with little success. Minor operations also took place in the Argonne Forest and along the Vosges front. On the whole, it may be said that the lines established at the close of 1914 remained practically unchanged during 1915

In 1915, the British forces on the Western front were greatly increased and at the close of the year the British front extended from the Belgian front north of Ypres almost down to Arras. The British were also prepared to place a third army in line early in 1916. This enabled the French to increase their reserve troops.

1916. Verdun. The offensives of 1915 were completely overshadowed by the battle of Verdun, which began in February, 1916. Von Falkenhayn, the German chief-of-staff, who succeeded von Moltke after the battle of the Marne, was greatly disturbed by the Allied offensives in September, 1915, which came so close to succeeding, and determined to forestall another Allied offensive by a German effort on a grand scale. After careful consideration Verdun was decided upon as the place of operations. For dynastic and political reasons the command of the attacking forces was given to the German Crown Prince.

Verdun was an entirely different place from the Verdun of the beginning of the War. Having profited by the fate of Liége and Namur, the forts at Verdun were held by light garrisons only and the French line was established about 10 miles to the north and east Intermediate lines and positions covered the area between the fortress and the outer line of defense. The Verdun position was a salient about 45 miles wide across the neck which extended from St. Mihiel to the Argonne. Most of the salient was on the eastern side of the Meuse. Along the east bank of the Meuse there is a ridge—Côte de Meuse—five miles wide and about 400 feet high To the east of the ridge and extending to the south is the plain of the Woevre, which in the spring is too soft for any operations. The French line crossed the ridge from the Meuse River and extended about five miles into the plain of the Woevre The two trunk lines, which supplied Verdun before the War, Paris-Verdun and Paris-Verdun via Commercy, were under the observation and fire of the Germans in the Argonne and at St. Mihiel. A single-track narrow-gauge road from Bar-le-Duc via Souilly was the only railway means of supplying troops to Verdun.

The Crown Prince planned his main attack along the ridge from the north. If this were successful, the French would be obliged to evacuate their line in the Woevre to prevent capture and a secondary attack could be made along that point. Von Falkenhayn believed that an attack on Verdun would succeed because its inferior rail communications and the limited number of bridges across the Meuse would interfere with its reinforcement. The operation, which he estimated would take eight days, was to have its right flank protected by a later advance on the west side of the Meuse, which would protect operations on the east from French artillery on the west bank. The German Crown Prince had at his disposal nearly one-half million men, many of whom were completely rest-

ed and others of whom were picked "shock" troops. Besides these, many other divisions were held in reserve along other parts of the Western front in readiness for immediate transportation. Tremendous amounts of heavy artillery were concentrated with an unlimited ammunition allowance. Every request for labor and equipment was complied with.

The artillery preparation for the attack was begun at 7 A.M. on Feb. 21, 1916. It continued until 4 P.M., when the infantry moved out on a front of about 4 miles southward along the ridge. During the first period of the battle (February 22–March 4), the Germans, in a slow advance, covered by extremely heavy artillery fire, captured the 1st, 2nd and 3rd positions east of the Meuse and Fort Douaumont, the most advanced of the Verdun forts, five miles from the city. Joffre immediately sent troops of the II army then in reserve, and selected its commander Pétain to command at Verdun. These were to be followed by the X army from the Arras section when they were to be replaced by the IV British army.

General Pétain arrived at Verdun on February 26, and ordered a counterattack at once along the entire line. He divided the front into corps zones and assigned the artillery, which was arriving in great numbers, to the zones. The occupied ground was to be organized and held, and the forts to be reoccupied and rearmed. The number of bridges between Verdun and St. Mihiel was to be increased from 7 to 41. Pétain also organized a truck line of communication from Bar-le-Duc to Verdun, over which 3000 auto trucks passed every day. This saved the supply situation, and the French call the road "the Sacred Way." On March 4 the French were holding their fourth position, a series of ridges between Douaumont and Verdun.

During the second period of the battle (March 5–22) the Germans were unsuccessful in their attempts to advance their right wing west of the Meuse to Hill 304 and Dead Man's Hill, and their left wing from the Woevre plains, which had been evacuated by the French who established a new line on the east crest of the ridge around Fort Vaux. During the third period (March 22–April 30), the German Crown Prince suffered such losses that, by March 22, fresh troops were required. On April 9–10 he ordered a general attack along the whole line and captured the crest of Dead Man's Hill. This was recaptured by the French on April 20. Many local battles were fought during this period. During the fourth period (May and June) General Nivelle, who on May 2, had succeeded General Pétain in command of the Second Army and of the defense of Verdun when the latter was promoted to command an army group, carried out Pétain's policy of counterattacking on every possible occasion. The violence of the German attacks and the stubbornness of the French defense may be judged by the fact that although the Germans attacked Hill 304 from May 4 to 7, with more than 100 batteries of heavy artillery, they captured only the north part of the hill. Douaumont was recaptured by the French on May 22–23. On the latter date, the Crown Prince captured Dead Man's Hill and retook Douaumont. In June, he concentrated on the attempt to capture Forts Vaux and Souville. Fort Vaux was completely destroyed in the first week of June, and the struggle for Souville, which was really the key to Verdun, became most desperate. Joffre forbade any retreat. The crisis of the attack came on June 22 and 23 when, after an unparalleled bombardment, the Germans reached the edge of Souville On the next day Nivelle began counterattacks on a grand scale and by June 30 had driven the Germans beyond Fleury a mile to north. The next day, Joffre and Haig launched the battle of the Somme, with such force that von Falkenhayn was forced to withdraw troops from Verdun for the Somme, and to abandon the idea of an immediate capture of Verdun.

The struggle now became a deadlock. This continued until the latter part of October, when the French regained in three hours what it had taken the Germans months of effort to attain. This and subsequent actions are usually referred to as the Second Battle of Verdun. This three-hour action was the most brilliant action of the whole Verdun campaign. General Nivelle's artillery preparations were brief but of exceedingly great intensity; then came the infantry attack on October 24. The Germans were driven back and what remained of the forts Douaumont and Vaux was again in the possession of the French. During the next six weeks there were scarcely any infantry engagements and the artillery actions that occurred were of minor importance. On December 15, however, despite wintry conditions, Nivelle executed another great coup. He attacked on a front of six miles after a three-day artillery preparation. He succeeded in penetrating the German front for a distance of nearly two miles. The immediate general in command was Mangin.

After this advance the Verdun front once again became quiet, each adversary watching the other and being content to remain on the defensive. After 10 months of heavy fighting the Verdun struggle was virtually over. The total loss, including prisoners, dead, sick and wounded, was exceedingly great on both sides. In the last analysis, it was a great French victory. The moral effects on the French troops and French nation can scarcely be overestimated. The Verdun slogan "They shall not pass" was taken up as a battle cry all along the front and behind the lines. As a reward for his heroic work at Verdun, General Nivelle was made commander-in-chief of all the French armies, succeeding General Joffre.

First Battle of the Somme (Picardy). In his reports on this battle, Haig made the following statements:

"The principle of an offensive compaign during the summer of 1916 had already been decided by the Allies. The various possible alternatives on the Western front had been studied and discussed by General Joffre and myself and we were in complete agreement as to the front to be attacked by the combined French and British armies. Preparations for one offensive had made considerable progress; but as the date at which the attack should begin was dependent upon many doubtful factors, final decision on that point was deferred until the general situation should become clearer

"Subject to the necessity of commencing operations becore the summer was too far advanced, and with due regard to the general situation, I desired to postpone an attack as long as possible. The British armies were growing in numbers and the supply of ammunition was steadily increasing.

"By the end of May the pressure of the enemy on the Italian front had assumed such proportions that the Russian campaign was opened early in June, and the brilliant successes gained by our allies against the Austrians at once caused a movement of German troops from the Western to the Eastern front. This, however, did not lessen the pressure on Verdun. The heroic defense of our French allies had already gained many weeks of inestimable value and had caused the

enemy heavy losses; but the strain continued to increase. In view, therefore, of the situation in the various theatres of war, it was eventually agreed between General Joffre and myself that the combined offensive should not be postponed beyond the end of June"

The Allies proposed to attack on a front of about 30 miles in an air line in order if possible to effect a break through the German lines; this front was about equally divided between the British and French. The VI French army—Fayolle—was astride the Somme with the X French army—Micheler—on its right. Directly in front of the French armies, and five miles away, lay their objective, the town of Péronne on the east bank of the Somme The ground in their front was generally level The IV British army—Rawlinson—was on the left of the French, facing a ridge which rose between the Albert-Péronne and the Péronne-Bapaume roads. On the slope of this ridge, facing the British, the Germans had organized the position consisting of two strong lines about two miles apart; between the two lines were woods, villages, etc., strongly organized for defense. A third and even a fourth line had been begun still farther to the rear The entire front was held by the II German army but after the attack began it was subdivided into two sectors, the I German army being organized in one of them.

The artillery preparation for the great attack began June 24 and continued for an entire week; the infantry attack was launched July 1. In the opening attack the greatest advance was made by the VI French army which broke through the German first and second lines and at one point advanced three miles by July 5; the British during the same period advanced their whole front about half this distance. Fresh troops were now brought up to reduce the centres of resistance between the two lines on the British front and by the middle of July on both fronts the Allies were ready for a second grand attack by which the VI French army advanced to the Somme River opposite Péronne but was unable to force the crossing; the British on their front broke through the German second line. It was now decided not to attempt any further advance of the VI French army south of the Somme but to move its reserves to the north of the Somme, where they were to be employed on the right of the British. From the middle of July until the middle of September, the British were engaged in the capture of the remainder of the German second line and the villages, woods and other strong points between it and the third line. About the middle of September, after a three days' artillery preparation, the German third line was taken. In this attack the British heavy tank was employed for the first time and met with considerable success. A fourth attack made about the end of September carried the last of the German prepared lines and the entire ridge was in the possession of the Allies. After September the attack died down somewhat but resulted in the straightening of the British front About the middle of November, the weather conditions made further operations impossible.

According to Haig, who had been in command of the British army in France since the beginning of 1916, the British employed in this attack 45 of their 70 divisions on this front and the Germans reinforced their original 6 divisions by 30 more during the operations The Germans had been driven back over the entire front of 30 miles and on the British front to a depth of about seven miles. Although a break-through had not been secured, it was felt that the morale of the German army had received a severe blow by their failure at Verdun and the advance of the Allies on a front that had been made especially strong. Although the losses incurred in the great attacks on the Western front had been very heavy in all three armies, it was felt that the Germans would feel the losses much more than the Allies.

1917. Retreat of the Germans. After the close of operations on the Western front in 1916, the Allies were quite confident that the War would be ended in 1917. They were now greatly superior to the Germans in artillery, aircraft, and men. In a conference between Joffre and Haig, it was decided to forestall the Germans in 1917 and begin operations as early as possible. To prevent the Germans from shifting their reserves as they had previously done when an attack was delivered on a comparatively narrow front, it was now proposed to attack simultaneously along the entire front from Lens on the north to the Oise River on the south, in combination with a secondary attack by the French between Soissons and Reims. In December, however, Nivelle succeeded Joffre, and he made a new plan which Haig was directed by his government to support. According to this plan the French were to make the main attack between Soissons and Reims, and, to aid in this attack, the VI and X French armies on the Péronne front were to be replaced by British troops The British, however, were to attack as previously arranged. The change of plan delayed the opening of the attack and enabled the Germans to secure the initiative.

In August, 1916, Falkenhayn was relieved as chief of staff of the German armies by Hindenburg, whose chief assistant was Ludendorff. In the winter of 1916–17, they decided that the Western front was too long for the available troops and decided to evacuate the Roy salient and fall back on a chord of this salient running from Arras on the north to the vicinity of Soissons on the south The new line was carefully selected and fortified during the winter; it was called the Siegfried line but was known to the Allies as the Hindenburg line The withdrawal of the stores began early in February and in the middle of March the troops began their retreat. To prevent the Allies from making an early attack on the new front, as the troops retired roads were blown up, and everything that could be of use or protection to the troops of the Allies was carefully destroyed

As a result of this unexpected movement, the plan of the Allies had to be changed, as the new line was in places 25 miles in the rear of the old one. Before any serious attack could be made on the new line it was necessary to construct railways, repair roads, organize munition dumps, etc., all of which would take considerable time. The Allied attacks could no longer be made as planned over the entire front from Lens to Reims but had to be confined to the parts of the old German front that had not been evacuated. It was decided, therefore, to make an attack as soon as possible with the III British army assisted by the I British army on the German line in the vicinity of Arras, while the IV and new V British army organized

their position before the new German line farther south. Nivelle was to make his great attack as planned between Soissons and Reims but it was to be extended to the east of Reims. The British and French armies on the front of the Hindenburg line were to coöperate as well as they could, simply to prevent reserves being sent to the fronts to be attacked.

Battle of Arras. One of the reasons for the German withdrawal was to nullify any preparations the Allies had made for a spring offensive This object failed of realization when scarcely a week later the British began an offensive on a 12-mile front north and south of Arras (April 9). Haig made long and minute preparations for the offensive. A continued aërial offensive gave him the control of the air. He also carried out a three-week wire-cutting artillery fire, interdicted the back areas, and for a few days preceding the attack laid down a terrific destructive fire, accompanied by extensive gas discharges; 4000 cannon were used in this preliminary work. Tanks were assigned to each corps to lead in the assaults. It was prescribed that halts for reorganization would occur only after the capture of each successive position.

On April 9 the British attacked on a 20-mile front. The I army under Horne advanced north of the Scarpe and the III army under Allenby advanced south of the Scarpe. On that day the Canadians stormed Vimy Ridge. The entire first line positions were captured in 40 minutes. The second positions were captured by noon. The third position presented greater obstacles, largely because the wire had not been effectively cut by the artillery. A gap had been made in the German lines but Haig failed to exploit his success and the probability of cutting the enemy's lines of communication was lost. Instead of sending the cavalry through the gap, Haig ordered the gap widened. This hesitation enabled the Germans to bring up the sorely needed reserves and prevented a serious break-through. The British were greatly hampered in their operations which began in a snow storm; this was followed by rain which made the movement of artillery extremely difficult. After the opening attack which ended April 13 the attacking divisions were replaced and the operations were renewed but the original momentum was lost. The attack, however, went on until May 4, in order to prevent reserves from being sent to the French front when Nivelle's attack was going on. By May 5, Haig had advanced five miles on a front of 20 miles and siege conditions again obtained. The Germans had lost 15,000 prisoners and 200 guns. The result was to give the British the Vimy Ridge and its extension southward, which proved of great value when the Germans made their great attack the following year. Checked on this front, the British suddenly shifted their operations to the Ypres sectors.

French Offensive on the Aisne. After the retreat of the Germans to the Hindenburg line, General Nivelle had concentrated a force of 1,200,000 men (V, VI, X and IV armies) and 5000 guns in the Aisne area between the Oise and the Argonne. With this force he planned to attack the German front on a grand scale. The German front ran due south from the Ailette River to the Aisne at the junction of the Vesle and thence along the south bank for a few miles where the Germans had a bridgehead captured in the winter of 1914–15; thence the line crossed the river to the Chemin des Dames Ridge (Ladies' Way, so called because it was built by Louis XV as a promenade for his daughters), between the Ailette and Aisne Rivers and along that ridge to Craonne. From Craonne the line ran southeast to some heights commanding Reims and thence over the Moronvillers ridge between the Suippe and Vesle Rivers to the Suippe. The attack was to be prepared by a long artillery bombardment.

The artillery began its operations on April 9, but the weather conditions were so bad that the infantry attack had to be postponed from the 12th to the 16th. Even then the weather conditions were unfavorable. Besides this, Hindenburg was fully cognizant of the French plans through the medium of captured despatches and had taken adequate means to fend off the French attack He also withdrew the I army from the Hindenburg line and sent it to the French front. As a result, although the German lines were penetrated at various points along the front, only the first of the German lines could be captured and held on the Chemin des Dames Ridge and to the east. At the close of the first day it was evident that there was to be no break-through. Despite this Nivelle kept up attack until the 21st. In an intermittent battle lasting from April 17 until May 20, the French IV army east of Reims—Anthoine—succeeded in capturing the high ground of Moronvillers. On the night of May 4 the French captured Craonne, a key point on the Chemin des Dames, and by the next day captured the crest of the Chemin des Dames to the west and, to the east, the plateau of Craonne.

The French troops, after the initial defeat of April 16, considered success on the Aisne impossible. Units up to divisions in size, although asserting themselves to be loyal and ready, if necessary, to die for France, refused to continue the attack on the Aisne, on the ground that it was a useless loss of life. Although 20,000 prisoners and a large number of guns had been taken the French casualties amounted to about 120,000 and its general advance west of Reims had been slight. General Nivelle lost the confidence of his government by this gigantic failure and on May 15, Pétain succeeded him in command of the French armies, and Foch, who had been without any important duty since the preceding December became chief of staff at the War Department. Foch had been in command of the northern group of French armies since 1914 but this group was broken up when the VI and X armies were moved to the Aisne front.

British Operations in Flanders. The U-boat campaign had become exceedingly effective and as the principal base of these operations was Zeebrugge, the Channel port of Bruges, the capture of this port became a very important objective. Haig believed that this could be accomplished by land operations from the British front in Flanders operating from the Ypres front in the direction of Bruges. In June, 1917, when operations were begun on this front, the IV German army held most of the front from the Channel to the Lys River. In the north, its line was the east bank of the Yser River except on the coast where the Allies had a bridge-head on the east bank. From the Yser it followed the Ypres Canal almost to that town, which was held by the British. South of Ypres it held the Messines Ridge, which had been captured from the British in

1914. To strengthen its lines it had constructed a large number of concrete machine-gun emplacements called by the British "pill boxes."

Haig was given the I French army—Anthoine—to assist in his campaign and brought up the headquarters staffs of the IV and V British armies whose fronts were taken over by the III army. A new IV army was to operate along the coast and a new V army was to operate with the II army already on this front. While preparations were made to attack north and east of Ypres he directed the II army to capture the Messines Ridge.

This attack opened on June 7, 1917, when there occurred one of the most spectacular events of the entire war. This was the blowing up of the Messines-Wytschaete Ridge. This ridge formed a salient which dominated the entire Ypres sector from the south and which was literally a thorn in the side of the Allies. For over two years British sappers had been burrowing under this ridge and finally succeeded in placing in position, undetected by the Germans, 20 mines containing more than 1,000,000 pounds of ammonite. These were exploded by electricity on the morning of June 7. The whole tops of the hills were blown off and the roar could be heard for a distance of 150 miles. A tremendous shell fire which had been playing on the ridge for two weeks reached its greatest intensity as the mines were exploded. After the explosion the British infantry rushed forward and by the end of the day had wiped out the entire salient. The Germans retaliated for this Allied offensive by a successful attack on the British line at its most northern extremity in Belgium. On July 11, after heavy artillery preparation, the Germans made a strong infantry attack on the British positions east of the Yser River and captured the entire works. The preparations on the front of the main attack were made during the month of July but as the Germans had captured the bridgehead near the Channel the attack was confined to the front from Dixmude to the Lys River. In this opening attack the I French and the V and II British armies were to be employed. After a prolonged artillery preparation the infantry attack was to be launched on July 31 and the Allied forces advanced about two miles, capturing the first and second German lines. A heavy rain now set in which lasted several days and made further operations impossible. The field of operations being generally flat, it was converted into an immense swamp over which movement was possible only on the few roads.

Some minor operations were undertaken about the middle of August by the V army that met with so little success that the commander of that army was relieved and the British front placed under the orders of the commander of the II army—Plumer. In the latter part of September the ground was again sufficiently dry to admit of another general advance and on September 20 the Allies again advanced about a mile. Then followed a succession of attacks with limited objectives carried on under very unfavorable weather conditions. The Allied objective was no longer the Belgian coast but only a ridge about five miles east of their original position; this ridge overlooked the ground to the east and in the possession of the Allies would make future offensive operations on this front practically impossible to the Germans. Most of this ridge was secured early in November when the Canadians captured Passchendaele. This closed the operations.

According to Haig, in these operations the British employed two-thirds of their divisions in France one or more times and the Germans 78 divisions, 18 of which were employed a second and a third time after being withdrawn to rest and refit. The casualties on both sides were extremely heavy. As a strategic movement it was not a success but it did produce a great effect on the morale of the German army.

Verdun Again. On Aug. 20, 1917, after nine months of comparative quiet, the French resumed the offensive at Verdun. After a three-day bombardment they advanced on both sides of the Meuse and penetrated a mile and a quarter on an 11-mile front. In the next four days smashing blows were delivered which resulted in a further advance. By the 15th of September the French had recovered 100 square miles of the 120 the Germans had seized in their great offensive. They now held all the dominating positions in the Verdun sector and on the west of the Meuse the Germans were back in the lines from which they advanced in 1916.

Second Battle of the Aisne. On Oct 23, the French X army—Maistre—launched a successful attack in the Aisne region. The attack was directed at the salient of the German line northeast of Soissons and just south of the Ailette River. The objectives were reached that day and immediately organized. The result of this attack was the abandonment by the Germans of the Chemin des Dames by November 2, and the retirement across the Ailette. This operation which was based on surprise, captured with comparative ease what Nivelle failed to capture with nearly a million and a half men. It worked marvels in the restoration of confidence and the rehabilitation of the French soldiers' morale.

Battle of Cambrai. While the British operations in Flanders were in progress, the commander of the III British army—Byng—had been preparing plans for an attack on new lines. The battle was to be a complete surprise without artillery preparation, a method untried up to this time in the War. The attack was to be led by a lone line of tanks followed by the infantry. Special preparations had been made to enable these tanks to cross the German trenches of the Hindenburg line which were here 15 feet wide and 9 feet deep. After the close of the operations in Flanders, Haig gave his consent to the attack but was unable to send enough divisions to hold the ground won by its unexpected success.

The attack was to be delivered on a front of about 6 miles between the Canal du Nord and the St. Quentin Canal southwest of Cambrai. A strong cavalry force was assembled in rear to be employed if a break-through was secured. On the morning of November 20, preceded by a barrage, 350 fighting tanks moved off followed by the infantry. The main and reserve lines of the German position were taken and on the second day the British were five miles in advance of their own lines fighting for a ridge which in their possession would have commanded Cambrai. Their force was too small to effect its capture and although other divisions were hurried up it was then too late. The cavalry was disappointed as the bridge

over which they expected to cross the St. Quentin Canal was broken down and the arrival of a German division from Russia closed this front. While the fighting was still going on in the captured area, the Germans hurried up reserves and on November 30 made a counter-attack across the St. Quentin Canal and recovered about half the area they had lost.

The battle of Cambrai established the value of tanks, and preparations were made both by the British and French to employ them on a grand scale in 1918.

Allied Unity. The prime ministers of France, Italy and Great Britain met at Rapallo, Italy, on November 9, and formed the Supreme War Council, which was to coördinate the military powers of the Allies and wage war as a unified group and not as individuals. The members of the Supreme War Staff were to be Generals Cadorna (Italy), Foch (France), and Wilson (British). According to the agreement, "The Supreme War Council has for its mission to watch over the general conduct of the War. It prepares recommendations for the considerations of the governments and keeps itself informed of the execution and reports thereon to the respective governments." General Bliss later became the American representative.

American Expeditionary Force. The first contingents of a United States army to fight in Europe arrived at a French port on June 26 and 27, 1917. They were commanded by Maj.-Gen. William L. Sibert and received a tremendous ovation from the French people. On the way over, the transports had been unsuccessfully attacked twice by submarines. Gen. John J. Pershing, the commander-in-chief of the American force, had been in France for some time preparing for the coming of the "Sammies," as the French characterized the American soldiers. Training camps for the American troops had been located in various parts of France and were ready for occupancy when the soldiers arrived. Infantry, artillery, aviation and medical bases were established. The number of men gradually increased, many of them stopping in England before going over to France. An intensive system of training was entered upon during the latter part of July. American officers were aided by officers and men of the British and French armies. The American transportation service took over transportation on all railways leading to American bases and a section of French forest was turned over to American lumbermen for the needs of the Expeditionary Force.

For the details of the actual raising, training, and equipping of the American army, see UNITED STATES and allied topics.

1918. Last Year of War on Western Front. The months of January and February, 1918, were months of comparative inactivity along the battle line from the North Sea to the Swiss border. The outstanding feature of the War at the close of 1917 was the signing of an armistice between the Central Powers on the one hand and Rumania and the de facto government of Russia on the other. The defection of Russia from the side of the Allies was the signal for a tremendous publicity campaign in Germany, predicting a gigantic blow on the Western front, which would completely crush the British and French armies before the American forces could land in sufficient numbers to give any substantial aid. The depression in Allied countries caused by the abolition of the Eastern front was somewhat overcome by Allenby's victories in Asia Minor and the unexpected rapidity with which the United States rushed men and material to Europe.

The chief cause for the optimistic tone of the Teutonic press was the fact that huge quantities of material and a large number of men could not be transferred from the Eastern front for immediate service on the Western front. The German High Command adopted a policy of careful selection of the men who were to be transported westward. As a skeleton for the new division to be formed they picked out all the soldiers in Russia between the ages of 25 and 35. They realized that it would be impossible to withdraw all the men from Russia inasmuch as the Treaty of Brest-Litovsk provided for the occupation of a considerable amount of Russian territory by German troops. While it was generally known that the personnel and morale of the Germans on the Eastern front were considerably lower than on the Western front, nevertheless the German command hoped to build up from the Eastern material about 59 or 60 divisions of 12,000 men each. This would increase the fighting strength on the Western front by about 700,000 men and would bring the highest total of available men up to approximately 2,340,000. This total would approximately equal the number of men Great Britain and France had available. American, Belgian, and Portuguese troops practically assured the Allies a numerical superiority over the whole front although not necessarily in any one sector.

On the Western front, during the first 10 weeks of the year the fighting consisted of a series of almost unending trench and aerial raids, carried out for the purpose of reconnaissance. Sometimes the trench raids would follow heavy bombardments, but generally speaking they were carried out by small patrols under cover of darkness. The Germans with varying success carried out raids in Flanders, Artois, Picardy, the Verdun sector, Champagne, and Lorraine, with the evident intention of ferreting out the weak points of the Allied line for the much heralded offensive on the Western front. The purpose of the Allied raids was to discover, if possible, the places on the German lines where any unusual concentration was being made. The aërial raids, to a large extent, were carried out over the valleys of the Rhine and Moselle Rivers, where it was known that the troops transported from the Eastern front were being refitted for service on the Western front.

The American troops, which had been pouring into France in an ever-increasing stream, and which had been gradually concentrating in camps in eastern France, were prepared to take over a section of the battle line. Pershing from the first had insisted on a distinctly American unit and had steadfastly refused to brigade the American troops with the British and French. The sector allotted to the 1st American division was about eight miles long and was on the southern side of the St. Mihiel salient, which had been established by the Germans advancing from Metz in 1914, and which had withstood several attempts on the part of the French to "pinch" it. Three French divisions were thus relieved for duty against the impending German attack. The Germans lost no time in trying out the new American forces by means

of heavy bombardments of high explosives and gas shells.

Second Battle of Picardy: The Somme Again. Shortly before 5 A. M. on Mar. 21, 1918, came the great blow which the German press and public had been so continually prophesying since the collapse of Russia and Rumania The German plan was based on sound military strategy. It was to strike the Anglo-French line where the two armies joined, break through and reach the channel ports, and thus either confine the British, Belgian and Portuguese armies in the narrow region between the Somme and the Belgian border or drive them into the sea, and then turn their attention southward to the French armies, and make a direct advance on Paris. The attack was so timed as to offset any increase to the Allied force from the United States. The success of this scheme depended entirely on a complete break-through at the junction point of the British and French armies.

The front chosen for the attack was between the Scarpe and the Oise Rivers, and was held by the III British army under General Byng and by the V British army, under General Gough. The V army section of the battle line was taken over by the British from the French at the beginning of the year. The V army was composed of about 14 divisions, roughly 170,000 men, which had to protect a line about 50 miles long. It is difficult to understand why this particular section of the line was held so lightly. This entire front was attacked by a force composed of between 40 and 50 divisions, amounting to approximately 750,000 men, about 150,000 of which were concentrated between St. Quentin and La Fère. It is scarcely to be wondered at that the V British army was brushed aside by such a superiority of men, and by the dogged determination on the part of the Germans to get through at any cost. The German armies facing the battle line were under the supreme command of the Crown Prince of Bavaria and the individual armies, XVII, II, and IX, under the leadership of Von Bülow, Von der Marwitz, and Von Hutier. The plan of attack was drawn up by the last named general.

The weather favored the Germans to a very large extent. The attack was begun a little before 5 o'clock on the morning of the 21st under the cover of such a heavy fog and mist that it was impossible to see more than 100 feet ahead. It was preceded by a brief but very intense artillery fire which was composed mainly of high explosive and gas shells. Simultaneously a heavy artillery fire broke out in the Champagne and Lorraine sectors with the obvious purpose of preventing the bringing up of reinforcements to the vital places attacked. The Germans also bombarded Paris with a long-range gun placed in the forest of St. Gobain, approximately 75 miles away. This gun killed many civilians and did much material damage in Paris, but instead of causing a panic it seemed to renew the grim determination of the Parisians to carry on.

General Gough, commander of the V British army, knew from documents taken from German prisoners that the assault was impending and had made preparation to meet it, but his preparations were practically nullified by the weather conditions. The first line of defense, i.e. the outpost line, was taken before the British were cognizant of the fact that the attack had begun. The tremendous superiority of numbers forced the resistance line (second line) very quickly and enabled the Germans to rush up to the battle line or last system of defense. Here again the inequality of numbers ultimately told and the II and IX German armies forced their way through where some of Gough's division joined. Apparently the British had made no provisions for a break-through, because there were no defense lines behind the third defense system. The road to Amiens seemed open and only heroic efforts saved it.

The battle line of the German offensive extended from southeast Arras in the direction of Cambrai, as far as La Fère The first infantry attack broke through the first and second lines of British trenches of the III army on a 16-mile front from Lagnicourt to just south of Gouzeaucourt. The result of this attack was evacuation of the British positions in the salient that remained after the battle of Cambrai at the close of 1917. On the 22nd, the Germans, after more heavy artillery preparation smashed through the entire British position along the whole front. The V British army was now completely cut off from the permanent French position before La Fère and the permanent British position at Arras. Between these two points there was a struggling mass of humanity with practically no organization as far as the Allies were concerned. It seemed certain that the German plan was to succeed and a permanent wedge inserted between the French and British armies On the 23rd the British were defeated near Monchy, St. Quentin, La Fère, and opposite Cambrai, and the British second positions between Fontaine les Croisselles and Mœuvres were penetrated. The Allies hoped to be able to hold the line of the Somme, but were unable to do so because no adequate defenses had been constructed there. On the 24th the Germans took Péronne, Chauny and Ham, and crossed the Somme River at various points south of the first mentioned place, by means of a pontoon bridge and rafts. The British were unable to completely destroy the bridge because of the haste with which they were withdrawing their artillery.

Continuing to advance on the 25th, the Germans captured Bapaume, Nesle, Etalon, Barleux, Biaches and Guiscard. On this day the French War Office announced that British lines south of St. Quentin and around Noyon had been taken over by a French army, thus showing that at last the Allies were making some successful attempts to stem the tide of invasion On the 26th, the Germans crossed the old battle line of 1916 in several places and captured Noyon, Roye and Lihon. The 26th was the decisive day of the battle of Picardy. This day saw the closing of the gap caused by the break-through of the 21st. The French came up along the Southern front from the Aisne to the Avre, and west of the Avre, where they united with the British at Moreuil. The 26th also saw the organization of a temporary force under Gen. Sandeman Carey, who had received orders to close a gap made by the Germans. With rare judgment and skill he improvised an army from sappers, laborers, engineers, in fact anybody he could find, and with this cosmopolitan force faced the Germans, fighting over unknown ground, and with officers in charge of men they had never seen before.

A few words should be said here of the

method used by the Germans to relieve men who were exhausted by constant attacking or shot to pieces by the heroic British defense. Reserve divisions were kept directly behind the battle line and when advanced divisions needed replacement, the reserves were passed through the forward divisions and the latter were rested and reformed, and then they became the reserve. By this means the Germans were able to present continually fresh men to the British, who had been fighting without rest or relief since the tremendous offensive began. Another thing to be noticed about this battle was the ease with which the Germans were able to manœuvre their attacking columns. The attack was made with three or four columns of several divisions each, and when they were stopped in one direction they were able to turn without loss of power in another direction. As most of the new ideas worked out in this battle were devised by Von Hutier, this plan of attack became known as the Von Hutier method. Many of its features were later adopted by the Allies.

The 27th saw the first perceptible signs of the slowing up of the German forward movement. The British, now reinforced, checked the Germans, and recaptured Morlancourt and Chipilly north of the Somme and advanced to Proyart south of the Somme. These gains were offset, however, by the capture of Albert and the crossing of the Ancre River north and south of that city, and forcing the French back east of Montdidier. The 28th saw the fall of Montdidier but it also saw the complete repulse of a tremendous German attack on Arras. The artillery preparation was terrific and the Germans' orders were not only to take the city but Vimy Ridge also, at all costs. The Germans used about 20 divisions in the huge effort, and after suffering appalling losses which materially reduced their numbers, were compelled to give up the attempt after an all-day battle which equaled in intensity anything that the War had produced.

The German effort had now almost spent itself and the German High Command found itself caught in a rather difficult position. The Germans had pushed a 35-mile salient towards Amiens, which was quite narrow at its extreme tip. The northern side of the salient was bounded roughly by the Ancre River and the southern side by the Avre. These water barriers were, comparatively speaking, no protection to the Allies, but the high ground on the Allied sides was an ideal spot for artillery emplacements, which commanded all the German positions in the tip of the salient. The German problem was to break through the sides of this wedge and broaden the salient or face a possible disaster. The attempt at Arras, as has been noticed above, failed During the first week of April tremendous assaults were made from Albert at the Ancre line on the north, and on the Avre line from Grivesnes to north of the Amiens-Roye road on the south Although local successes were gained by the Germans, they failed in their main purpose, i.e. breaking the lines of the Avre and Ancre and widening the salient. The chief reason for this was the time element, which had permitted the British and French to bring up men and guns and thus stabilize their lines. Another contributory cause was the fact that a heavy rain had turned the Somme battlefield into a desolate sea of mud, and hindered the Germans' transportation of men, munitions and supplies. The failure during the first week of April to smash the sides of the Amiens salient ended the battle. As to results, the main German plan was frustrated. The French and British were still united and held strong defensive positions. The Germans had taken practically all the ground they held at the beginning of the battle of the Somme in 1916, and some more besides, approximately 1500 square miles. Both sides suffered severe losses. A conservative estimate would place the German casualties at a quarter of a million men, while the Allies' were probably 50,000 less. Most of the Allies' losses were borne by the British.

Ferdinand Foch, Allied Commander-in-Chief. The terrific blow struck at the British army on the 21st of March, with the subsequent demoralization and almost complete defeat of the Allies, compelled them to take a step that up to this time they had been loath to take. That was to appoint one man as the leader of all the Allied armies. It is idle to speculate on what might have happened if this had been done previously, but many critics have stated that the great March disaster would have been avoided under a unified command. On Nov. 12, 1917, after creation of the Supreme War Council, Lloyd George said concerning it ". . . The Italian disaster necessitated action without delay to repair it. . . . It is true we sent troops to Saloniki to succor Serbia, but as always they were sent too late. Half the men who fell in that vain effort to pierce the Western front would have saved Serbia, saved the Balkans, and completed the blockade of Germany. . . . 1915 was the year of the Serbian tragedy: 1916 was the year of the Rumanian tragedy. . . . National and professional traditions, questions of prestige and susceptibilities, all conspired to render our best decisions vain. . . . The War has been prolonged by particularism. It will be shortened by solidarity" These words seem to point to a unified command but Lloyd George was compelled to go back on them because the British General Staff, which was opposed to the scheme, was too influential with the British public and Parliament. The move was characterized as an attempt to subordinate the military to the political leaders. The British felt that a French leader would not protect the British lines to the sea, and the French felt that a British leader would sacrifice Paris for the sake of defending the coast. But Allied failure on the Western front, such as at Cambrai, the collapse of Italy, and the colossal defeat just suffered by the British arms, converted the British public to Lloyd George's point of view.

From the time that the United States entered the War, President Wilson had argued unity of command as well as the pooling of all the resources of the Allies. When the Germans struck in March, General Pershing offered the small American forces in France to the Allies for use in any way they saw fit. This act on the part of the American commander finally overruled the last objections on the part of the British Staff. General Foch, whose ability, achievements, and popularity in the Allied countries, eminently fitted him for the task, was named Commander-in-Chief of all the Allied Armies. His first statement was an assurance that Amiens would not fall. In all the

countries involved he was heartily welcomed as the savior of the world by the press and the public.

Battle of Lys River. Possibly as a result of the Von Hutier idea of changing the direction of the attack or possibly as a result of the check they received before Amiens, the Germans suddenly launched an attack between the high ground north of Ypres and Arras with their IV and VI armies. The German Staff also estimated that the British armies defending these fronts were considerably weakened by the attack on Amiens. The main part of the attack was aimed between the first mentioned positions and La Bassée, astride the Lys River. A break-through of any size would seriously imperil the channel ports, inasmuch as the British had scarcely 40 miles to manœuvre in. An advance similar to that before Amiens would have resulted in the capture of Calais, one of the chief bases of supply of the British armies. The chief objectives of the first German thrust were Béthune, Bailleul and Hazebrouck. The last named place was a little over 15 miles from the starting-place, and if captured meant the fall of Ypres and the dislocation of the entire railway line behind the British and Belgian armies.

On April 9 the German armies struck at a portion of the line between Estaires and Bac St. Maur, held by a Portuguese division and smashed it completely, capturing Richebourcq-St Vaast and Laventie. This attack created a gap of about 3 miles in the British lines and through this opening German troops began to pour and spread out in ever-increasing numbers. On the 10th the Germans crossed the Lys River at several points between Estaires and Armentières, and launched a tremendous assault at the base of Messines Ridge. These movements caused the fall of Armentières. On the 11th the Germans launched an attack all along the front from La Bassée to the Ypres-Comines Canal and took Estaires and Steenwerck. The Germans, as in their previous offensive, were making rapid advances in the centre toward Hazebrouck, but were checked by the defense around the wings at Ypres and Arras. Unless one or the other of these wings could be pierced the German advance was bound to be stopped before it could reach its main objective at Hazebrouck. By the 13th the Germans were only 5 miles from Hazebrouck. The seriousness of the British position may be gathered from General Haig's statement to his troops on April 12, "Many among us are now tired. To those I would say that victory will belong to the side which holds out the longest. Every position must be held to the last man. There must be no retirement. With our backs to the wall, and believing in the justice of our cause, each one of us must fight to the end. The safety of our homes and the freedom of mankind depend alike upon the conduct of each one of us at this critical moment."

Although it appeared that the German offensive had slowed up on the 14th, on the 15th the Allies met with severe reverses. A terrific assault towards Bailleul and Wulverghem resulted in the capture of Bailleul, Wytschaete and Spanbraekmolen. On the 17th the Germans occupied Poelcappelle Langemarck, and Passchendaele, which the British were compelled to evacuate, in order to escape the dangers of a salient, the base of supplies of which was nearer to the Germans than to the British themselves. The capture of Wytschaete placed the British positions around Ypres in a very precarious situation. Messines Ridge, on which this was located, dominated all the British positions in Ypres and overlooked the means of communication with that city. In order to prevent a serious catastrophe the British retired to a line that ran from Bixschoote to the neighborhood of Zonnebeke. By the 18th their positions were almost identical with those they held after the first battle of Ypres in 1914. The surrender of territory was a terrible blow to British morale and pride. The first and second battles of Ypres had made that city, in the eyes of all Englishmen, what Verdun was to the Frenchmen.

The Germans, checked for the time being in the north, made a heavy assault on Villers Bretonneux, southeast of Amiens, on the 24th. With the aid of a number of tanks, they captured the village. At the same time, just south of this, French and American forces were compelled to abandon an unimportant salient near Hangard, in the valley of the Luce River. Mount Kemmel, which seemed to be the only remaining key to the Ypres salient, was the scene of extremely bitter fighting from April 24 to April 27. The Germans, prodigal of men, made frontal and flank attacks on the positions, until by sheer weight of men and metal they compelled the Allies to relinquish the height, as well as the villages of Kemmel and Dranoutre. Ypres did not fall as was expected because of the failure on the part of the Germans to capture Mont Rouge, Mont des Cats, Scherperberg, and several other hills that belonged to the same range as Mount Kemmel.

The second great German thrust was ended. It failed to accomplish its purpose, although approximately 800 square miles of French and Belgian territory were occupied. The significant fact that remained after these two German attempts to gain a decision was that the 15-mile front between Lens and Arras held. This prevented the Germans from broadening their salients and thus, in a sense, limited the depth of their penetration inasmuch as a narrow salient is constantly in danger of being "pinched."

Forcing of the Aisne and the Marne. The fact that the defensive around Arras, particularly Vimy Ridge, and around Ypres, particularly Mont Rouge, held against all assaults, forced the Germans to turn to the southern side of the Picardy salient and attempt to widen it there. Hindenburg would undoubtedly have preferred to attack the British army again, but as that would require a large amount of preparation, he decided to go through with his plans on the Aisne, in order to keep the offensive. A few days previous to the beginning of the battle of the Aisne heavy artillery fire in the Picardy and Ypres salients seemed to presage an attack in those localities. When the real direction of the attack was revealed and the Germans forced the Chemin des Dames positions and the Aisne River with comparative ease, many critics believed that Marshal Foch had been out-generaled and out-manœuvred. Later events proved that he had adopted the best course of action, because, while he could doubtless have held these positions at great cost, he achieved far better results by permitting the Germans to advance in the centre while holding

them on the wings, thus placing them in a vulnerable position.

On May 27, the Aisne offensive began. As in the previous two, great concentrations of men and material were made by the Germans with comparative ease, and apparently without the knowledge of the Allies. A three-hour artillery preparation, composed mainly of gas, with a sprinkling of high explosives, preceded the infantry attack. The attacking force comprised 250,000 of the best fighting men in the German army. The British and French defenders consisted of between 50,000 and 75,000 men. The attack was on a 40-mile front from around Vauxaillon, near the Ailette, to Reims. The chief attack was near Craonne and its purpose was to outflank the Chemin des Dames, in case it could not be taken by frontal assault. The entire Chemin des Dames line was overrun on the 27th, and the Allies retreated across the Aisne between Vailly and Berry-au-Bac, a distance of 18 miles, in relatively good order. On the 28th, the Germans drove forward about 6 miles on a 9-mile front between Vauxaillon and Cauroy, took about 20 towns and villages, crossed the Aisne and Vesle Rivers and reached Fismes on the southern bank of the latter river. The Allies were falling back in the centre, but on the Reims side they held the Thilloix-Savigny-Brouillet line which protected that city. An attempt was made to do the same on the western side to protect Soissons, but the line failed to hold. The same day also saw the end of the German assaults in the Ypres and Picardy sectors, which were intended to divert attention from the main battle. The Allies recovered their lines on the Lys-Ypres front east of Dickebusch Lake. The American 1st division took Cantigny, near Montdidier, after a brilliant assault, and held it against several strong counterattacks.

On the 29th Soissons fell after an extremely heavy bombardment of high explosive and incendiary shells. On the 20th the Germans continued their advance in the centre but were checked on the flanks. They captured Fère-en-Tardenois and Vezilly, and forced the Allies back on Reims, but in the south were held along the Soissons-Château-Thierry highroad. They succeeded in wiping out the salient south of Noyon from the Oise canal to Soissons. The 31st saw an 8-mile drive to the Marne, which was reached on a 6-mile front from Château-Thierry to Dormans. Attempts in the next few days to broaden this front, particularly in the direction of Epernay, were severely repulsed.

On June 15 the Germans began to widen this salient to the westward. They pushed 6 miles in that direction along the Ourcq, a tributary of the Marne. This drive brought them beyond Neuilly and Chony and reached Nouvron and Fontenoy northwest of Soissons. A heavy assault against Reims, with the intention of smashing the eastern side of the salient, was severely checked before it made any headway. The tide of battle was now slowly but surely swinging to the side of the Allies. Although the Germans had almost 500,000 men across the Aisne, General Foch, by calling on the British, French, American, and Italian reserves, presented at least an equal number to them. On the next day French counterattacks in force slowed up the German drive westward.

The German advance had now practically stopped and during the next few days, the French, with the assistance of the Americans, not only stopped the Germans, but drove them back in the neighborhood of Château-Thierry. On June 6, Franco-American troops advanced nearly a mile in the vicinity of Veuilly-la-Poterie, and Americans took Torcy and Bourescheș, which they held against strong counter-assaults. The subsequent activities of the Americans in this sector will be treated in the following section. On June 18, a terrific attack on Reims, carried out by 40,000 Germans, was completely crushed.

The German War Office announced that 45,000 prisoners and 400 guns had been captured; 650 square miles of territory had been occupied, and the Germans had advanced a maximum depth of 30 miles, and created another salient with a narrow tip, only 6 miles, along the Marne. No considerable strategical advantage had been gained, unless it be the fact that the Germans were now only 44 miles from Paris instead of 62. The price paid to gain what was merely a geographical advantage, was conservatively, 110,000 men, killed, wounded, and captured.

The Offensive Against Compiègne. The battle of the Aisne and Marne left the Germans in a very precarious position. The salient had to be widened, strongly fortified, or else abandoned. The line from Château-Thierry was in the shape of a huge crescent with the bend facing towards the Germans. The German plan was to link up the Picardy salient with the Marne salient and thus wipe out the huge bulge in their line and to capture Compiègne, Compiègne Forest, and Villers Cotterets Forest and then use the first mentioned place for a direct attack on Paris. The capture of Compiègne was considered absolutely necessary because of the insufficient line of supplies for the troops in the Marne salient. The capture of Compiègne would open up the Liége trunk line and solve the problem of supply. The river valleys of Aisne, Oise, Marne, and Ourcq would then be available for a converging attack on Paris, the nerve centre of France. The strategy of the offensive was sound but its execution failed. In five days the Germans suffered one of their most ghastly failures of the entire war The offensive lacked the element of surprise, which, undoubtedly, was the chief cause of the initial successes of the earlier offensives. The French command had made a minute survey of the field and placed artillery and machine guns in such position as to enfilade all avenues of attack. They also made provisions, in case of initial German successes, to check their forward movement on second and third defense lines, as carefully prepared as the first. The French plan was to hold this front line lightly and resist the enemy on the combat lines, which were out of range of the German light artillery.

The attack was preceded by a heavy artillery attack, again mainly composed of gas, which lasted from midnight until 4.30 in the morning of the 9th of June when the attack began on a 20-mile front from Montdidier to Noyon. As in the previous battles the Germans advanced in the centre but were held on the flanks. The total advance on the first day was 2½ miles and was only attained after frightful losses. The French made a heavy counterattack on the very first day between the Oise and the Aisne, which showed that the forces on both sides were nearly equal. On the next day the Germans

advanced about 3 miles farther and captured, after extremely bitter fighting, Mery, Belloy, and St. Maur. The German penetration was now about 5 miles and this was approximately the depth of their entire advance.

On the third day the Germans were compelled to bring up fresh divisions and, with their aid, reached the Aronde River, a small stream on the western side of the battle line. They also advanced a mile along both banks of the Matz River and almost reached its junction with the Oise on its northern bank On the eastern end of the battle line, Ourscamps Forest was enveloped. This day was the turning-point of the battle, because before it was over, two French counterattacks had driven the Germans back between Ribescourt and St. Maur, and recaptured Belloy, Senlis wood, and the heights between Mortemer and Courcelles. On the next day the French gained further ground between Belloy and St. Maur. The Germans forced a crossing of the Matz, but on the 13th the French again counterattacked in force and drove the Germans back across the Matz. This ended the German offensive which resulted in the using up of over 300,000 German troops and the actual putting out of action of 80,000. No strategical advantage was gained.

A word should be spoken here of the activities of the Franco-American troops in the neighborhood of Château-Thierry. On the 10th, American marines moved forward in the Belleau Wood and by the next day had captured all of it The Americans also crossed the Marne on scouting expeditions.

Second Battle of the Marne. On July 15, Ludendorff opened his fifth and what proved to be the last German offensive of the year. It also proved to be the last German offensive of the War. It was under the personal direction of the German Crown Prince and was called "Friedensturm" (peace offensive). The whole line attacked was roughly 60 miles long and extended from Château-Thierry to Dormans, around Reims, and then east almost to the Argonne Forest. It is estimated that the German Crown Prince had more than 800,000 men available for this "peace offensive." The plan of attack was to encircle and capture Reims by taking the Reims mountains, and also to get control of the railway centre of Epernay, which would compel the French to give up the entire Champagne line, which was very strongly fortified, and thus leave the centre in a very vulnerable position. The capture of Reims would also solve the supply question of the overextended Marne salient.

The attack began at 6 A.M. on the 15th. The first blow was aimed at the Americans on both sides of Château-Thierry. The Germans crossed the Marne in June southeast of Château-Thierry between Fossay and Mezy, compelling the Americans to retire on Condé-en-Brie. Here a counterattack was immediately organized, which drove the Germans back across the river and left 1500 prisoners in American hands On other positions of the front the Germans were more successful. They crossed the Marne east of Dormans and advanced astride it in the direction of Epernay. At Bligny, southwest of Reims, they penetrated positions held by Italian troops and thus threatened to get in the rear of Reims. Southeast of Reims, the Germans made a fierce attack east of Prunay, with the idea of squeezing out the city, in conjunction with the advance at Bligny. General Gourand's IV army put up a magnificent resistance and held the Germans to very slight gains after inflicting appalling losses on them. The 42d American division formed part of this army. On the 16th and 17th, further attacks against the American forces were checked almost before they had started, but the pockets around Bligny and Prunay, southwest and southeast of Reims, respectively, were deepened. Everywhere else the Germans were held or driven back by counterattacks. The distance across the base of the Reims salient was scarcely 10 miles, which shows the critical position of this Allied bulwark. It is estimated that the Crown Prince in this "peace offensive" used 400,000 men, just one-half of those available, and that at the end of three days one-fourth of those employed were on the casualty list.

The Allied Offensive. The great German offensive begun in March was finally terminated on July 17 and the Allied counteroffensive began on the following day. In this counteroffensive there were two distinct periods although the fighting was practically continuous. The first period was that covered by the operations that ended in the compulsory retirement of the Germans not only from the three great salients made by the advance of their armies in 1918—the Marne, Somme and Lys salients—but also from the St. Mihiel salient captured in 1914. This period ended about the middle of September. This was followed by the final campaign in which the Allied armies advanced in practically a continuous line from the Channel to the Meuse River; it ended with the Armistice. This period began about the 25th of September and ended November 11.

Marne Salient. As early as June 1, General Pershing saw that the Marne salient was inherently weak, and suggested to Marshal Foch an immediate attack along the western face toward Soissons. Marshal Foch was strongly impressed by Pershing's plan but determined to wait until he had a preponderance of force. By the middle of June a plan for a counteroffensive, drawn up by General Pétain, in conference with Generals Fayolle, Mangin, and Degoutte, had been approved by Marshal Foch. While the Crown Prince was attempting to encircle Reims and cross the Marne the details were being worked out. The plan was to strike on the western side of this salient along the line between Soissons and Château-Thierry. The preparations for this counterattack were kept very secret. Vast quantities of supplies were stored up in the Villers-Cotterets forest, which lent itself admirably to the purpose. Great numbers of men of the army of manœuvre (the existence of which the Germans doubted) were concentrated in the ravines and valleys of this forest without detection by the enemy.

The Allies attacked on July 18 on a 28-mile front from Amblény, west of Soissons, to Bouresches northwest of Château-Thierry. The attack was made without artillery preparation, the advancing infantry being protected by large numbers of tanks and a creeping barrage. It was made by Franco-American troops, the latter being most prominent in the Soissons and Château-Thierry regions, actually being the spearhead of the attack in the former place. The blow took the Germans completely by surprise, and, as a result of it, and the vulnerability of the German lines, the Crown Prince and his ar-

miles were driven across the Vesle. The hinge of the entire German retirement was the high ground around Chaudon, southwest of Soissons. The first push netted the Allies a 6-mile advance to the Crise River, which runs around the Chaudun plateau and which joins the Aisne at Soissons. This brought General Mangin and his Franco-American force to within a mile of the city, but the German High Command continued to hurl in fresh divisions in this vicinity, which effectively prevented the retreat from becoming a rout. The Allies also advanced from 2 to 3 miles astride the Ourcq, and the whole German line from Soissons to Château-Thierry began to retreat. Assaults carried out by British, Italian, and French troops, along the line from Château-Thierry to Reims won initial success but were unable to make a breakthrough similar to that on the western side.

Château-Thierry was evacuated on the 21st and on the same day Franco-American troops crossed the Marne and advanced 4 miles toward the Ourcq. By the 23rd the entire Soissons-Château-Thierry highroad, with the exception of a small portion south of Soissons, was in the hands of the Allies. On the eastern leg of the salient the British and Italian troops achieved local successes, but were unable to make a hole big enough to threaten the rear of the enemy. They did keep many German divisions actively engaged which might otherwise have been used to stem the Allied advance. On the 24th the Franco-American forces advanced 2 miles north of Château-Thierry and the British penetrated the German lines in the neighborhood of Vrigny on the eastern leg of the salient. On the next day the Germans made a heavy assault against the eastern leg, with the hopes of widening the salient, but they were thrown back everywhere. On this day the French captured Oulchy, and, together with the Americans, occupied 40 square miles of territory. After a week of severe fighting, the Crown Prince was using every effort to extricate his armies in the best possible shape out of a salient of which the neck was scarcely 20 miles wide. A German counter-offensive or another attack against Ypres which Hindenburg had planned for August, were out of the question.

By the 27th the Germans were in full retreat and on the 28th they abandoned the line of the Ourcq. On the eastern side of the salient the Allies crossed the Reims-Dorman highway after bitter fighting. This threat to completely crush the Germans resulted in severe fighting in the vicinity of Vrigny and St. Euphraise. The advance to the Vesle River was marked by extremely heavy fighting between the Prussian Guards and American forces at Sergy and Seringes. The former place changed hands nine times and the latter five before remaining in the hands of the Americans. On the 31st, the Germans made bitter but unsuccessful efforts to keep the Americans from Nesles forest. On August 1 the Allies struck on a 10-mile front north of La Fère, penetrated 2 miles, captured the height north of Grand Rozoy, and advanced to Cramoiselles. This effectively broke the hinge around Soissons and enabled the French to enter the city on the 2d after bitter street fighting. The advance on the 3d was 6 miles deep in some places and recovered more than 50 villages, the most important of which was Fismes. The Germans were now completely behind the Aisne-Vesle line and made desperate attempts to hold the north bank of the latter river with the aid of the heavy artillery on the far side of the Aisne. The results of the first Allied offensive of the year were enormous—35,000 prisoners and more than 500 guns were in Allied hands. The Germans at home, as well as in the field, were convinced that their armies were not invincible. On the other hand the morale of the Allies was considerably heightened both by the German defeat and the spirited fighting of the American soldiers.

Somme Salient. On Aug. 8, 1918, Marshal Foch struck his second great blow. In many ways it resembled the Marne offensive. His aim was to "pinch" the overextended salient in Picardy, reaching out toward Amiens. He was making his plans and preparations for this attack while the offensive was being carried out on the Marne. The immediate objective was the railroad running from Péronne to Roye.

The attack was on a front approximately 30 miles long from Amiens to Montdidier. Later this front was extended all the way to Soissons. The element of surprise was entirely with the Allies. The Allied aircraft, artillery, and tanks, worked in complete harmony with the infantry. The British IV army, under Rawlinson, struck the Germans, under von der Marwitz, before Moreuil, and, in three days, drove them back 15 miles in some places and an average of 10 miles along the entire line. Most of the advance was on the plateau just south of the Somme River. During this time the French I army under Debeney, who were supporting the right of the British, crossed the Avre River in the face of an extremely destructive artillery fire and wiped out strong enemy positions, which threatened to outflank Rawlinson's advance. When he had accomplished this, he and Rawlinson began a concerted advance in the general direction of the Hindenburg line. By the 18th the Germans had retreated to the Albert-Chaulnes-Roye-Lassigny line and had lost most of the Lassigny plateau. On the 13th the French struck between the Oise and the Matz Rivers and captured Canny-sur-Matz. This blow also threatened Noyon, since that place was dominated by the artillery along the banks of the Oise.

On August 20 Mangin, with the aid of American troops, launched an offensive from the Oise near Ribecourt to the Aisne near Soissons. This was a part of Foch's plan to keep the whole line in action so that the German High Command would have great difficulty in bringing up reserves. Probably it was the activity of the Franco-Americans from Montdidier to Reims that enabled the British to make such huge strides to the Hindenburg line without suffering severe losses. The object of Mangin's blow was to secure the control of the plateau between the two rivers. Ten thousand prisoners fell into the hands of the Franco-American troops. On the same day Lassigny fell and the Germans evacuated Ourscamps Forest. On the 23d, the French advanced 7 miles along the front from Lassigny to north of Soissons. They captured several villages and crossed the Ailette River. On the 23d the III French army crossed the Divette River, near Avrincort, and General Mangin's X army crossed the Oise River and the Oise Canal at Manicamp 8 miles east of Noyon and reached the outskirts of Morlin-

court, which seriously threatened the entire Noyon salient.

Roye fell on the 27th, Chaulnes on the 28th, and Noyon on the 29th. The operation which resulted in the capture of Chaulnes drove forward 8 miles and made it certain that the German retreat could not stop short of the Hindenburg Line.

On the 30th, Mt. St. Siméon northeast of Noyon was completely occupied and the Franco-Americans captured Juvigny, a small town north of Soissons, which was of great strategic importance because it controlled the Juvigny plateau. The entire line of the Roye-Noyon-Soissons railway was now in the hands of the Allies. During the next five days the Franco-Americans saw bitter fighting, but nevertheless made advances of an extremely important nature. They gained a strong foothold on the Soissons-St. Quentin highway, by the capture of Terny-Serny. In conjunction with this advance on and from the Juvigny plateau the French made rapid progress up the Ailette River and captured Crecy-au-Mont and Leury (September 1). The result of this drive between the Oise and the Aisne in the neighborhood of Soissons was to outflank the German positions on the Vesle. Consequently, on September 4, the Germans began a hasty retreat on a 20-mile front from the river, setting fire to ammunition dumps and other supplies that they could not take away with them. Their retreat was covered by the heavy artillery on the north bank of the Aisne and the Chemin des Dames. Franco-American troops forced a crossing of the Vesle on the first day of the retreat. By the eighth, the Allied troops were fighting around Villers-en-Prayères and Revillon. By the middle of the month the Germans were everywhere thrust behind the Aisne in this region as far as Vailly. The French now began preparations to make a direct assault on the St Gobain forest and the western end of the Chemin des Dames. Laon could be seen in the distance.

In the meantime, the other French armies operating just south of the Somme River were making rapid strides toward the Hindenburg line. On September 4 the French gained northeast of Noyon and forced the Germans to beat a hasty retreat over the territory between the Canal du Nord and the Oise. On the 6th, Ham and Chauny fell and the French advanced 6 miles in some places east of the Canal du Nord. During the next few days they made slow progress astride the Oise in the direction of La Fère. When the fighting slowed down the French and Americans were practically in the positions held by the French before the Hindenburg line previous to the huge offensive of March 21.

The beginning of this section related that Rawlinson smashed the southern side of the Amiens salient by striking from Albert to Montdidier. Foch gave the Germans no rest. After Rawlinson's blow had exhausted its possibilities, he hurled Byng's III British army north of the Somme and took Bapaume, and when this blow exhausted possibilities he hurled Horne's I British army astride the Scarpe and actually broke the Hindenburg line, besides threatening Cambrai and Douai.

On August 21, Byng struck on a 10-mile front from the Ancre River to Moyenneville and took seven villages. In the course of the next day's fighting the British captured Albert, after bitter street fighting, and advanced 2 miles on a 6-mile front. A similar gain was made the next day from Bray to the vicinity of Grandcourt, which resulted in the seizure of nine villages and an imminent threat to outflank Bapaume. On the 24th, the British captured Bray on the Somme, 10 other towns and the famous Thiepval Ridge captured by the British in the Somme drive of 1916. The British swept on despite stiffening resistance and the utter disregard with which the Crown Prince of Bavaria hurled his reserves into the fray; 12 more villages and the Albert-Bapaume highway were seized on the 25th. After steady pressure the Germans were compelled to give up Bapaume on the 29th, and to begin a retreat along the whole line southward to Péronne and Brie on the Somme. Two days later the Australians in a brilliant assault stormed Mt. St. Quentin and Feuillancourt. The former position is the key to Péronne and this city fell on the first of September, along with Bouchavesnes and Rancourt.

The interest of the drive toward the Hindenburg Line now centres in the advances made by Horne's army, which struck astride the Scarpe, when Byng's forward movement began to slow up. Nevertheless it was the success of Byng's push that made Horne's attack possible. Horne's blow was tremendously successful because it not only broke the Hindenburg line at its northern end but broke the famous Drocourt-Quéant switch line as well. The very first day of the new drive, August 26, saw the piercing of the Hindenburg line. The Canadians captured Wancourt and Monchy-le-Preux. On the next day they smashed through the Hindenburg line for 4 miles southeast of Arras, and occupied Cherisy, Vis-en-Artois, and the Bois-du-Sait. Scotch troops crossed the Sensée River just south of the Cojeul and captured Fontaine-les-Croiselles, besides seizing Rosux and Gavrelle, north of the Scarpe. On the 28th, the Germans lost Croisselles and the Canadians took Boiry and Pelves behind the Hindenburg Line. Bullecourt was reached on the 29th, and the British were face to face with the Drocourt-Quéant line which had held them up in their Cambrai offensive at the end of 1917 (see *supra*).

The Drocourt-Quéant line was a very formidable line of defense intended to be a second barrier to the great bases at Cambrai and Douai. It branched off from the main line at Quéant and then ran almost parallel to it to Drocourt. The British attacked it at 5 o'clock on the morning of September 2, under the protection of an extremely heavy barrage fire. In their first attack the British penetrated 6 miles of the lines to a depth of 4 miles. During the second day, the British having broken the line, penetrated 6 miles along a front of more than 20 miles. Quéant was taken by storm, along with a dozen towns and villages. More than 10,000 prisoners fell to the British in this one operation.

They now settled down to a slow but steady advance along the Bapaume-Cambrai road. It might be added here that Lens was evacuated by the Germans on September 4, but the Allies were unable to occupy it immediately because it was saturated with poison gas. By the 12th, Havrincourt, Mœvres, and Trescault were in their hands, and the threat toward Cambrai increased.

Lys Salient. In order to save the Crown Prince of Bavaria's army from an overwhelming defeat similar to those suffered during the "pinching" of the Marne and Picardy salients, the German High Command determined to withdraw from the overextended salient south of Ypres. This withdrawal was accelerated by short, sharp blows by the British. The first retirement was in the neighborhood of La Bassée on August 5. This movement was followed by an attack on the Lawe River which advanced more than ½ mile on a 5-mile line. Two days later the British made an advance between the Lawe and Bourre Rivers which penetrated 2000 yards and occupied five villages, including Locon. Haig then struck due west of Armentières, between Bailleul and Vieux-Berquin, and captured Outtersteene. These attacks were made on the side of the salient and besides joining almost all of its area, placed the tip pointing toward Nieppe Forest, in a serious position.

Merville, almost at the tip of the salient, was entered on August 19, after an advance by the British on a 6-mile front. On August 30, the Germans evacuated Bailleul, and the next day the famous Kemmel Hill. Haig had planned to take this hill by assault with the aid of the American divisions, but the German withdrawal forestalled him. The British on the same day advanced along the Lawe River on the southern leg of the salient. On September 2 American troops north of Wytschaete were thrown into battle and captured Voormezeele, while the British were taking Neuve Eglise and some territory east of Estaires. Early in September the IV and VI German armies were ordered to evacuate the Lys salient to economize troops.

St. Mihiel Salient, and the American Army. By September 12, Foch realized that he had exhausted the possibilities of further immediate advance against the Hindenburg line. Instead of resting, which of course, would permit the Germans to rest also, he hurled the American army against the St. Mihiel salient, and reduced it, thus confronting the Germans with the necessity of defending Metz and the Briey iron fields. This salient, enclosing the Woevre plain, and with its tip extending to the Meuse, had existed since the first year of the war. One of the most important results of Pershing's successful offensive was the freeing of the great railway system running through Verdun, Toul, and Nancy. It was the loss of this railway that greatly hampered the bringing up of reserves during the Crown Prince's tremendous assaults on Verdun.

Pershing was able to form his distinctly American force only with the greatest difficulty The Allied attitude from the beginning had been one of absorption. France and Great Britain and even Italy requested that the American troops be used to reinforce Allied troop units. General Pershing stoutly insisted on the foundation of an American army which should be thoroughly trained in open warfare and deliver an American blow against Germany on a definite front. After considerable argument and many conferences Pershing finally won his point, and as the first step he organized seven army corps. The American army was formed on the Vesle front but it was secretly transferred to the Woevre front with headquarters at Neufchâteau. It was given the mission of reducing the St. Mihiel salient by Foch, at Bombon, on July 24. General Pershing took command of the army himself.

Pershing's general plan was to make a feint toward Belfort, and then in a surprise attack strike at both sides of the salient and advance to the centre while carrying on a holding engagement at the nose of the salient. The battle order from left to right was as follows:

The Southern Force. The American 1st Corps (General Liggett) with right near Pont-à-Mousson, had divisions on the line as follows: 82d (Burnham), 90th (Allen), 5th (McMahon), and 2d (Lejeune), with the 78th (McRae) in reserve. The American 4th Corps (Dickman) with right joining the left of the 1st Corps had divisions on the line as follows: 89th (Wright), 42d (Menoher) and 1st (Summerall) with the 3d (Buck) in reserve.

Central Force (French). The French 2d Colonial Corps (Blondlet) with right joining the left of the American 4th Corps, had French divisions in the line as follows: 39th, 36th, and the 2d Cavalry division (dismounted).

The Western Force. The American 5th Corps (Cameron) with the right joining the left of the French 2d Colonial Corps, had divisions on the line as follows: 26th (Edwards), 4th (Hines), and the French 15th.

The west of the line was near Watronville. General Pershing held the 35th and 91st Divisions (Traub and Johnston) in rear of the western face of the salient, in reserve, and a general reserve consisting of the 80th Division (Cronkhite) in rear of the western face and the 33d Division (Bell) in rear of the southern face.

The chief attack was made on the southern leg on a front extending about 12 miles due west of Pont-à-Mousson. The attack on the western leg extended for a distance of about 8 miles from between Dommartin and Fresnes Simultaneously with these attacks the French destroyed the bridges over the Meuse River at St. Mihiel. The attacks were made at 5 A.M. on September 12, after about four hours' artillery preparation. Foggy weather aided the attackers. The chief resistance was in the west, where the German positions were defended by the heights on the edge of the Woevre plains. The Americans stormed these heights, the highest of which is Les Eparges, and took the villages of Herbeuville, Hattonchâtel, Hanonville, Billy, St. Maurice, Thillot, and Hattonville, and during the night entered Vigneulles, which is at the southern end of the line of hills protecting this side of the salient. On the southern leg of the salient the results were just as successful to American arms, and were carried out with the same precision. During the first day Labayville, St. Bausseaut, Vilcey, Essey, and the important town of Thiaucourt were captured. During the night Pannes, Nonsard, Buxières, and St. Mihiel were captured. Twenty-seven hours after the attack began, the forces advancing from the east and west met at Vigneulles and Heudicourt, and the St. Mihiel salient was no more.

During the next few days the pocket was "mopped up" and the new lines consolidated; 16,000 prisoners, among whom were some Austro-Hungarians, and almost 450 guns were taken. Besides these, vast stores of ammunition, arms and military supplies were captured. Nearly 175 square miles of territory and 70 villages were delivered by the enemy. The

Allies were now in a position to seriously threaten Metz and the great Metz-Mézières trunk railway, one of Germany's main supply lines Another important result, for the Germans as well as for the Allies, was to show that the American forces had reached a stage of development where they could be depended upon to take their full share in the War.

What might be called the first period of the Allied offensive was now over. The result was everywhere favorable to the Allies With the exception of the Aisne region, the Germans were back at their starting-place in March The German people at home, although somewhat buoyed up by false reports, had lost their supreme faith in the army. Vast quantities of supplies and ammunition were captured or destroyed to prevent capture Eight German divisions had been destroyed since the beginning of the Allied offensive up to the middle of September Approximately 200,000 prisoners and 2300 guns had fallen into Allied hands. Almost 300,000 fresh American troops were pouring into France a month. Ludendorff's attempt to retreat to a smaller front was frustrated by Foch's tactics, the fundamental theory of which was to keep the enemy engaged all along the line and not to let him effectively use his reserves. This was the principle of exhaustion and is strikingly similar to Grant's campaign which won the Civil War.

Argonne-Meuse Offensive. As has been related above, Marshal Foch, in the last week of September, began an offensive over the entire front from Switzerland to the sea. He attacked the German right in Flanders, the centre along the Hindenburg line, and the left between Reims and the Meuse River. From the strategic point of view, the German left was by far the most important front. A break-through of any size here would cut the lines of communication between Germany and her armies in France and Belgium. The Argonne-Meuse line was also the hinge of the German retreat in Belgium and northern France, and, if broken, would doubtless cause a huge débâcle. The German defenses on this region, both natural and artificial, were exceptionally strong. The bend in the Aisne, west of the Argonne Forest, the forest itself and the Meuse River, were tremendous natural advantages; the German High Command, realizing the strategic importance of the sector, had placed many of its best divisions there, as well as profusely sprinkling the area with barbed wire and machine-gun emplacements.

After the fall of the St. Mihiel salient, which really paved the way for this offensive, the American army took over the lines from the Argonne Forest and the Meuse River. This army was to coöperate with Gouraud's IV French army, which extended from the neighborhood of Reims to where it joined the Americans in the Argonne. For the opening attack in the American sector General Pershing employed three corps: *Left.* 1st Corps (Liggett), which contained the 77th, 28th, and 35th divisions, with the 1st division in reserve. *Centre.* 5th Corps (Cameron) which contained the 91st, 37th and 79th divisions, with the 3d division in reserve. *Right.* 3d Corps (Bullard) which contained the 4th, 80th and 33d divisions, with the 32d division in reserve. The general reserve included the 29th, 82d, and 92d divisions. Pershing stated "About 2700 guns, 189 small tanks, 142 manned by Americans, and 821 airplaines, 604 manned by Americans, were concentrated to support the infantry. We thus had a superiority in guns and aviation and the enemy had no tanks. The French and Americans hoped to advance on either side of the Argonne and squeeze the Germans out of the Argonne. They were unable to do this in the first attack as they were temporarily held up by German second positions."

First Phase. The preliminary bombardment began at 11 P.M on September 25 and at 5.30 A.M. on the 26th of September the infantry attack was launched. The French advanced 4 miles and the Americans about 6. By the 28th the Americans had taken Montfaucon, Exermont, Garcourt, Cuisy, Septsarges, Malancourt, Ivoiry, Epinonville, Charpentry, Very, and 10,000 prisoners. The French took Sevron, the Butte des Mesnil, and Navarin Farm. The Americans were within range of the Kriemhilde line which extended from Grand Pré to Damvillers across the Meuse. East of the Meuse the Americans captured Marcheville and Rieville, which strengthened the flank of the army west of the Meuse. On the 29th and 30th, Gouraud advanced to within 5 miles of Vouziers.

Second Phase. The second phase of the Argonne-Meuse offensive was carried out by the 1st, 5th, and 3d Corps and lasted from October 4 to 31. In the first part of this phase the American army encountered its hardest fighting of the War. About the middle of this period, General Pershing divided the American forces into the I and II armies. The I army, which was assigned to General Liggett, extended from the Argonne to Fresnes-en-Woevre. The II army, extending from Fresnes to the Moselle, was commanded by General Bullard. Beginning on the 4th, the I American army captured Cesnes, and advanced 2 miles up the Aire River valley. On October 5, the Germans before Gouraud retired along a 12-mile front closely pursued by the French army. By the 11th, the French held the whole line of the Suippe River and the Americans had seized the heights dominating the Aire valley. So far the French had taken 21,000 prisoners and 600 guns. On the 14th, the Americans took St. Juvin, and two days later took the important town of Grand Pré and Champigneulles. On the 17th Romagne fell and the Americans were everywhere beyond the Kriemhilde positions. During the next day Banthéville and Talma Farm were seized in surprise attacks. They changed hands several times before remaining in the possession of the Americans. On the same day the French crossed the Aisne near Vouziers, and made important gains toward Rethel.

The only German defense between the Americans and the Belgian border was the Freya-Stellung which ran from near Dun-sur-Meuse to the Bourgogne wood. About 10 miles north of this line was the great trunk railway line running from Metz to Mézières, through Sedan and Montmédy. Part of the Freya line was seized on October 26 and the railway line was bombarded

Last Phase and Pursuit. In connection with this phase of the Argonne-Meuse offensive, General Pershing states, "On the 21st my instructions were issued to the I army to prepare thoroughly for a general attack October 28 that would be decisive if possible. In order that the

attack of the I army and that of the IV French army on its left should be simultaneous our attack was delayed until November 1.

"On this occasion and for this first time the army prepared for its attack under normal conditions. We held the front of attack and were not under the necessity of taking over a new front with its manifold installations and services. Our own personnel handled the communications, dumps, telegraph lines and water service, our divisions were either on the lines or close in rear, the French artillery, aviation and technical troops which had previously made up our deficiencies had been largely replaced by our own organizations, and our army, corps and divisional staffs were by actual experience second to none."

On November 1, both General Pershing and General Gouraud began their final advance The latter crossed the Aisne between Rethel and Vouziers, and advancing with Berthelot's army on the left, reached the outskirts of Mézières, when the Armistice went into effect (November 11). General Pershing's forces reached Sedan on the 6th. Between that date and the 11th, east of the Meuse, he seized the heights of the Woevre, and had brought Metz into offensive gun-fire range.

The Franco-American advance in the Champagne-Argonne-Meuse region cut the German main line of communication (mentioned above) and foreordained a complete defeat within a very short time for Germany, had the Armistice not intervened Some of the bitterest fighting of the War occurred in this section. Most of it was hand to hand and the nature of the ground, with its ravines, gullies, forests, etc., made it necessary to wipe out machine-gun nests with infantry rather than with artillery. The Americans captured 26,000 prisoners and 468 guns. The French took about 30,000 prisoners and 700 guns It is estimated that the Germans lost 150,000 men trying to defend their main line of communication.

American Troops in France. On Armistice Day, 42 American divisions had either reached France or were en route; of these, 29, including replacements from the other divisions, were actually engaged in combat. Of the latter, 7 were Regular divisions, 11 National Guard divisions, and 11 National Army divisions The total American forces sent to France is given as 2,084,000 of whom it is estimated that 1,390,000 took part in campaign; of the latter 1,100,000 as divisional troops, 240,000 as corps and army troops, and 50,000 in the service of supply

The casualties in the American army were about 260,000, of whom about 50,000 were battle deaths As the army met with no serious reverses, the number of prisoners taken by the enemy was small, only 4500. The casualties occurred mainly between May 28, 1918, when the 1st division attacked Cantigny, and November 11. In its operations it captured 63,000 prisoners and about 1400 pieces of artillery in addition to other arms and stores.

Breaking the Hindenburg Line. In the section treating the German retreat to the Hindenburg line it was narrated how certain sectors of this line were penetrated and how the Quéant-Drocourt line was smashed This section will deal with the breaking of the line itself, the capture of Cambrai, St Quentin, and Laon and the advance across France and Belgium until the Armistice put an end to the fighting. The reader must bear in mind that while this tremendous drive was pushing the centre back the Allies were crushing one flank in Flanders and the other in the Argonne-Meuse region. In the bitter fighting that resulted in the breaking of the famous defense system, the 27th—O'Ryan—and the 30th—Lewis—American divisions played important parts.

Although the main attack was made on September 29, important advances in the direction of Cambrai were made on the 27th, when Byng and Horne with the American 2d Corps—Graves—(27th and 30th divisions) struck on a 14-mile front before Cambrai, crossed the Canal du Nord, and pierced the outposts of the Hindenburg line. On the 28th, Marcoing, Fontaine-Notre-Dame, Cantaing, and Novelles were taken. On the 29th, Rawlinson, with the aid of the Americans, struck on a 30-mile front from St Quentin to the Sensée Canal The former crossed the Scheldt Canal and the latter, after seizing Ballicourt and Nauroy, entered the suburbs of Cambrai itself Horne now attacked in the Arras sector and advanced toward Douai by capturing Oppy and Biache-St. Vaast. This compelled the Germans to retire from the Lens coal-field region. Byng, by crossing the Scheldt Canal northwest of Cambrai, threatened the city from that direction.

While these operations were going on around Cambrai, the fate of St Quentin was being sealed After nibbling operations, the French and British captured Thorigny and Le Tronquoy, about 3 miles from the city (September 30). On the first of October, Debeney's army occupied part of the city, and the next day seized all of it. In the meantime Rawlinson's army forced the Scheldt Canal and occupied Le Catelet and Beauvoir.

On October 9 a great drive covering the whole line from Cambrai to the neighborhood of St. Quentin was begun without artillery preparation. It was a tremendous success, penetrating 9 miles on a 20-mile front Cambrai was occupied on the very first day, which necessitated a further retreat on the Arras-Lens front, toward Douai By the 10th the British had advanced their lines to the Selle River between Solesmes and St. Souplet, and captured the important German base of Le Cateau. On the next day the Germans abandoned the line along the Sensée River and the Allies were closing in on Douai This city fell on the 17th.

On the 20th, the British forced a crossing of the Selle north of Le Cateau and on the 22d advanced from northwest of Tournai to southwest of Valenciennes, patrols actually reaching the suburbs of the latter city. On the 25th the Valenciennes-Le Quesnoy railway was reached on a 7-mile front On November 2, Valenciennes fell after a pinching operation, and they advanced along the road to Mons. On November 4, the British and Americans struck a 20-mile front between the Scheldt and the Oise-Sambre Canal and forced the Germans to make a retreat on a 75-mile front from the Scheldt to the Aisne. As a result of this the French took the fortified city and railroad centre of Hirson, and the British captured the fortress of Maubeuge on the 9th of November. On the 11th, the last day of fighting, the British captured Mons, the scene of their defeat and retreat in August, 1914.

In considering the breaking of the Hindenburg line, the events that occurred between the Oise and the Aisne and which resulted in the capture of Laon and the Chemin des Dames, must be included. Foch determined to use his "pincers" method on a large scale in order to capture Laon. To accomplish this he had to advance through the formidable forest of St. Gobain and recapture the Chemin des Dames positions. After the "pinching" of the Marne salient (July, 1918) the Franco-Americans had nibbled away at the German positions to get a good place to start their offensive. The Americans had taken the Juvigny plateau and later the French seized the Vauxaillon plateau just south of the Aisne. The German Crown Prince made repeated and bitter attacks to retake these strategic positions, but they were futile as well as costly. On September 28, General Mangin's Franco-American army captured Fort de Malmaison, the old limestone position which is in the rear of the Chemin des Dames. Then began a slow advance between these positions and the Ailette River as well as between the Aisne and the Vesle. Berthelot's V army in conjunction with Mangin's X army and with the aid of Italian troops, began an advance northwest of Reims, which resulted in the capture of Berry-au-Bac on October 7. On the 9th, Bazancourt and Vaux-les-Mauron fell. By the 12th, Mangin had succeeded in occupying practically the entire Chemin-des-Dames positions. The next day saw the success of Foch's strategy because the St. Gobain Forest, La Fère, and Laon were evacuated by the Germans with scarcely any fighting.

The French armies of the left now advanced rapidly between the Aisne and the Oise Rivers with the idea of reaching the Franco-Belgian frontier between Hirson and Mézières. When the Germans began their retreat between the Scheldt and the Aisne, the French armies of the left exerted strong pressure on the German flank. By the 8th of November they were at the outskirts of Mézières, but were unable to capture it before the Armistice was signed on the 11th.

Thus ended the battle or series of battles which resulted in the breaking of the Hindenburg line and which were also largely responsible for the Germans suing for an armistice. The occupation of the east bank of the Meuse north of Verdun by the Americans left the Germans with no easily defended line west of the Rhine. It is extremely doubtful whether the Germans could have reached the Rhine with sufficient men, material and organization, to prevent an invasion of Germany by the Allies on a grand scale.

Operations in Belgium. The opening attack on September 28 was made by the reorganized Belgian army, under the personal direction of King Albert, and the British II army, under Plumer, on a 10-mile front from Dixmude to Passchendaele Ridge, north of Ypres. This initial attack penetrated 4 miles. On the next day the Belgians captured Dixmude, Passchendaele, Stadenberg, Mooreslede, and Zarren and were only 2 miles from Roulers. On this same day the British took the formidable Messines and Passchendaele Ridges and Gheluvelt. On the 1st of October, the Allies crossed the Menin-Roulers road and struck in a southerly direction, reaching the Lys River between Warvioq and Warneton.

The threat to develop the industrial centre of Lille had now become so pronounced and had created such a serious position for the German forces that the German command determined to evacuate it, which necessitated retirement from the Belgian coast Consequently, on the 2d the Germans began the evacuation of the city and a retreat on both sides of La Bassée Canal. This retreat was accelerated by the joining of Degoutte's VI French army to the Belgian and British armies. The Belgians captured Hooglede and Handzeeme northeast of Roulers, and the British seized Rolleghencapelle, between Courtrai and Roulers. Armentières was entered on the same day.

After a week and a half of further preparation, the Allies struck an extremely heavy blow aimed at clearing the west bank of the Scheldt as far as Ghent. The attack extended from the Lys, near Comines, to the sea. The Belgians drove forward 7 miles north of a line running from Handzeeme to Courtermarck, and the French and British to the Hooglede plateau, Winckelhoek and Lendelede The German forced retreat from Belgium now began in earnest. The Belgians advanced steadily along the roads to Bruges and Ostend from Thourout, and the French advanced toward Thielt, while the British advanced along the Lys from Comines. On the 17th the British entered Lille and naval forces entered Ostend, which had been evacuated. On the next day Zeebrugge was entered, as well as Bruges, Thielt, Courtrai, Tourcoing, and Roubaix.

Between the 20th and 25th of October, the French and British forced the Lys Canal in the direction of Ghent. The British in the south took Bruay and Estain. On the last day of the month Byng's army, with the aid of the 30th American division, struck between the Lys and the Scheldt from Deynze to Avelghem and captured several villages, and towns. While this operation was going on the British and French were driving the Germans back on Ghent and the lines of the Scheldt. The retreat was precipitous. On November 3, the Belgians advanced 10 miles along the Dutch frontier and reached the Terneuzen (Dutch) Ghent Canal. This advance coupled with that of the French and the British in the south brought the Allies to within 5 miles of Ghent. The British forced the Scheldt near Pofter and began an advance on Brussels. Tournai fell to the British on November 9, and when fighting ceased two days later, the line in Belgium ran almost north and south from Terneuzen to north of Audenarde and then southeast to Mons. Marshal Foch is credited with the statement that the German army would have been captured or destroyed within six weeks (after November 11) but he had agreed to an armistice to save lives. More than 60,000 prisoners and 500 guns of all calibres had been captured in this flank movement.

The Armistice. Negotiations between the United States and Germany, which began on October 5, ended on November 5, when President Wilson informed the Germans that Foch had been authorized by the United States and the Allies to open negotiations with accredited German agents. This was followed two days later by announcement that German agents had been appointed and were about to leave the German Headquarters at Spa, Belgium. They were received at Foch's quarters the next day and received the terms of the armistice from

him. A request to stop hostilities until the terms had been sent to the German Headquarters was refused. After several delays the terms were accepted by Germany on November 11 at 5 A.M., Paris time, and the War ended at 11 A.M. that day. A brief summary of the terms follows.

Germany surrendered all her submarines and agreed to disarm her surface men-of-war which were to be interned in neutral ports, or taken over by the Allies. The treaties of Bucharest and Brest-Litovsk were renounced, all damage done was to be repaired and all foreign occupied territory was to be evacuated. An indemnity was to be agreed upon later. The Allies were to occupy the valley of the Rhine. There was to be a neutral zone on the east bank of the Rhine and Allied and American bridgeheads at Mayence, Coblenz, and Cologne, each with a radius of 30 kilometers.

The evacuation of the territory west of the Rhine went along very smoothly. The Allies were hailed as deliverers in Belgium, Luxemburg and especially in Alsace-Lorraine, which was triumphantly entered by French forces. A similar entry was made into Brussels by King Albert and his Queen riding at the head of the Belgian troops. The British took over the administration of the zone around Cologne, the Americans that around Coblenz, and the French that around Mayence.

On Dec. 14, 1918, the terms of the Armistice were renewed until Jan. 17, 1919. During this period the conditions that were unfulfilled were to be completed. The following provision was also added to the general terms: "The Allied High Command reserves the right to begin, meanwhile, if it thinks it wise in order to ensure new guarantees, to occupy the neutral zone on the right bank of the Rhine to the north of the bridgehead of Cologne, up to the Dutch frontier. This occupation will be announced by the Allied High Command by giving six days' notice." Subsequent renewals of the Armistice terms occurred during the time that the Peace Conference was holding its meetings at Paris.

THE EASTERN FRONT

The early advance of the Russian armies into East Prussia in August, 1914, seriously affected the German invasion of France and almost upset the entire German plan. Von Hindenburg, however, frustrated the attempt of the Russians to overrun East Prussia by his victory at Tannenberg. Meanwhile the Russian armies advanced victoriously into Galicia and soon were well on their way to Cracow and into the passes of the Carpathians. To relieve the pressure on the Austrians, German Headquarters organized a counteroffensive through West Poland, which ended in a deadlock in the winter of 1914–15 with the opposing armies intrenched. In the spring of 1915, the Central Powers began a great offensive and by September of that year the Russians were driven out of Poland and Courland. This front then remained stabilized until May, 1916, when the Russians opened a successful campaign against the Austrian front to relieve the pressure of the Austrians in Italy. This success was followed by the Russian Revolution which ultimately prevented that country from being a further factor in the War.

The detailed account of the military operations falls under the following head: (1) Russian invasion of East Prussia terminating in the battle of Tannenberg and the first battle of the Masurian lakes; (2) Russian invasion of Galicia; (3) German operations in West Poland; (4) second battle of the Masurian lakes; (5) Austro-German drive in Galicia; (6) great Austro-German drive in the east; (7) Russian offensive in 1916; (8) military operations during the Kerensky government; (9) military operations during the Bolshevik government to the end of the War.

The struggle on the Eastern front was conditioned by a number of circumstances. First the German plan, which was based on a decisive victory in France before the Russians could get ready; few troops were therefore to be left to guard the east front. Next was the unexpected promptness of the Russian mobilization and concentration. Lastly and of paramount importance was the configuration of the frontier itself and its organization in view of war. The striking feature of the configuration was that Russian Poland projected like a huge bastion 200 miles deep between East Prussia on the north and Gâlicia on the south and that the political frontier separating the belligerant states was in no sense a military frontier. The Russian base of operations against East Prussia and the line of defense to which the armies could retire in case of defeat was that formed by the Niemen River between Kovno and Grodno and the Narew River with its principal tributary, the Bohr, from Grodno to the mouth of the Narew. On the Niemen were the fortified bridgeheads of Kovno, Olita and Grodno where railways crossed the river. On the Narew and Bohr were the fortified bridgeheads of Osowiec, Lomza, Ostrolenka, Rozan, Pultusk, Sierok, and at the junction of the Narew and Vistula the great fortress bridgehead of Novogeorgievsk. The German base of operations in the north was the Vistula River between the fortresses of Danzig and Thorn. Along this stretch of river there were a number of fortified bridgeheads. The province of East Prussia lay in advance of this line and for its defense the Germans had to rely on active defense by troops based on their complete network of railways and roads. The Masurian lakes near the frontier formed a north and south natural barrier about 40 miles long and the fortress of Königsberg was a strong point of support for military operations.

The Russian base of operations in Central Poland was the Vistula River from Novogeorgievsk to the Austrian frontier; along this stretch of river were the great fortified bridgeheads of Warsaw and Ivangorod. The German frontier from the Vistula to the Austrian frontier was an open one but parellel to it were a number of excellent railways for active defense.

From the Vistula to the frontier of Rumania the Austro-Russian frontier was an open one and for its defense both countries had to rely on active operations of their armies. The military frontier of Austria was the Carpathian range of mountains in rear of its border provinces of Galicia and Bukovina. Against invasion from the east, Austria could hardly hope to hold the entire province of Galicia, so her military authorities had constructed a barrier line from the Vistula to the Carpathians along the San River. On this river there were the fortified bridgeheads of Jarislau, Radymo and the great fortress of Przemysl.

In accordance with the Allied plan, the Russian armies were to assume the offensive as soon

as possible. The aim of their first campaigns was to drive the Germans out of East Prussia and the Austrians out of Galicia and Bukovina in preparation for an advance from West Poland For these campaigns they immediately organized six great armies, two for the invasion of East Prussia and four for the invasion of Galicia. The Russian commander-in-chief was the Grand Duke Nicholas.

Russian Invasion of East Prussia. For the defense of East Prussia, German Headquarters left in the east of the active army only three army corps and a cavalry division. There were mobilized in addition two reserve corps and the local Landwehr and Landsturm troops. These troops formed the VIII army—von Brittwitz—and also furnished the garrisons for the fortified bridgeheads on the Vistula and the garrison of the fortress of Konigsberg. As the Russians would probably invade East Prussia both north of the Masurian lakes from the direction of Kovno and south of the lakes from the Narew River, the VIII army was divided into two separate wings; the left wing, consisting of two active corps and three reserve divisions with the cavalry division, was to guard the frontier north of the lakes, while a single active corps with Landwehr troops was to guard the frontier south and west of the lakes.

In August, 1914, Russian Headquarters organized two armies for the invasion of East Prussia. The I army—Rennencamp—was to advance from the Niemen River between Kovno and Grodno and advance along the Kovno-Konigsberg railway north of the Masurian lakes. The II army—Samsanoff—was to advance from the Narew River with its left resting on the Warsaw-Danzig railway and its right passing the south end of the Masurian lakes. Contact between the two armies was to be secured after passing the lakes. Rennencamp was the first to reach the frontier, August 17, just as the German armies in the west began their advance; here he encountered the advance posts of the left wing of the VIII army. For a week there was constant fighting in which the weaker German force was steadily pushed back and on August 24 Rennencamp reached the line of the lakes and Insterburg. Instead of pushing on westward he apparently halted here to await the arrival of Samsanoff to protect his left and in the meantime his cavalry sought the right flank of the II army and reconnoitred along his front. Samsanoff reached the frontier several days later, August 22, and easily dispersed the weak detachments in his front. His centre now moved on Allenstein while his right moved northward to seek contact with Rennencamp.

On August 22 the situation seemed very serious to the commander of the VIII German army, who found both wings in retreat, and although he made preparations to concentrate on Samsanoff, he informed German Headquarters at Coblenz that he might be compelled to retire behind the Vistula. At this stage Headquarters decided to intrust the command of the VIII army to von Hindenburg, a retired general who was thoroughly conversant with the topography of East Prussia, and sent to him as his chief of staff von Ludendorff, a staff officer of the II army who had shown great initiative in the capture of the town and bridges of Liége. Von Hindenburg took command on August 23 and found the situation as above stated. The two Russian armies were still separated and his only chance for success was to decisively defeat one of them before they could unite. Calling from the nearby fortresses all their available troops, he succeeded in raising his army to five and one-half corps, which was nearly that of the II Russian army. His plan was a bold one for he proposed to leave but a mere screen in front of Rennencamp and employ his entire force against Samsanoff. In order to make his victory decisive, if possible, he proposed to envelop both wings of the II Russian army. His predecessor had already made this possible by moving a corps from the extreme left of his army to the extreme right by rail. It took several days to get the troops in position but by the 27th all was ready for the attack. Two and one-half corps were in front of Allenstein to check the advance of Samsanoff's centre, consisting of three corps; two corps had withdrawn from Rennencamp's front and were ready to move southward in rear of the lakes on Samsanoff's rear protected by a single corps, and one corps was ready to turn Samsanoff's left protected by a single corps. Fortunately for Hindenburg, Rennencamp made no attempt to advance and his cavalry failed to penetrate the German screen to discover what was going on in its rear.

The battle of Tannenberg, as it was called, began on the morning of August 27 and lasted three days. Samsanoff was found dead on the field and two of his corps commanders with 90,000 men were captured Three of his corps were practically annihilated and the others escaped only with severe losses. The battle was named in honor of one of the same name fought there in 1409 between the German Knights and the allied Poles and Lithuanians. As the I and II Russian armies were advancing into East Prussia, Russian Headquarters began the organization of the X Army at Grodno to serve as a general reserve. Two corps of this army advanced across the frontier east of the Masurian lakes just in time to cover the retreat of the remnants of the II army.

After the battle of Tannenberg, von Hindenburg was reinforced by two army corps and a cavalry division from the Western front and made preparations to attack Rennencamp's army. His plan was to engage Rennencamp's front with his main force while his right wing moved south around the Masurian lakes to cut off the retreat of the Russian army. His right wing, however, unexpectedly encountered the X Russian army, which defeated his plan, and all he was able to accomplish was the retreat of the Russians across the frontier to the Niemen River. In these operations, which began September 7 and lasted about a week, the Germans claim to have taken 45,000 additional prisoners; they call the operations the first battle of the Masurian Lakes. While the situation on this front was still unstabilized, von Hindenburg was compelled to go to the assistance of the Austrians.

Russian Invasion of Galicia. The German plan, as we have seen, contemplated the crushing of France, while Russia should be held by the Central Powers. In form, so far as Austria was concerned, the holding was to begin by an invasion of Russian Poland. South of the frontier two railways run roughly parallel to the boundary, and from these two ran branch lines and feeders. The Russians were not nearly so well off in the matter of transportation. Given, therefore, the supposed slowness of Russia's mobilization and the poverty of her rail system,

an invasion of Russian Poland seemed to be a promising undertaking.

According to the plan of attack drawn up by the chief of staff, Gen. Conrad von Hotzendorff, the invasion was to be made by two armies. The I army under General Dankl concentrated on the lower San River was to advance northward east of the Vistula to seize the railway junction of Lublin; its left was protected by a detachment, largely cavalry, which was to operate west of the Vistula and then cross that river. Its right was protected by the IV army —Auffenberg—which was concentrated at Jaroslav and was to advance northward to the railway junction of Cholm. The III army—Brudermann—was concentrated east of Lemberg and was to defend the frontier between the Bug and Dniester Rivers. The II army was on the Serbian frontier but had one corps in Galicia which was to guard the frontier south of the Dniester River and coöperate with the III army.

The Russian mobilization against Austria was begun a week before that against Germany and in the month that elapsed before actual hostilities the armies were concentrated for active operations In southern Poland between the Vistula and Bug Rivers was an army group consisting of the IV and V Russian armies under General Ewart. On the eastern frontier of Galicia between the Bug and Dniester Rivers were the III Russian army—Russky—and the VIII Russian army—Brusiloff—forming a group under Ivanoff. South of the Dniester River were detachments of the VII Russian army on the frontier of Bukovina. Each of the four principal armies was stronger than any of the three Austrian armies.

On August 25, well south of Lublin and Cholm, the two Austrian armies encountered such strong resistance that they were unable to advance as the IV and V Russian armies were in their front. On August 22 the great Russian advance of the III and VIII armies began and the VII invaded Bukovina The Austrians were unable to offer any adequate resistance and the Russians advanced triumphantly and occupied Lemberg on September 3. To stem the Russian tide, Austrian Headquarters recalled the remaining corps of the II army from Serbia and with the II, III and IV armies took up the position of Rawaruska-Grodek west of Lemberg facing east. Here was fought a battle, September 7–11, on the same days that Hindenburg was attacking Rennencamp in the north and the battle of the Marne was in progress in the west. The Austrians were defeated and retired to the San River where the I Austrian army was compelled to join them. The Russians now pushed on, crossed the San River and invested the fortress of Przemysl. South of the Dniester they occupied Bukovina, took possession of the passes in the Carpathians and their cavalry was advancing into Hungary. Such was the situation when Austrian Headquarters called on the Germans for help and von Hindenburg was sent from East Prussia to Silesia to take command there and organize a new army.

German Operations in West Poland. In order to create the IX German army in Silesia, von Hindenburg was compelled to withdraw four of his corps from East Prussia and replace them as far as possible with Landwehr and newly organized units. When he reached Silesia, von Hindenburg learned that there were few Russian troops in Poland west of the Vistula River; with the Austrian chief of staff he decided on the plan of operations. The IX German army with the I Austrian army on its right were to advance eastward to the north of the Vistula thus turning the flank of the Russians in Galicia, so that they would be obliged to cease their pressure on the Austrians south of the Vistula to meet this threat. The IV, III and II Austrian armies were then to advance as soon as possible and relieve the fortress of Przemysl; the IV army from the west and the III and II over the Carpathian mountains.

The IX German army began its advance in the latter part of September and soon the effects of the movement were seen in the shifting of the Russian troops These fell back across the San River and the IV and V armies began a movement up the east side of the Vistula River The IX German and the I Austrian armies reached the Vistula without much opposition and eventually the I Austrian army took up the front from Ivangorod to the San while the IX German army extended its flank northward to Warsaw. They were, however, unable to capture the bridgehead of Ivangorod or that of Warsaw, so the Russians still had access to the west bank. In Warsaw the Russians had begun the formation of their IX army. Due to the shifting of the Russian troops, the Austrians were able to get supplies into Prezemysl but that was all; their armies were unable to cross the San River.

When the Russians began to shift their troops, the command of those left in Galicia was given to Ivanoff and those assigned to operate in West Poland to Russky. By the 20th of October, Russky felt strong enough to engage his adversaries west of the Vistula and the Russians advanced once more, this time on the whole front from Kovno to the Carpathians. In East Prussia, the German VIII army was compelled to retire across the frontier to an intrenched line which ran from the Masurian Lakes to the Niemen River Von Hindenburg was unable to offer adequate resistance in West Poland and with the I Austrian army retired about 200 miles back across the frontier into Posen and Silesia. To delay the Russian advance he destroyed the railways that his troops had just repaired. In Galicia the Austrians retired to the vicinity of Tarnow and over the Carpathians leaving the garrison of Przemysl to its fate.

On November 1 the situation of the Central Powers on the Eastern front was apparently desperate, as the German armies in the west were engaged in the desperate battle of Flanders and could not afford to send infantry to the east; most of the cavalry had already been sent to the VIII and IX armies. Von Hindenburg was now placed in command of both the VIII and IX armies and von Mackensen was placed in command of the IX army.

Realizing that he was not strong enough to meet the Russians at all points of their front, von Hindenburg decided to concentrate the IX army for a flank attack. He therefore had it railed to the frontier between the Vistula and Warta Rivers where it could advance with one flank protected by the Vistula. The defense of the frontier from the Warta southward was left to Landwehr and local troops assisted by the I Austrian army. They were to advance if his attack was successful.

On November 11 he was ready to strike; at this time the Russians were already near the

frontier all the way from the Vistula to Cracow and some of their cavalry had actually crossed it. The IX German army drove back the right wing of Russky's armies between the Niemen and the Warta and the endeavor of the Russians to check the advance resulted in more or less confusion along their entire front. Ewart now took command of the left wing of these armies while Russky remained in command on the right. The operations in West Poland continued from week to week and ended only about the close of the year. They ended with the opposing armies intrenched along the Bzura, Rawa and Nida Rivers. The most important engagement was the battle of Lodz, in which, in attempting to envelop the flank of the Russian armies, three German divisions and two cavalry divisions were suddenly cut off from the remainder of the IX army and for two days were surrounded by Russians. According to German reports they finally emerged with 10,000 prisoners. In Galicia the Austrians were driven behind the Dunajec River and lost nearly all the important passes in the Carpathians. After operations closed in November on the Western front, a number of corps were sent from there to West Poland in the hope that the Russians might be forced behind the Vistula River. By the time of their arrival the Russians were already intrenched and the desperate attempts made to dislodge them resulted only in tremendous losses in the attacking German troops.

At the close of the year the combatant troops on the Eastern front, as given by the German chief of staff, were as follows:

	Germans	Austrians	Total	Russians
On the East Prussian frontier	105,000	. . . .	105,000	320,000
West Poland	385,000	140,000	525,000	847,000
Galicia and Bukovina	12,000	513,000	525,000	521,000

A German division was assisting the Austrians in the Carpathian passes.

1915. Second Battle of the Masurian Lakes. At the close of 1914, as previously stated, the Russians again occupied East Prussia as far west as a north and south line through the Masurian Lakes. This force was the X Russian army—Sievers—as the I Russian army was now along the frontier between the lakes and the Vistula. German Headquarters decided to take advantage of the cessation of hostilities on other fronts and by a winter campaign drive the Russians across the frontier and if possible across the Niemen and Narew Rivers. For this purpose several new divisions were sent to von Hindenburg and he formed the X German army —von Eichorn—to operate to the left of the VIII army. As at Tannenberg, von Hindenburg planned to envelop both flanks of the X Russian army by attacking close to the Niemen in the north and south of the lakes. The Russians were in winter quarters and not expecting attack when it suddenly developed February 7 and was executed under severe weather conditions with frequent snow storms. The campaign lasted two weeks and ended with the capture of 100,000 Russians, including a corps and three division commanders and some 300 guns. The Germans attempted to capture the fortress of Ossoviec but were repulsed. The operations were extended to cover the front of the I Russian army but met with little success. Russky, who had been in command of the Russian right which included the X army, was now relieved by Alexieff.

In Galicia, during the winter, the IV Austrian and the III Russian armies faced each other between the Vistula and Carpathians while the II and III Austrian and VIII Russian armies faced each other on the crest of the Carpathians. The XI Russian army was besieging Przemysl. German divisions had been sent to reinforce the Austrians in the mountains to recapture the passes but the winter operations there were of no avail. In March, Przemysl surrendered and its besieging army reinforced the VIII Russian army. In Bukovina the VII Austrian army was engaged with the VII Russian army.

In the spring of 1915 the situation on the Eastern front was very unsatisfactory to German Headquarters. The Austrian armies were discouraged and from the crests of the Carpathians the Russians threatened an invasion of Hungary. The government of Italy was wavering and at any moment Austria might be called upon to meet a new enemy. It was therefore decided to attempt a blow that would compel the Russians to retreat from the mountains. For this purpose a new army, the German XI army, was organized behind the IV Austrian army; this was made up of picked corps from the Western front and was well supplied with heavy artillery. Von Mackensen, who had successfully commanded the IX army, was assigned to its command and the IV Austrian army as well as the Austrian and German troops in the Carpathians were directed to coöperate with him. This new army quietly replaced the troops of the IV Austrian army in the southern sector between the Vistula and the Carpathians. If the XI German army could break through the left wing of the III Russian army and advance at the foot of the mountains, the Russians in the passes would have to retreat or risk the danger of capture. Once the passes were freed, the Austrian and German troops in their rear could advance to the plain and take part in the general drive. It should be stated that the Russian intrenched lines were by no means so strong as the intrenched lines on the Western front.

Austro-German Drive in Galicia. A terrific cannonade began along Mackensen's front on the afternoon of May 1 and continued through the night to prevent the Russians from repairing damages. On the 2d it began at daylight and lasted four hours, when the infantry attack was launched. The Russian front was shattered and although here and there the Russians offered stubborn resistance the tide swept on and one by one the Carpathian passes were evacuated and the Austro-German forces in their rear moved down to swell the forces in the plain. By May 15 the San was reached, where the advance was temporarily halted to repair the railways, bring up supplies and heavy artillery, relieve some of the corps engaged in the first movement, and secure both banks of the river for a further advance. It was at this time that Italy declared war and a part of the I Austrian army was sent there to reinforce the V and VI armies from the Serbian front. On June 2, Przemysl was evacuated by the Russians and by the middle of June the Austro-German armies were ready for another advance. In the meantime the Russians had taken up a defensive position on the Rawaruska line, where they had defeated the

Austrians in 1914. This line was forced on June 18 and on June 22 one of the Austrian armies occupied Lemberg.

From the San River the IV Austrian and XI German armies had turned northward and advanced with the left flank resting on the Vistula but at the frontier they were stopped. The Russian armies in West Poland had retired to the vicinity of the Vistula and had concentrated a strong force in their front. To reduce this resistance it became necessary to strike another blow at some other point of the Russian front. Operations had already been begun in the extreme north where the German Baltic army, largely cavalry, had crossed the Niemen River in April and now occupied the line of the Libau-Kovno railway. On July 2 there was a conference between von Falkenhayn, chief of staff of the German armies, and von Hindenburg to determine the new point of attack. Von Hindenburg recommended that this attack be made in the direction of Kovno and thus threaten the main lines of communication of the Russians which ran through Vilna and its vicinity. A successful drive here would compel the Russians to retreat toward the Pripet marshes. Falkenhayn, however, considered this plan too ambitious and was content with forcing the Russians to evacuate the line of the Vistula. Upon his recommendation, therefore, the attack was to be delivered along the Narew River; here a successful drive would compel the Russians to evacuate Warsaw but would leave their lines of retreat open.

The Great Austro-German Drive in the East. For the opening attack of the great drive which was to extend from the Baltic on the north to Rumania on the south a new XII army—von Gallwitz—was formed on the left of the VIII army, whose mission was to force the crossing of the Narew River. The attack opened on July 13 but it was only 10 days later that the Germans by the capture of the bridgeheads Ostralenka, Rozan, and Pultusk were able to cross the Narew in force. It was immediately followed by the complete withdrawal of the Russian forces from West Poland across the Vistula River and the beginning of the general retreat. Ivangorod was evacuated on August 4 and Warsaw on the following day. In Novogeorgievsk the Russians left a garrison of 80,000 men but under the fire of heavy artillery it fell in a few days and its garrison surrendered. The retreat of the Russians was followed by an advance of the Austro-German forces along the entire front. In the south the Austro-German Carpathian armies moved eastward from Lemberg and into Bukovina; farther north von Mackensen with his two armies advanced to the Bug River, where the Russians evacuated the fortress of Brest-Litovsk, August 25, and fell back to the Pinsk marshes, the Austro-German forces in West Poland crossed the Vistula and reinforced the XII army; the VIII army forced the crossing of the Narew and Bohr Rivers and captured the bridgehead of Lomza, August 10, and that of Ossoviec, August 22; the X army advanced against the fortress of Kovno on the Niemen, captured it on August 17, and the great railway junction at Vilna a month later; in the extreme north the German Baltic army captured Mitau and reached the Dwina River between Riga and Dwinsk or Dunaberg

About the middle of September active operations ceased and the Eastern front became stabilized. The new front followed the Dwina River from Riga to Dwinsk then ran almost due south to the Dniester River; the Russians still occupied a small section of eastern Galicia. While the Germans had possession of all the frontier fortresses of Russia and had seriously injured the morale and the fighting ability of the Russian armies, they had not been able to force a decision on the Eastern front because of their failure to prevent the retreat of the Russian armies. It was during the Russian retreat on September 5 that the Grand Duke Nicholas was relieved from the command of the Russian armies and sent to command the Russian forces on the Turkish front; the Czar took command of the armies with Alexieff as chief-of-staff and Russky again commanded the northern group.

Year of 1916. After the cessation of operations in the autumn of 1915 and during the following winter the Russians made strenuous efforts to reorganize and equip their armies. In this they were considerably handicapped by a corrupt and inefficient war department and by their inability to receive munitions from their allies and neutrals. During the winter supplies from the outside could only be received through ports on the Pacific where terminal facilities were inadequate and over a long line of railway with limited rolling stock in poor condition as a result of the War. In the spring, Kuropatkin, who had been in command of the Russian armies in the Russo-Japanese War, was assigned to the command of the northern group, and Brusiloff to the southern group. Ivanoff was assigned to duty at headquarters. Ewart remained in command of the central group.

The military situation on the Russian front was improved during the autumn, winter, and spring by the withdrawal of German and Austrian troops, first for the drive in Serbia, then the attack on Verdun and lastly by the Austrian drive in Italy. At this time the northern and central groups of Russian armies, which extended from Riga to the Pripet marshes, were facing the Baltic, X, VIII, and XII German armies under von Hindenburg and the central group under Prince Leopold of Bavaria, consisting of the IX German army with some Austrian troops which prolonged the line to the marshes. The southern Russian group was opposed mainly by Austrian troops; in the centre was an Austro-German army under German command.

When the German Crown Prince opened his tremendous assault on Verdun in February the Russians were requested to attack the Germans to relieve the pressure on the Western front and to prevent the sending of German troops to the Western theatre. Attacks were consequently made at various points. The main attack was made by two armies of the central group east of Vilna in March. Severe fighting followed, but did not change the position of the lines, although the object was probably accomplished. While they were unable to assume the offensive, the Germans had strongly organized their lines, as they desired to hold all the territory gained in order to draw from it supplies; the Allied blockade had cut them off from supplies through neutral states. Minor attacks were made on this front during the year but without material results.

Brusiloff's Offensive. Brusiloff whose front extended from the Pripet Marshes to Rumania had under his command four armies and was later reinforced by a fifth from the central

group. When called on in May to assist the Italians by a counterattack in the east he was ready to act. At this time, the Russians had on the east front about 140 divisions of infantry and 33 divisions of cavalry, probably depleted in strength. From the railway junction of Rovno, then held by the Russians, two railways run westward, one to the northwest to the railway junction of Kovel where the line forks toward Warsaw and Brest-Litovsk and the other to the southeast toward Lemberg crossing the Galician frontier at Brody. It was along these two railways that Brusiloff planned attacks by his right wing, consisting of two armies with Kovel and Brody as objectives. Farther south one army was to attack on each side of the Dniester River.

The attack began on May 4; that same day the Austrian line in front of his right wing was broken and two days later the Russians had captured Lusk, several miles in rear of the Austrian front. The two Russian armies now advanced and at the end of two weeks had advanced about 40 miles on a front of 80. In the meantime, German troops were sent from the north, and succeeded in checking the advance. A fifth Russian army was now deployed on the right of the others but was unable to make any headway; the objective, Kovel, could not be reached. The attack north of the Dniester was repulsed and it was only in the latter part of July, when Brusiloff captured Brody and threatened the flank of the Austro-German army on this front, that it fell back to a new position 15 miles in the rear, from which it could not be dislodged. South of Dniester, the Russians recaptured Bukovina and advanced as far as they could safely go while the Austro-Germans still held the north bank. About the middle of August the Russian operations ceased on this front, as Rumania was about to declare war and Brusiloff was directed to send troops to her aid.

Although he had effected no material change on the Eastern front, Brusiloff had caused Austrian troops to be withdrawn from Italy where they had begun an offensive campaign and thus permitted the Italians to go on with their own offensive operations, and he probably also encouraged the Rumanians to declare war. Had the Russian armies in the north coöperated with him, possibly greater results might have been attained.

Year of 1917. The operations on the Russian front were greatly influenced by the political changes during the year. In March the reactionary government of the Czar was overthrown and a provisional government established under Kerensky. In November the Kerensky government was overthrown and the Bolsheviks came into power under the leadership of Lenine and Trotsky. For the details of the Russian Revolution see RUSSIA, *History*. Previous to the fall of the Czar's government there was an unsuccessful offensive attempted on the Aa River in the Riga district, the prime object of which was to relieve the tremendous pressure on Rumania.

Military Operations During the Kerensky Government. After the breakdown of the Russian offensive on the Aa River, the Russian front was comparatively quiet until the Russian Revolution was well under way. The situation on the entire front was deplorable. Discipline had completely broken down. Generals were appointed and removed or they resigned. The orders issued by the officers had to be approved by the men themselves. Fraternization between the Russian and German soldiers was carried on to a large extent and could not be checked. The situation could not have been much worse. As a result of this demoralization, the Germans and Austrians were able to remove several divisions from the Russian front for use on other fronts. What fighting was done was spasmodic and of a local character. The Allies looked on the revolution at first with favor as they thought it would result in a more vigorous prosecution of the War but they soon discovered that it really resulted from war weariness. The Kerensky government was urged to renew hostilities but it was not until the middle of the year that operations could be renewed. Even then there was little hope that anything could be accomplished by the northern armies as they had been influenced by German propaganda and by the events in the capital.

Brusiloff, who was now commander-in-chief, therefore decided to assume the offensive with his old armies, now commanded by Guter on the Austrian front, as these armies had been less affected by the revolution than those in the north. The northern armies were to coöperate in the general advance but it is doubtful if he expected much from them.

The operations of the southern armies began on July 1 and, as in the preceding year, the Russian armies swept all before them for about two weeks and advanced about 30 miles on a front of 100. This attack compelled German Headquarters to bring some of their best shock troops from the Western front. The counterattack of these troops was made against the left flank of the Russian group of armies July 19 and it was at once discovered that the Russians were no longer the disciplined troops of the previous years. The left army was routed, and as disintegration began in the other three, all the armies retired across the frontier and for the first time since the beginning of the War there were no Russian troops in Galicia. The northern Russian armies made some isolated attacks but without success.

In August, in the extreme north, the Germans captured the port of Riga which had resisted all their efforts of the preceding year. This was followed by the occupation of the islands at the mouth of the Gulf of Riga and the landing of troops on the coast of Esthonia to the east in preparation for an advance on Petrograd if necessary. However, the Kerensky government was replaced by that of the Bolshevist government in November and an armistice was declared between the new government and the Central Powers early in December. Military operations on the Russian front now ceased as the armistice was later followed by the treaty of Brest-Litovsk (see RUSSIA).

Military Operations Under Bolshevist Government Until Nov. 11, 1918. After the Bolshevists had made peace with the Central Powers, their attempts to pacify that part of Russia which remained in their hands were rather unsuccessful. A considerable army of Czecho-Slovaks was roaming around the central part of Russia, attempting to reach Vladivostok and then join the allies in order to down their hereditary enemies, the Austrians. These men had deserted from the forces of the Central

Powers or had been taken prisoners and had later fought with the Russians. After Brest-Litovsk they received permission to cross Siberia. For some time their relations with the Bolsheviks were very friendly, then Moscow ordered them disarmed; the Czecho-Slovaks resisted and conflicts occurred between them and the Soviet forces. The first battles began in May and continued throughout 1918.

When it became known that the treaties of peace between Germany on the one hand and Finland, Russia, Rumania, and the Ukraine, on the other, were to be used by Germany as a means for making these countries subservient to Germany, the Allies determined upon a certain amount of military intervention in order to try to save something from the chaos that existed in Russia. The Allies seized the region around the Murman coast, with the cities of Murmansk, Kola, and Kem (July, 1918). The purpose of this was primarily to prevent the Germans from capturing the supplies that the Allies had landed at the Arctic terminus to the Murman railway completed during the War. The Americans furnished a small force for this expedition.

In July, 1918, it was also announced that the Allies after a long period of consultation had determined to send a combined force of men to Vladivostok to aid the Czechs as far as possible, and also to attempt to break up the armed bands of Austrian and German prisoners who were the main part of the Bolshevik forces. Therefore 10,000 Americans, 10,000 Japanese, and smaller numbers of French and British were placed under the command of General Otani (Japanese), and despatched to Vladivostok in August. Maj.-Gen. William S. Graves was placed in command of the American troops. For further details see SIBERIA.

ITALIAN FRONT

Italy's entrance into the war in May, 1915, which the Allies hoped would relieve the pressure on Russia, had two main movements: (1) to the north, to close the passes of the Alps against invasion; (2) to the northeast, to cross the Isonzo and take Trieste. The Isonzo line was reached, but the operation was not completed. An Austrian invasion from the north (May, 1916) was checked mainly by an opportune Russian drive into Galicia. After a successful attack against Austria the Italians were compelled to beat a precipitous retreat to the Piave in 1917. From there they organized the blow that crushed Austria in 1918.

Year of 1915. As a result of an agreement between Great Britain, France, and Italy, known as the Pact of London, Italy declared war on Austria, May 23, 1915. The Italian army on a peace footing consisted of 12 army corps or 25 infantry divisions, which at war strength without reserves would give an army of about 375,000 men. The division consisted of two brigades of infantry, about 12,000 men, and one regiment of field artillery with 30 guns. Each regiment of infantry had a section of two machine guns. The cavalry consisted of 29 regiments which were to furnish the corps cavalry and independent cavalry divisions. Of heavy artillery there were four regiments of four batteries each, equipped with 6-inch howitzers which were to be assigned to armies. The Italian army entered the campaign with an insufficient equipment of artillery, which was gradually increased in the course of the War.

The work before the Italians was simple in respect of conception, difficult in point of execution. The configuration of the frontier at once fixed the nature of the task. It was absolutely essential to close the passes of the Alps from Switzerland eastward in order to protect the flank and rear of their armies on the Isonzo line and to prevent invasion of Italy from the Trentino. This condition secured, the task of the remainder of the forces was to cross the Isonzo, for it must not be forgotten that Italy's material objective was Trieste with the Istrian Peninsula.

Four armies took the field, two on each frontier, the northern and eastern. A fifth force, composed of Bersaglieri and Alpini, was designated for operations in the Carnic Alps. Gen. Count Luigi Cadorna, the chief of the general staff, was in general command, although the armies were under the nominal leadership of the King. On May 24 the frontier of the Trentino was crossed and two weeks later the road to Verona was closed. During the opening days of the campaign in this region the Austrians had opposed but slight resistance to the forward movement of the Italians because of the events on the Eastern front. Farther west the Italians closed the gateways opening southward into the valley of the Tagliamento after severe fighting. In the Trentino as a whole the Italians managed to get control of most of the roads leading into their own country.

The nature of events on the eastern frontier was almost wholly determined by the obstacle forming the line of separation between the contending armies, i.e. the Isonzo River From its left (Austrian) bank rises ridge upon ridge, whereas the right bank from which the attack must come, below Gorizia, is flat, the Friuli plain. In crossing the river here, therefore, the Italians would be compelled to fight uphill. The rectangle Gorizia-Gradisca-Trieste-San Daniele is occupied by the Carso plateau, with hills from 150 to 1700 feet high. This plateau would have to be taken, or at least a passage opened through it, before Trieste could be reached. On May 24, Italian troops occupied various small towns just across the frontier. Their troubles began when they undertook to cross the Isonzo, for soon after reaching it they found it in flood. Their difficulties were increased by the failure of the cavalry to seize the bridges at Pieris A dash for these bridges would have insured a crossing and might have gained possession of a part at least of the Carso plateau. As it was, the Austrians blew up the bridges before any Italians got across. The flood subsiding on June 5, a crossing was made at Pieris, and Monfalcone occupied. But now a fresh obstacle presented itself; the Austrians flooded the low country at the foot of the Carso plateau. The advance was thus blocked, and operations along the entire line delayed. After three unsuccessful attempts to make another crossing of the river just above Sagrado, the Italians finally succeeded on June 24. By the 27th they had obtained a bridgehead on the Isonzo and a line of advance to the Carso plateau. This formed part of a general struggle over the whole line from Plezzo to the sea. The conflict was necessarily intensified at certain points, such as Gorizia, Plava, and Tolmino.

Gorizia lies in a bend of the river, and is

dominated by the hills behind it stretching away into the general mountain system. On the west bank, Monte Sabotino, itself commanded by the hills on the eastern bank, likewise controls the position; from Sabotino run the Podgora heights well below (south of) Gorizia. Between Podgora and Gorizia is open ground 3 miles wide, bounded on the southeast by the river. Sabotino and Podgora, thoroughly organized defensively by the Austrians, were unsuccessfully attacked by the Italians at the end of May. They were slightly more successful at Plava On the 17th of June, after heavy fighting, they gained the summit of the hill controlling this town. They held the hill thereafter in spite of the efforts of the Austrians to win it back, but were unable to extend their holdings on the left bank. At Tolmino the river turns 90 degrees from southeast to southwest. In the bend stand two hills joined by a saddle, Santa Maria and Santa Lucia. These were held by the Austrians, and formed with Sabotino and Podgora the only positions retained by them on the west bank of the Isonzo. The resistance offered at Tolmino was more serious than apparently the Italians had expected. Their attempt to seize it by sudden attack failed, and they were compelled to proceed against the place by regular investment. In the meantime they were more fortunate to the northwest at Caporetto, which they had occupied on the first day of the War. By June 23, the Italians had succeeded in getting into positions from which they threatened the Plezzo valley. They now came down from the north against Tolmino. In August they attacked Santa Lucia and Santa Maria, but were compelled to resort to trench warfare. Later in October the offensive was resumed, without, however, succeeding in dispossessing the Austrians. At the end of the year the Italians had gained one of their points. They had closed the gates of the northern frontier, and held the keys On the other hand, they were unsuccessful on the Carso. A period of relative quiet then prevailed.

1916. Austrian Attack in the Trentino. The Austrian plans for 1916 contemplated an attack on the Italian front before the Italians recovered from their unsuccessful campaign of 1915. Inasmuch as they selected the Trentino front, which was largely mountainous, they were compelled to wait until May before beginning operations, so that the snow would have a chance to melt. During the winter and spring, the Austrians were concentrating troops in Trent, collecting them from the Russian and Serbian fronts, as well as from the interior. The advance was to be made over the mountains between Lake Garda in the west and the Brenta River in the east In this section there were a number of valleys which led to the crest of the mountain boundary and thence to the plains of Italy. The Austrian forces, which were concentrated, however, were entirely too weak to accomplish the object set before them and did little more than divert interest from the Isonzo front.

The front to be attacked was held by the 1st Italian army, which was ill prepared for modern warfare and which was led by an overconfident commander, who had taken little care to fortify his position, which he knew for months was going to be attacked. The attack began in the middle of May and was preceded by a heavy bombardment, which, being new to the Italian troops, had a very demoralizing effect upon them. The result was a slow but steady advance on the part of the Austrians. At the end of two weeks, Asiago and Arsiero had been captured. By this time the attack had exhausted itself and this fact, coupled with an attack by the southern group of Russian armies, forced the Austrians to begin to recall their troops. They fell back to a position intermediate between their advanced and original positions. No serious fighting followed this withdrawal, as the Italians returned to their attacks on the Isonzo front.

Operations on the Carso Plateau. While the Austrian attack was being carried on in Trentino, the Italian II and III armies continued their operations against the Austrian positions north and south of Gorizia. By August their work had produced results which made a successful assault feasible. The attack was delivered north and south of Gorizia on August 6 It was preceded by a bombardment of great intensity. By the 9th the Austrian first line had been broken and by the 12th they had been driven back 3 miles to their second position. Gorizia had been evacuated on the 9th. North of this town all the Austrian positions on the heights of Sabotino and Podgora west of the Isonzo were captured. During the remainder of the year attempts were made by the Italians to advance farther along the Carso plateau, but the Austrian lines proved too strong.

1917. Italian Spring and Summer Offensive. The winter on the Italian front was very severe and of long duration. The time was spent in increasing the entire military establishment on the front and in preparing to meet an Austrian attack on the Trentino front and in organizing an Italian attack on the southern part of the battle line. The plans of the Italian General Staff were as follows: First, to engage the enemy on the entire front from Tolmino to the sea in an intense artillery action which would leave him doubtful as to the real direction of the decisive attacks; then to attack along the Isonzo with the II and III armies. The II army was to seize the heights on the east bank of the Isonzo from Gorizia about 6 miles northward. When the Austrians concentrated here the III army was again to press forward in the main attack along the Carso plateau in the south.

Operations were begun on May 12, and on May 14, the infantry advanced from Plava and Gorizia. On the entire front the Austrians presented stubborn and determined resistance. The first phase of the assault lasted until May 22, by which time the Italians had captured the Austrian first line. The Austrian second line, however, was on heights which overlooked and dominated the first line. In order to create a diversion the Austrians unsuccessfully attacked in the Trentino region, May 19 to 22.

On May 23 the Italian infantry began the second phase of the battle. After tremendous artillery preparation, it attacked on the south edge of the Carso plateau from Castagnavizza to the sea. Over 100 aëroplanes aided in this battle. On the next day the battle was resumed and extended from Gorizia to the sea. Allied monitors bombarded the extremity of the Austrian lines with heavy naval guns. The Italians advanced in the face of exceedingly stubborn resistance—counterattacks, violent shelling, and aërial bombardments from machines

flying near the ground. The Italians advanced their lines about 2 miles, but had not accomplished all that was expected, inasmuch as the key position was 2 miles farther on from the new Italian front line.

The Austrians, on June 1, began an offensive which compelled the Italians to retire somewhat from their newly-won positions. On account of conditions in Russia they were able to bring up great quantities of men and material from the Eastern front On June 3, a general attack from Mount San Marco to the sea was begun and lasted with unabated intensity for three days. It was at first successful, driving the Italians back about 1¼ miles. A counterassault by General Cadorna in the Trentino compelled the Austrians to give up this offensive, which was supposed to neutralize the Italian gains in the latter part of May. During July and the first part of August the opposing forces battled back and forth in an attempt to get advantageous positions. On the night of August 18, the Italians began a spectacular offensive from Tolmino to the sea, a front of approximately 37 miles. The attack was made by the II army, under General Cappello, which operated on the Bainsizza plateau, Monte Santo, and Monte San Gabriele, and the III army under the Duke of Aosta, which operated in the Vippacco and Brestovizza valleys, and in front of Mount Hermada, the keypoint to the Carso plateau. These armies were aided by Italian and British monitors in the Gulf of Trieste.

The Italians paved the way for their advance by a great engineering feat. They had diverted the course of the waters of the Isonzo River from its bed above Anhovo and had built bridges across the shallow stream that remained. This work was done at night and at daylight the stream was rediverted to its regular channel. By means of these bridges and some pontoon bridges hastily constructed, the Italians crossed the river on the 18th and gained a foothold on the northern part of the Bainsizza plateau At the same time Cappello's right wing began to envelop Monte Santo. These two movements compelled the Austrians to retire to the easternmost edge of the Bainsizza plateau. From the nature of the Austrian defenses, it was quite apparent that the Austrian Staff thought this plateau impregnable On August 24, the Italians occupied the summit of Monte Santo, 2240 feet high, but attempts to reach the summit of Monte San Daniele were futile.

The Duke of Aosta had been busy in the south in the meanwhile His object was to surround the Hermada Mountains, which were the key to the Carso plateau and Trieste, and to occupy the Vippacco valley. He was unable to break through the Hermada Mountains, however, and spent the entire month in fruitless efforts

At the end of September, General Cadorna reported to his allies that his offensive of 1917 was ended. In the attacks north and south of Gorizia his losses in killed, wounded, and missing were 350,000; with losses due to sickness, his casualties were about 700,000. The II army especially suffered from the latter cause. It is probable that the Austrian losses were about as great, as they appealed to the German G. H. O. for assistance

Austro-German Counterattack and Italian Retreat. As has been described above, the main Italian army was striking on a comparatively limited front on the Bainsizza plateau. This attacking force was composed of seasoned veterans. The armies protecting its flanks were of unequal strength and were used for different purposes. Those on the upper Isonzo were Territorials, i.e. older men who in peace times are held in reserve They extended from Tolmino to Plezzo and were to protect the flank of the Bainsizza army. The troops on the lower Isonzo were veterans, who were thrusting forward on the Carso plateau *pari passu* with the troops on the Bainsizza and who were ultimately to march on Trieste

The German General Staff had been receiving calls for help for some time and at last gave heed to them, sending the XIV Germany army, consisting of six or seven divisions The strategy of the Austro-German plan was to strike at the unseasoned troops on the upper Isonzo, break through, and then cut the lines of communications of the other two armies by outflanking them. This plan was put into operation and worked exceedingly well. The task was made easier by the collapse of Russia, a superiority of artillery, surprise, socialistic propaganda, and cowardice, which General Cadorna claimed was exhibited by his troops on the upper Isonzo.

The battle began on October 24, with a bombardment of the Plezzo-Tolmino front and the northern flank of the Bainsizza plateau Under cover of these guns the Germans and Austrians broke through the front line trenches at Plezzo and Tolmino and crossed to the western bank of the Isonzo. Converging from these points on Caporetto, the Germans opened the way down the valleys of the Natisone and Judrio Rivers. This move threatened the rear of the Bainsizza and Carso armies, and compelled them to begin a hasty retreat. The retreat from the plateau through Gorizia across hastily constructed bridges over the Isonzo became a rout. On the 28th, Civadale was taken, which opened up railway communication with Udine, the seat of the Italian Headquarters. This advance also compelled the IV Italian army, which was guarding the frontier in the Carnic Alps, to abandon the passes on the frontier and retreat down the streams flowing into the Tagliamento and Piave Rivers. On October 30, Udine fell, and by November 1, the Austro-German forces had reached the Tagliamento River, which they crossed in scores of places after a slight pause The Italian II army was no longer a fighting unit. The next river flowing into the Gulf of Trieste was the Livenza. This offered very little chance of resistance and was defended merely to give more time to prepare the line of the Piave River, from 10 to 20 miles farther west French and British infantry and heavy artillery, which were sorely needed, were arriving daily in ever-increasing numbers, and being sent to the critical points. The French sent six divisions and the British five. At this stage a change in command was made. General Cadorna was succeeded by General Diaz, who was to be assisted by Generals Badoglio and Giardino. Cadorna was assigned to the Supreme War Council, which was organized largely as a result of the Italian disaster (see above). Reserves were held on the Adige line in case the Italians were unable to hold the Piave. The Adige line was very strong naturally, and was practically incapable of a flanking movement such as had won all the rivers so far gained

The line eventually taken by the Italians ran

along the Piave River from the Adriatic to the foothills of the mountains, thence westward across the Mount Grappa group of mountains to the Brenta River where it connected with the lines of the I Italian army, which prolonged the line across the Asiago plateau and through the mountains to Lake Garda. The IV Italian army held the line between the two rivers, while the III held the line along the Piave. The Austro-German attack had by this time exhausted itself and neither the X or XI Austrian armies in the north nor the German and Austrian Isonzo armies were able to make any impression on the new line. During December, therefore, the German divisions were withdrawn. The Austro-Germans had taken almost 4000 square miles of territory, 300,000 prisoners, and 2700 guns. The winter months, which were very severe, were spent by the Italians, with the aid of the British and French, in strengthening the Piave line, particularly at its weakest point, in the mountains.

1918. The Austrian Failure. The long looked for offensive on the Italian front, which was expected to finish the work of 1917, developed in June, 1918, and extended along the whole front from the Asiago plateau to the sea, nearly 100 miles. The Austrian plan of attack was as follows: Field Marshal von Hoetzendorf was to break through the Allied positions on the Asiago plateau, and at Monte Grappa and Monte Tomba, and then march down the Brenta valley, and debouch on to the plains by way of Bassano. In conjunction with Hoetzendorf, General Borovic was to cross the Piave between Montello and the upper stretches of the Piave delta, and thus outflank Venice and leave it the alternative of surrender or destruction. The capture of Montello would assure the Austrian domination of several important railway centres and possibly cause a huge disaster. The offensive was well planned and everything was done to insure its success. The Austrians were well supplied with gas shells, smoke shells, rafts, pontoons, and every other means of carrying on modern warfare. From the outset, the attempts to reach the manufacturing heart of Italy were doomed to failure. In the mountain region the opening attack took the first line trenches from the British and French defenders. Less than two days later, the Allies, at the point of the bayonet, had recovered all the ground lost and some more besides.

The Austrians were little more successful along the Piave. Their success was largely due to the effective use of "tear" shells and smoke screens. They crossed the Piave at several places and, by the 16th, they reached Fossalta and threatened to cross the canal of the same name, which branches off from the Piave at Fossalta and extends to Porte Grand. Nature now came to the aid of the Italians, in the form of exceedingly heavy rainstorms, which made the Piave a swollen flood. This had two effects: first, by washing away nearly all the bridges, it cut off almost completely the Austrians on the western bank of the river; and second, it enabled Italian naval monitors of light draft to go up the river and heavily bombard the Austro-Hungarian positions. On June 23, the Italians began an offensive all along the western bank against the isolated Austrian positions. By the first week in July, not only had the Allies driven the enemy back to its old positions, but in some cases had captured ground that had been lost in 1917, notably the delta at the mouth of the Piave. The offensive and counter-offensive had now exhausted themselves and General Diaz held the line of the Piave until ordered by Foch to open an offensive.

Complete Collapse of Austria-Hungary. Austria-Hungary was the third member of the Central Alliance to make a separate peace with the Allies (see below). An armistice amounting to unconditional surrender was signed on November 3, after Italy and her Allies had secured one of the most decisive victories of the War in which 63 Austrian divisions were utterly routed by 51 Italian divisions, 3 British, 2 French, and 1 Czecho-Slovak division, and the 332d American infantry regiment. On November 4, the Italian War Office reported "The Austro-Hungarian Army is destroyed. It suffered heavy losses in the fierce resistance of the first days of the struggle, and in pursuit it has lost an immense quantity of material of all kinds, nearly all its stores and depots, and has left in our hands about 300,000 prisoners, with their commands complete, and not less than 500 guns."

The main attack was made on October 24, when the Italians and their allies began a heavy artillery fire in the mountainous regions around the Asiago plateau and Monte Grappa. The first Italian infantry assault forced a passage of the Ornic River and captured Monte Salarole, and parts of Mounts Prossolan and Pertica. By the 28th the allied armies had forced their way across the Piave and were driving the enemy precipitously before them, with cavalry units well in advance of the infantry. The Austro-Hungarians were in a disorderly rout and made absolutely no attempt to carry along or destroy their munitions and supplies. Vittorio was reached on the 30th, and on the next day Italian forces reached Ponte nelle Alpi, which separated the Austrian army in the mountains from that along the Piave. The capture of the Vadal Pass on the same day penned 15 Austrian divisions between the Brenta and Piave Rivers.

By November 1, four armies had reached the Livenza and cavalry outposts had operated almost to the Tagliamento. On the 2d, the Italians had advanced in the Trentino as far as the Sugana valley and by the next day, when the armistice was signed, Roverato and Trent were occupied. Italian and British cavalry also had entered Udine and had overrun the plains surrounding it. On the last day of the fighting, Italian land and sea forces had occupied the great Austrian naval base and seaport at Trieste.

On October 31, Austria-Hungary sued for an armistice. Terms were handed to her on the next day, which were accepted. They went into effect on November 4. The more important clauses provided briefly for the demobilization of the Austro-Hungarian Army on all fronts, the evacuation of all occupied territory, wherever held by Austro-Hungarian troops, repatriation of Allied prisoners of war, and the occupation of any strategical points in Austria-Hungary by the Allies that they desired.

BALKAN FRONT

Serbia, Bulgaria, Saloniki. War was declared by Austria on Serbia June 28, 1914, and at once Austrian forces began to concentrate on the Serbian frontier. Serbia began

her mobilization two days before Austria declared war. The Austrian plan was to invade the northwest corner of Serbia; one corps was to cross the Save River at Shabatz and three were to cross the Drina River from Bosnia. Accordingly, after demonstrations on the Danube, on August 12, she sent her first troops over at Losnitza on the Drina and on the same day she crossed the Save near Shabatz. Other troops crossed the Drina at Zvornik and Linbovia. The direct objective of the Austrians was to reach Valievo, and thence Kraguyvats, the site of the national Serbian arsenal. The commanding generals of the respective sides were Potiorek (Austrian) and Putnik (Serbian).

The line of the Austrian invasion being known, the bulk of the Serbians moved to meet it in the direction of the Jadar valley, while sending troops to the northwest to offset the invasion from Shabatz. In the meantime the Austrians moved up the Jadar, and the Serbians intrenched at Jarebitze, across the valley. The battle opened in earnest August 16, on the Serbian right. The action, lasting all day, resulted in the defeat of the Austrians, and in bringing to naught their plan to join their forces on the Jadar. It also left the Serbians free to operate against Shabatz, which they entered on the 14th While this operation was going on, the Austrians farther south had been retreating to the Drina, and the Austrian invasion had failed, due to overconfidence and exposing their columns to separate attacks by the Serbians who were thoroughly acquainted with the country.

On September 1, the Serbs invaded Syrmia, a province lying between the Save and the Danube. On the whole this step was ill-advised, and in any case of short duration, for now the Austrians were about to launch another invasion, like the first, from the line of the Drina, under the same general.

After six weeks of position fighting the Serbs retreated, abandoning the Matchva and the Tzer. On November 1, the Austrians again invaded Serbia from the same frontier with two armies, composed of four active corps and reserve divisions. Valievo was entered on the 11th. The Serbs now took up a position down the Kolubara River to the Lyg, up which their line turned to the southeast; the heights south of this position were occupied and protected by earthworks. On the 11th, the Austrians attacked towards Lazorevatz, and moved against a detached force 20 miles southwest guarding the valley of the western Morava. On November 20, the first of these attacks proved successful and drove in the Serb centre. By the 24th, the action had extended over the whole front with continued success falling to the Austrians. They had now succeeded in extending their front to Belgrade, which they entered December 1, and thus had cut the region in two, driving back the Serbs in the direction of Kraguyevats, on a line from the Belgrade railway to the western Morava. The situation was now saved to the Serbs by the resumption of the offensive. On December 2 they attacked, and in the next few days drove back the Austrians right and centre to Valievo. The advance was equally successful in the other sectors. Its result was an interposition between the three Austrian corps in the south and the two farther north. The three southerly corps retreated as well as they could on the frontier. The action now turned towards Belgrade, towards which the Austrians were steadily driven back. The evacuation of the capital occurred on December 14 and 15.

It is difficult to understand the object of Austria's operations in Serbia during 1914 when she needed all her troops on the Russian front. It was highly improbable that the Serbians would cross the Danube and an invasion of the mountainous provinces of Bosnia and Herzegovina could have been easily defeated by the local corps stationed there. It was to her interest to remain on the defensive on this front.

1915. Bulgaria. In October, 1915, Serbia was once more called upon to defend her territory, for Bulgaria had finally decided to cast in her lot with the Central Powers (see BULGARIA). Accordingly her armies crossed the Serbian frontier towards Nish, striking in conjunction with the Austro-German forces which had already begun their invasion from the north under the leadership of Von Mackensen. Meanwhile French and British troops, under an arrangement with Venizelos, the prime minister of Greece, debarked at Saloniki, and were hastening up along the Saloniki-Nish railroad. In the first week of October the Austro-German army crossed the Danube near Belgrade and at Semendria, while other armies attacked farther west along the Drina and Save Rivers. Bulgaria's first operations were directed towards Nish; but realizing the danger of the arrival of Allied reinforcements at Saloniki, the Bulgarians then developed their main attacks farther south against the railroad at Vranya and Vilandovo. The advance of the Austro-German columns was at first slow, for by the end of October they had gained, advancing on a 100-mile front, only from 25 to 40 miles south of Belgrade. In the south, however, the Bulgarians having seized the Nish-Saloniki railway at Vranya, promptly confirmed their grip on the enemy's line of supplies by taking the important city of Uskub (October 22), and Veles, 25 miles farther south

The Germans took the Serbian arsenal at Kraguyvats during the second week in November. In the meantime, the other Austro-German columns had reached the east and west line of the Western Morava before the middle of the month. The fall of Nish was not long delayed, upon a heavy bombardment by the Bulgars. A route to Constantinople had already been opened via the Danube, when Germans and Bulgars joined hands near Orsova.

Meanwhile the Anglo-French forces from Saloniki held the railroad from Krivolak south to the frontier, and had gained some successes against the Bulgars around Strumnitza. The French were scarcely able to maintain their position on the Vardar and Cerna Rivers, and the small British force was but little in evidence north of Doiran.

The remaining strokes in Serbia's defeat followed quickly. Sienitza, Novibazar, and Mitrovitza (the last the temporary Serb capital) fell in rapid succession before the Austro-German columns. Teutonic and Bulgarian invading forces joined hands at Prishtina, on the railroad branch south of Mitrovitza. On November 30, the two remaining cities of importance, Prisrend and Monastir, were lost to Serbia. The fugitive Serb army was driven either into Montenegro or Albania. At the beginning of December, the main object of the German-Bulgar campaign in Serbia had been achieved. The

Serbian army had been eliminated as a fighting force and the surviving Serb troops, fewer than 100,000 men, had retreated into Montenegro and Albania en route for the Adriatic shores.

The retreat of the Serbs from Katchanik left the French left flank, on the Cerna River, in a critical position. The retreat of the Allies, however, was skillfully conducted, and they succeeded in escaping to neutral territory, where they fortified themselves at Saloniki, with the intention of holding their position at all costs and using it as a base for future operations.

Year of 1916. Montenegro was conquered by the Austrians in January, 1916. The Austrians then proceeded to take Scutari in Albania (Jan. 26, 1916), and joined hands with the Bulgars, east of Durazzo, February 17. The Italians abandoned the place February 26, and the Austrians now advanced against Avlona. The remnant of the Serbian army was transported by the Allies from the Albanian coast to the island of Corfu to undergo reorganization. After a few months' rest the refitted army was taken to Saloniki to reinforce the French and British.

When Rumania decided to enter the War on the side of the Allies (see below) one of her terms was that the Allies should begin an offensive from Saloniki to prevent Bulgaria from taking part in the operations against her. About the first of August, therefore, General Sarrail was made commander-in-chief of the Allied forces and began operations in the centre against the Bulgarians on his front. The Bulgarians replied by invading Greece and occupying the line of the Struma River and the fortress of Kavala on the coast of Macedonia and the town of Florina west to Lake Ostrovo. Sarrail, not being able to advance in the centre, transferred his offensive to the west and the French and Serbs captured Florina and advanced into Serbia, capturing Monastir about the end of November. This campaign was of little assistance to the Rumanians. The failure of Greece to declare war on Bulgaria after the invasion of the country led to the establishment of the Greek revolutionary government under Venizelos at Saloniki and on some of the Greek islands.

Year of 1917. No events of any importance occurred on this front during this year. General Sarrail began an offensive in the spring but gave it up very shortly, accomplishing nothing. King Constantine was forced to leave the country and one of his sons was placed on the throne by the Allies in the course of the year (see GREECE). Greece declared war on the Central Powers and the Greek army was organized and trained to aid the Allies.

1918. Surrender of Bulgaria. The Bulgarians were very much dissatisfied with the terms of the Treaty of Bucharest and resented the action of the German and Austrian governments, which had dictated the terms. Of the Bulgarian army at this time, Ludendorff says: "The Bulgarian army had time for rest and training. But it could not be denied that since March its spirit had visibly deteriorated, owing to bad food and clothing. The irritation against Germany was cleverly fomented by hostile propaganda and by Bulgarians who favored the Entente. The peace of Bucharest and the withdrawal of a few German units to the west added fresh fuel to it."

Bulgaria was the first of the Central Powers to surrender to Allied arms. This act marked the beginning of the end of the great War. Bulgaria's surrender was the direct result of a brilliant offensive carried out by the Allies under the supreme leadership of Gen. Franchet d'Esperey, who assumed command of the Saloniki front in June, 1918. The artillery preparations began on Sept. 14, 1918, and on the 17th and 18th the Allied right started to advance, as well as the centre. British and Greek troops struck around Lake Doiran, on the right of the Macedonian front; French and Serbian troops struck in the centre, and Italians struck on the left rear and in Albania. By September 22, the Serbians had succeeded in cutting the communications of the I Bulgarian army, operating along the Vardar, and those of the II army and the Germans north of Monastir. This day saw a general pursuit of the armies of the Central Powers on a 90-mile front. On the 23d, the Serbians and French crossed the Vardar. On the 24th French cavalry entered Prilep. The British entered Strumnitza on the 26th, and the Serbians reached Kochana and Veles. The road to Sofia was opened to the victorious Allies. Consequently the Bulgarians sued for a separate armistice. One containing terms of unconditional surrender was granted on the 30th, when active fighting ceased. The last act of the fighting was the occupation of Uskub by the French on the 30th.

A brief summary of the armistice terms, which were purely military, are as follows: Bulgaria was to evacuate all Allied territory, demobilize her army as rapidly as possible, and turn over to the Allies all means of transport. The Allies were to be allowed to pass through Bulgaria if necessary to future military operations; control of the Danube and Bulgarian merchant marine on that river was to be given up; all important strategic points to be occupied by the Allies if they wished; the armistice was to remain in force until a general peace was concluded.

Interest in the Balkans after the signing of the armistice centred in the driving out of Austrian troops from Albania, Serbia, and Montenegro. On October 1, the Bulgarians began to evacuate Serbian territory, and two days later the Austrians began the evacuation of Albania. By the end of the month they were well out of Montenegro also. On November 3, Belgrade was reoccupied and the II Serbian army crossed the Danube and Save Rivers, and on the 10th entered Sarajevo, the Bosnian capital and scene of the assassination of the Archduke Francis Ferdinand and his wife on June 28, 1914.

RUMANIAN FRONT

As has been stated above, the question of Rumania's entrance into the War was settled on Aug. 27, 1916. Her period of neutrality was greatly affected by events on the Russian and Dardanelles' fronts. The failure of the Gallipoli campaign, the Russian retreat, and the invasion of Serbia kept her out of the War in 1915. After Brusiloff's successful advance in June, 1916, Rumania determined to enter the War on the side of the Allies. She frankly admitted that her action was influenced to a great extent by the thought that the time was ripe to put into effect her nationalist policies. She made the following demands upon the Allies before she took the decisive step: Brusiloff was to keep up his offensive, the Saloniki army was to

attack, certain concessions of territory were to be made to her, and she was to be supplied with ammunition, etc. These demands being promised, Rumania declared war. Her reliance on the Allies was too great, however. Her chief weakness was lack of ammunition. As this could be supplied only through Russia, it was inevitable that Rumania should go short, because Russia had scarcely enough for herself, in the first place, and in the second, the Russian Revolution soon put Russia out of the War. This new force added about 500,000 trained men to the Allied cause. Including the reserves, 900,000 men could be put into the field.

The territory of Rumania forms a great letter Y. The base is formed of the province of Dobrudja, which is bounded on the south by Bulgaria, on the east by the Black Sea and on the north and west by the Danube. The two arms are formed by the province of Moldavia, which extends northward between the Pruth River and the Carpathian range of mountains; and the province of Wallachia, which extends westward between the Danube and the Transylvanian Alps. The two mountain chains form a great barrier 350 miles long, separating Rumania from Hungary.

The Rumanian plan of operations contemplated an invasion of Hungary by three armies deployed over this immense front, which were to advance in a number of small columns through the passes and eventually unite on the Maros River near Karlsburg for the final advance to the range of mountains separating Transylvania and Hungary proper. The Rumanians proposed to hold and annex Transylvania, which was largely inhabited by Rumanians. Assuming that even if Bulgaria declared war, her forces would be held by the Allied advance from Saloniki, the Rumanians left a single army to guard the line of the Danube and the Bulgarian frontier.

The plan of the Central Powers was to form a group of three armies for operations in Transylvania and one in Bulgaria. One of the former armies was composed of the scattered troops on the frontier at the beginning of hostilities and the other two were to be new armies organized from reserves and troops on other fronts; i.e. the I Austrian and the IX German. The German army was to be commanded by von Falkenhayn, late chief-of-staff. These new armies would not be concentrated before the middle of September. In Bulgaria, a group under von Mackensen was to be formed of the III Bulgarian army and a number of German and Turkish divisions.

In the campaign which began on August 28, we note the following phases:

Aug. 28 to Sept 20.	Advance of Rumanian armies into Transylvania and the advance of Mackensen's group into Dobrudja.
Sept 20 to Oct. 20	Retreat of Rumanians from Transylvania. Mackensen held in check in Dobrudja.
Oct 20 to Nov. 10	Austro-Germans held on the frontier in the north Mackensen advances in Dobrudja across the Bucharest Constanza railway.
Nov. 10 to Nov. 25.	Austro-Germans penetrate Vulcan Pass and reach the plains of Wallachia. Mackensen held in check in Dobrudja.
Nov. 25 to Jan. 10.	Mackensen crosses the Danube at Sistova with his German and Turkish forces and with the Austro-German forces from the north drives the Russian and Rumanian forces out of Wallachia and across the Sereth River. The Bulgarians left in the Dobrudja hold the Russo-Rumanian forces in check until the latter retire from the Dobrudja, when the Bulgarians cross the Danube and rejoin Mackensen.

On August 28, the I, II, and IV Rumanian armies crossed the mountains; the I army in the west from the Danube to the Red Tower Pass; the II army in the centre between the Gyimes and Tarsburg Passes, and the IV army north of the Gyimes Pass. The II and IV armies met with little opposition and by September 20 were on the meridian of Fogaras between the Maros River and the Carpathians. The various columns of the I army met with greater opposition, and had barely reached the base of the mountains. At the Red Tower Pass the column had taken Hermanstadt and at the Vulcan Pass the town of Petrosiny. The division on the Danube had taken Orsova at the Iron Gates. While the Rumanian armies were advancing triumphantly in Transylvania, Bulgaria declared war on September 1 and immediately von Mackensen crossed the frontier into Dobrudja, and on September 6 captured the larger part of two divisions left by the Rumanians on the south bank of the Danube at Tutrakan. This unexpected blow caused the Rumanians to divert the commander of the II Rumanian army —Averescue—with some of his divisions from Transylvania to the Dobrudja to check the advance of Mackensen. This he was able to do before Mackensen reached the Bucharest-Constanza railway.

Such was the situation about September 20 when the I Austrian and IX German armies had completed their organization and were ready to move. Their plan was first to secure the Vulcan Pass and then penetrate the gap between the II Rumanian army at Fogaras and the I army at the Red Tower Pass and attempt the capture of the Rumanians in the vicinity of Hermanstadt by seizing the pass in their rear. The operations were successfully executed; both passes were captured, with a large number of Rumanian troops. Leaving guards in the passes, the main body of the two armies moved eastward against the II Rumanian army, which was obliged to seek safety by falling back to the mountain passes. The IV Rumanian army was compelled to conform to this movement and by October 20 both armies were back in the mountain passes. The Russians now relieved the IV Rumanian army so it could be used farther south. During this period Mackensen was unable to advance and called for reinforcements.

As a result of the retreat of the Rumanian armies in the north, Averescue was sent to his old command, the II army, and strenuous efforts were made to hold the I Austrian and IX German armies at the mountain passes. In this the Rumanians were successful during the latter part of October and the early part of November. During this period, however, Mackensen, having received reinforcements, broke through the Rumanian defense in Dobrudja and succeeded in advancing across the Bucharest-Constanza railway and capturing the seaport of Constanza. A short distance east of the railway he was obliged to again intrench, as the Rumanians had been strongly reinforced by Russians and he met with temporary defeat.

Early in November the Austro-Germans north

of the mountains received further reinforcements and made a determined effort to reach the Wallachian plains by the Vulcan Pass, where the Rumanians were weakest. After 10 days' hard fighting they succeeded in reaching Craiova and about November 25 were on the Aluta River facing east. As soon as he was assured that the northern armies would reach the Wallachian plains, Mackensen decided to leave the Bulgarians to hold his trench line in Dobrudja and transfer his German and Turkish troops to the north bank of the Danube. These troops were ferried across the Danube November 23–25 at Sistora and Mackensen assumed command in Wallachia. The Rumanian division that had taken Orsova was now wholly cut off and was later compelled to surrender.

From November 25 to January 10, the Russo-Rumanian armies were driven steadily eastward and the passes in the north were evacuated in succession. At the close of the operations the opposing armies were facing each other along the Sereth River. The Dobrudja was evacuated by the Russo-Rumanians and most of the Bulgarians joined von Mackensen on the north bank of the Danube. Moldavia still remained in the possession of the Rumanians, who moved their capital to Jassy, as the Russians still held the passes of the Carpathians.

In October, a French Military Mission reached Bulgaria, and after the close of hostilities, the Russians took over the front and the Rumanian army was reorganized and trained by French officers.

1917. In July, 1917, the Rumanians were again to assume the offensive in cooperation with Brusiloff's offensive under the Kerensky government. The Russian advance, however, soon terminated in a rout and operations ceased. In December, the Bolshevik government entered into an armistice with the Central Powers and Rumania was compelled to follow suit.

1918. After the surrender of Bulgaria, September 30, Rumania again took up arms but the surrender of Austria followed so quickly that the Rumanian forces were not engaged.

TURKISH FRONT

The strategic importance of Turkey from the Germanic point of view lay in keeping supplies from Russia through control of the Dardanelles. Activities on the Turkish front manifested themselves in five distinct phases: (1) Armenian front (a) Turkish thrust against Russia (1914–15), (b) Russian campaign (1916) forcing the Turkish armies behind Trebizond, Erzerum, and Bitlis line to the west and threatening Bagdad on the south; (2) British advance in Mesopotamia; (3) Turkish attack on the Suez Canal; (4) Gallipoli campaign by Franco-British forces; (5) conquest of Mesopotamia and Palestine with resultant collapse of Turkey.

War was begun by Turkey and Russia on Oct. 31, 1914, through the activities of the Turkish fleet, but formal declaration was withheld by the Allies until the first week in November. As a matter of fact Turkey began to mobilize at the end of July, 1914, and by the end of October it was estimated that she had 500,000 men in her army with 250,000 more at the depots. The strength of her army on a peace basis was estimated at 250,000. Attempts had been made by German officers to reorganize and train the Turkish army just previous to the Balkan wars, but without much success. The staff and supply services were woefully weak, and the great quantities of artillery lost in those wars were scarcely replaced. The country was divided into four military districts with headquarters at Constantinople, Erzingan in Armenia, Damascus in Syria, and Bagdad in Mesopotamia. At the beginning of the War, Allied troops appeared in the Caucasus district of Russia on the Armenian border and in Mesopotamia a British force landed at Fao at the mouth of the Shatt-el-Arab River and secured a base for operations in Mesopotamia.

1915. Armenian Front. On the Armenian front the Russian base for operations was Kars and the Turkish base Erzerum, opposite Kars. Each city was about 50 miles from the frontier and about midway between the Black Sea and Mount Ararat. About the middle of November, 1914, a Russian column crossed the Turkish frontier and advanced about half the distance to Erzerum along the roads leading to that base. In the meantime a Turkish force advanced against the Russian column, while a corps at Trebizond attempted to reach the flank and rear by way of Kardahan. The Turks crossed the frontier but were defeated and the Trebizond unit got no farther than Kardahan. The Turks recrossed the frontier and operations ceased for the remainder of 1915 because both the Russian and Turkish troops were needed elsewhere. Persian territory was invaded and some operations of minor importance carried out near Tabriz.

Mesopotamia. The Turks had two corps in the Tigris valley, one at Mosul and the other at Bagdad, 200 miles farther south. The British occupied Basra early in November, 1914, to gain a base for operations in Mesopotamia and to protect the British oil fields in southern Persia. The operations of this force were conducted by the Indian government. The force was gradually increased to an army corps and in April, 1915, General Nixon was sent to command it. About the end of May, General Townshend started north up the Tigris with the 6th Indian division, accompanied by naval vessels of light draft. In a month, it reached Amara about 100 miles up the river with only slight opposition. During July the 12th Indian division advanced about 100 miles up the Euphrates.

The advance had been accomplished so easily that the British commanders determined to combine the two forces and advance up the Tigris to Kut el Amara, which is about 100 miles south of Bagdad. The expedition started on August 1, and Kut was reached about the last of September, with only one engagement of any size. The British were successful in this. The pursuit was kept up until the British-Indian army reached Azizieh about halfway between Kut and Bagdad. The problem before the British was now whether to continue on to Bagdad or wait at Kut for reinforcements. Townshend favored the latter course but for political reasons General Nixon overruled him and ordered the advance on Bagdad. Consequently an advance was begun from Azizieh in the middle of November and by the 21st Townshend reached Ctesiphon, about halfway between Azizieh and Bagdad. Here the Turks were strongly intrenched. Townshend unsuccessfully attacked on the 22d. He remained in front of the Turkish positions until the night of the 25th, when,

upon learning that the Turks were about to be reinforced, he began a retreat on Kut. He reached this place December 2, closely pursued and harassed by the Turks. He determined to hold it until relief arrived and as the year closed he was invested by the Turks and his position was very precarious.

Egypt. As early as 1914, the Turks planned a campaign against Egypt, in the hope probably of raising an insurrection in that country. The plan of operations called for the crossing of the Sinai Peninsula through a desert 150 miles wide, as well as the Suez Canal. The main column, consisting of three divisions, was to start from Beersheba in southern Palestine. A smaller column was to follow the coast road from Gaza to El Kantara on the canal, and a third column was to follow a caravan route still farther south and reach the town of Suez. The three columns reached the canal about the first week in February. A miscellaneous force defended the canal, Australians, New Zealanders, Indians, English, and Egyptians. All attacks on the canal were easily repulsed and the Turks retreated unpursued by the Allies. No damage was done to the canal and the front remained stabilized for the remainder of the year.

Gallipoli Campaign. The temptation to strike a blow at the vitals of Turkey by taking possession of the Dardanelles, and hence of Constantinople, was irresistible (for a description of the straits, see VOL. VI). Success here would have met with a rich reward. A way would have been opened to supply Russia with the war munitions she so sorely needed; the Balkan question would have been settled out of hand, and in a manner favorable to the Allies. But the entire campaign was mismanaged from the outset; the nature of the effort to be made was certainly not correctly estimated; efforts were scattered; time was lost.

For the naval campaign, reference should be made to the naval sub-division of this article. It opened Nov. 3, 1914, and it was not until the following March that joint land and naval operations were decided upon after a great deal of bickering and hesitation. By that time the Turks had received ample warning, and here, as elsewhere, under German leadership, had made what turned out to be more than ample preparation.

In the Gallipoli Peninsula, nature was on the side of the defense. Furthermore, the Turks enjoyed an advantage in their supply of men, for the bulk of their forces was in the neighborhood of Constantinople and could therefore be drawn upon as needed. Gen. Sir Ian Hamilton was selected to direct the land operations of the Allies. These were to be carried on by a French force under General d'Amade, drawn from north Africa, and by Colonials, Territorials, and some Indians from Egypt and Imperial troops.

On arriving at Tenedos (March 17), selected as his headquarters, Sir Ian made up his mind that the transports had been so badly loaded that he would not undertake any operations until the loading had been corrected. The transports were accordingly sent back to Egypt to be reloaded. Upon their return five weeks had been lost to the Allies and gained to the Turks. The British began their landings on April 25, under exceedingly great difficulties. The Turkish force on the peninsula was in the neighborhood of 100,000 men, commanded by the German general, Liman von Sanders. The chief landings were made at the tip of the peninsula. Once ashore, the advance was to be made against the village of Krithia, and the height of Achi Baba was then to be carried. At each of the beaches selected the Turks were ready and received the landing party with tremendous fire. Obstacles of all sorts under the water and on the beaches and cliffs were skillfully placed in way of the invaders. The Australian and New Zealand corps (Anzacs) near Gaba Tepe especially distinguished themselves by rushing the Turks with the bayonet, clearing the slopes and securing a foothold on the top. The French landed a regiment on the Asiatic side, near Kum Kale, for the purpose of preventing an attack by gun fire against the transports at the nose of the peninsula. In this they were more or less successful, but at considerable loss to themselves. The result of the work of the 24 hours was that the Anzacs, isolated, were holding a semicircular line against an enemy ever increasing in numbers; at the tip of the peninsula one landing was abandoned, some forces were holding their own but isolated, while other landing parties had managed to join hands. The next three or four days were marked by severe fighting and an advance of the British from the tip of the peninsula. By the afternoon of April 28 some of the troops had pushed up to within 1300 yards of Krithia but could get no farther. The lines then dug in. On May 1, the Turks attacked at night, and there was a counterattack the next day. This is the first so-called battle of Krithia. The second occurred on May 6, and was an attempt to win the Krithia Ridge; this attempt failed but the British advanced their line 500 yards. The third came off on June 4, with the same objective and the same result. The fourth was fought on July 12, and resulted in an advance of 300 yards more or less. Achi Baba still remained in Turkish hands. Meanwhile the Turks were attacking the Anzacs (May 5–10) and were repulsed. They renewed their efforts in great force on May 18, and were again beaten off with great loss. There were other engagements, as that of the French (June 21) who captured a work known as the Haricot Redoubt, and the English action of June 28, known as the battle of the Gully Ravine. And so it went until fresh British forces were landed at Suvla Bay on August 7, and the Anzacs advanced upon the ridges of Sari Bair.

The Suvla Bay landing and simultaneous operations at the tip of the peninsula and by the Anzacs constitute the last great attempt to drive the Turks off the peninsula. In May, Sir Ian Hamilton asked for two additional corps; by the end of July he got them. His plan was now to reinforce the Anzacs and direct them to make a drive and capture Sari Bair. A landing at Suvla Bay would surprise the Turks and might enable the Anzacs after taking Sari Bair to push on to Maidos. The Turks at Krithia and on Achi Baba would thus be cut off. A containing attack was to be made at the tip of the peninsula. This attack was delivered on August 5 and failed. It was renewed on the 7th and resulted in minor local successes; its main purpose of keeping the Turks busy on the spot, and preventing them from lending a hand elsewhere, may be said to

have been realized. The Anzacs, reinforced, attacked on the 6th, and very nearly succeeded in their purpose; but on the 9th an assaulting column lost its way, and arrived too late to clinch the positive gains made on the spur to the southwest of the main elevation (Hill 305) of the Turkish position. During the attack on Sari Bair the landing at Suvla Bay was begun August 6 by night under the direction of Lieut.-Gen. Sir F. Stopford. It resulted in failure, for although the troops got ashore, once there they accomplished nothing. Apparently there was no well thought out plan of operations, or, if there was, it was not carried out. Some of the troop units were landed in places other than those designated, others were late in moving out. Some local successes were obtained, however, and on the evening of August 7, the British extended in a semicircle around the bay. On the 8th, the British stood fast and made no attempt to advance, and so lost their opportunity not merely to accomplish something on their own account, but to help their comrades farther south engaged in the desperate struggle for Sari Bair. There was more or less fighting during the next week. Open fighting gave way to trench warfare. There was one more battle on August 21, when an unsuccessful attack was made to take Hill 100, about 2 miles east of Suvla Bay.

The struggle for the Dardanelles was now virtually over and it ended in a ghastly failure for the Allies. Sir Ian Hamilton was recalled in October, and the whole peninsula evacuated in December and January, some of the troops going to Saloniki, but most of them going to Egypt to be apportioned among the other fronts. General Hamilton in his *Gallipoli Diary* places the blame almost entirely upon the insufficiency of artillery and inefficiency of the Home authorities in supplying guns, ammunition, spare parts, workshops, etc. The British casualties were 100,000 with about an equal number evacuated because of sickness. The Turkish losses were placed at about the same amount.

1916. Armenian Front. As soon as operations were possible in 1916, the Russians, under General Yudenitch, advanced across the frontier from the Black Sea to Lake Van. Another unit under General Baratoff entered Persia to drive the Turks out of northern Persia. In the middle of February, Erzerum was captured. This was followed by the capture of Bitlis and Mush near Lake Van, and Trebizond on the Black Sea in April. In July, Erzingan, the headquarters for Turkish troops in Armenia, was captured. In the meantime the Russian forces in Persia advanced south as far as Kermanshah, then turned toward the frontier which they reached in May; the objective was Bagdad. The surrender of the British forces at Kut, however, prevented this column from advancing past the frontier. In August the Turks began a counteroffensive which resulted in the recapture of Van and Mush. An advance in Persia forced the Russians back almost to their own frontier. The second half of the year saw little fighting on this front but the Russian forces compelled the retention of a large Turkish force also.

Mesopotamia. As stated above, General Townshend was invested in Kut-el-Amara at the close of 1915. His position was a strong one and the Turks made several futile efforts to take it by assault and bombardment. Then they determined to starve the British out. In order to accomplish this they constructed defenses on both sides of the Tigris below Kut to prevent a relief expedition from advancing up the river. About the middle of December, General Lake, who relieved General Nixon, began to organize a relief expedition 50 miles south of Kut. This force was organized around the 12th and 7th Indian divisions. This unit was weak numerically and did not have the proper artillery, transportation, or medical supplies.

The relief force, commanded by General Aylmer, set out on January 4, but received a check at Sheik Saad, 25 miles from Kut. Although the attempt to take the positions by force failed, the Turks abandoned the works by January 9 By the 21st, the British had advanced 6 miles further but were compelled to halt before Umm-el-Heuna, which also successfully resisted an attack in force. They held on here until early March, when they were reinforced. An unsuccessful attack was made on the night of March 8–9. On April 5, with the aid of the 13th division which had arrived from Gallipoli, the British captured Umm-el-Heuna. The Turks, however, merely retired to a stronger position at Sannaiyat a mile in the rear. Attempts to take these works between the 8th and 18th failed, and on April 29, General Townshend and his force of 10,000 men, after 143 days of siege, were compelled to surrender because of starvation. After the fall of Kut operations in Mesopotamia came to a standstill. The British made preparations on a larger and much more efficient scale for an advance on Bagdad in 1917. General Lake was relieved of the command in Mesopotamia by General Maude. The failure in Mesopotamia has generally been ascribed to overconfidence, weather (heat and floods), and inadequate transportation and equipment for trench warfare.

Egyptian Front. After the unsuccessful attack on the Suez Canal in 1915, the British, early in 1916, destroyed all the water holes within 30 miles of the canal to prevent further operations against it. They also determined to construct a railroad north to the Katica oasis and to put a pipe line alongside it. In April and August the Turks made efforts to interfere with this construction work but were repulsed. By the end of the year the British had pushed the railway and a complete and modern water-supply system to within 15 miles of El Arish, the most advanced of the Turkish strongly held positions. This activity presaged an attack in Palestine in the near future. During the year the revolt of the Arabs in Hedjaz occurred (see HEDJAZ).

1917. Palestine. The British began an advance on Rafa on the Sinai Peninsula, based on the railway which had been constructed there. This town fell early in February and the British advanced northward toward Gaza and eastward toward Beersheba. They were compelled to spend the summer on the Gaza River after failing to take these places in two attacks. In October they advanced again and by January, 1918, had won a series of brilliant successes. On October 31, Beersheba was taken and on November 6, Gaza fell. By November 15, General Allenby had cut the Jaffa-Jerusalem railway at Ludd and Er Ramle. Two days later Jaffa, the port of Jerusalem, was occupied. The British advanced down the Surar River val-

ley toward the Holy City and up the Damascus-Beersheba railway in order to encircle the city and cut off its supplies, so that it would not come under the bombardment of the artillery. All the towns surrounding the city were gradually taken by storm and as the British closed in it became apparent that the Turks would not risk a siege. The city fell on December 10 There was general rejoicing throughout the world over the return of the city to Christian hands after having been in Turkish hands for almost seven centuries. The Turks west and northwest of the city broke up into small bands and carried on guerilla warfare until the British finally got control of all the high land. General Allenby then pushed across a small stream 4 miles north of Jaffa and captured several small towns which gave him all the high land in the neighborhood, and assured a good defense of the Jaffa-Jerusalem railroad.

The success of the British arms in Palestine effectively put an end to Turkish threats on the Suez Canal and Egypt which had been going on for three years. It also revived the hopes of the Zionists, who dreamed of reëstablishment of the Jewish nation in Palestine The British government announced on several occasions that it looked with favor on the Zionist movement.

Mesopotamia. General Maude, who took command of the Mesopotamian forces in August, 1916, spent the remainder of the year in reorganizing his command and lines of supply. During the same time the Turks had reduced their force at Kut, although they considerably strengthened their positions When General Maude was ready he began an attack on the Turkish lines east of Kut between the Tigris and the Hai (Dec. 20, 1916). By the middle of January, 1917, the British reached the Tigris up as far as Kut. A month later the Turks evacuated their works on the south bank and were all on the north bank of the Tigris, which owing to floods was 350 yards wide at this point. Under great difficulties the British crossed the river on February 23. The Turks were now in full retreat. On March 11, the British entered Bagdad. This campaign did much to restore the prestige of the British in Mesopotamia and throughout the entire Moslem world. It also compelled the Turkish forces in Persia to retreat. The remainder of the year was spent by the British in making their position secure within a radius of 100 miles of Bagdad.

1918. Collapse of Turkey. Turkey was the second member of the Central Powers alliance to surrender to Allied arms. This was a direct result of a crushing defeat administered by General Allenby. As was narrated above, Jerusalem was captured by General Allenby in December, 1917. Between that time and September, 1918, the British commander was making preparations for his attack on a grand scale. His first object was to secure his right flank by the capture of Jericho and the line of the Jordan. This operation was carried out in February, and was highly successful, the two objectives having been taken shortly after the middle of the month. During March General Allenby was engaged in gaining a line which would enable him to carry out operations east of the Jordan and against the Hedjaz railway, in cooperation with the Arab forces under the Emir Faisal. These were southeast of the Dead Sea and were under the command of Allenby. Rainy weather and the raising of the level of the Jordan River prevented General Allenby from making any advance across that river. He made several raids which materially hindered the Turkish forces. His further progress was also held up by the difficulties of the Allies in France. He reported that in April the 52d and 74th divisions, 9 yeomanry regiments, 5½ siege batteries, 10 British battalions, and 5 machine gun companies were withdrawn preparatory to embarking for France. In May, 14 more battalions were sent to Europe. During July and August, 10 more British battalions were withdrawn from the fighting in the eastern area While it is true that most of these units were replaced by Indian forces, nevertheless his actual fighting force was so reduced that he was unable to continue the advance against the Turkish troops until the following September. During the hot summer months the only fighting of any note was an attack delivered by Turkish-German forces on July 14 It gained initial successes by taking Abu Tellul, an important height, and surrounded several other advanced positions. These gains were almost immediately lost again as a result of a brilliant counterattack by Australian forces.

On September 18, the British and the Arabs began an advance in Mesopotamia and Palestine which was ultimately to result in the surrender of Turkey and settle once and for all the Berlin to Bagdad route which had already been broken by the collapse of Bulgaria. Allenby made minute preparations for his blow and completely fooled the Turks as to his intentions. The British, with some French forces in support, struck on a 16-mile front and broke through the Turkish lines between Fafat and the sea and advanced 13 miles. By the 22d, enemy resistance between the Mediterranean and the Jordan River had practically broken down completely and the Allies were forging ahead rapidly. In four days they had advanced approximately 60 miles and had occupied Beisan, Nazareth, and El Afule. Arab forces east of the Jordan destroyed railroads and bridges crossing the stream and thus forced the Turks to retreat in a northerly direction only. Haifa and Acre were seized on the 23d and the Turks east of the Jordan were forced to retreat southerly in the direction of Amman. Three days later saw the British at the Sea of Galilee and the occupation of Tiberias, Semakh, Es-Samra, and Amman. On the 27th the British forces joined with the Arabs east of the Jordan at Mezeris The advance was now a steady pursuit, without any frontal fighting on the part of the Turks. Damascus fell on the 1st of October, Zahich and Rayak on the 6th, and Tripoli and Homs on the 16th. In the first three weeks of the campaign more than 80,000 prisoners and 350 guns fell into the hands of the British and Arabs.

The last half of October saw the capture of Aleppo and the complete defeat of the Turkish troops along the Tigris by British forces under General Marshall. This last event was accomplished by the capture of Kaleh Sherghat, which completely cut off communication with Mosul, which, with Aleppo, was the main base of supplies of the Turkish-German forces in Asia Minor.

Facing a supreme disaster, the Turks sued for an armistice. They sent the British gener-

al, Townshend, who had been captured at Kut-el-Amara, to the Allied commander of the Ægean fleet, Vice Admiral Calthorp, to ask for terms. He asked for regularly accredited agents to carry on the negotiations. These were sent to the island of Lemnos, and after a three-day session, terms were handed to the Turks which they accepted on October 30, and which went into effect the next day. A summary of these terms, which practically amounted to unconditional surrender, follows:

The Dardanelles, Bosporus, and Black Sea were to be opened to the Allies; there was to be immediate demobilization of the Turkish army; surrender of all Turkish warships, and use of mercantile vessels; Allied occupation of any strategical points in Turkey desired by them; immediate withdrawal of Turkish forces from Persia; all Germans and Austrians to get out of Turkey within a month and Turkey to break off all relations with their countries.

COLONIES

Africa. As early as Aug. 7, 1914, the British government telegraphed the South African government to suggest the desirability of seizing such parts of German Southwest Africa "as would give them command of Swakopmund, Luderitzbucht, and the wireless stations there or in the interior," but before operations could be carried on against German territory the local government found itself face to face with a rebellion. See SOUTH AFRICA, UNION OF.

Togoland was taken in a campaign that lasted just three weeks, Aug. 7–28, 1914. Surrounded on three sides by hostile territory, with the sea under British control, it could not hope to offer any resistance.

Kamerun called for a more serious effort on the part of the Allies Like Togoland, it was surrounded on three sides by hostile territory, with the sea under Allied control, but its vastly greater area made operations more difficult and it was more strongly defended. Three expeditions from the northwest were defeated by the Germans in August and September, 1915. Attacking from the sea, however, the Allies took Duala (September 27) and from this point widened their holdings. Two columns pushed their way into the interior along the railways; one of them on October 26 took Edea, repelling six weeks later a counterattack for its recovery. The other column north of Duala captured the entire railway and advanced beyond its head. The French sent down troops from the Tchad, and others, reinforced by Belgians from Equatoria. The result of all these efforts was that German resistance was well worn down, and came to an end with the surrender of Mora Hill early in 1916.

In *German Southwest Africa* the situation was complicated by the South African Rebellion. This rebellion crushed, real operations began in January, 1915, Luderitz Bay having been occupied as early as Sept. 18, 1914. Swakopmund was occupied January 14. The campaign was directed against Windhoek and carried on by two armies; the northern under Botha was to move from Swakopmund, while the southern under Smuts, divided into three columns, was to move east from Luderitz Bay, north from Warmbad, and west from Bechuanaland. By May 1, the end was near. On the 12th, Botha entered Windhoek and the struggle was practically over; for, pushing on to Grootfontein, now the German capital, he received there the surrender of the enemy forces, on July 9.

German East Africa, the most important colony in Africa, gave the British far more trouble than any of the others. During August, 1914, some successes fell to the British—for example, they demolished, August 13, the port of Dar-es-Salaam—but they decided to remain on the defensive, waiting for troops from India These arrived November 1, and lay off the German port of Tanga. An attack made on the 4th resulted in a decided reverse for the British, who were compelled to reëmbark. The Germans now invaded British East Africa, but were pushed back to Jassin in German territory, where on January 18 they defeated the British, and forced a withdrawal of all outlying posts in that region. They had, as early as September, 1914, invaded northeast Rhodesia, where they came into contact with Belgian troops. General Smith-Dorrien, later relieved by General Smuts, was sent out to take command of the troops in British East Africa and the invasion proceeded from that region, as well as from Nyasa on the south.

The British expedition, commanded by General Jan Smuts, won an important victory at the Kitovo Hills, near the northern boundary of German East Africa. After five days of fighting (Mar. 7–12, 1916) the Germans fell back to a position in the forest along the Rufu River. As a result of the operations that followed, the Germans, although reinforced, were compelled to abandon their positions and retire southward along the Tanga railway.

In September, 1917, the Allies began to tighten the ring around the colony. The Belgians, French, British, and Portuguese were invading it from all sides. All of the seaports were in their hands and Tabora, a strong fortress in the north, was captured (September 1–11), by the Belgians. General von Lettow-Vorbeck, the German commander who held out for such a long time against the Allies, finally surrendered on Nov. 14, 1918, three days after the Armistice was signed.

The Pacific. Japan, as Great Britain's ally, declared war on Germany Aug. 23, 1914, but confined her offensive to Germany's possessions in the Pacific. On August 27, she began the blockade of Tsingtao, and by the end of September, two Japanese armies and a few English troops had completed landing, one on the north and the other with the English at Rozan Bay The German defenses consisted of three lines, the first of fortified hills, the second of 10 forts, and the third of five. By September 28, the first two lines had been carried, and the siege was begun. On October 31 a general attack was opened on the third line which was occupied November 6. The next day the place was surrendered.

For the capture of the other German islands in the Pacific see the section on *Naval Operations*, below.

NAVAL OPERATIONS

Operations in North Sea and Waters About Great Britain. At the end of July, 1914, the German High Seas Fleet was off the coast of Norway and nearly the whole of the British Grand Fleet lay at Spithead off the Isle

of Wight. As the probability of war increased, more and more definite steps were taken to prepare for mobilizing the entire British naval force and putting into commission all ships in reserve and laid up. On August 2, German troops invaded Belgium; on July 29, the British Grand Fleet got under way to proceed to its war base at Scapa Flow. On August 4, Great Britain and France declared war and mobilization of both fleets was directed. Within four hours of the declaration of war, British scouting squadrons were sent towards the German coast, and one submarine flotilla explored the Helgoland Bight.

The German High Seas Fleet, being vastly inferior to the British forces facing it, was hastily withdrawn behind the defenses of the German coast at Kiel and in the Kaiser Wilhelm Canal.

The laying of mines now proceeded with great rapidity. Not only were the German harbors and the vicinity of Helgoland protected but the North Sea was planted with mines where they were most likely to be useful and the passages leading to the Baltic were closed excepting a narrow strip along the coast in Swedish territorial waters, the channels in the mined areas being known only to German and Danish pilots. The separate mine areas were small or narrow but were so numerous as to make navigation dangerous. The British thereupon closed the Strait of Dover by a mined area. They then began a systematic search for German mines, mine layers, and protecting forces, and also despatched their mine-sweeping groups of trawlers as fast as work was found for them. It was in connection with mine planting that the first naval action of the War was brought about. On August 5, H. M. S. *Amphion*, with the third destroyer flotilla, was carrying out a prearranged plan of search when a suspicious ship was reported by a trawler. This was the German mine-layer *Konigin Louise*, and she was chased and sunk; but early the next morning the *Amphion* struck a mine and was herself destroyed

On August 9, protected by the Channel squadron and a special detail of cruisers and destroyers, the first expeditionary force of the British army crossed to France; and thenceforward there was a similarly protected steady stream of transports carrying men, munitions, and supplies.

On August 26, the Eighth Submarine Flotilla, two destroyer flotillas, and their flag cruisers and tenders were ordered to proceed and reconnoitre Helgoland and the waters to the southward. They were followed by the battle cruiser and first light cruiser squadrons. On August 28, the destroyer flotillas, when about 25 miles from Helgoland, and not much farther from Wilhelmshaven, found the enemy in superior force and were compelled to fall back. Admiral Beatty promptly sent the First Light Cruiser Squadron to their assistance, but, as the enemy's force seemed strong, he soon decided to follow with his heavy vessels. The advent of the battle cruisers quickly decided matters. In a short time the German vessels were retiring along the whole front. The light cruisers, *Mainz*, *Köln*, and *Ariadne*, and the destroyer *V-187* were sunk. No British vessels were lost, but the *Arethusa*, flagship of the destroyer fleet, was severely injured and had to be towed to England. The *Queen Mary* was twice attacked and the *Lowestoft* once, by submarines, but the high speed in each case made the attempt abortive. The short range of the torpedoes used in the German submarines was first noticed in these attacks. This action caused the Germans to adopt a purely defensive position.

The month of September was a particularly eventful one. On September 3, the British gunboat *Speedy* was destroyed by a mine and, on September 5, the light cruiser *Pathfinder* was sunk by the German *U-21*, the first surface craft to fall a victim to the dreaded submarine. On September 28, there came an event which startled the world and greatly added to the prestige of the submarine. About daylight that morning, the British armored cruisers *Aboukir*, *Hogue*, and *Cressy* were on patrol duty in the North Sea and steaming at moderate speed in column. At 6.25 A.M., the *Aboukir*, which was leading, was struck by a torpedo from a submarine and began to sink slowly. The *Hogue* and *Cressy* came up to her assistance, stopped and attempted to save life. A little before 7 A.M. a torpedo struck the *Hogue*. She quickly capsized and sank. At 7.15 the *Cressy* was hit by a torpedo and 15 minutes later by another. Some 1460 officers and men lost their lives. All were sunk by the German submarine *U-9*, a 300-ton boat commanded by Kapitan-Leutnant Weddigen. The ease with which he performed his work was due to a lack of a destroyer screen and the folly of the *Hogue* and *Cressy* in stopping their engines in the known presence of submarines. The frightful loss due to this error caused the Admiralty to issue orders forbidding large vessels to proceed to the assistance of others under such circumstances. See section below on *Convoy*, etc., for methods of fighting the submarine.

During the month of October, the Germans lost a destroyer and a submarine; the British, a submarine, an old cruiser, and the dreadnought battleship *Audacious* by a mine. On November 3, Yarmouth and Lowestoft were bombarded. The armored cruiser, *York*, returning from this service, struck a chain of mines entering the Jahde estuary and was sunk.

On the 16th the German auxiliary cruiser *Berlin* was interned at Trondjem; on the 20th, *U-18* was rammed by a patrol boat and floundered; on the 23d, the German destroyer *S-124* was sunk in a collision with a Danish steamer; and on the 26th, the old British battleship *Bulwark* was blown up in Sheerness harbor, due to some form of interior explosion in which her magazines were involved. On December 16, a German battle cruiser squadron bombarded the cities and harbors of Hartlepool, Whitby, and Scarborough. Nearly 100 noncombatants were killed and 500 wounded. These were not fortified places.

On the morning of Jan. 24, 1915, the fast cruiser fleet in charge of Vice Admiral Sir David Beatty, was patrolling in the North Sea. This fleet consisted of the Fast Battle Cruiser Squadron, *Lion*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable;* the First Light Cruiser Squadron, *Southampton*, *Nottingham*, *Birmingham*, and *Lowestoft;* and two destroyer flotillas. About 7 A.M., the cruiser *Aurora* sighted the German light cruiser *Kolberg* and a destroyer flotilla and at 7.25 action began between them. About this time the German fast squadron (Rear-Admiral Hipper), steering

northwest, was sighted from the destroyer flotillas. This consisted of the battle cruisers *Derfflinger*, *Seydlitz*, and *Moltke* and the large armored cruiser *Blücher*. As soon as the information was signaled to Admiral Beatty, he headed for the enemy, which had changed its course to southeast as soon as it perceived the British battle cruisers. At 8.52, the *Lion* (flagship) opened fire on the *Blucher*, the rear ship of the German column, at a range of a little less than 20,000 yards, but did not get a hit until 9.09. The German vessels began to return the fire at 9.14. The *Blucher* had much less speed than the other German vessels and slowly dropped astern. About 10.48 she fell out of line and turned to the northward with a heavy list. The *Indomitable* was ordered to complete her destruction while the others of the British fleet pushed forward after the main body. At 11.03, the *Lion* received a shell in her engine room which disabled her port engine and she hauled out of action. The *Lion* was towed home by the *Indomitable*. The British squadron was now retiring, having pursued the enemy as close as possible to the areas protected by the mine fields and submarines.

On May 1, 1915, the British destroyer, *Recruit*, was sunk by a submarine and a week later the *Maori*, a much larger boat, was destroyed by a mine off Zeebrugge. On May 27, the British auxiliary cruiser *Princess Irene* was blown up in Sheerness harbor, only one of her crew escaping. Early in July *U-30* was accidentally sunk, but was raised within 48 hours and only one of the crew was found dead.

October 1–4, the Belgian coast was bombarded to assist military operations. On October 28, the armored cruiser *Argyle* ran ashore and was wrecked. On November 4, a German submarine of new type (250 feet long) was captured in a British wire net. On November 17, the hospital ship, *Anglia*, was sunk by a mine in mid-Channel with a loss of 100 lives—chiefly wounded men. On November 28, a German submarine was sunk off the Belgian coast by a bomb from a seaplane. On December 30, the armored cruiser *Natal* was destroyed by an internal explosion while at anchor. On Jan. 9, 1916, the *King Edward VII* was sunk by a mine. This battleship belonged to a class that was one of the last and best of the predreadnoughts.

On May 31, 1916, began the greatest naval battle of the War. About four o'clock in the afternoon the British fast battle squadron of seven battle cruisers and four battleships met the German High Seas Fleet of five battle cruisers and 24 battleships off Jutland on the northwest coast of Denmark. The British engaged the enemy but fell back before the vastly superior force in the direction of their main fleet. In this part of the action they lost the battle cruisers *Queen Mary*, *Invincible*, and *Indefatigable*, and three armored cruisers—all of which were sunk; eight destroyers were sunk during the night attacks. The British Grand Fleet came up about six o'clock, and soon afterward the Germans began to retire, pursued by the British. The action continued until after midnight; the night attacks being those of destroyers and submarines chiefly. The German losses included the battleship *Pommern*, the battle cruiser *Lützen*, four fast cruisers, and five destroyers. The losses of officers and men were about: British, 5000; Germans, 3500; among the British were Rear-Admirals Hood and Arbuthnot. The Germans were favored by misty weather, the close proximity of their own coast (which injured vessels could quickly reach), and by the fact that a few minutes after the arrival of the main British fleet, mist and darkness obscured them from the enemy.

On June 5, 1916, the British cruiser *Hampshire* was destroyed by a German mine near the Orkney Islands. Lord Kitchener of Khartum and his staff, on their way to Russia, lost their lives.

In August, Admiral Scheer, commanding the German High Seas Fleet, made a sortie in force. He first sent out 12 submarines which he posted in two lines of six boats each across the expected track of the British Grand Fleet—one 15 or 20 miles north of the Tyne and one about twice as far to the south of it. On August 18, the High Seas Fleet put to sea. Admiral Jellicoe had received ample warning of the probability of such a movement and had instant report of its actual commencement so that he was able to start south with the British Grand Fleet soon after Scheer got his force formed outside the German mine fields. Some hours later, British Submarine *E-23* hit the dreadnought battleship *Westfalen* with two torpedoes which injured her so seriously that she was forced to return to her base under escort. But Scheer pushed on, six Zeppelins scouting ahead. After meeting Beatty's battle cruiser squadron, Jellicoe placed it 30 miles ahead and continued on a southerly course calculated to intercept Scheer before he could reach the British coast. About 6 A.M. on August 19, Beatty's light cruiser screen ran into the first line of U boats, which was moving slowly northward. The light cruiser *Nottingham* was hit by two torpedoes and, while endeavoring to make port, was sunk an hour later by a third torpedo. Jellicoe immediately turned and headed north for a short time while the submarine menace could be gauged and dispositions made to meet it. About 6.30, the Harwich forces (Commodore Tyrwhitt), which were scouting for the German fleet, sighted its light cruisers and upon steaming towards them soon discovered the enemy's battle fleet. About 10.30, Jellicoe turned south again, Beatty and the cruiser screen ahead as before. At 12.30 Beatty's squadron was abreast Newcastle and only 42 miles from the German battleships. Scheer, informed of the situation by his airship scouts, then turned to the south, driving Tyrwhitt's light forces ahead of him. At 2.35 he changed course to the eastward and headed for the entrance to the Helgoland Bight. The Grand Fleet ran into the second line of U boats about 3.20 and soon afterwards Jellicoe, deeming it impossible to overhaul the German fleet until long after dark—and then in the vicinity of the Helgoland submarine base—gave up the chase. He sent Tyrwhitt to take up a position north of Terschelling and make a night attack if practicable. The latter proceeded in obedience to orders but as conditions were unfavorable he returned without attacking. Soon after the Grand Fleet turned north, about 5 P.M. the U boats made another attack and succeeded in sinking the light cruiser *Falmouth*. Scheer's objective was undoubtedly the British Grand Fleet, provided his submarines could sink or disable enough battleships to reduce its strength materially. As they failed to do so he retired. With two or three times as many sub-

marines in three or four lines he might have succeeded if the first one or two lines had allowed Beatty's force to pass over them without attack. A second sortie was planned for October; but the resumption of the qualified submarine warfare against commerce (with warning, visit, and search) left no submarines available for service with the fleet and the project was given up.

On the night of October 26–27, 11 German destroyers made a very successful raid in the Channel, destroyed the transport *Queen* (no troops on board) and seven drifters, disabled one other destroyer and, although chased and fired upon, escaped into Zeebrugge.

On November 5, British submarine *J-1* discovered a division of German battleships endeavoring to refloat two stranded U boats. She torpedoed and seriously injured the battleships *Grosser Kurfurst* and *Kronprinz* but they were able to get back to port.

About November 25 the German raider *Moewe* made her way through the blockade and was followed on the 30th by the *Wolf*. On Jan. 9, 1917, unrestricted warfare against commerce (see BLOCKADE, SUBMARINE) was ordered to begin on February 1, but this was not publicly announced until January 31. In February, German destroyers made a raid in the Channel but effected no damage. On March 17, a more successful raid took place. One British destroyer and a merchant vessel were sunk and another destroyer disabled. On the same day the raider *Leopard* attempted to pass through the blockade but was intercepted and sunk. About this time the *Moewe* slipped back through the blockade after capturing 27 ships, one of which she sent into Swinemunde.

On the night of April 20 occurred the sharpest fight of the War in which only destroyers and flotilla leaders were engaged. About 12.45 A.M., the flotilla leaders *Broke* (Comdr. E. R. G. R. Evans) and *Swift* (Comdr. A. Peck), constituting the West Barrage patrol, sighted German destroyers on the port bow 600 yards away. These boats, six in number, were of the latest and largest German type and were on their way back from the Dover coast where they had fired a few shots but effected no damage. The *Swift* tried to ram the leader but failed and passed through the German line, firing a torpedo at one of the rear boats; then, turning, she again attempted to ram the leader which once more eluded her and fled with the *Swift* in pursuit. The *Broke* hit the second German boat with her torpedo and opened a furious fire from every gun that would bear. At the same time she turned to port and rammed the third German, her stem remaining in the hole it made. While thus locked together, the crews fought hand to hand as in old sailing-ship days. Of the Germans who attempted to board, two were captured, several killed and the rest driven back. The *Broke* then succeeded in extricating herself and attempted to ram one of the other Germans; while she failed in this she hit the German's consort with a torpedo. They both started away and the *Broke* attempted to follow but a shell partly disabled her engines, so she gave up the chase and, turning her attention to a disabled German, which was on fire, silenced her guns and sank her with a torpedo. The *Swift*, returning, completed the destruction of the boat the *Broke* had rammed. The British lost 22 killed; the bodies of 28 Germans were recovered; 10 German officers and 108 men were saved and made prisoners.

On May 4, the first division (six boats) of American destroyers joined the British fleet and they were followed within 30 days by three other divisions of the same size. By midsummer the numbers had grown to 35 while dozens more were nearly completed and were despatched as soon as they were finished, commissioned, and supplied. This great addition to the destroyer fleet made a real convoy system possible, but it was not until a year later that the production of destroyers had so much more than caught up with the U boat building as to make commerce and the transportation of troops sufficiently safe to insure German defeat.

During the summer of 1917 the British monitors bombarded the German submarine and destroyer bases at Zeebrugge and Ostend but effected no important results. On July 9 the British dreadnought battleship *Vanguard* was utterly destroyed by an internal explosion while at anchor in Scapa Flow. Ten (and probably eleven) Allied warships were lost in this way during the War. Eight, if not all of them, were using some form of nitroglycerin gunpowder. The Americans, French, and Germans—who used nitrocellulose powders—had no such experiences.

On October 17, at early dawn, the weekly convoy between Lerwick, Scotland, and the Norwegian coast was attacked by two German light cruisers. There were two British and nine neutral vessels convoyed by the destroyers *Strongbow* and *Mary Rose*. The destroyers were sunk in a very few minutes, and only two or three of the merchant vessels escaped. Considering the fact that this convoy made a regular weekly sailing each way, the convoying force was inexcusably weak.

On November 2, a German decoy cruiser lying in wait for British submarines was sunk by a destroyer flotilla and on November 17 an indecisive action occurred off Helgoland. The British had been laying mines in large numbers across the German exit channels through their own mine fields and the enemy's mine sweepers were kept busy in maintaining a clear channel An attack on the light cruisers scouting ahead of the mine sweepers was made by a British force consisting of the light cruisers *Courageous* and *Glorious*, several other light cruisers, the battle cruisers *Renown* and *Repulse*, and a number of destroyers. But the German battleships *Kaiser* and *Kaiserin* coming up, followed by the battle cruisers *Moltke* and *Hindenburg*, the British retired.

This was followed, on December 12, by a second attack on the Norwegian flotilla (six vessels) convoyed by the destroyers *Pellew* and *Partridge* and four trawlers. The German force consisted of five or six destroyers. The four trawlers were quickly sunk. The *Partridge* was disabled, captured, and sunk. Her officers and men were made prisoners. The *Pellew*, though chased by three of the enemy, escaped in a rain squall. This second catastrophe led to a change in the Norwegian convoy which had its escort greatly strengthened.

On Feb. 15, 1918, the Second German Destroyer Division made a raid into the Channel from Helgoland Bight, sinking seven drifters and one trawler and injuring three drifters and one mine sweeper. They were not discovered by the patrol until too late and they escaped home-

ward without injury. In another raid from Dunkirk on March 21, the German destroyers were not so lucky. Instead of trawlers and drifters, they met the flotilla leader *Botha* (1700 tons) and the destroyer *Morris* (1000 tons). The *Botha* rammed a German at full speed and cut it in two. A second German was disabled by the fire of the British boats. Shortly afterward the *Botha* was hit by a torpedo that disabled her engines. The *Morris* chased the other German boats into Ostend. On her return she sank the disabled German and took the *Botha* in tow.

On the night of April 22–23 occurred one of the most daring feats of the War. This was an attempt by the British navy to close the inner channels of Zeebrugge and Ostend by sinking in them old cruisers whose holds were half filled with concrete. The force consisted of the old 5750-ton cruiser *Vindictive* carrying a landing party of several hundred sailors and marines; the ex-ferry steamers *Iris* and *Daffodil* carrying some hundreds more, the old 3400-ton cruisers *Thetis*, *Intrepid*, and *Iphigenia*, with holds half filled with concrete; several patrol boats fitted to make a heavy smoke screen; many motor boats and launches for scouting, laying navigation lights, carrying off survivors, etc.; lastly, three destroyers, one carrying Admiral Keyes, commander-in-chief of the district. The destroyers were not expected to join in the blocking operations or in the attack but were designed to keep off German destroyers and to sink any trying to escape. Just at midnight the Zeebrugge breakwater was sighted 400 yards away and the cruisers and ferryboats started in at full speed followed by the small craft. A moment later they were discovered by the enemy who opened on them with heavy and machine guns on the shore and breakwater. In five minutes the *Vindictive* had her bow secured to the breakwater but had to have the *Daffodil* force her stern in on account of the sweep of the tide. The gangplanks—18 in number—were promptly placed but the rolling of the ship made them difficult to use, the men having to jump, drop, or get ashore as best they could, carrying their rifles, machine guns, bombs, etc. Meanwhile the enemy's fire was terrific. The naval captain commanding the bluejackets of the landing party and the colonel commanding the marines were killed before they could get ashore, as were many of their officers and scores of their men. The commander, executive officer, and senior lieutenant of the *Iris* were killed and the officer next in rank was wounded. A shell, exploding between decks among the 56 marines waiting there to go ashore, killed 49 and wounded the other seven. Altogether the *Iris* lost eight officers and 69 men killed and three officers and 102 men wounded. The guns of the *Vindictive* swept the mole and behind their barrage the landing party advanced, driving the Germans before them or into the water. After 15 minutes of desperate fighting the breakwater was cleared, its guns silenced, and the long row of hangars and storesheds set blazing or blown up. An old submarine loaded with explosives was now driven under the viaduct leading to the shore, abandoned and blown up, the Germans who were still firing from the viaduct going up with it. The way was now clear for the concrete ships and 10 minutes later they rounded the end of the mole and drove straight for their objective under fire that was still heavy. The leading ship fouled the wire nets in the channel so she had to be sunk too far out to be of much use, but she cleared the way for the others which were sunk in the narrowest part of the channel, one heading east and one west. It was still possible to work small submarines and torpedo boats around the sunken hulls, but destroyers and large craft were barred. Notwithstanding the heavy fire directed at them practically all of the officers and crews of the concrete ships escaped and were picked up by small craft. The *Vindictive* and her consorts then gathered up their wounded and unwounded and put to sea. Two less well-planned attacks on Ostend failed to secure results of importance.

On Apr. 23, 1918, the German High Seas Fleet made its last sortie. This was directed against the Norwegian convoys which had grown greatly in size and now consisted of 25 to 50 merchantmen with a strong convoying force. The Germans arrived off the Norwegian coast a day too soon to catch the westbound ships and two days too soon to catch those bound to the eastward. The *Moltke* had lost one propeller on the way north and, while being towed back by a battleship, though supposedly covered by the returning fleet, she was torpedoed by a British submarine and seriously injured.

Work on the great northern mine barrage (see MINE, SUBMARINE) began early in the year, but shortage of mines, mine-layers, and men delayed a serious prosecution of the work until the arrival of the American mining squadron in May, with many large mine-layers and vast supplies of mines, permitted the operations to be carried on rapidly.

United States Transport Service. As, at the outbreak of the War, very few American troops were ready for foreign service, the lack of adequate means for the transport of large numbers of officers, men, and supplies was not felt; and the facilities grew faster than the demand for them until May, 1918, when the great rush of troops to stem the German advance strained the capacity of transport to the utmost. The first troops were sent in July, 1917, and the convoy consisted of a few cruisers and transports. The Cruiser and Transport Service was then organized and placed under the command of Rear-Adm Albert Gleaves who rapidly developed it into the most wonderful thing of its kind the world has ever seen. So successful was the convoy system that after its establishment not a single American transport was torpedoed on her eastward voyage when she was carrying troops. On the return trip, with only the crews and a few others on board, three transports were sunk by submarines and one badly injured but able to reach port, total loss of life on the four ships being 138. On the return voyage it was not always practicable to give the same protection as on the eastward trip The total army personnel carried was 2,075,834, of whom about 83,000 were doctors, nurses, hospital attendants, mechanics, and civilians employed in auxiliary services In addition, 5,150,000 tons of cargo were delivered in France and England—artillery, ammunition, aircraft, food, clothing and other necessary military supplies. In July, 1918, 306,500 officers and men were brought over and for the other months of the year from May to October the figures were almost equally large. About half the vessels used were American and half Brit-

ish, but four French men-of-war assisted and several neutral vessels were chartered, principally for carrying supplies.

The German Surrender. The terms of the Armistice required Germany to immediately surrender to the Allies 10 battleships, 6 battle cruisers, 6 light cruisers, 2 light mine-laying cruisers, 50 destroyers of the latest types, and all submarines; all except the destroyers and submarines were designated by name. On November 21, the following vessels surrendered to Sir David Beatty, the British commander-in-chief: 9 dreadnought battleships (*Friedrich der Grosse, Konig Albert, Kaiser, Prince Regent Luitpold, Kaiserin, Bayern, Markgraf, Kronprinz,* and *Grosser Kurfurst*); 5 battle cruisers (*Seydlitz, Moltke, Derfflinger, Hindenburg,* and *Von der Tann*); 5 light cruisers (*Karlsruhe, Frankfort, Emden, Nurnberg, Coln*); 2 light mine-laying cruisers (*Brummer* and *Bremse*), and 49 destroyers. To make up the deficiencies, the dreadnought battleship *Konig*, the light cruiser *Dresden*, and one destroyer were surrendered on December 4, and on Jan. 10, 1919, the dreadnought battleship *Baden* was sent in place of the battle cruiser *Mackensen* which was not ready for sea. The total number of submarines to be surrendered was 158; of these, 87 reported to Rear-Adm. Sir Reginald Tyrwhitt off the Suffolk coast in November; by Jan. 1, 1919, 114 were received.

With the exception of the submarines, all the vessels named or enumerated in the foregoing list were interned in Scapa Flow. The Treaty of Versailles provided that the interned ships be permanently given up to the Allies; that within two months the 8 dreadnought battleships still in Germany should be given up, also 8 light cruisers, 42 modern destroyers, and 50 modern torpedo boats. It further provided that the German navy was thereafter not to possess more than 6 battleships of a predreadnought type, 6 light cruisers, 12 destroyers, 12 torpedo boats, and was to have no submarines. All vessels under construction and not permitted by the foregoing limitations were to be broken up. No vessels were to be built except to replace allowed units of the fleet—battleships after 20 years, cruisers and destroyers after 15 years The personnel, including reserves for the fleet and coast defenses, was not to exceed 15,000 officers and men. As soon as the decision of the Versailles Treaty was understood by the Germans to be irrevocable, and one week before it was signed, at 11.15 A.M., June 21, 1919, upon signal from the *Emden*, the German captains at Scapa scuttled their ships. Only four were salvaged, the *Baden, Emden, Frankfort,* and *Nurnberg*. As partial indemnity for this act of treachery, Germany was compelled to deliver to the Allies 300,000 tons of floating docks, her remaining light cruisers (*Graudenz, Konigsberg, Pillau, Regensburg,* and *Strassburg*), and 42,000 tons of floating cranes, dredges, and tugs.

Naval Vessels of All Combatants Lost or Destroyed. The accompanying table gives the numbers of the most important vessels (arranged in classes) lost by each of the belligerent navies from Aug. 1, 1914, to Nov. 11, 1918, not including any vessels surrendered by the Armistice or by peace treaties. The abbreviations used signify as follows: D B., dreadnought battleship; P. B., predreadnought battleship; B. C., battle cruiser; A. C., armored cruiser; L. C., light cruiser or protected cruiser; D., destroyer; S., submarine. Numbers marked with an asterisk (*) are approximate.

Nation	D. B.	P. B.	B. C.	A. C.	L. C.	D.	S.
United States	...	...	....	1	....	2	2
Great Britain	2	11	3	13	16	64	54

Germany	....	1	1	6	17	68 *	208 *
Austria	2	1	....	.	3	6	11 *
Turkey		2			1	3	

The merchant ships of the Allies and neutrals sunk by submarines during the course of the war totaled 4837, divided by years as follows: 1914, 3; 1915, 396; 1916, 964; 1917, 2439; 1918, 1035. During the same period surface craft sank 177 merchantmen, and mines accounted for 497 vessels The total tonnage of the ships sunk by submarines, surface craft and mines amounted to 12,739,000. The peak year was 1917, when more than 6,000,000 tons were sunk. According to British Admiralty reports, 189 enemy submarines were sunk.

Convoy and Other Antisubmarine Defense Measures. The principle of protecting noncombatant vessels by means of accompanying warships is as old as recorded history and has been used to some extent in almost every naval war. In the great War, for various reasons, its adoption was delayed—except for cross-Channel transport—until the submarine sinkings reached a point that demanded the better use of every method to reduce the destruction. The system of patrolled routes in which cruisers, destroyers, and patrol vessels moved back and forth along the lines of traffic was found to be wholly ineffective. General convoy was opposed by the British Admiralty, the officers of the Grand Fleet, and owners and captains of merchant vessels. Suitable escort vessels were inadequate in number, and so many destroyers—by far the most efficient escort craft—were needed for naval operations that few were left for other purposes; but the urgency of the situation forced the naval authorities to detach as many of them from the fleet as could possibly be spared. The owners of fast merchant vessels agreed, after considerable grumbling, to the delays made necessary by convoy, and the dissenting captains were forced to accept the convoy system, which entailed much additional care in steering, speedkeeping, etc. The available British destroyers were reinforced in May, 1917, by 24 from the United States Navy. Additional ones were constantly arriving from the United States and new British boats were being completed so that, notwithstanding the withdrawal of many United States boats to protect American troopships, the number available for general British convoy increased from 29 in January, 1917, to 139 in November, and continued to grow. After the system got in full working order in the summer of 1917, the amount of ton-

nage sunk each month, with some slight fluctuations, decreased steadily to the end of the War.

In most convoys the train (i.e. the vessels being convoyed) consisted of 12 to 40 ships—preferably 25 to 35—arranged in three or more columns. The distance between ships in each column was usually 500 yards and the interval between columns 800 yards, but these figures were sometimes increased in bad weather or under special circumstances The escort of the earlier convoys consisted of two destroyers, a wholly inadequate force which offered no protection against the weakest of German cruisers or destroyer divisions (usually five boats) and very little against submarines. Cruisers, acting as a covering force for the convoy, were always on patrol in its vicinity, but they frequently failed to arrive until after the escorting destroyers had been sunk or driven off and a heavy toll taken of the ships convoyed. Later convoys had an escort of 6 to 12 destroyers distributed ahead, on each beam, and astern. British convoys were assembled in certain ports and placed in charge of a naval officer, called "commodore of convoy," who took passage in one of the ships with his staff and returned in the escort when the convoy broke up 200 to 400 miles off shore. He received reports of danger and directed the course, speed, and steering. The American troopship convoys were usually accompanied by a regular naval cruiser, the captain of which acted as commodore of convoy. As the captains of most of the troopships were officers of the navy or of the naval reserve, a high degree of convoy efficiency was obtained and this was an important factor in the wonderful success of the work. The "zig-zag" method of steering used when in submarine-infested waters, or when a submarine was sighted, consisted in an irregular and frequent change of course of one to two points on either side of the regular course. This seriously interfered with a submarine's calculations and compelled it to get very close to the target (and therefore within easy sight and range of the destroyers) in order to have any reasonable probability of scoring a hit. Another means of deceiving the submarine as to the course steered by a vessel was camouflage painting, which also added much to the difficulty of sighting a ship and identifying her character; for these reasons it was very generally adopted by both war vessels and merchant ships. A camouflaged ship resembled a huge futurist painting of nothing in particular, the stripes, areas, colors, and lines so breaking up the picture as to render it almost impossible to make out the actual contours of the hull and upperworks except at close range or under exceptional conditions of light and background. Smoke screens, much used by destroyers in naval actions, were occasionally employed by merchant vessels, especially when not under convoy. They were produced by special handling of the fires under oil-burning boilers or by chemicals.

Operations in the Baltic. As soon as the relations with Russia became strained, German ships began to patrol the coast from Memel to the Gulf of Riga. Mine laying by Germany and Russia began in the Baltic at least as early as in the North Sea. On August 27, the German cruiser *Magdeburg* ran ashore in a fog on the Island of Odensholm and was blown up to avoid capture by an approaching Russian naval force. On December 12, the German armored cruiser *Friedrich Karl* was sunk by a mine and on the 25th the old cruiser *Hertha* and a mine layer were attacked by Russian cruisers and sunk. The Russian submarines were now becoming effective and, notwithstanding the ice, were cruising in the Baltic, although the ice interfered with prosecuting operations of importance during the remainder of the winter and in the early spring.

On July 2, 1915, a Russian cruiser squadron drove off a German light cruiser and several destroyers and forced the mine layer *Albatross* to run ashore in a sinking condition. British submarines had now reached the Baltic in considerable numbers, passing under the mine fields or through the Sound and along the Swedish coast. Their presence acted as a strong check on German operations, especially after the German armored cruiser *Prinz Adalbert* was sunk (October 23) off Libau. On November 7, a British submarine sank the German cruiser *Undine*, and on December 19, another submarine sank the *Bremen* and a torpedo boat.

No operations of importance occurred during 1916 and early in 1917 the Russian Revolution left the control of the Baltic entirely in the hands of the Germans.

Operations in the Mediterranean. On the day after war was declared, the German naval force in the Mediterranean bombarded undefended seaport towns in Algeria, the battle cruiser *Goeben* firing upon Philippeville and the light cruiser *Breslau* upon Bona. These cruisers arrived in the Dardanelles on August 10. To avoid immediate trouble for the Ottoman authorities they were supposedly sold to Turkey and renamed *Sultan Selim Javuz* and *Medillu*, but they continued in command of German officers and retained a part at least of their German crews.

On August 9, Austria declared a blockade of the Montenegrin coast and bombarded Antivari. About the same date French and British fleets established a blockade of the Austrian coast at the Strait of Otranto. The Austrians had placed mine fields all along their coast. About the middle of August, Allied forces swept up the Adriatic, driving the Austrians to the northward. They then attempted to take Cattaro for a naval base, but lacked the military force for a garrison and shore operations, and therefore failed.

The peculiar behavior of Turkey and the mining of the Dardanelles caused a British force to be maintained in that region. While on this duty the armored cruiser *Warrior* ran ashore and was injured on September 7. On the 10th, Turkey abrogated the capitulations with foreign governments and during the latter part of October permitted her vessels to sink Russian ships of war and to attack Odessa. De facto war was begun by the Entente Allies on November 1. On November 21, the French submarine *Curie* was sunk while scouting along the Austrian coast On November 24, Italy landed a force at Avlona to assist her protégé Essad Pasha against the Albanian insurrectionists.

On February 24, 1915, the French destroyer *Dague* was sunk by a mine off Antivari. On April 26, the French armored cruiser *Léon Gambetta* was torpedoed by the Austrian submarine *U-5* and sank in 10 minutes.

On May 24, Italy declared war on Austria; on the same day Austrian torpedo boats, sup-

ported by the light cruiser *Novara*, made a raid on the Italian coast, where they were first met by Italian destroyers and finally driven off by Italian cruisers. The Italian destroyer *Turbine* was sunk early in the action. On June 10, the Italians captured Monfalcone with its shipbuilding yards. The advent of Italy into the War completed the control of the Adriatic by the Entente Allies and, on July 6, Italy clinched the situation by a proclamation closing it to all merchant vessels not possessing special permits. Operations of the Austrian submarines were much hampered by the destruction of their base on Lagosta Island by the French destroyer *Bisson*.

On September 28, a fire broke out on the Italian battleship *Benedetto Brin* while she was lying at anchor in Brindisi harbor. The fire was quickly followed by an explosion which destroyed the ship.

During the month of December, 1915, the Italians landed a large force of troops in Albania. The expedition was most efficiently guarded against submarines and the only losses were the destroyer *Intrepido* and the troopship *Ré Umberto*, which struck drifting mines. In January, 1916, a cruiser of the *Novara* type was sunk by the French submarine *Foucault*.

The Italian dreadnought, *Leonardo da Vinci*, blew up in the harbor of Taranto on August 2. The British transport, *Franconia*, was torpedoed on October 5, and on October 9, the French auxiliary cruiser, *Gallia*, was similarly sunk. The British ship *Britannic* was sunk by a mine in the Ægean Sea on November 21. On December 11, the Italian battleship, *Regina Margherita*, struck a mine and sank and 675 lives were lost.

The naval operations in the Adriatic during the year 1918 were very active. On Dec. 9, 1917, Italian torpedo boats made a raid on Trieste, and sank the small battleship *Wien* (5500 tons), and injured another of the same class. On April 22, in a fight between two British and five Austrian destroyers, the former were reenforced, and the latter retreated to Durazzo, with the British in pursuit. On June 10, 1918, the Austrian battle fleet of four dreadnought battleships, accompanied by cruisers and destroyers, while on its way to make a demonstration in force against the Otranto barrage, was attacked by two small Italian torpedo boats which sank the battleship *Szent Istvan* and seriously injured the *Prinz Eugen*, a sister ship.

Operations in the Black Sea and Dardanelles. The first operations took place on October 29, when the Turkish squadron, including the *Sultan Selim Javuz* (ex-*Goeben*) *and Medillu* (ex-*Breslau*) bombarded several Russian ports. A destroyer entered Odessa harbor, torpedoed and sank the gunboat *Donetz* and badly injured the *Kubanetz* (a sister to the *Donetz*), and four merchant steamers. On the same day the *Medillu* bombarded Theodosia, seriously injuring the cathedral and other buildings. On their way to Sebastopol the Turkish destroyers sank the Russian mine layer *Pruth*. The next day (October 30), accompanied by destroyers, the *Sultan Selim* bombarded Sebastopol. By the return fire of the forts she was so badly injured that the admiral collected the squadron and returned to Constantinople.

During January, 1915, the Russian fleet sank several Turkish vessels in the Black Sea, including a number of troopships and transports, and shelled the Turkish naval station at Sinope. On the 17th the French submarine *Saphir* was sunk by a mine in the Dardanelles. About the middle of February, the combined British and French fleets began their fruitless attempt to force a passage of the Dardanelles. No operations in the whole course of the War were so poorly conceived and so inefficiently carried out. It is hard to understand the folly of the British government in embarking upon such an expedition. If there is one thing that is well understood in naval war it is the absurdity of attacking strong forts by ships, especially without adequate military support. Even if the ships can drive out the garrison it will return as soon as the bombardment ceases. Unless the fortifications are badly placed, they cannot be wholly destroyed and the ravages of bombardment can be largely restored by a few days' work. Permanence of victory can only be obtained by occupying the works as soon as the defenders are expelled (see MILITARY OPERATIONS).

As already stated, the operations began in February. Several bombardments of the forts were carried out and considerable injury inflicted upon them. The ships, much hampered by bad weather outside, then entered the straits for closer work. On March 18, the British battleships *Ocean* and *Irresistible* and the French battleship *Bouvet* were sunk by mines and the British battle cruiser *Inflexible* badly injured by gun fire. The plan of forcing the passage by battleships was then given up, and the second phase of the operations soon began. Late in April the British and French troops were landed under fire at the Dardanelles. On May 12, the British battleship *Goliath* was sunk by a Turkish destroyer in a night attack; the battleships *Triumph* and *Majestic* were sunk by submarines a few days later, the former on the 25th, the latter on the 27th. The British submarines were very active at this time in the Black Sea and Sea of Marmora, sinking many vessels, chiefly transports and troopships, but on August 8 they sank the old Turkish battleship *Kheyr-ed-din Barbarossa* and the Turkish gunboat *Berk-i-Satvet*. In June, the German *U-51* was sunk in the Black Sea and the German submarine base at Smyrna destroyed.

About August 1, the French submarine *Mariotte* was sunk. During the summer many British transports and troopships were destroyed by German submarines, the most important being the troopship *Royal Eduard*, which was sent to the bottom on August 14 with the loss of 800 lives; but the sinking of the troopships *Ramazan* (British) and the *Marquette* (French) were disasters almost equally great. In the Black Sea the Russians seemed to have been unable to blockade or capture the *Medillu* (ex-*Breslau*) or the *Hamidieh*. In October, the *Sultan Selim Javuz* (ex-*Goeben*) appeared again in the Black Sea but accomplished nothing of importance and seemed to be partly disabled.

The Dardanelles operations were now admitted to be a failure, and the British began to transfer their troops to Saloniki. The operations in the Black Sea still continued but by the summer of 1916 had become of no special importance, since the Turkish navy had for a time been reduced to impotence. On Oct. 20,

1916, the *Imperatritsa Marie*, a Russian dreadnought, blew up.

At the outbreak of the Bolshevik revolution, many of the officers and men of the Black Sea fleet refused to recognize the authority of the Bolshevik leaders, Lenine and Trotsky. This resulted in several battles between the two factions which usually ended disastrously for the anti-Bolshevik men. The ships were surrendered to the Germans on June 10, 1918. The Turkish cruiser *Medjidieh*, which had been sunk in action, and afterwards raised and repaired by the Russians, was returned to the Turks.

Cruiser Operations in Atlantic, Pacific, and Indian Oceans. At the outbreak of war the only German vessels beyond the reach of home ports were the battle cruiser *Goeben*, the armored cruisers *Scharnhorst* and *Gneisenau*, the fast cruisers *Karlsruhe*, *Breslau*, *Emden*, *Dresden*, *Nurnberg*, *Konigsberg*, *Leipzig*, and *Breslau*, and a number of small cruisers and gunboats. To these were quickly added several fast merchant steamers, the *Kaiser Wilhelm der Grosse*, *Kronprinz Wilhelm*, *Prinz Eitel Friedrich*, *Cap Trafalgar*, and *Spreewald*. These had their armaments on board or in German colonial ports.

The operations of the *Goeben* and *Breslau* are described elsewhere in this article. The *Scharnhorst* and *Gneisenau* were, after the *Goeben*, the most important vessels on the list and were under the command of Vice Admiral Count von Spee, the only German flag officer outside of European waters. After the commencement of hostilities these vessels were first heard of at Tahiti, where they bombarded the port of Papeete and sunk the French gunboat *Zélée*. The *Nürnberg*, after cutting the America-Australia cable at Fanning Island, joined Von Spee's squadron. He then proceeded to the west coast of South America, where he met the *Dresden* and *Leipzig*. On the afternoon of Nov. 1, 1914, Rear-Adm. Sir Christopher Cradock, with a squadron consisting of the armored cruisers *Good Hope* and *Monmouth*, the fast light cruiser *Glasgow*, and the armed merchant steamer *Otranto*, was off the Chilean coast searching for German cruisers. The old battleship *Canopus* was near at hand and proceeding to a rendezvous to join the squadron. About 4.20 P.M. smoke was seen to the northward and soon afterward Von Spee's squadron, consisting of the *Scharnhorst*, *Gneisenau*, unarmored cruisers *Dresden*, *Leipzig*, and *Nürnberg*, was sighted heading south. At 7.03, the enemy opened fire at about 11,500 yards, quickly followed by the British. The superiority of the German ships was at once apparent. At 7.50 a tremendous explosion occurred on the *Good Hope* amidships, the flames reaching an altitude of 200 feet. The *Monmouth* was already out of action, down by the head, and leaking badly. Darkness and a rain squall coming up made the pointing of the guns very difficult, so Von Spee signaled the light cruisers to attack the enemy's ships with torpedoes. The *Good Hope* could not be found and had probably gone down, but the *Nürnberg* discovered the *Monmouth* and, by gun fire at close range, caused her to capsize. In the darkness and thick weather the *Glasgow* and *Otranto* got away without difficulty.

The British Admiralty immediately took steps to meet the situation by secretly despatching a squadron under Vice Admiral Sturdee in pursuit of Von Spee. This consisted of the battle cruisers *Invincible* and *Inflexible*, the armored cruisers *Carnarvon*, *Cornwall*, and *Kent*, the fast cruiser *Bristol*, and the *Macedonia*, supply steamer. At some rendezvous on the South American coast they were joined by the *Canopus* and *Glasgow*. About 8 o'clock on the morning of December 8, while Sturdee was coaling in the Falkland Islands, the leading ships of the German squadron were sighted. Knowing nothing of the battle cruisers, the Germans came leisurely on, apparently intent on destroying the wireless station. At 9.20, they were within 11,000 yards, and the *Canopus*, still at anchor, opened fire on them over the lowland. They then turned to the southeast to rejoin the main body which immediately proceeded to the eastward at full speed At 9.45, the British squadron came out and started in chase. About 1 P.M. the *Invincible* and the *Inflexible* began firing on the rear ships of the German column and a little later were able to reach the armored vessels and leave the others to the cruisers. At 4.04, the *Scharnhorst* began to list heavily to port and at 4.17, sank with all hands. The *Gneisenau* continued the hopeless fight, though after 5 o'clock she was hors de combat. At 6 P.M., she heeled very suddenly and sank. Of the German light cruisers, the *Leipzig* was sunk by the fire of the *Glasgow* and *Cornwall* about 9 P.M., and the *Nürnberg* by that of the *Kent* at 7.27. The *Dresden*, which escaped, was discovered off the island of Juan Fernandez on Mar. 14, 1915, by the *Glasgow*, *Kent*, and auxiliary cruiser *Orama*. After an action of five minutes' duration she surrendered, but was on fire and soon afterward blew up.

Of all the German cruisers the *Emden* had the most spectacular and successful career. On August 1, she left Tsingtao. During her remarkable career of 94 days, the *Emden* captured or sank 30 vessels, destroyed $25,000,000 worth of the enemy property, almost paralyzed the commerce of the East, and had 19 war vessels of the enemy seeking her. She was finally compelled to run ashore on the Cocos Island by the *Sydney* on November 9.

The *Konigsberg* was less successful. After a cruise of two months along the South African coast, in which she destroyed several British merchant ships and the small cruiser *Pegasus*, she was blockaded in the Rufiji River, German East Africa, where she was destroyed by a British expedition on July 11, 1915.

Of the German armed merchant steamers, the *Spreewald* was captured by the armored cruiser *Berwick* on September 12. The *Kaiser Wilhelm der Grosse* had a still shorter career, being sunk on Aug. 27, 1914, by the British cruiser *Highflyer*. On October 14, the *Cap Trafalgar*, which was beginning to interfere with the British trade to South America, was sunk by the British armed steamer *Carmania*, late of the Cunard line. The *Kronprinz Wilhelm* and the *Prinz Eitel Friedrich*, after long and successful cruises as commerce destroyers, entered United States waters and were interned at Norfolk.

Immediately after war was declared, the Entente Allies began perfecting arrangements for the capture of German colonies. On August 7, Togoland was seized by land forces. On August 27, Japan declared a blockade of Kiaochow, and on November 7, Tsingtao, the German stronghold in China, surrendered to the Allied

forces, chiefly Japanese. Early in August, a New Zealand expedition sailed for Samoa. At Noumea, the convoy, which was a weak one, became strengthened by the battle cruiser *Australia* and the cruiser *Melbourne* of the Australian navy, and the French armored cruiser *Montcalm*. The expedition arrived at Apia on August 29 and the German governor surrendered at once, as he had practically no means of resistance. On its return from Samoa, the Australian squadron captured Herbertshohe, the capital of the Bismarck Archipelago, and, on September 27, took possession of the town of Friedrich Wilhelm in Kaiser Wilhelmsland (German New Guinea). During September and October, Australian and Japanese expeditions seized the remaining German possessions in the Ladrone, Marshall, and Caroline Islands.

AËRIAL OPERATIONS

The outbreak of the War found the Great Powers of Europe ready and anxious to make immediate application of aëronautics to their respective military and naval operations. That all were inadequately prepared on the score of equipment and trained personnel the opening weeks of the war soon showed, and early the demands likely to be made on the aërial services were clearly indicated. But in no field did developments follow more rapidly, and as early as the Germans undertook the invasion of Belgium and France it was realized that aëroplane and airship had worked materially to change the nature and scope of military operations and to render obsolete tactics and movements that long had prevailed in warfare. By affording to scouts and intelligence officers a complete view of the enemy's territory, the disposition and movement of his troops and fleets, and his permanent or even most temporary defenses, surprise or flanking movements were rendered practically impossible. With both sides adequately informed as to the forces of their adversaries through constant aërial scouting and reconnoissance, the tendency towards trench fighting and the protracted sieges and bombardments of the Western front was as pronounced as it was inevitable. The direction and control of fire from an observation or kite balloon or aëroplane early became an indispensable feature of the work of the artillery. The tactical changes wrought by the use of aircraft were stupendous, and the service of security and information by aërial observers and range finding for the artillery became essential features of the everyday work of the forces in the field. In addition there were raids by aëroplane and airship to drop explosive or incendiary bombs on fortified positions, moving columns, railway trains, supply dépôts or munitions works, or on warships, submarines, and transports.

Such activities on the part of the airmen soon became so valuable in a military sense that the prevention of these efforts was essential, and this naturally led to the development of the purely combative side of aërial warfare, which soon passed from individual duels in the air to savage actions often at close range participated in by a number of aëroplanes of different types, where battle tactics of an elementary form were evolved as a result of training and drill to secure harmony of action.

Naturally this led to increased armament and armoring of the aëroplanes, and the calibre of the rapid-fire gun that soon took the place of the automatic pistol became greater, so that an air battle was indeed a serious matter, and the protection of fuel tanks and machinery and the design of machines to withstand as much penetration of the wings as possible figured prominently, as indeed did the entire question of design and construction for power, carrying capacity, speed, ease of manœuvring, and general reliability. Remarkable advances were realized, together with wholesale demands which taxed the facilities for manufacture in the belligerent nations as well as in America.

Flying corps existing in armies and navies on the outbreak of the War were greatly augmented and preparations made to train vast numbers of aviators. It was estimated that the various belligerent nations at the outbreak of the War possessed about 5000 aëroplanes and 109 dirigibles. Naturally Germany, where 12 Zeppelins and about 23 Parseval and Gross airships and about 1000 aëroplanes were available at the beginning of the War, was preëminent as regards numbers and trained pilots and observers, but here the policy of standardization and organization contributing so much to her efficiency in other fields was not of corresponding avail. A year's service, even less, demonstrated that much of the equipment so carefully assembled and standardized soon became obsolete and inferior with respect to the rapid developments that war conditions were bringing out for the Allies.

While the Germans had trained men in their aviation corps, the French, with perhaps 31 airships of nonrigid or semirigid types and possibly 1200 military aëroplanes of different designs, had fewer enrolled aviators at the outbreak of the War in actual service, but had a large number of expert civilians and their machines to call upon, so that soon there was organized a body of men whose equipment, both available and rapidly supplied, represented the note of progress ever peculiar to the French in this field. The organization and drill of the various units was done with remarkable military skill and care.

Great Britain, distinctly inferior in organization and equipment as well as numbers, for its aëroplanes hardly totaled 500 and its dirigibles but 15, at the beginning of the War endeavored speedily to repair these deficiencies, and while the defensive efforts to repel the Zeppelin raids were crowned with but moderate success, British aviators at the front and at sea achieved a good record. Russia, with 16 small airships and perhaps 800 aëroplanes, many of which were in poor shape, suffered from inadequacy of equipment, while in Austria and Italy from the outset aërial war was waged by both powers with a fair degree of preparation.

Aërial activities in war became not only important but indispensable under modern conditions, yet it did not have a direct and primary effect on the progress of the War itself, comparable, let us say, to the activities of the submarine. Indirectly the influence of aircraft on warfare proved enormous, but four years of experience indicated that there was but little direct military advantage in the attempts at

wholesale destruction of noncombatants, buildings, and material, by airplanes and dirigibles. The numerous air raids over Great Britain resulted in little positive military advantage and the "frightfulness" that they were to inspire soon gave way to a feeling of intense irritation on the part of the invaded.

1914–15. In the early weeks of the War, a Zeppelin dropped bombs over Antwerp, and at the end of August and on Sept. 1, 2, and 3, 1914, Taube monoplanes made daily visits to Paris, where, as in London, all street and other lights were extinguished and means hastily improvised to defend the city by searchlight and anti-aircraft guns, as well as to organize special fire-fighting facilities to deal with the results of incendiary bombs. On Oct. 11, 1914, another raid was made on Paris and bombs were dropped, some of which fell on the Cathedral of Notre Dame, while others damaged streets, sewers, and the underground railway, besides causing the deaths of three persons and injuries to 14. In the meantime the aërial defense of the city was being developed, but on Mar. 22, 1915, another raid was made on Paris, which, while resulting in little damage, nevertheless emphasized the need of a more complete system of defense. This was organized under General Hirschauer, former chief of the aëronautical department, and after it had been developed, Paris was free from attacks for many months.

Naturally an air attack on the British Isles was the goal aimed at by the Germans. Various reconnoissances were made by the Germans in connection with the flights on the Western front and the observation of the British navy. The first serious raid on Britain was on the evening of Jan. 19, 1915, and was directed against Yarmouth, Sandringham, and other points of the Norfolk coast. This raid was but a beginning, for on the night of May 31, 1915, the metropolitan section of London was reached and considerable damage was done, 41 lives being lost, while on June 6, another raid attended by 24 casualties was made on the east coast of England, and again on June 15, on this last 18 persons being killed and 40 injured. The attacks of the Zeppelins reached, perhaps, a climax on September 8–9 when the heart of London was reached, and the Zeppelins flying over Trafalgar Square were distinctly visible from the streets. The casualties of this raid were given as 20 killed and 88 wounded. The material damage was considerable. These raids continued during September over parts of the eastern counties. On October 13–14, London was again attacked by Zeppelins which, fearful of searchlights and gun fire, flew very high with a corresponding effect on the accuracy of their bomb dropping. The roll of casualties included 71 killed and 178 wounded. For a few months there was a lull in the air attacks on Great Britain, but the most serious raid came on the night of Jan. 31, 1915, when nine Zeppelins passed over the midland counties, dropping over 300 bombs. Here 71 were killed and 101 injured.

1916. Beginning Mar. 31, 1916, air raids were made over Great Britain for five successive nights and not only the eastern counties but even Scotland and the northeast coast were visited and bombs dropped. In one of these raids the Zeppelin *L-15* suffered severely from gun fire and was forced to descend and was captured by the British.

The aërial defense of Great Britain came in for considerable criticism both within and without Parliament and unfavorable comparisons with that maintained in France were made. Many Englishmen urged that too much had been done for defense and not enough in the way of offensive movements against the Zeppelins in their home ports and stations.

Such raids as these described stand out apart from their actual military significance, but they must not be allowed to eclipse the daily routine and the ever-increasing number of frequent combats on all the battle fronts of this great War. What was remarkable at the beginning of the War, such as visits of the German Taubes to Paris in August, 1914, or the bomb dropping by a Zeppelin on Antwerp on September 1, of the same year, soon became commonplace as did the bombing of the German hangars at Düsseldorf and Cologne by the Allies later in the month. Attacks on Friedrichshafen by the British and on Freiberg by the French followed, while a British raid on Cuxhaven on Dec. 25, 1914, was an early example of a number of aëroplanes working together. Air attacks and reconnoissances in force became more frequent, ever on a larger scale and with more elaboration of organization as well as with more powerful and more heavily armored machines. Bombing raids by aëroplanes were organized on a large scale by the French, especially with their heavier machines, and many of these were very successful. While both sides continually lost many aëroplanes in actual fighting, the Germans suffered severely with respect to their Zeppelins by accident as well as by gun fire.

Along with brilliant feats of individual aviators there was developed a tendency towards tactical formations and the use of many machines. Aëroplanes were assembled for flight over the enemy lines, difference in speed and armament making possible tactical dispositions of the greatest advantage. The Germans for a time had some machines of superior armament, and from August, 1915, heavier guns and armored aëroplanes figured and operations by flotillas became more general, these including the use of powerful bombing machines accompanied by armored scouts for their protection, and swift flying machines for reconnoitring. Aircraft were also used at sea against warships. Aëroplanes were also in evidence in the south and east, for the Russians attacked Constantinople in August, dropping bombs on the harbor forts, and from this time both sides were in active aërial warfare until the close of the Dardanelles campaign. The Austrians were active against Italy, and bombing raids were made against Brescia, Verona, Venice, Udine, and other points while the Italians in turn made attacks on Austrian territory.

Everywhere there was aërial activity and damage wrought by aëroplanes, yet unavoidably this was accompanied by wholesale destruction of machines and lives of aviators. As samples of air attacks, and in fact but little more here can be attempted, mention may be made of the bombing of a poison gas plant at Dormach on Aug. 26, 1915, by a French aviator, and a bomb attack on the royal palace at Stuttgart, a step, it was announced, taken in retaliation for German bomb dropping on unfortified towns and civilians. In every kind of operations aircraft aided, as at the battle in the attack on Artois, Sept. 25, 1915, when the British airmen

were prominent, and later at Verdun in the spring of 1916. Typical of a day's work for the airmen may be mentioned the British War Office report of Dec. 19, 1915, which announced 44 combats in the air on the Western front.

In 1916, everywhere there was increased aërial activity, a more active patrol service was maintained, and actions were frequent and serious. At sea aëroplanes were searching for submarines and scouting, and employment of airships and aëroplanes before and in a large naval battle for scouting and reconnoissance in a manner and on a scale somewhat corresponding to their use on land found a notable opportunity in the great fight off Jutland on May 31, 1916.

1917. In the battle of the Somme and during the great German retreat, General Haig depended on his air service to find out just what the Germans were doing and how far they had retreated. We find the aëroplane possibly used to its greatest advantage in the spring and summer campaigns on the Italian front and during their retreat to the Piave. Fleets of 150 or more machines would fly low to the ground and drop bombs on forming troops, lines of communications, munition dumps, or they would rake the enemy with machine-gun fire. One of the interesting outgrowths of increased air activity was the developing of the "camouflage" system. This means the covering of trenches, artillery and other things of military value with trees, painted scenes, etc., so that they could not be distinguished from the rest of the landscape from the air. This was of particularly great value because aëroplanes were compelled to stay 2 or 3 miles in the air as anti-aircraft guns were improved.

England was the scene of many raids during 1917. Only the more important will be noted here. Between May 23 and June 16, five air attacks were made. In almost all of these the Germans used aëroplanes instead of Zeppelins. In one attack, on May 25, 76 were killed and 174 wounded. The worst raid of the month was on June 13. It was carried out in broad daylight over London and resulted in the death of 159 persons and the wounding of 424. London was again attacked by a fleet of 24 aëroplanes which penetrated all the defenses (July 4); 37 were killed and 141 injured. On August 22, Yorkshire, Dover, Ramsgate, and Margate were raided. The Germans suffered heavily in this raid, losing eight Gotha machines. On the moonlight night of September 4, nine were killed and 62 injured in a raid on London. The defenses of London were now in much better shape and the Germans were compelled to give up their daylight attacks.

Raids were made on England on September 24, 25, 29, 30, and October 1. As a result of these, 52 were killed and 216 injured. The Germans carried them out with scarcely any loss to themselves, the British claiming only to have destroyed two machines. One of the most disastrous raids from the German point of view was made on the night of Oct. 19, 1917. At least 11 Zeppelins participated and on their way home, four were lost in French territory. One was captured undamaged at Bourbonne-les-Bains. On December 6, 25 Gotha planes attacked London, killing 10 and injuring 31. On December 18, 20 aëroplanes raided Kent, Essex, and London, killing 10 and wounding 70. In these last two raids, three planes were forced to descend, and their crews were taken prisoner.

The consensus of opinion among the Allied nations was that these raids were of no military value and were merely another form of Germany's "frightfulness." Public opinion in England demanded reprisals, but for physical reasons the government refused to heed the popular clamor. Instead they gave their attention to the air bombardment of purely military centres such as the submarine bases at Ostend and Zeebrugge and the Krupp works at Essen. France made one or two spasmodic attempts to retaliate by bombarding towns in Alsace and Lorraine, but met with comparatively little success.

With the entrance of the United States into the War, it was felt that as soon as her resources were available the supremacy of the air would pass once and for all to the Entente Allies. She devised the standardized Liberty motor which was supposed to contain in one engine all the best points secured by foreign designers.

1918. On the nights of Jan. 21 and 24, 1918, British aviators carried out successful raids over Belgium and in German Lorraine, dropping bombs on Mannheim, Treves, Saarbrücken, and Thionville. During the month of January the Germans and Austrians were particularly active in carrying out raids over the Italian lines. Treviso and Mestre were bombarded on January 26; Venice, Padua, Treviso, and Mestre, on February 4 and 6, and on the latter date Calliano and Bassano were also bombed.

London was attacked on the night of January 28 and 58 persons were killed and 173 wounded. Another raid the next night killed 10 and injured the same number. On the 30th, Paris was heavily bombarded; 45 persons were killed and 207 wounded. During a raid on Venice on February 26, the Churches of Santa Giustina, San Simeone, Piccolo, and St. John Chrysostom were badly damaged. Naples was attacked on March 11. This resulted in the killing of 16 and the injuring of 40. A raid on Paris on Mar. 8, 1918, resulted in the death of 13 and the injuring of 50. Another raid which occurred on March 11 caused the death of 34 and the injuring of 79. Four German machines were brought down and 15 Germans killed or captured.

Italian aviators coöperating with the Allies on the Western front bombed Metz on Mar. 17 and 23, 1918, and raided the railway station at Thionville on the night of March 24. Paris was again the objective on April 12, when 26 were killed and 72 wounded. Italians raided Pola, Trent, and Trieste on May 10, and British forces coöperating with them attacked the aviation grounds at Campo Maggiore (May 4) and destroyed 14 machines.

On May 3, 1918, the British bombarded Karlshütte and on May 16 brought down five German machines during an attack on Saarbrücken. British seaplanes attacked Ostend, Westende, and Zeebrugge successfully on May 6. London was again attacked on May 19, with a casualty list of 44 killed and 179 wounded; the British succeeded in bringing down five German aëroplanes. In an air raid over Cologne on May 18, 14 persons were killed and 40 injured. Raids were carried out by the Allies over railway stations in Lorraine and on a factory in Mannheim on May 21 and 22. The rail-

way station was destroyed and 26 persons were killed in Liége on May 26.

On June 14, 1918, the first American bombing squadron to operate behind the German front raided the Baroncourt Railway and returned safely. A second raid was carried out the same day when Conflans was attacked. On the night of Oct. 9, 1918, an expedition of more than 350 planes bombarded many towns in the American sector, with the loss of only one man. American activity in the Argonne sector was particularly noticeable. During a six-month period before the signing of the Armistice it is estimated that the American fliers brought down over 500 planes with a loss of about 70.

German Zeppelins again appeared in the rôle of raiders on the night of Aug. 5, 1918, when they made an attempt to raid the east coast of England. One machine was brought down 40 miles at sea, another was damaged, and the third was compelled to return. On the 12th, a Zeppelin was destroyed off the English coast. It fell in flames.

During the War the air raids on England caused the death of 1413 people and the injury of 3407. The vast majority of these were civilians. One hundred and ten raids were carried out by airships and aëroplanes. For a general discussion of aëroplanes and airships see AËRONAUTICS.

Political and diplomatic aspects of the War and its settlement will be found in the articles WAR, DIPLOMACY OF THE; PEACE CONFERENCE AND TREATIES; REPARATIONS; WASHINGTON CONFERENCE; LEAGUE OF NATIONS; RACIAL MINORITES TREATIES; LABOR ORGANIZATION, INTERNATIONAL; EUROPE. See also the sections *History* under the articles on the following countries: UNITED STATES; AUSTRIA-HUNGARY; GERMANY; FRANCE; GREAT BRITAIN; ITALY; JAPAN; CZECHO-SLOVAKIA; JUGO-SLAVIA; GREECE; BULGARIA; RUMANIA; TURKEY; RUSSIA.

WARD, CABOT (1876–). An American lawyer, born in New York City, and educated at Harvard and its law school. He practiced in New York City in 1905, when he was appointed auditor general of Porto Rico, and was Secretary of State for Porto Rico in 1908 and president of the Executive Council in 1909, when he was also appointed acting governor. He served as delegate to several Pan-American conferences and was a member of the United States Commission to Chile. From 1914 to 1917 he was president of the Park Board and Commissioner of Parks of New York City. In 1917 he was a member of the military commission studying anti-aircraft defense of cities in the war zone and on the French and British fronts. He served during the War as a major in the aviation section of the Signal Corps and was also assistant chief of staff and chief of the intelligence section on the line of communications with the American Expeditionary Forces. He was a member of many historical and other societies and contributed to magazines on Latin-American subjects.

WARD, HENRY BALDWIN (1865–). An American zoölogist, born at Troy, N. Y., and educated at Williams College and Harvard University and at Göttingen, Freiburg, and Leipzig. After teaching science in Troy (1885–88) he was instructor in zoölogy at the University of Michigan (1893); associate professor and professor of zoölogy (1892–1909) at the University of Nebraska and dean of the College of Medicine there (1902–09); and professor (1909–) at the University of Illinois. His research work was in connection with the Michigan Fish Commission, the biological survey of the Great Lakes, the Alaska salmon investigations, and studies on parasites of man and the lower animals. He published various papers on these subjects and *Fresh Water Biology*, with Whipple (1917). He also did editorial work for *The American Naturalist* and a *Reference Handbook of the Medical Sciences*. He founded the *Journal of Parasitology*.

WARD, JAMES (1843–1925). A British philosopher (see VOL. XXIII). His long-awaited *Psychological Principles* was published in 1918. It contains a systematic exposition of mental life from the point of view of the Act school. The mind is defined as a "continuum of presentations." In 1922 Professor Ward published his exhaustive *Study of Kant*.

WARD, SIR JOSEPH GEORGE (1857–). A New Zealand statesman, born at Melbourne, and educated privately. At 30 he was elected to Parliament and in 1891 became Postmaster General. He held this office continuously until 1912 and assumed it again in 1915; this second tenure lasted until 1919. In 1900 he was appointed Minister of Public Health; this is said to have been the first appointment of its kind in the world. Sir Joseph was premier of New Zealand from 1906 to 1912, and in 1915 he became Finance Minister. At the Imperial War Cabinet and War Conference meetings of 1917 and 1918 in London and also at the Peace Conference in Paris he represented New Zealand. He disappeared from public life when he shared the defeat of his party in the election of 1919

WARNE, FRANK JULIAN (1874–). An American economist, born in Parkersburg, W. Va., and educated at the University of Pennsylvania (Ph.D., 1902). From 1896 to 1902 he was connected with the Philadelphia *Public Ledger*, and during 1903–06 he was editor of *The Railway World*. In 1908 he became secretary of the New York State Immigration Commission and in 1910 was special expert with the United States Census; then, after holding various relations with different organizations, he became chief statistician of the Emergency Fleet Corporation in 1916. More recently he devoted attention to the publication of his studies on economic topics. In addition to many pamphlets and special articles he is the author of *The Slav Invasion and the Mine Workers* (1904); *The Coal Mine Workers* (1905); *The Immigrant Invasion* (1913); *Railway Operation and Finance* (1914); *Intercorporate Ownership and Interlocking Directorates of the Railroads of the United States* (1914); *The Tide of Immigration* (1916); *Warne's Book of Charts* (1917); *Industrial Relations* (1919); *The Workers at War* (1920); and *Train Employees' Reply to the Railroads* (1921).

WARNER, EDWARD PEARSON (1894–). An American aëronautical engineer, born in Pittsburgh, Pa., and educated at Harvard University and the Massachusetts Institute of Technology. He was engaged in aëronautical work continuously after 1916. He did much of the teaching in aëronautics at the special army and navy schools in aëronautical engineering. He was aëro engineer with the United States Army and did wind tunnel work and made miscellaneous researches in stability and stress analy-

sis (1917–18). In 1918–20 he was chief physicist with the National Advisory Committee for Aëronautics. He was in charge of aëronautical research at Langley Field and after 1919 was secretary of the committee on aërodynamics of the National Advisory Committee for Aëronautics. In 1920 he became associate professor of aëronautics at the Massachusetts Institute of Technology. He has written many books, reports, and technical notes, dealing chiefly with stability stress analysis and free-flight testing.

WARREN, CHARLES (1868–). An American lawyer, born at Boston, Mass., and educated at Harvard University and its law school. Admitted to the bar, he practiced in Boston, and after acting as private secretary to Gov. William E. Russell he was associated with him in law practice until the latter's death in 1896. From 1914 to 1918 he was Assistant Attorney General of the United States. He wrote *The Girl and the Governor, History of the Harvard Law School and Early Legal Conditions of America* (1909), and *The Supreme Court in United States History* (1922).

WARREN, CHARLES BEECHER (1870–). An American lawyer and diplomat, born at Bay City, Mich., and educated at the University of Michigan. He began the practice of law in Detroit in 1893. He was associate counsel for the United States before the Joint High Commission on the Behring Sea claims in 1896 and also represented the United States in the North Atlantic coast fisheries arbitration with Great Britain before The Hague tribunal in 1910. During the War he served on the staff of the Judge-Advocate-General. In 1921 he became United States ambassador to Japan, and the negotiations which he carried on with the Japanese government resulted, in March, 1923, in the cancelation of the Ishii-Lansing Agreement. He resigned from this post in December, 1923, and was appointed United States ambassador to Mexico in January, 1924.

WARREN, FRANCIS EMROY (1844–). An American legislator (see VOL. XXIII). He served continuously as United States Senator from Wyoming from 1890 and was reëlected in 1919 for the term expiring in 1925. He was chairman of the Committee on Appropriations in the 68th Congress and was also a member of the committees on education, labor, military affairs, and public buildings and grounds. He was the oldest Senator in point of service.

WARREN, WHITNEY (185?–). An American architect (see VOL. XXIII). Following the bombardment of Reims Cathedral by the Germans during the War, he made an examination of the damage done and prepared a report on restoration. He also prepared plans for and supervised the reconstruction of the University of Louvain in Belgium, destroyed by the Germans in 1914. During the entire period of the War he was engaged in relief work and was zealous in stimulating sympathy for France. He was a member of many architectural societies in the United States and foreign countries.

WAR RISK INSURANCE. See INSURANCE.

WARSHIP. See VESSEL, NAVAL; NAVIES OF THE WORLD.

WAR TAXES. See TAXATION IN THE UNITED STATES.

WASHBURN, ALBERT HENRY (1866–). An American diplomat, born at Middleborough, Mass., and educated at Cornell University and at the law school of the University of Virginia. At Cornell he acted as secretary to Andrew D. White. From 1890 to 1893 he was United States consul at Magdeburg, Germany. On his return to America he held various public offices and was prominent in the affairs of the Republican party. He was president of the Association of the Customs Bar (1917–22) and became professor of international law at Dartmouth in 1919. In 1922 he was appointed Envoy Extraordinary and Minister Plenipotentiary to Austria.

WASHBURN, EDWARD WIGHT (1881–). An American chemist, born in Beatrice, Neb., and educated at the Massachusetts Institute of Technology, where during 1906–08 he was a research associate in physical chemistry. In 1908 he became an associate at the University of Illinois, where during 1912–16 he was professor of physical chemistry and since 1916 professor of ceramic chemistry and head of the department of ceramic engineering. Dr. Washburn has made studies in physical chemistry on such subjects as ionic hydration and the theory of solutions, but more recently his researches have been concerned with high-temperature chemistry and the physics of ceramic materials. In addition to many papers on chemical, physical, and ceramic matters, he is the author of *Introduction to the Principles of Physical Chemistry* (1915; 2d ed., 1921).

WASHBURN, STANLEY (1878–). An American war correspondent and author, born at Minneapolis, Minn., and educated at Williams College and the Harvard University law school. He was reporter and correspondent with the Japanese army, for Chicago and Minneapolis papers, during the Russo-Japanese War; correspondent for *Collier's Weekly* in Russia (1914); correspondent of the *London Times;* and for 26 months the only American correspondent attached to the Russian army. He was also with the French at Verdun in 1916 and was in Rumania in the same year. His published writings include: *The Cable Game* (1911); *The Spirit of the Wilds* (1913); *Field Notes from the Russian Front* (1915); *Victory in Defeat* (1916); *The Russian Offensive* (1917); and a play, *The Man in Hiding.* In 1921 he was appointed to the secretariat of the American Delegation at the Conference for the Limitation of Armament.

WASHBURN COLLEGE. A coeducational institution founded at Topeka, Kan., in 1865. The student enrollment increased from 831 in 1915 to 1249 in 1923, including the summer session and the night school. The endowment rose from $260,000 to $950,893 and the value of the buildings from $274,708 to $543,664. Benton Hall, a dormitory for women, was built, at a cost of $170,000; the Mulvane Art Museum, at a cost of $60,000; and the Larrick Memorial Fountain. Holbrook Hall, formerly a dormitory for women, was completely remodeled and converted into a classroom building for the School of Law. There were 35,000 volumes in the library in 1923. President, Parley P. Womer, Sc.D.

WASHINGTON. The capital of the United States. The population increased from 331,069 in 1910 to 437,571 in 1920. Between 1914 and 1924 many public buildings and monu-

VIEW ACROSS THE LAGOON

STATUE IN MAIN HALL

THE LINCOLN MEMORIAL AT WASHINGTON, D. C.

ments were constructed. During the War concrete office buildings were built for the Navy and War Departments, a stone office building for the Department of the Interior, and 12 temporary hotels of gray stucco for women war workers, who found it extremely difficult to find quarters. These were still in use in 1924. The Lincoln Memorial, finished in 1921 at a cost of $2,584,000, was a finely proportioned building in the form of a Greek temple, containing a colossal seated figure of Lincoln, carved in marble by Daniel Chester French (q.v), and mural paintings representing emancipation and reunion. The Grant Memorial, the work of Henry Merwin Shrady, was dedicated in 1922, and George Washington Memorial Hall, containing a large auditorium and several smaller meeting-halls, was built in memory of heroes of the Revolution and the War in Europe. The National Academy of Sciences, on a gift of $5,000,000 from the Carnegie Corporation in 1919, erected a new building to contain its library and exhibition rooms. The Freer Museum was erected under the direction of the Smithsonian Institution through a gift from Charles L. Freer, to house the American and Oriental art collections of the capital. The National Shrine of the Immaculate Conception was begun by the Roman Catholic church, and work on the National Cathedral was continued by the Protestant Episcopal church. A new library was under construction in 1924, on funds of $200,000 contributed by the Carnegie Corporation. Following the passage of a law in 1920, the entire District of Columbia was zoned. A gas tax law was enacted in 1924. In 1919 race rioting in Washington resulted in death to seven and injury to scores of others.

WASHINGTON. Washington is the nineteenth State in size (69,127 square miles), and the thirtieth in population; capital, Olympia. The population increased from 1,141,990 in 1910 to 1,356,621, in 1920, a gain of 18.8 per cent. The white population increased from 1,109,111 to 1.319,777. The number of Indians fell from 10,997 to 9061, and the number of Chinese from 2709 to 2363. The Japanese increased from 12,929 to 17,387, and the negroes from 6058 to 6883. The native white population rose from 867,914 to 1,069,722; the foreign-born white from 241,197 to 250,055. Both urban and rural populations mounted, the former from 605,530 to 748,735, the latter from 536,460 to 607,886. The growth of the principal cities was as follows: Seattle, 1910, 237,194; 1920, 315,312; Spokane, 104,402, 104,437; Tacoma, 83,743, 96,965. See articles on these cities.

Agriculture. As in most of the western States, agriculture in all its phases showed a considerable increase in Washington from 1910 to 1920. The increase in number of farms (18 per cent) kept pace almost exactly with the increase in population (18.8 per cent). The acreage of land in farms increased from 11,712,235 in 1910 to 13,244,720 in 1920, or 13 1 per cent; the number of farms increased from 56,192 to 66,288; and improved land in farms increased from 6,373.311 to 7,129,343 acres. The percentage of total land area used for agricultural purposes in 1910 was 27.4, and in 1921, 31. The percentage of farm land improved decreased from 54.4 to 53.8. The total value of farm property showed an apparent increase, from $637,543,411 to $1,057,429,848, or 65.9 per cent; the average value per farm, $11,346 to $15,952, or 40.6 per cent. In interpreting these values and indeed all comparative values for the decade 1914–24, the inflation of the currency in the latter part of the period is to be taken into consideration The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 66,288 farms in 1920, 52,071 were operated by owners, 1168 by managers, and 12,419 by tenants The corresponding figures for 1910 were 47,505, 961, and 7726. White farmers in 1920 numbered 65,022, of whom 45,265 were native and 19,757 foreign-born. There were 1266 colored farmers; 460 Indians and 699 Japanese White farmers in 1910 numbered 55,067 (37,770 native, and 17,297 foreign-born), and in that year there were 673 Indian and 316 Japanese farmers. Farms free from mortgage in 1920 numbered 25,012, compared with 30,979 in 1910. Those under mortgage numbered 24,004, compared with 16,026. The area under irrigation increased from 334,378 acres in 1909 to 529,899 in 1919. The number of dairy cows increased from 186,233 in 1910 to 289,635 in 1920; "beef cows" from 58,140 to 88,969; sheep, from 295,264 to 623,779. The estimated production of the principal farm crops in 1923 was as follows: corn, 2,959,000 bushels; spring wheat, 21,147,000; winter wheat, 37,015,000; oats, 11,110,000; barley, 3,295,000; potatoes, 8,467,000; hay, 2,465.000 tons; and apples, 30,668,000 bushels. Comparative figures for 1913 are: corn, 952,000 bushels; wheat, 53,300,000; oats, 14,250,000; barley, 7,290,000; potatoes, 7,380,000; and hay, 1,794,000 tons.

Mining. The mineral resources of Washington were as yet largely undeveloped. The chief mineral is coal, although cement, clay products, and sand and gravel also are produced in valuable quantities. The coal output during the decade 1914–24 was as follows: 1914, 3,064,820 net tons; 1915, 2,429,095; 1916, 3,038,588; 1917, 4,009,902; 1918, 4,082,212; 1920, 3,757,093; 1921, 2,428,722; and 1922, 2,581,165. The value of the cement produced annually was between $2,000,000 and $4,000,000 during this period. The State produced also a small amount of copper, gold, and iron ore. The total value of the mineral production in 1921 was $17,605,878, compared with $26,677,191 in 1920; $18,267,938 in 1919; $20,999,691 in 1918; and $13,830,739 in 1914.

Manufactures. Washington developed greatly in industrial importance after 1909. In 1920 there were in the State 10 cities having more than 10,000 inhabitants. These formed 63 8 per cent of the total population, and in 1919 reported 63.8 per cent of the total value of the State's manufactured products There were in the State, in 1909, 3674 manufacturing establishments; in 1914, 3829; and in 1919, 4918. Persons engaged in manufacture numbered 80,118, 78,448, and 150,479; and the capital invested amounted to $222,261,229, $277,715,262, and $574,235,183, in those years. The value of the manufactured product amounted to $220,746,421 in 1909; $245,326,456 in 1914; and $809,622,984 in 1919 The increase in value of products between 1914 and 1919 was due in great measure to changes in industrial conditions brought about by the War and cannot be properly used as an index of the industrial expansion during the census period; but the in-

crease in number of persons employed clearly indicates decided growth in the manufacturing activities of the State. The lumber and timber industry is chief in point of value of product, with an output valued at $89,155,000 in 1909; $83,536,000 in 1914; and $234,881,000 in 1919. Shipbuilding and boatbuilding ranks second in this respect, amounting in 1909 to $1,550,000; in 1914, to $3,101,000; and in 1919, to $166,520,000; the phenomenal increase in the value of this product from 1914 to 1919 was due to the building of many vessels for war purposes. The chief manufacturing cities are Seattle and Tacoma. There were in Seattle, in 1909, 753 establishments, with a product valued at $50,814,000; in 1914, 1014 with $64,475,000; and in 1919, 1229 with $274,431,000. In 1909, Tacoma had 277 establishments, with a product valued at $24,462,000; 1914, 339 with $27,708,000; and 1919, 348 with $103,172,000.

Education. Educational progress in Washington was steady and consistent in the decade 1914–24. The Legislature passed important measures, especially in the latter part of the period, which did much to improve the administration and efficiency of the schools. Progress was especially notable in connection with the rural school work. The following objects had been accomplished: the establishment of a State-wide retirement fund; a constructive programme in State-wide consolidation; increased aid for high schools; establishment of the observation of a State-wide temperance and good citizenship day; increased direct supervision of rural schools through the eighth grade; exemption law, and higher professional standards for teachers. Strong efforts were being made for the establishment of the community unit system; i.e. the grouping of related school districts in neighboring units sufficiently large to support community high schools; and while the bill failed to pass the Legislature, keen interest was aroused in this constructive solution for rural education in State school administration. Vocational education had been carried on since 1919, and the Legislature passed an act providing for its further development in accordance with the Smith-Hughes Act. There was a constant increase from year to year in the number of courses offered and in the number of students. The enrollment in public schools increased from 239,663 in 1914 to 301,800 in 1922. The enrollment in high schools in 1921–22 was 29,069. Total expenditure for educational purposes in 1922 was $29,983,084. The percentage of illiteracy in the State decreased from 3 2 in 1910 to 2.1 in 1920. In the native white population it remained at 0.3 per cent; in the foreign-born white, it increased from 4.7 to 5 per cent; in the negro, it decreased from 4.8 to 4.6.

Finance. For finance, see STATE FINANCES.

Political and Other Events. There were more political overturns in Washington in 1914–24 than in any previous decade. The State, for the most part, remained in Republican control. Elections were held in 1914 for United States Senator and for Representatives in Congress. Senator Jones was reëlected. In the city of Seattle, Hiram C. Gill, who was once recalled as mayor, was again chosen mayor on a Nonpartisan ticket. A measure providing for State-wide prohibition was carried in November. In 1916 a Democratic governor, Ernest Lister, was reëlected and the electoral vote went to Wilson by a narrow margin. On the other hand, Senator Poindexter, Republican, was elected to the Senate by the largest majority ever given a candidate for that office in the State, and the entire Republican State ticket except the governor was elected. A strike in the shipyards, involving 25,000 workmen, broke out in Seattle in February, 1919 It was said to be instigated largely by the I. W. W. Mayor Ole Hanson took action by increasing the police force and by calling for troops from Camp Lewis. These measures had a determinative effect on the strike. There were no State elections in 1918. In 1920 the Republicans elected their candidate for governor, Louis F. Hart, and Wesley L. Jones was reëlected to the Senate. In the presidential voting in this year, W. G. Harding received 223,137 votes; J. M. Cox, 84,298. In 1922 a campaign on Poindexter's record in the Senate resulted in the election of C. C. Dill, Democrat, to the Senate. On Nov. 12, 1923, the United States Supreme Court sustained the State laws prohibiting the ownership of agricultural lands by Japanese and other aliens ineligible to citizenship.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature passed a minimum wage act which went into effect on Feb 20, 1915 On Jan. 13, 1917, the Legislature adopted the "bone dry" prohibition amendment. It also passed measures substituting life imprisonment for the death penalty, unless the jury in addition to the verdict of guilty found that the death penalty should be inflicted. The Legislature created a State Safety Board with legal aid boards to investigate industrial accidents. It also enacted measures defining and punishing criminal syndicalism and sabotage. In 1921 a measure was passed extending the power to vote for county and precinct, as well as for Federal and State officers, to absent voters. In 1923, the sale of narcotics was made a felony, and the possession of drugs illegally obtained was made a crime.

WASHINGTON, STATE COLLEGE OF. A coeducational State institution founded at Pullman, Wash., in 1890, under the National Land Grant Act. The student enrollment increased from 1184 in 1914 to 2256 in 1923–24 and the total yearly income from $458,000 to $1,082,195. The members of the faculty numbered 264 in 1923–24, and the library contained 90,000 bound volumes and 100,000 pamphlets. David S. Troy Hall for the dairy department, three dormitories for women, one for men, and several farm buildings were constructed during the period. President, Ernest O. Holland, Ph.D.

WASHINGTON, UNIVERSITY OF. A coeducational State institution at Seattle, Wash., founded in 1861. The university increased considerably in size between 1914 and 1924. In 1914 the student enrollment stood at 2888; the faculty numbered 194; the library contained 64,000 volumes. In 1923, the total enrollment reached 7005, and the enrollment for the first term of 1923–24 was 5221; the faculty was increased to 275 members; the library contained 126,784 volumes. The three Schools of Business Administration, Library Economy, and Fisheries were opened during the decade. Education Hall, Home Economics Hall, Commerce Hall, Philosophy Hall, the forest products laboratory, the mines laboratory, and a stadium

seating 30,000 were built. Construction was begun on a new library building. The university received a gift of the Boeing Aërodynamical Laboratory in 1919 and a gift of $250,000 for a new building for the College of Forestry in 1923. The four quarter plan was adopted in 1917, and various war courses were offered. The requirements for entrance and the scholarship standards were materially raised in 1921. President, Henry Suzzallo, Ph.D.

WASHINGTON AND JEFFERSON COLLEGE. A nonsectarian institution at Washington, Pa., founded in 1802. The student enrollment in 1915 was 326 as compared with 464 in the year 1923–24, and 276 in the summer school of 1923. The faculty numbered 21 members in 1915 and 31 in 1923, and the library was increased from 26,000 to 36,000 volumes. The endowment of the university was about $1,000,000 in 1923–24. The presidents during the decade were Frederick W. Hinett, Ph.D., D.D., 1914–18; W. E. Slemmons, D.D., acting president, 1918–20; Samuel Charles Black, D.D., LL.D., 1920–21; S. S. Baker, M.S., LL.D., 1921–

WASHINGTON AND LEE UNIVERSITY. A nonsectarian institution for men at Lexington, Va., founded in 1749, maintaining departments of liberal arts, commerce, engineering, and law. The student enrollment increased from 492 in 1914 to 801 in 1923–24 and after 1920 was strictly limited in number. During the same period the size of the faculty was increased from 26 to 57; the salaries were increased about 40 per cent; and a complete system of contributory retiring allowances was established. The permanent endowment of the university was increased 50 per cent between 1914 and 1923–24; the number of volumes in the library rose from 50,000 to 55,000; and the income was more than doubled. A new dormitory, with accommodations for 116, was built in 1920, and a chemical laboratory, to cost about $150,000, was under construction at the close of 1923. Two years of college work were made requisite for entrance to the Law School, and departments of education, electrical engineering, and public speaking were opened. A campaign was carried on in the South during 1923–24 to raise $500,000 to reëstablish the original School of Journalism of the university, which was founded in 1869 while Gen. Robert E. Lee was president The United Daughters of the Confederacy were raising $150,000 for building a Lee Memorial Chapel. President, Henry Louis Smith.

WASHINGTON CONFERENCE. The possibility of the nations' disarming has been a favorite theme of prophets and poets. The Hebrew prophets told of a time when nations would "beat their swords into ploughshares and their spears into pruning-hooks." Tennyson sang of the day when "the war drum throbs no longer and the battle flags are furled." But after the Paris Conference the reduction of expenditures for armaments was the concern of statesmen, and some real progress was made The great naval powers actually put a limit on capital ships, and European states even discussed a treaty to limit land armaments.

Previous Attempts. In the past numerous proposals were made to limit armaments, but the actual results were extremely meagre. In 1764 Prince Kaunitz, Prime Minister of Austria, suggested to Prussia that each state dismiss three-fourths of its army, but Prussia declined. Five years later the suggestion was renewed by Joseph II, but Frederick the Great again declined. In 1841 Sir Robert Peel made a disarmament proposal in the House of Commons, and in 1862 Disraeli suggested the possibility of an agreement with France. Winston Churchill proposed a naval holiday (1913). Napoleon "the Little" also dreamed of curtailing his military expenditures. In 1853 he expressed his intention of calling a European conference to reduce armaments. He discussed the matter with Czar Alexander II and William II of Prussia and received some encouragement, but in 1870 an informal proposal to Prussia through the English Secretary of State for Foreign Affairs, Lord Clarendon, was rejected by Bismarck. The Chancellor was responsible for the rejection of several other attempts to secure a discussion of armament. Resolutions were introduced into the Reichstag, but the influence of the government was always sufficient to prevent them from coming to a vote. Bismarck refused, furthermore, to consider the matter with Crispi, then President of the Italian Chamber.

In the United States the problem of armament agreements was several times on the tapis of Congressional and executive policy. Elihu Root, as a member of the American delegation to the Second Hague Peace Conference, held that he and his colleagues should support any European power which desired to secure consideration of armaments. In 1910 the American Congress authorized the appointment of a commission to inquire into the possibility of securing a limitation of armaments and of constituting the combined navies of the world into an international police force. The commission was never appointed, and no action was taken under a similar authorization in the Naval Appropriation Bill of 1916. Until the Washington Conference only two attempts to check war expenditures had not proved abortive; in 1817 the United States and Great Britain entered into the Rush-Bagot agreement for the limitation of armaments on the Great Lakes, and in 1902–03 Argentina and Chile negotiated a treaty relating to naval armaments. "The Christ of the Andes" was erected to commemorate the signing of this treaty. During the War both the Allies and the Central Powers professed their willingness to discuss armaments. Wilson's Fourth Point stipulated that "adequate guarantees [be] given and taken that national armaments will be reduced to the lowest point consistent with domestic safety." The Treaty of Versailles provided for a thoroughgoing disarmament of Germany, and the Covenant of the League of Nations declared that the members recognized "that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety." The Council was instructed to "formulate plans for such reduction for the consideration and action of the several governments." The members agreed, furthermore, that "the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those members of the League which are not able to manufacture the munitions and implements of war necessary for their safety." At

Saint-Germain-en-Laye, on Sept. 10, 1919, 23 powers signed a convention for the control of the trade in arms and ammunition, but before this could go into effect and before any action could be urged by the League of Nations, a conference called by the United States at Washington had agreed to a limit on capital ships.

The Conference at Washington. Senator William E. Borah of Idaho was more than any other individual responsible for the calling of the Washington Conference, and his activities were at first viewed with some suspicion by President Harding and Secretary Hughes. On Dec. 14, 1920, Senator Borah introduced in the Senate a resolution which became part of the Naval Appropriation Bill of 1921. The President was authorized and requested "to invite the Governments of Great Britain and Japan to send representatives to a conference, which shall be charged with the duty of promptly entering into an understanding or agreement by which the naval expenditures and building programmes of each of said governments . . . shall be substantially reduced annually during the next five years to such an extent and upon such terms as may be agreed upon." Executive opposition could not keep this provision out of the Naval Bill, but how far the agitation in Congress and the country forced the executive to reluctant action and how far it was simply pressure on a door which had begun to swing open, it is difficult to say. On July 10, 1921, the State Department issued a proclamation announcing that a conference was to be called. Great Britain, Japan, and the United States were the principal naval powers, but before they could agree on limitation, there had to be a full discussion and agreement on the political situation in the Pacific. Policy and armament go hand in hand. Preparedness is only half-preparedness if not measured according to the demands of a nation's foreign policy. President Harding appointed as the American representatives Secretary Hughes, Elihu Root, Senator Lodge, leader of the Republican majority in the Senate, and Senator Underwood, leader of the Democratic minority. Apparently President Harding, unlike Wilson in the case of the Treaty of Versailles, was ready to placate the Senate in advance. The Conference began on Nov. 12, 1921, and lasted until February, 1922. Seven treaties were adopted:

(1) A treaty between the United States, the British Empire, France, Italy, and Japan with respect to the limitation of naval armament
(2) A treaty between the same powers in relation to the use of submarines and noxious gases in warfare.
(3) A treaty between the United States, the British Empire, France, and Japan relating to their insular possessions and dominions in the Pacific Ocean.
(4) A declaration accompanying this treaty.
(5) A treaty between the same four powers supplementary to the above.
(6) A treaty between the United States, Belgium, the British Empire, China, France, Italy, Japan, the Netherlands, and Portugal relating to policies in matters concerning China.
(7) A treaty between the same nine powers relating to the Chinese customs tariff.

In addition, 12 resolutions were adopted relating to such matters as proposals for the amendment of the laws of war; extraterritoriality in China; reduction of Chinese military forces; the Chinese Eastern Railway; and radio stations and foreign postal agencies in China. The most spectacular result of the Conference was the Five-power Naval Treaty which established a 5-5-3 ratio for the capital ships of the United States, Great Britain, and Japan, and maintained the status quo in respect to American and Japanese fortifications in the Pacific. This treaty was in large part due to the important speech which Secretary Hughes made at the opening of the Conference. He not only urged disarmament with an eloquence which recalled President Wilson's utterances, but he had a definite scheme which the United States approved and which, at the same time, was not unfair to Great Britain and Japan. He suggested the following four principles:

1. All capital shipbuilding programmes, either actual or projected, should be abandoned.
2. Further reduction should be made through the scrapping of the older ships.
3. In general, regard should be had to the existing naval strength of the powers concerned.
4. The capital ship tonnage should be used as the measurement of strength for navies, and a proportionate allowance of auxiliary combatant craft should be prescribed.

This scheme entailed the scrapping of 1,878,073 tons, or 60 capital ships—30 for the United States, 23 for Great Britain, and 17 for Japan. Some modifications of detail were made, largely because of Japanese reluctance to agree to the ratio. Japan was finally permitted to retain the *Mutsu*, one of the most powerful ships afloat; but it was a Pyrrhic victory, for in compensation Great Britain was allowed to build two superdreadnoughts, and the United States got the right to complete two battleships of the *West Virginia* class. This bargain, however, was rather costly in money to Great Britain and the United States.

Some naval strategists maintained that the capital ship was obsolete; if that were so, its limitation was little more than a magnificent gesture. The limitation of capital ships, furthermore, it was contended, would really cause an increased construction of smaller vessels, and these the Conference failed to limit. Indeed, the naval programmes of the powers, following 1922, already began to compete in ships which the treaty did not cover. Archibald Hurd, one of the most distinguished naval experts of England, declared that one of the results of the Conference would be to "set up a higher standard for submarines, placing on each nation what amounts practically to an obligation to continue building submarines." Here, probably, was the most conspicuous failure of the Conference. The submarine, "the criminal of the seas," which was directly responsible for the entrance of the United States into the War, was turned loose with a certificate of good conduct. Article I of the treaty on the subject authorized the use of the submarine under certain specified conditions as a commerce destroyer. Article IV, however, declared that the signatory powers recognized the practical impossibility of using the submarine as a commerce destroyer. There were ambiguities in the treaty which seemed likely to cause difficulty in the event of war, and meanwhile there was no limitation. Great Britain was anxious to act drastically, but France, on account of her strategic position, wished to retain the submarine as a weapon. France was excluded from the meetings in which England, the United States, and Japan deliberated on the naval holiday; and she was not notified of the decisions until they were accomplished facts. The American delegation might have been more diplomatic in this respect, since France's coöperation was necessary

if submarines were to be successfully dealt with, to say nothing of the interests of the United States in having France agree to the rehabilitation of Germany. Aircraft, also, was too big a problem for the Conference, although in this case their commercial possibilities would make any form of limitation extremely difficult. Another lacuna of the conference was its failure to define a merchant ship in the treaties relating to this subject.

Of the other treaties one deserves special mention. The United States, Great Britain, France, and Japan agreed "as between themselves to respect their rights in relation to their insular possessions and insular dominions in the region of the Pacific Ocean." Article II provided that "if the said rights are threatened by the aggressive action of any other power, the high contracting parties shall communicate with one another fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation." This was the so-called Four-power Treaty. It gave rise to a lively controversy in the United States Senate. In particular, critics did not fail to point out the similarity of this language to that of Article X of the League of Nations Covenant. One serious question raised by the treaty was whether the phrase "insular dominions" included the Japanese mainland. If it did—and this was the interpretation first given the treaty—the United States would be bound to confer on the measures necessary to protect Japan. The United States might be forced into indirect support of possible Japanese imperialism. There was a difference of opinion between President Harding and Secretary Hughes as to whether Japan proper was included, and as a result of the ensuing public discussion, a supplementary treaty was drawn up, excluding the mainland from the term "insular possessions and insular dominions." The treaty probably left Japan in a better position in the Pacific than she was in before, for American diplomatic freedom of action was limited. The most beneficial result was that the Anglo-Japanese Alliance (q.v.) was canceled. This was one of the principal objectives of the American delegation to the Conference. But if, from the point of view of the United States, the Four-power Treaty was considered a winding-sheet for the Anglo-Japanese Alliance, Japan apparently thought that the Alliance was extended. Premier Takahashi declared that the "Quadruple Entente, which for Japan replaces the Anglo-Japanese Alliance, is much wider in its bearing and removes all chances of war." But some pledge like the Four-power Treaty was necessary to provide the moral disarmament which must be secured before actual disarmament could be achieved. The Four-power Treaty was bound up with the naval pact.

At the Conference, China met with both successes and reverses. One achievement of the Conference, the Shantung (q.v.) agreement, was a real advance. Direct negotiations had failed. China had little hope of securing assistance from the League of Nations, but in the Washington Conference she was able to debate the matter with Japan and to receive satisfaction. Two important treaties relating to foreign rights and interests in China and the Chinese tariff failed to give China what she wanted. The United States stood back of China on occasion, but the matters involved were quite technical. The country was much more interested in the naval aspects of the conference, and there was no strong public opinion in the United States in favor of going to her aid and letting China get out of the straitjacket in which imperialistic policies had succeeded in placing her. See CHINA; SHANTUNG; YAP ISLAND; NAVIES OF THE WORLD.

Land Armaments. One other matter requires mention. The Washington Conference failed to consider land armaments. This problem, to be sure, had been on the agenda of the Conference, but it was soon seen that it was too closely bound up with the situation in Europe for it to be dealt with by naval powers meeting in Washington. One of the results of the Paris Conference, however, was the Treaty of St. Germain to deal with the traffic in arms and munitions. Its purposes were two. In the first place, it was intended to prevent shipments of arms, except for strictly governmental purposes, to so-called "backward areas," e.g. the African colonies, Persia, Arabia, etc. The second purpose was to require government licenses for all shipments of arms and to insure publicity for licenses that were granted. States ratifying the convention promised to allow no exports except under a license indicating the character and destination of the shipment and to prohibit shipments if the state of destination were not a party to the convention. In other words, shipments to revolutionaries or to countries not signatory to the convention would be forbidden. Annual reports on the licenses were to be made to an office under the control of the League of Nations. The first two Assemblies of the League urged ratification of this convention, and the desire was expressed that the matter be taken up at the Washington Conference; but nothing was done.

By September, 1923, the convention had been ratified by a number of unimportant states. France, Great Britain, Spain, Italy, and Japan had signified their willingness to ratify on condition that all the principal munitions-making powers would come in. The United States remained indifferent to the convention, but finally Secretary Hughes did consent to state some of the objections of the United States. The principal one was that the contracting parties were prohibited from selling munitions to states not parties to the convention. The agreement of the United States, one of the principal manufacturing nations, was essential if the matter was to be dealt with, and it was a hopeful sign when early in 1924 a League of Nations committee began consideration of the St. Germain convention to see if it could not be made satisfactory to the United States. Joseph C. Grew, American Minister to Switzerland, was present as an "observer" for the State Department.

The first Assembly of the League of Nations set up a so-called Temporary Mixed Commission on Armaments. To make possible the reduction of land armaments in Europe, the commission proposed a Draft Treaty of Mutual Assistance, the work of Viscount Cecil. The treaty was based on the theory that "a certain number of states are not in a position to contemplate a reduction of their armaments without receiving in exchange a guarantee of their security." The treaty provided a general guarantee, supplemented in the case of certain countries by special treaties. The scheme was approved by

the third Assembly of the League (1923) and was sent to the constituent governments for consideration. No doubt there would be objections to the proposal as a plan encouraging alliances, but at least it showed that the League was seriously at work on the problem of military expenditures in Europe.

WASHINGTON UNIVERSITY. A nonsectarian, coeducational institution at St. Louis, Mo., founded in 1853. The student enrollment increased from 1390 in 1914 to 4849 in 1923–24, the faculty from 208 to 395 members, the library from 142,589 bound volumes and 60,000 pamphlets to 225,000 bound volumes and 83,000 pamphlets, and the productive funds from $6,156,223 to $14,481,364. The Wilson swimming pool and funds for Wilson Memorial Hall for the department of geology, the latter in memory of her husband, were given by Mrs. Newton R. Wilson; and the Grace Valle January law school building and funds for the erection of a building for the School of Fine Arts were received by the university from other sources in 1922. By donation of private persons and the General Education Board the projected School of Medicine was endowed with $1,600,000, and $100,000 was given by Robert S. Brookings in 1923 for a residence foundation in Washington, D. C., in connection with the newly established Graduate School of Economics and Government. A chair of history was endowed through an anonymous gift of $100,000 in 1922. Frederic A. Hall was acting chancellor, succeeding David F. Houston on his resignation in 1917, and was succeeded in turn by Herbert S. Hadley, in 1923.

WASSERMANN, JACOB (1873–). A German novelist, born at Furth. He has lived much in Austria. He is the author of many works, including: *Die Juden von Zirndorf* (1897); *Geschichte der Jungen Renate Fuchs* (1901); *Der Niegeküsste Mund* (1902); *Der Moloch* (1903); *Alexander in Babylon* (1905); *Die Schwestern* (1906); *Caspar Hauser, oder die Trugheit des Herzens* (1908); *Die Masken Erwin Reiners* (1910); *Der Goldene Spiegel* (1911); *Der Mann von Vierzig Jahren* (1913); *Das Gansemännchen* (1915); *Christian Wahnschaffe* (1917); *Der Wendekreis* (1920); and several prose essays, *Die Kunst der Erzahlung; Faustina, oder ein Gesprach uber die Liebe* (1912), and *Mein Weg als Deutscher und Jude* (1920). In 1924, *Gold* was published in America.

"WATCHFUL WAITING." See MEXICO, *History*.

WATER METERS. See WATER WORKS AND WATER PURIFICATION.

WATER POWER. In the period from 1914 to 1924 there was no more important movement for the development of natural resources than that concerned with making water power available for the use of industry in an economical, convenient, and efficient manner. This was particularly evident with the increased cost of fuel, involved especially in the raising and transportation of coal, and due to the growing demands of industry along with the improved standards of living. This condition held good the world over, and the development of water power in such countries as Switzerland, Italy, and Scandinavia, not to mention North America, was indeed most important. Obviously it was a subject which required deep interest and supervision even when private capital was employed, and for the construction of dams, power plants, and transmission lines considerable outlay was involved, although the maintenance costs were comparatively low. Naturally in the years immediately succeeding the War it was not always easy to secure such capital in view of government indebtedness, high rates for loans, and often lack of private capital. Nevertheless, in many parts of the world there were important developments, as, for example, in connection with railway electrification in France and in Switzerland, for industrial purposes in Italy, and for general power development in America. In most instances there was involved the construction of dams to provide suitable reservoir and adequate heads of water for the use of natural waterfalls, as at Niagara and other places. See DAMS.

Although North America contains less than 15 per cent of the water-power resources of the globe, nevertheless by 1924 it had developed more water power than all the rest of the world. About 41 per cent of the world's developed water power was in the United States, and even at that it was estimated that only about 8 per cent of the water-power resources of the United States had been developed. European countries, particularly Germany, the territory comprised in the former Austria-Hungary, Norway, Sweden, France, Italy, and Switzerland, had developed a relatively larger percentage of their water power but had not in any way approached the possible. Many of these countries had little or no natural fuel, and consequently with their ever-increasing industrial demands for power they were forced to develop their water-power resources. These developments were somewhat restricted by economic and financial conditions following the War, but by 1924 they had progressed steadily, and there was every indication that much more would be done in that direction. While Asia, Africa, South America, and Central America all possess water power in varying degrees, much of the territory of these countries has been comparatively unexplored, and in their present economic condition the development of water power is a subject of little interest.

It might be said that Northern and Southern Africa, where the rainfall is low, have but limited water-power resources, while tropical Africa, particularly the Congo Basin, with a heavy rainfall, has vast possibilities for the production of water power. Asia with its vast area and the high altitude of its central part is inferior in water-power resources to Africa, on account of the low precipitation through Northern, Western, and Central Asia. This subject is comprehensively summarized in "Water Power of the World," Part II of the *World Atlas of Commercial Geography*, published by the United States Geological Survey (Washington, 1921).

Water Power in the United States. For many years there had been considerable discussion and controversy as to the Federal water powers on streams within its jurisdiction. The matter, however, had not attained important dimensions until the twentieth century, and even then laws passed in 1901 and 1910 on the administration of water power hardly took into consideration the part which electrical power was destined to play in transportation and industry, or the safeguards which the State in the disposition of its important natural resources

would be required to make in the interest of the investor as well as of the public. In fact, the rights granted at first were so insecure and the liabilities imposed were so uncertain that it was difficult to finance water-power developments requiring Federal authority, and the result was that American industry was unable to utilize the large water-power resources available to it. The Congress of the United States in 1924 had control over the disposition of some 85 per cent of the potential water powers of the nation. This authority depends on three fundamental bases: first, that the United States is owner of the public lands, which may be used only in such manner and for such purposes as Congress may direct; secondly, that jurisdiction over all navigable waters of the United States is given to Congress through its power to regulate commerce, and it also has authority to determine what structures may be erected in or over them and under what conditions, thirdly, the manner in which international waters can be diverted and used, which of course must be the subject of treaty between the nations concerned, and the only power of making and enforcing treaties in the United States belongs to the Federal government.

In the beginning, Congress left the regulation of navigable rivers, and in a large measure their improvement, to the several States and acquiesced in the construction on such streams of whatever structures the State laws might authorize. The use of public lands for power purposes also fell under a condition of similar policy, but later this policy was modified through legislation seeking to preserve the public interest in the power resources under public control. Such legislation, however, did not appreciate the conditions which were necessary if these resources were to be developed for public use. Under the Act of 1901 grants on public lands and reservations were made by the Executive Department, on navigable streams, power grants demanded a special act of Congress. The Act of June 23, 1910, superseding a similar act approved on June 21, 1906, merely fixed the general conditions under which the special grants were made. These acts were considered practical failures, and in order to meet the conditions which had arisen and to provide for the proper requirements of industry as well as to protect the nation at large, the Federal Water-power Act was passed by Congress and approved June 10, 1920. This Act created the Federal Power Commission, made up of the Secretary of War, the Secretary of the Interior, and the Secretary of Agriculture, together with an engineering, technical, legal, and administrative staff which was authorized to make investigations and to collect and report data concerning water resources and the water-power industry.

The Commission was also empowered to issue permits and licenses for the construction, operation, and maintenance of dams, water conduits, reservoirs, power plants, transmission lines, and like projects, such licenses being issued for a period not exceeding 50 years, and prescribing special conditions under which the licensee should operate, including, of course, those that were set forth in some detail in the Federal Water-power Act itself. After the passage of this Act three important projects affecting navigable waters where power development had already taken place were adjusted to the Water-power Act. These were the Coosa River project in Alabama, the Connecticut River project, and the Niagara Falls project, all of which were adjusted to the new statutes, and licenses were issued bringing the various operating companies into line with the new order of control. These of course were not the only projects that were brought before the attention of the Federal Power Commission, as many applications were made for licenses in cases where there was no question of policy or controversy involved, as well as for projects which involved political or other complications. At the close of the fiscal year ending June 30, 1923, the Federal Power Commission reported that it had received applications involving an estimated installation of 21,500,000 horse power and had issued permits and licenses for an aggregate installation of 7,500,000 horse power, and that there were built or were building 2,400,000 horse power under license of the Commission. Previous to the passage of the Power Act only 1,400,000 horse power had been made available under Federal authority, while at the time of the passage of the Water-power Act the aggregate installation in all water-power plants in the United States amounted to only 9,000,000 horse power.

From this summary it will be apparent that the legislation of 1920 not only was needed but was the forerunner of improved and substantial developments. This does not mean that the Federal Power Commission was not involved in controversy or that there was a uniform acceptance by the various States of attempts to exert Federal authority over streams more or less navigable. This gave rise to legislation and to litigation which up to the autumn of 1924 was far from settled. For example, the water-power developments proposed for the Colorado, Columbia, and St. Lawrence Rivers and at Muscle Shoals, representing some 13,000,000 horse power, were far from settled in the summer of 1924. The State of Arizona refused to ratify the treaty negotiated among seven States for the development of the Colorado, while the method of utilizing the Wilson Dam and Power House, constructed by the Federal government, was long a subject of controversy. (See DAMS and MUSCLE SHOALS.) Likewise over the Columbia River project a controversy arose between the reclamation and power interests, and until these and other matters could be settled it was not possible to proceed with such projects as the Priest rapid development which would involve 750,000 horse power developed by a dam two and a half miles in length, situated about halfway between Spokane and Portland. In 1924 the development of power along the St. Lawrence River was awaiting international agreement before either United States or Canadian interests could proceed with it. In 1923 the Federal Power Commission issued a permit involving 360,000 horse power on the Susquehanna River, and also a permit to the West Virginia Power and Transmission Company on the Chesapeake River, where an installed capacity of 600,000 horse power was considered possible.

In 1923 in the electric public-utility power plants in the United States, about 19,333,000,000 kilowatt hours of electricity was produced by the use of water power. To produce this quantity of power by the use of fuel would have required 23,250,000 tons of coal, representing a

cost considerably over $100,000,000. The electricity produced by the use of water power for public-utility power plants in 1923 was 34.8 per cent of the total, a decline from the 37.5 per cent of 1919; but it was believed that in a year of more than normal water supplies throughout the United States, the quantity of electricity so produced would increase materially. California ranked first in the use of water power for the production of electricity, 21 to 22 per cent of the total production for the entire United States being generated within its limits. In this respect it exceeded New York, which ranked first in 1920 and produced in

1923 about 18 per cent of the total for the United States.

Developed and Potential Water Power of the United States (1924). Early in 1924 the United States Geological Survey published a summary of developed water power in the United States which showed that there were then about 3200 water-power plants of 100 horse power or more, having a total capacity of installed water wheels of 9,086,958 horse power, an increase of about 1,160,000 horse power, or nearly 15 per cent over the total in 1921, which

was 7,926,958 horse power. Of the 1924 total 81 per cent was in public-utility plants and 19 per cent in manufacturing plants. The corresponding percentages in 1921 were 78 and 22. New York, with 1,542,983 horse power, was the leading State in developed water power; California, with 1,451,830, was a close second; Washington, with 480,356, was third; Maine, with 473,188, was fourth; and North Carolina, with 431,500, was fifth, displacing Montana, which ranked fifth in 1921. Water-power development in the New England, east north central, west north central, and mountain States had not kept pace with that in the other parts of the United States, as the following table shows.

DEVELOPED WATER POWER IN SPECIFIED DIVISIONS OF THE UNITED STATES, IN 1921 AND 1924

Division	Percentage of total in U. S.		Difference
	1921	1924	
New England	16.5	15.3	−1.2

* Plus sign indicates increase; minus sign, decrease.

WATERS, HENRY JACKSON (1865–). An American educator and editor born at Center, Mo., and educated at the University of Missouri and in Germany and Switzerland. He was connected with the Missouri Agricultural Experiment Station and from 1892 to 1895 was professor of agriculture at the Pennsylvania State College. Professor Waters was director of the Missouri State Agricultural Exhibition at the St. Louis Exposition in 1904, and from 1895 to 1909 he was director of the Experiment Station and professor of agriculture at the University of Missouri. From 1909 to 1917 he was president of the Kansas State Agricultural College and in 1918 became managing editor of the Kansas City *Weekly Star*. He was commissioner to the Philippines to report on agricultural and educational development and was a member of several State agricultural boards. During the War he was Federal Food Administrator. He wrote *The Essentials of Agriculture* (1915); *The Development of the Philippine Islands* (1915), and *Laboratory Manual of Agriculture*, with J. D. Elliff (1918).

WATERWAYS. See CANALS.

WATER WHEELS AND TURBINES. In the interval between 1914 and 1924 many important improvements were made in water wheels and turbines so that more efficient types were developed and greater capacities secured which were needed with the large power plants which were being built. By 1924 there were 3200 water-power plants of 100 horse power or more in the United States with a total capacity of installed water wheels of all types of 9,086,958 horse power, an increase of some 1,160,000 horse power, or nearly 15 per cent over the total in 1921. Of the 1924 total, 81 per cent was in public-utility plants and 19 per cent in manufacturing plants. The year 1923 was one of unprecedented activity in hydroelectric development in the United States and Canada. It was stated in *Power* (New York) that contracts for over 2,000,000 horse power of hydraulic turbines were placed in the two countries. One company alone had contracted to manufacture some 61 units for 31 plants to aggregate over 500,000 horse power, while another manufacturing corporation had contracts for more than 380,000 horse power. Of the new business of the year, nearly 1,000,000 horse power of hydraulic turbines were manufactured for the Dominion of Canada, and 750,000 horse power was to be installed in the provinces of Ontario and Quebec. Actual construction of hydroelectric plants either completed or in progress in the United States totaled over 2,000,000 in 1923. Both new plants and extensions to old installations were included in this total.

Hydraulic turbines are roughly divided into two main groups, reaction and impulse turbines. The reaction turbines are those in which the water enters the turbine runner when only a part of its energy has been converted into velocity; in the impulse turbines, the water strikes under atmospheric pressure when all its energy has been converted into velocity. The former type is the most used; both kinds are built in ever-increasing sizes. Thus in 1923 a 70,000 horse power turbine was placed in service at the No. 3 Plant of the Niagara Falls Power Company, and while this was the largest single unit to be installed up to 1924, it was typical of the tendency of the larger hydroelectric plants to provide as much capacity as possible in a single unit of large capacity.

The increase in the capacity of water wheels and their improvement was a natural result of the incentive to make every possible use of water power wherever available which came with the increased costs of fuel. (See WATER POWER.) For this reason not only were new installations made, but in many of the older plants new working parts were installed with the object of modernizing the equipment and securing larger power output and greater operating efficiency. The use of large single units practically began during the period under consideration, especially in the United States. Thus in 1916 the Tallahassee Power Company installed at its Yadkin River development in North Carolina three turbines which gave 31,000 horse power under an effective head of 180 feet and at 154 revolutions per minute. These were the largest units of the single-runner Francis type that had been built up to this time. Greater heads were used, as in 1918 at the White River generating station of the Puget Sound Traction Light and Power Company, where an output of 25,000 horse power was secured in a unit working under a head of 440 feet. This was part of an installation which numbered among its consumers of electric power the Coast Division of the Chicago, Milwaukee, and St. Paul Railway This head was exceeded in 1921 at the Kern River Plant No. 3 of the Southern California Edison Company, where two vertical-shaft 22,500-horse power Francis-type turbines were put into operation under an effective head of 800 feet. At this time were designed a group of 5 55,000-horse power reaction turbines, to work with an effective head of 305 feet, for the Queenston development of the Hydroelectric Power Commission of Ontario. By 1924 this installation had been increased to 8 units In 1921 there were installed at the new Caribou station of the Great Western Power Company

COURTESY WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY

HYDRO-ELECTRIC INSTALLATION AT THE NIAGARA FALLS POWER CO. PLANT

Diagrammatic view of No. 3 A unit including (above) a 32,000 Kv-a, 3-phase, 12,000 volts, vertical Westinghouse Waterwheel Generator operating at 150 revolutions per minute, and (below) a Morris Turbine

at Belden, Cal., two very large impulse wheel units rated at 30,000 horse power each; each unit consisted of two independent wheels mounted on each side of the generator and operating under a head of 1008 feet at 171 revolutions per minute. The high-head impulse wheels found favor on the Pacific Coast, and among the important units of this type installed in 1924 were four 25,000-horse power units in the Moccasin Creek plant of the San Francisco development of the Hetch Hetchy project with a head of 1200 feet, a new unit for the Caribou station already mentioned, and a 22,500-horse power unit of the Southern California Edison Company operating on a head of 1900 feet.

As distinct from these high-head impulse wheels, other modern developments were those with propeller type runners such as the two 28,000-horse power units in the Great Falls plant of the Manitoba Power Company, which in 1923 were working under a head of some 22 feet, but which with the completion of the rock-fill section of the dam would run with a head of 56 feet. A novel form of propeller-type runner was in use in Sweden; its blades were adjustable, so as to take care of variation in load. One particular unit of this type had its runner 19 feet in diameter and operated under a head of 21.25 feet. It was of 11,500-horse power capacity. In the La Gabelle development of the Shawinigan Water and Power Company on the St. Maurice River in Quebec, four 30,000-horse power propeller-type turbines were designed to operate under a 60-foot head. These not only were the largest units of this type built up to 1924 but were designed to operate under a higher head than had been previously attempted with machines of this class.

In 1924 there was built for the Oak Grove plant of the Portland Railway, Light, and Power Company in Oregon, a 35,000-horse power Francis-type turbine to operate under a head of 850 feet and to run at a speed of 514 revolutions per minute. Previously, two 25,000-horse power turbines had been built to operate with a head of 810 feet, so that the new unit had the record in this respect. It was one of a group of three ultimately to be installed in the power plant mentioned. At the Pitt River No. 3 hydroelectric plant of the Pacific Gas and Electric Company, three 33,000-horse power vertical Francis turbines were installed to operate under an effective head of 280 feet. At the No. 3 plant of the Niagara Falls Power Company, its first 70,000-horse power turbine, referred to above, designed to operate under a head of 214 feet and to run at 107 revolutions per minute, was put into service on Dec. 18, 1923, and the other two new units in this extension were completed in 1924. These turbines were the largest in capacity up to the time of their installation. Another large hydroelectric plant where new units were installed in 1923 was that of the Ontario Hydroelectric Power Commission at Queenston Here eight units of 60,000 horse power each had been provided for, and Nos. 5 and 6 were installed during 1923, while foundations for Nos. 7 and 8 had been completed so that these units could be placed and put into operation in 1924.

One of the important developments in connection with water-power plants was the increased use of automatic and remotely controlled hydroelectric stations. For example, at the Searsbury station of the New England Power Company, a 7500-horse power Francis turbine was directly connected to a 5000-kilovolt-ampere generator, which from a stationary condition could be put into operation, so as to supply current to the line in 35 seconds. Likewise a smaller unit with a generator of 1500-kilovoltampere capacity with automatic control was installed by the Adirondack Power and Light Corporation, while at another plant, two 4000-kilovoltampere waterwheel generators were employed with full automatic and supervisory control. It was believed that stations with larger installations than any attempted were economically possible under these conditions and that such plants would continue to be built in increased numbers.

Bibliography. Among the more notable new books dealing with turbines and hydraulic machinery generally were: Church, *Hydraulic Motors;* Mead, *Water Power Engineering*, 2d ed. (New York, 1915); Lof and Rushmore, *Hydroelectric Power Stations*, 2d ed. (New York, 1924); Camerer, *Wasserkraft Maschinen.* Also, for convenient reference, consult Kent, *Mechanical Engineers' Handbook*, 10th ed. (New York, 1923).

WATER WORKS AND WATER PURIFICATION. In number of places and number of population supplied, as well as in general efficiency and vital relations to the health and safety of the public, water works lead among the municipal enterprises of the United States. The number of municipalities actually served with public water supplies in 1924 was unknown, but taking into account the rate of growth indicated by the various issues of *The Manual of American Water Works* (1897, the latest) and *The McGraw Water Works Directory* (1915), it may be assumed that some 10,000 places enjoyed public water supplies. Many of these places were supplied from works outside their boundaries and several by private companies. In number of separate municipalities supplied, the Hackensack Water Company held the lead; it supplied some 50 different municipalities in northeastern New Jersey. A much larger population, although fewer separate municipalities, was supplied by State-built works in the Boston metropolitan district, operated under the direction of the Metropolitan District Commission. Both the first cost and operating expenses of these works are met by the municipalities, to which the water is delivered wholesale by meter measurement.

By far the greater part of the entire water supply in all countries of the world is drawn from surface sources, but considerable areas are favored with underground water drawn from springs and wells, some of the latter tapping artesian sources. Broadly speaking, water supplies drawn from surface sources are subjected to some degree of purification—filtration in Europe and largely also in the United States and Canada, with chlorination widely used in the two latter countries and gradually being introduced in England as a finishing process or insurance against stray disease-producing bacteria that may have escaped the filters. Chlorination is also extensively used in the United States where filtration has not been introduced. The chlorinating plants are relatively inexpensive in both first and operating cost. More than 50 of these were installed on the New York water supply; they ranged from capacities of

hundreds of millions of gallons a day on the Catskill Aqueduct supply down to small plants in other parts of the water-works system. New York City, Boston, San Francisco, Los Angeles, Portland, and Seattle are exceptional among larger American cities in not having filtration plants for their surface water supplies drawn from streams, and so are Chicago and Milwaukee among the cities on the Great Lakes. Nearly all the filtration plants of later construction in the United States and Canada have been of the rapid or mechanical type as compared with the slow sand filters most commonly used in England and introduced quite largely in the United States from the early 1890's onward for some 10 or 15 years. Water softening, long common in England, was introduced somewhat sparingly in the United States but was adopted in connection with a number of the mechanical filtration plants in the later years of the decade 1914–24. In the case of some underground water supplies, aëration and filtration plants were built for the removal of iron and manganese; a notable instance was recorded by Lowell, Mass., which in 1914 let a contract for a plant of this kind with a capacity of 10,000,000 gallons per day. An iron removal plant at Berlin, Germany, was described in *The Engineering News-Record* (Sept. 13, 1923).

Aside from the rapid introduction of chlorination and the increase in filtration plants, the most notable change in water-works systems during the decade was the substitution of centrifugal for reciprocating pumps. The centrifugal pumps, except in the rare cases where water power is directly available, are most frequently driven by steam turbines; but many of the later installations of centrifugal pumps are electric-driven. Cast iron remained by far the most widely used material for water pipe distribution systems. To keep down waste and to distribute justly the cost of the service according to the volume of water wasted and used, meters were becoming more and more common; many cities had practically all consumers metered. Meter rates or charges were being simplified by the elimination of the many slides in the old sliding scales. After careful committee work, both the American and the New England Water Works Associations adopted standard specifications for water meters and a standard basis of charging for water supplied through meters. Under the standard meter charge plan there is first of all a yearly, quarterly, or monthly stand-by charge, regardless of the quantity of water used. This is designed to take care of the large capital expense required to make a water-works system available regardless of how much or little water is used by a given consumer. For water actually consumed, there is a higher charge for relatively small quantities between a stated range, a low charge for large volumes, and also an intermediate charge.

Bibliography. Consult Flinn, Weston, and Bogert, *Water Works Handbook* (New York); Wegmann, *Conveyance and Distribution of Water* (New York); Hazen, *Meter Rates for Water Works*. See also AQUEDUCTS; MUNICIPAL OWNERSHIP; SEWERAGE AND SEWAGE TREATMENT.

WATSON, JAMES E. (1864–). An American public official, born at Winchester, Ind., and educated at De Pauw University. He began the practice of law in 1886 in his father's office. He was elected a member of the fifty-fourth, fifty-sixth, and sixtieth Congresses and was a candidate for the governship of Indiana in 1908. In 1916 he was elected United States Senator to fill the unexpired term of Benjamin F. Shively, deceased, and was reëlected for the term 1921–27.

WATSON, JOHN (1847–). A Canadian professor of philosophy (see VOL. XXIII). He published a volume of political philosophy, *The State in Peace and War* (1919), and in 1922 was honored by a collection of testimonial essays written by his former students.

WATSON, JOHN BROADUS (1878–). An American psychologist (see VOL. XXIII). He resigned from the faculty of Johns Hopkins University in 1920 and became consulting psychologist for a prominent advertising agency. In 1921 he joined the staff of the New School for Social Research (New York City), and lectured on behaviorist psychology. His work on *Psychology from the Standpoint of a Behaviorist* (1919) was instrumental in directing a movement on the part of American psychologists away from introspection to the empirical observation of external behavior. See BEHAVIORISM.

WATSON, THOMAS EDWARD (1856–). An American politician and writer (see VOL. XXIII). In 1916 he was for the third time tried for the publication of three chapters in his book, *The Roman Catholic Hierarchy*, and was finally acquitted. In 1917 he opposed conscripting soldiers for service abroad, and his magazines were barred from the mails.

WATSON, THOMAS LEONARD (1871–). An American geologist, born in Chatham, Va., and educated at the Virginia Agricultural and Mechanical College and later at Cornell University. During 1890–05 he was assistant chemist at the Virginia Experiment Station and during 1891–95 he was instructor in geology at his alma mater and during 1904–07 professor there. Meanwhile (1901–04) he held the chair of geology at Denison University and (1907–10) that of economic geology at the University of Virginia, where since 1910 he has also been head professor of the school of geology. In addition to many articles on geological subjects contributed to various journals and reports of surveys with which he has been connected, he was associated with H. Ries in the authorship of *Engineering Geology* (1914) and *Elements of Engineering Geology* (1921).

WATTS, MARY STANBERY (MRS. MILES TAYLOR WATTS) (1868–). An American novelist (see VOL. XXIII). Her later works include: *Three Short Plays* (1917); *The Boardman Family* (1918); *From Father to Son* (1919); *The Noon Mark* (1920); and *The House of Rimmon* (1922).

WAUGH, FRANK ALBERT (1869–). An American horticulturist, born at Sheboygan Falls, Wis., and educated at the Kansas Agricultural College and at Cornell University and in Germany. For several years he was engaged in newspaper work and from 1902 was professor of horticulture and landscape gardening at the Massachusetts Agricultural College. Professor Waugh was a member of several agricultural societies and wrote: *Landscape Gardening* (1898); *The Landscape Beautiful* (1910); *Beginner's Guide to Fruit Growing* (1912); *Rural Improvement* (1914); *Outdoor Theatres* (1917); and *Downing's Landscape Gardening* (1921). He was also landscape engineer col-

laborating with the United States Forest Service and in 1918–19 captain in the Sanitary Corps of the United States Army.

WEATHER AND WEATHER FORECASTING. See METEOROLOGY.

WEBB, BEATRICE (1858–). An English economist and author (see VOL. XXIII). She was a member of several important committees during and after the War, including the Reconstruction Committee in 1917–18, the war cabinet committee on women in industry in 1918–19, and the Lord Chancellor's advisory committee for women justices in 1919–20. In 1919 she wrote *Men's and Women's Wages: Should They Be Equal?*

WEBB, SIDNEY (1859–). An English economist and Socialist (see VOL. XXIII). His later works include *Toward Social Democracy* (1916), *The Works Manager To-day* (1917); *Story of the Durham Miners* (1921); *Fabian Essays, Edition of 1920.* He edited *How to Pay for the War* (1916). In collaboration with his wife, Beatrice Webb (q.v.), he also published *A Constitution for the Socialist Commonwealth of Great Britain* (1920) and *English Prisons under Local Government* (1922). In 1924 he became a member of the Macdonald government with the portfolio of President of the Board of Trade.

WEBB-POMERENE ACT. See TRUSTS.

WEEKS, JOHN WINGATE (1860–1926). An American banker and legislator (see VOL. XXIII). He succeeded Winthrop Murray Crane as United States Senator in 1913 but failed of reëlection in 1919. During the War he assisted in investigations which resulted in the reorganization of the ordnance and quartermaster departments and also of the aircraft production board. President Harding appointed him Secretary of War in 1921.

WEINGARTNER, FELIX (1863–). An Austrian musical conductor (see VOL. XXIII). From 1919 to 1924 he was chief conductor and general director of the Volksoper at Vienna. In the fall of 1924 he entered on his duties as general director of the Deutsches Opernhaus in Charlottenburg (Berlin). His recent works include two operas, *Meister Andrea* and *Terokayn* (both produced in Vienna, 1920); an overture, *Aus Schwerer Zeit;* and a second violin concerto.

WEINMAN, ADOLF ALEXANDER (1870–). An American sculptor (see VOL. XXIII). Among his recent works are a bronze statue of Lincoln in the Capitol at Frankfort, Ky.; the pediment group of the Capitol at Madison, Wis., and several war memorials. His most important recent decorative works were the sculptures for the Pennsylvania Station in New York City, culminating in the bronze statue of Alexander J. Cassatt (1923), and the sculptures for the Municipal Building, New York City. He recently became well-known as a medalist, having designed besides others the medals of the National Institute of Arts and Sciences, the American Numismatic Society (1920), and the dime and half-dollar of the national currency.

WEISMANN, THEORIES OF. See HEREDITY.

WELCH, WILLIAM HENRY (1850–). An American pathologist (see VOL. XXIII). Professor Welch has collected and published many individual contributions with the title *Papers and Addresses* (1920) and assumed the editorship of the *American Journal of Hygiene* (1921).

WELDING, ELECTRIC. See ELECTRIC WELDING.

WELFARE LEGISLATION. See CHILD LABOR.

WELLER, STUART (1870–). An American geologist, born in Maine, N. Y., and educated at Cornell and Yale Universities. In 1895 he became connected with the University of Chicago, where since 1915 he has been professor of palæontological geology. In addition to his professional work he has had wide experience on State geological surveys. He was also assistant geologist on the United States Geological Survey during 1901–06 and since then has been geologist. His specialty is palæozoic palæontology, particularly in its relation to geologic problems. In addition to papers on geological subjects he is the author of many reports on palæontology contributed to the publications of the national and State geological surveys with which he has been connected.

WELLESLEY COLLEGE. An institution for women at Wellesley, Mass., founded in 1875. The enrollment of students in 1914 was 1452 as compared with 1630 in 1923–24, the faculty numbered 140 in the earlier year as compared with 145 in the latter, and the library was increased from 80,000 to 109,444 volumes. In 1914 the main building of the college burned, and in the following years two dormitories, Tower Court, given by Mrs. Ellen Stebbins James, and Claflin Hall, named in memory of Governor and Mrs. Claflin; Founder's Hall, a recitation hall; the student alumnæ building, and two faculty residence buildings were constructed. A $2,000,000 endowment fund was raised, to which the Rockefeller Foundation gave $750,000; the General Education Board, $200,000; two anonymous donors, $100,000 each; and Andrew Carnegie, $95,000. The total endowment in 1923 amounted to $4,283,224. President, Miss Ellen Fitz Pendleton, M.A., LL.D.

WELLESZ, EGON (1885–). An Austrian composer and musicologist, born at Vienna. He studied there under Arnold Schönberg (counterpoint) and Bruno Walter (composition), at the same time taking courses in musicology at the university under Professor Adler. In 1911 he became professor of the history of music at the Neues Konservatorium in Vienna. His literary essays, contributed to various important musical journals, deal mainly with Byzantine and Oriental music. As a composer he is a follower of his teacher, Schönberg, and an extreme futurist. His compositions consist of an opera, *Prinzessin Girnara* (Frankfort, 1921); the ballets *Diana, Persisches, Achilles auf Skyros;* a symphonic poem, *Vorfrühling;* four string quartets; piano pieces; and many songs.

WELLS, FREDERIC LYMAN (1884–). An American psychiatrist (see VOL. XXIII). He was attached to the McLean Hospital at Waverley, Mass., from 1918 to 1921, and in 1921 he became consulting psychologist at the Boston Psychopathic Hospital and instructor at the Harvard Medical School. His works after the War include *Mental Adjustments* (1917) and *Pleasure and Behavior* (1923).

WELLS COLLEGE. An institution for women founded in 1868 at Aurora, N. Y. As the number of students was limited, the student body increased only slightly, from 194 in 1913 to 219 in 1923, and the faculty from 34 to 39 members. The number of volumes in the li-

brary rose from 25,160 to 44,861. Largely through two endowment drives, one for $500,000 and one for $1,000,000, the funds of the college were increased from $361,800 to $1,153,290; of this sum the General Education Board contributed $300,000. The comprehensive examination system for matriculation was adopted, honors courses instituted, and a modification of the group system put in force A wing was added to Glen Park, six cottages were bought, and an athletic club house was received from R. L. Zabriskie. The campus was increased from 76 to 280 acres. President, Kerr D. Macmillan, S.T.D.

WELLS, H(EBERT) G(EORGE) (1866–). An English novelist (see VOL. XXIII). During the War and after, he wrote several serious works which achieved wide circulation and added considerably to his already high reputation. These included: *Mr. Britling Sees It Through* (1916); *The Elements of Reconstruction*, under the pseudonym D. P. (1916); *War and the Future; God, the Invisible King; The Soul of a Bishop* (1917); *In the Fourth Year*, on the League of Nations; *Joan and Peter* (1918); *The Undying Fire* (1919); *The Outline of History; Russia in the Shadows* (1920); *The Salvaging of Civilization* (1921); *The Secret Places of the Heart; Washington and the Hope of Peace; A Short History of the World* (1922); *Men like Gods* (1923); *The Dream* (1924)

WENCKEBACH, KARL FRIEDRICH (1864–). An Austrian physician, known chiefly as a prominent member of the later school of cardiac specialists which came into being as the result of improved methods of diagnosis. He received his medical degree from the University of Vienna and was made a professor of internal medicine there. His first work on the heart was *Die Arrhythmie als Bestimmter Funktionsstörungen des Herzens* (1903), which appeared in English translation; and in 1914 he added *Die Unregelmassige Herzthatigkeit.* Dr. Wenckebach lectured in the United States after the War.

WERFEL, FRANZ (1890–). An Austrian poet and dramatist, born at Prague, and educated there and in Leipzig. He became a reader for the publishing house of Kurt Wolff in Munich. He is the author of *Der Weltfreund* (1911); *Wir Sind* (1913); *Einander* (1915); *Die Troerinnen* (1915), *Gesange aus den Drei Reichen* (1917); *Der Gerichtstag* (1919); *Besuch aus dem Elysium* (1919); *Nicht der Morder, der Ermordete Ist Schuldig* (1920); and the dramas, *Spiegelmensch* (1920), and *Bocksgesang* (1922), which have had a sensational success. See GERMAN LITERATURE.

WERRENRATH, REINALD (1883–). An American concert baritone, born in New York City. He studied first with his father, then with C. Dufft, A. Mees, and Percy Rector Stephens, and made his début at the Worcester Festival of 1907. He then made several transcontinental tours and everywhere met with enormous success. In 1918–19 he was a member of the Metropolitan Opera Company. He is especially fine in oratorio. He has written some male choruses and edited a collection of modern Scandinavian songs.

WERTHEIMER, MAX (1880–). A German psychologist, born at Prague, and educated in philosophy and psychology at the Universities of Prague and Berlin. He performed experiments at the Psychological Institutes of Berlin and Würzburg. He was professor at the University of Berlin and one of the editors of the review, *Psychologische Forschung.* His published monographs deal largely with the perception of movement, which he investigated from a new point of view. He was one of the leaders of the school of *Gestaltpsychologie*, or psychology of forms. His works include: *"Experimentelle Studien über das Sehen von Bewegung"* (*Zeitschrift fur Psychologie*, 1912); *"Untersuchungen zur Lehre von der Gestalt"* (*Psychologische Forschung*, 1922); and a doctoral dissertation, *Experimentelle Untersuchungen zur Tatbestandsdiagnostik.*

WESLEYAN METHODIST CHURCH OR CONNECTION OF AMERICA. An outgrowth of a society formed in Michigan in 1841, this denomination was established in 1843 at Utica, N. Y. In doctrine it is in accord with Methodist bodies generally throughout the world. The membership of the church increased slightly from 20,000 in 1914 to 20,939 in 1923, while the number of pastors declined from 840 to 628, and the number of societies from 675 in 1915 to 586 in 1923. The number of pupils in the Sunday schools increased from 29,038 in 1917 to 35,254 in 1923. In 1914 the denomination maintained three colleges and one theological seminary, in 1923, four colleges and the seminary. Home mission work was carried on throughout the decade in Alabama and the Blue Ridge Mountains, and foreign missions in Africa, India, and South America, and in Japan after 1919. Steps were taken at the 1923 General Conference toward the union of the Mennonite Brethren in Christ and the Pilgrim Holiness Church with the Wesleyan Connection.

WESLEYAN UNIVERSITY. A nonsectarian institution for the higher education of men at Middletown, Conn., founded in 1831. A sudden increase in the enrollment to nearly 600 men in 1919 demonstrated that without large additions to physical equipment and teaching staff the college could not give high-grade instruction to so large a number. The trustees therefore voted to limit the enrollment to 500 During the decade 1914–24 the number of members in the faculty was increased from 42 to 55, with 9 assistants, and the library was increased from 100,000 to 140,000 volumes. The Van Vleck Observatory, largely the gift of Joseph Van Vleck in memory of his brother, Prof. John Monroe Van Vleck, was opened in 1916; in the same year Mrs. Gardner Hall, Jr., gave $150,000 to build a chemistry laboratory in memory of her husband. Ralph Ensign and his son, Joseph R. Ensign, gave $30,000 to remodel the chapel, John Gribbel gave $10,000 for an organ; and the class of 1863 gave a set of chimes. The university received in 1923 from Mrs. Dexter Smith of Springfield, Mass., $175,000 toward the new library building. In the spring of 1922, William Arnold Shanklin, president of the university since 1909, successfully completed the campaign for adding $3,000,000 to the productive endowment. Dr. Shanklin was on leave of absence during the year 1922–23. In September, 1923, he resigned the presidency and was made president emeritus. Stephen Henry Olin was acting president in 1922–23 and Leroy Albert Howland in 1923–24.

WEST, REBECCA (1892–). An English author, educated at George Watson's Ladies' College in Edinburgh. In 1911 she became a

reviewer on the staff of the *Freewoman* and in 1912 began writing political articles for *The Clarion*. Later she wrote many articles for magazines and newspapers in England and America. Her books include: *Henry James* (1916); *The Return of the Soldier* (1918); *The Judge* (1922).

WEST AFRICA. See ASHANTI.

WESTERMANN, WILLIAM LINN (1873–). An American educator, born at Belleville, Ill., and educated at the University of Nebraska and in Berlin. For several years he was assistant at the University of Nebraska and taught in several schools in Illinois. He was instructor in Latin and Greek at the University of Missouri (1904–06), assistant professor of history at the University of Minnesota (1906–08), assistant professor of history at the University of Wisconsin (1908–20), and professor of ancient history at Cornell University (1920–). Later he came to Columbia. At the Peace Conference in Paris, he acted as adviser on Turkish matters and as chief of the division of western Asia. Professor Westermann wrote *Story of the Ancient Nations* (1912) and contributed to American historical and philological journals. He was also the author of *Westermann's Classical and Historical Map Series.*

WESTERMARCK, EDWARD ALEXANDER (1862–). A Finnish anthropologist (see VOL. XXIII). His recent works are *Marriage Ceremonies in Morocco* (1917); *The Origin and Development of Moral Ideas* (1917); and *The Belief in Spirits in Morocco* (1920).

WESTERN AUSTRALIA. A state of the Australian Commonwealth, occupying the entire western third of the continent. Area, 975,920 square miles; population in 1911, 284,114; in 1922, 339,501. Perth, the largest city, including its suburbs, had 154,866 inhabitants in 1921 (85,945 in 1911). Cultivation was spreading, there being 1,901,677 acres under crops in 1922 (1,537,922 acres in 1914). The wheat acreage continued to increase. Other agricultural products were oats, hay, barley, and fruits. The government, after the War, continued to apply itself to aiding settlers. Soldiers in particular were singled out for loans. Pastoral activities remained important. Sheep increased from 4,421,375 in 1913 to 6,506,177 in 1922. In 1921–22, 58,000,000 pounds of wool were exported. Gold production showed decreases over the period; the output of 1921 was valued at £2,352,098 as compared with £5,237,351 in 1914. There was a falling off in total mineral production: total value in 1913, £6,036,265; in 1921, £2,880,169. Value of production for 1920: agricultural, £8,733,000; pastoral, £4,380,000; dairying, £1,033,000; forestry and fisheries, £1,850,000; mining, £3,259,000; value added by manufacture, £3,718,000; total, £22,973,000. Imports and exports for 1914 were £8,960,397 and £8,406,182; for 1921–22, £12,037,779 and £13,628,883. Government accounts showed: revenues and expenditures for 1913–14, £5,205,343 and £5,340,754; for 1921–22, £6,907,107 and £7,639,242. The public debt of £30,728,078 in 1914 mounted to £58,485,854 in 1923. Railroad construction continued. Railway lines in 1922 totaled 3539 miles (2967 miles in 1914).

WESTERN COLLEGE FOR WOMEN. An institution at Oxford, Ohio, founded in 1855. The student enrollment increased from 260 in 1914 to 330 in 1923–24, the faculty was increased from 28 to 36 members, and the number of volumes in the library from 20,000 to 30,000. The productive endowment grew from $250,000 to $700,000. A new dormitory and a stone chapel were built during the period. President, William W Boyd, A.B., A.M., Ped.D.

WESTERN RESERVE UNIVERSITY. A nonsectarian institution at Cleveland, Ohio, founded in 1826. It included two colleges of liberal arts and sciences, Adelbert College for men and the College for Women, with 815 undergraduates in 1914, and 1500 in 1923–24; and five professional schools with 544 students enrolled in 1914, and seven professional schools, with 841 enrolled in 1923-24. The summer school in 1923 enrolled 1242 students, in association with the Cleveland School of Education. Under the same joint jurisdiction, 92 teachers in service were taking courses in 1923–24, and 343 students were enrolled in evening courses in business administration and chemistry. During the decade the faculty was increased from 228 to 478 in the regular staff, and the libraries from 82,000 to 163,000 volumes. The endowment in 1914 was $3,521,081.22, as compared with $4,403,282.07 in 1922–23, and the income was $269,006 10 in the earlier year as compared with $967,423.58 in the later. Twelve acres adjoining the main campus were bought for the School of Medicine in 1915, and in 1921 Samuel Mather gave $500,000 to assure the removal of the school to the new site. In the following year he pledged himself for the entire cost of the new buildings, which were expected to be completed early in 1924. The plans for the new campus included a hospital group consisting of Lakeside Hospital, the Babies' Dispensary and Hospital, and the Maternity Hospital; building of the two last mentioned was begun in 1923. New buildings constructed since 1914 include Flora Mather House, a dormitory for women; a gymnasium for men; and laboratories for the School of Pharmacy and for the department of household administration of the College for Women. The entrance requirements of the undergraduate colleges were broadened in 1919 by an increase in the number of electives which might be offered, and a diminution in the number of prescribed subjects. In 1922 the Dental School increased its entrance requirements to include a year of college work, the School of Pharmacy instituted a four-year course leading to the B S. degree, and a department of nursing education was added. to the College for Women. In 1922 a course in business administration was added to the liberal arts curriculum, leading to the B.A. degree, and in 1923 the department of nursing education was organized as a separate school of the university with an initial endowment of $500,000, the gift of Mrs. Chester C. Bolton. On the retirement of Charles Franklin Thwing after 31 years' service as president, James D. Williamson became acting president in 1921 and continued in office until 1923, when Robert E. Vinson, until that time president of the University of Texas, was elected president.

WEST INDIES. See the articles on the island groups and the separate islands: BAHAMAS; BARBADOS; CUBA; JAMAICA; HAITI; PORTO RICO; LEEWARD ISLANDS; WINDWARD ISLANDS; TRINIDAD; VIRGIN ISLANDS; GUADELOUPE; MARTINIQUE.

WESTMINSTER COLLEGE. A coeducational United Presbyterian institution at New

Wilmington, Pa., founded in 1852. The student enrollment increased from 206 in 1914 to 340 in 1924, the faculty from 18 to 25, and the library from 12,000 to 13,300 volumes. The endowment rose from $150,000 to $500,000, and a Bible Chair fund of $40,000 was raised. The gymnasium was built in 1921. President, W. Charles Wallace, D.D.

WEST POINT. See UNITED STATES MILITARY ACADEMY.

WEST VIRGINIA. West Virginia is the fortieth State in size (24,170 square miles), and the twenty-seventh in population; capital, Charleston. The population increased from 1,221,119 in 1910 to 1,463,701 in 1920, a gain of 19.9 per cent. The white population increased from 1,156,817 to 1,377,235; negro, from 64,173 to 86,345; native white, from 1,099,745 to 1,315,329; foreign-born white, from 57,072 to 61,906. The urban population rose from 228,242 to 369,007; the rural, from 992,877 to 1,094,694. The growth of the principal cities was as follows: Wheeling, 1910, 41,641; 1920, 56,208; Huntington, 31,161 to 50,177; Charleston, 22,996 to 39,608.

Agriculture. Agriculture in West Virginia, between 1910 and 1920, showed a considerable decline in some of its phases Thus, while the population increased 19 9 per cent, the number of farms decreased 9.7 per cent (from 96,985 to 87,289); and the total area in farms decreased 4.6 per cent, from 10,026,442 to 9,569,790 acres. The improved land in farms remained practically unchanged: 5,521,757 acres in 1910 and 5,520,308 in 1920. The percentage of total land area in farms decreased from 65.2 to 62.2; while the proportion of improved land to total land area remained constant at 35.9 per cent. The total value of farm property showed an apparent increase of 57.7 per cent, from $314,738,540 to $496,439,617; the average value per farm, from $3255 to $5687. In interpreting these values, however, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 87,289 farms in 1920, 72,101 were operated by owners, 1090 by managers, and 14,098 by tenants. The corresponding figures for 1910 were 75,978, 872, and 19,835. White farmers in 1920 numbered 86,785 and colored farmers 504. In 1910 white farmers numbered 95,977; colored, 708. In 1920, 52,617 farms were free from mortgage, 10,274 under mortgage; in 1910, 66,093 were free from mortgage, 9525 mortgaged. Cattle in 1920 numbered 587,462 (255,021 dairy cattle); in 1910, 620,288 (239,539 dairy cattle). Sheep numbered, in 1920, 509,831, compared with 910,360 in 1910; hogs, 305,211, compared with 328,188. The estimated production of the principal farm products in 1923 was as follows: corn, 20,152,000 bushels; wheat, 2,964,000; oats, 4,553,000, potatoes, 5,040,000; sweet potatoes, 362,000; tobacco, 7,529,000 pounds; and hay, 807,000 tons. Comparative figures, for 1913, are: corn, 22,692,000 bushels; wheat, 3,055,000; oats, 2,760,000; potatoes, 3,984,000; hay, 925,000 tons; and tobacco, 10,200,000 pounds.

Mining. West Virginia is second among the States in the value of its mineral products and second in the production of coal. Coal is by far its most valuable mineral although the output of natural gas, petroleum, and clay products is also of great importance. The progress of coal mining during the decade 1914–24 is indicated by the following production figures: 1914, 71,707,626 net tons, valued at $71,391,408; 1915, 77,184,069, $74,561,349; 1916, 86,460,127, $102,366,092; 1917, 86,441,667, $200,659,368; 1918, 89,935,839, $230,508,846; 1920, 89,970,707, $390,046,000; 1921, 72,786,996, $206,061,500; and 1922, 80,488,192 net tons. The greatly increased value of the coal produced in 1917 was due chiefly to conditions in the coal mining field which resulted in a greater demand for coal, and partly to the inflation of the currency which reduced the buying power of money and thereby increased prices. The production of natural gas, in which West Virginia ranks first, in 1914 was 236,489,175 thousand cubic feet; 1916, 299,318,907; 1918, 265,160,917; 1920, 239,718,800; and 1921, 174,920,800. In later years the production of natural gas gasoline was large and valuable: in 1920, 58,941,488 gallons; in 1921, 54,646,053. The production of petroleum was as follows: 1914, 9,680,033 barrels; 1916, 8,731,184; 1918, 7,866,628; 1920, 8,249,000; 1921, 7,822,000; and 1922, 7,021,000. Clay products increased from a value of $5,761,411 in 1914 to $7,634,321 in 1916; $10,988,677 in 1918; and $17,167,843 in 1920. In addition to the minerals mentioned above, the State produces also salt, sand and gravel, and stone. The total value of the mineral production in 1921 was $316,180,647, compared with $547,872,937 in 1920; $298,168,194 in 1919; $327,962,620 in 1918, and $133,633,229 in 1914.

Manufactures. West Virginia has many important industries. These had a steady growth from 1909. There were in the State, in 1920, 10 cities with more than 10,000 inhabitants, which contained 17.9 per cent of the total population and reported, in 1919, 41.2 per cent of the value of the State's manufactured products. There were in the State, in 1909, 2586 manufacturing establishments; in 1914, 2749; and in 1919, 2785. Persons engaged in manufacture numbered 71,463, 79,353, and 93,688; and the capital invested amounted to $150,922,586, $175,995,011, and $339,189,678, in those years. The value of products in 1909 amounted to $161,949,526; in 1914, $193,511,782; and in 1919, $471,970,877. The increase in value of products was, however, in great measure due to the change in industrial conditions brought about by the War and cannot be taken to indicate a proportionate increase in the manufactures during 1914–19; but the increase in number of persons employed clearly indicates a growth in the State's manufacturing activities. The principal industry in point of value of its product is the iron and steel and rolling mill, with an output valued in 1909 at $22,435,000; in 1914, $21,186,000; and in 1919, $85,036,000. Lumber and timber products rank second in point of value, amounting to $28,758,000 in 1909; $28,994,000 in 1914; and $46,314,000 in 1919. The manufacture of glass, third in value, had a product valued at $7,779,000 in 1909; $14,631,000 in 1914; and $42,730,000 in 1919. Wheeling and Huntington were the leading manufacturing centres. There were in Wheeling, in 1909, 176 manufacturing establishments, with a product valued at $27,077,000; in 1914, 201 with $27,879,000; and in 1919, 243 with $72,640,000. Parkersburg had, in 1909, 75 with

$5,498,000; in 1914, 83 with $7,143,000; and in 1919, 73 with $24,056,000.

Education. Much progress was made in the decade 1913–23, especially during its latter part, in the development and improvement of education. Among the notable features was the addition to the Department of Education of a supervisor of teacher training, a supervisor of health and sanitation, and a supervisor of physical education. A high school assistant supervisor and two rural professors were also added as part of the organization. The Legislature of 1919 passed three important measures: the teachers' salary law; a measure providing for the standardization of rural schools; and a law increasing the general school fund by $1,000,000 for each of the next two years. A high school movement in the State was increasing from year to year; the number of classified high schools rising from 171 in 1919–20 to 205 in 1922. The negro schools of the State made splendid progress during the decade. There were, in 1922, 16 recognized negro high schools, 6 of which were high schools of the first class. The enrollment in these schools had increased from 484 in 1919 to 903 in 1922. The development of vocational education kept pace with that of other branches. There was a very considerable enrollment in home economics, trades and industries, and mining and vocational agriculture. The Legislature of 1921 took an advanced step by passing what is known as the compulsory part-time law, requiring all cities with a population of 10,000 or more, and other industrial centres where as many as 50 young people are working under labor permits, to establish part-time schools or classes. In cooperation with the Federal government, the State Board of Education organized a civilian rehabilitation service, which was proving very effective in its operation. The total enrollment in the high and elementary schools in 1912 was 435,611; in 1922–23 it was 452,029. In the high schools, in the latter year, there were enrolled 29,334. The total colored enrollment in the elementary schools in 1921 was 18,979; in the high schools, 610. The total disbursements for public schools in 1922–23 amounted to $19,944,716. The percentage of illiteracy in the State decreased from 10.2 in 1910 to 8.2 in 1920: in the native white population, from 8.4 to 6.1; in the colored, from 24.2 to 18.9. In the foreign-born white population it increased from 23.9 to 24.5.

Finance. For finance, see STATE FINANCES.

Political and Other Events. The Democratic and Republican parties shared control in West Virginia in the decade 1914–24. On July 1, 1914, a drastic prohibition law went into effect, as a result of a State-wide prohibition amendment passed in 1912. The explosion at the New River Colliery Company's mines at Echo on Apr. 28, 1914, resulted in the death of some 180 miners, who were buried in the mine. In 1915 a report was made on the long-standing controversy between Virginia and West Virginia as to the liability of the latter in the State debt of Virginia before the separation of the two States. Charles D. Littlefield acted as special arbitrator and decided that West Virginia should pay between $12,000,000 and $18,000,000 as its share of the debt. He also declared that West Virginia should share in the assets, which he valued at $14,000,000. The Supreme Court, on June 14, 1915, decided the case by declaring that West Virginia should pay $12,393,929 as its net share of the debt at the time of the division of the States. In 1916, at the quadrennial elections for State officers, the Democrats, for the first time in two decades, elected their candidate for governor, John J. Cornwell. The Republicans elected their candidate for the United States Senate, Howard Sutherland. In the presidential voting of this year, Charles E. Hughes received 141,432 votes; President Wilson, 139,013. On Aug. 9, 1916, a cloudburst near Charleston destroyed many villages and caused a loss of 50 lives, with a property loss over $2,000,000. In 1918, Davis Elkins, Republican, was elected to the United States Senate. Elections for governor and other State officers were again held in 1920. E. F. Morgan, the Republican candidate, was elected governor. In the presidential voting of this year, W. G. Harding received 282,007 votes; J. M. Cox, 220,789. In May, 1921, as a result of disorders arising from strikes in the coal mines, Mingo County was placed under martial law by Governor Morgan. The strike was the result of an attempt to unionize the mines in this part of the State. The trouble continued until September, when the armed miners surrendered to Federal troops, who took charge of the situation. In 1922, M. M. Neely, Democratic candidate for Senator, was elected, defeating Senator Sutherland. The Democratic State committee, in May, 1924, endorsed John W. Davis as Democratic candidate for the presidency.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. In 1915 the Legislature enacted an amendment to the prohibition law and voted to submit to the people an amendment providing for woman suffrage. The Legislature of 1917 amended the election laws and passed a measure providing for the better protection of judges against personal violence. This Legislature refused to make provisions for the payment of the State's portion of the Civil War debt. The Legislature of 1919 provided for a constitutional amendment dividing the legislative session into two parts, the first, lasting 15 days, to be devoted to the introduction of bills; the second, after a recess, to be given to their consideration and final action. This Legislature authorized the creation of a State police force and enacted measures forbidding child labor. It also passed a measure providing for the compulsory school attendance of children under 14 years of age. A special session of the Legislature was held in 1920 to ratify the woman suffrage amendment. By virtue of a constitutional amendment ratified by the people in 1920, the Legislature of 1921 authorized the governor to issue $50,000,000 in bonds for permanent road improvement.

WEST VIRGINIA UNIVERSITY. A coeducational State institution at Morgantown, W. Va., founded in 1867. The student enrollment increased greatly during the decade between 1914 and 1924, with 775 registered in the first year and 2712 in the latter. The faculty membership was correspondingly increased from 80 to 216 and the number of volumes in the library from 47,000 to 70,000. Woman's Hall, Oglebay Hall, the medical building, and the Law School building were constructed during the period. A gift of valuable coal lands was received from Dr. I. C. White

and a farm and live stock from the estate of Lawrence A. Reymann. President, Frank Butler Trotter, LL.D.

WHARTON, EDITH (1862–). An American novelist (see VOL. XXIII). Her later books are: *Summer* (1917); *The Marne* (1918); *French Ways and Their Meaning* (1919); *The Age of Innocence* (1920); *Glimpses of the Moon* (1922); *A Son at the Front* (1923).

WHEAT. For the countries reporting their yields every year the production of wheat increased from an annual average of 1,500,000,000 bushels for the three years 1891–93 to 2,500,000,000 bushels for the three years 1919–21. In the United States production rose rapidly during the World War. For the years 1914–24 the average annual production was 837,464,000 bushels as compared with 681,368,000 bushels for 1904–13. The largest crop ever grown, 1,025,801,000 bushels, was produced in 1915 and the highest acreage, 73,099,421 acres, an increase of 20 per cent over any previous year, was harvested in 1919. The average annual yield of the leading States for 1914–23 was 115,968,000 bushels for Kansas, 83,703,000 bushels for North Dakota, and 56,595,000 bushels for Nebraska. The general effect of the war was to increase production and to limit consumption. The principal governments of the world passed laws requiring a maximum percentage of flour in grinding, prescribing minimum percentages of wheat flour substitutes in baking, placing wheat flour consumption on a rationing basis, regulating the trade in wheat and fixing the price. In the United States, wheat prices, beginning to rise with the outbreak of the War, had reached $1.40 per bushel by May, 1915. In 1917 the United States Food Administration fixed the price of Number One Northern Spring Wheat at $2.20 per bushel at Chicago with differentials for grades and other terminal markets. The price had reached $2.58 per bushel on June 1, 1920, a month before price fixation by the government terminated, and a downward movement began which, by December, 1921, had reduced the price to $.90 per bushel. In purchasing power the price of $.94 on Dec. 1, 1921, was below that of the low price of $.49 on Dec. 1, 1894.

The low prices for wheat and other farm products prevailing for a series of years while the things farmers had to buy remained practically at war-time price levels brought about a critical economic situation, especially in the spring wheat States, to the solution of which much thought and discussion were given. Congress revived the War Finance Corporation to assist in financing exportation, an Export Credit Corporation was launched, and other similar means were applied or proposed to alleviate the critical conditions. During this period cooperative marketing of products and purchasing of supplies was entered into by farmers more extensively than ever before. In Australia a system of selling wheat through state-controlled pools, inaugurated during the War, was continued after the War.

Standards and Grading. The United States Grain Standards Act of Aug. 11, 1916, authorized the Secretary of Agriculture to investigate the handling and grading of grain, establish official standards and license grain inspectors. Under this law all wheat in inter-State and foreign commerce is graded by the licensed inspectors according to the official wheat standards of the United States as revised and effective July 17, 1922. These standards, based on color and texture of kernels as indicating quality, comprise the following classes and subclasses:—Class I, hard red spring wheat, with subclasses (a) dark northern spring, (b) northern spring, and (c) red spring; Class II, durum wheat, with subclasses (a) amber durum, (b) durum, and (c) red durum; Class III, hard red winter wheat, including subclasses (a) dark hard winter, (b) hard winter, and (c) yellow hard winter; Class IV, soft red winter wheat, including subclasses (a) red winter, and (b) western red; and Class V, white wheat, with subclasses (a) hard white, (b) soft white, and (c) western white. Each subclass is divided into five grades, determined by test weight per bushel, moisture content, percentage of damaged kernels, purity, cleanliness and condition. Wheat failing to meet the specifications for any one of these grades is designated "sample grade." An extensive campaign to eradicate the common barberry, on which the spring stage of black stem rust of wheat occurs, was begun in 1918, and several million bushels of this plant were located and destroyed in the wheat-growing States of the northern Mississippi Valley. Consult *United States Department of Agriculture Year Book*, 1921. See AGRICULTURE.

WHEATON COLLEGE. A college for women at Norton, Mass., founded as a seminary in 1834, and chartered as a college in 1912. Between that year and 1924 the number of students entering for college work increased from 15 to 400. College courses replaced seminary courses; they were organized into departments and arranged in a group system; an entirely new faculty composed of 35 men and women was built up. The college had in 1924 about $1,000,000 in productive funds and $1,000,000 in buildings and equipment. During the decade 1914–24, the plant was enlarged by the construction of six brick buildings, including Science Hall, Cragin and Stanton Halls (dormitories), the chapel, the observatory, and the library; and by the purchase of two dwellings adjacent to the campus for faculty houses and three others for student dormitories. President, Samuel Valentine Cole, A.M., D.D., LL.D.

WHEAT RUST. See PLANTS, DISEASES OF.

WHEELER, BURTON KENDALL (1882–). An American public official, born at Hudson, Mass. He began his career as a stenographer in Boston, but later became a lawyer in Butte, Mont., and attracted much attention by his success in winning damage suits for the miners against the big copper companies. The liberal political element in Montana sent him to the State Senate, and he was appointed Federal District Attorney in Montana in 1913. During the War, Wheeler was accused of being too lenient with the miners and their leaders, and in 1918 President Wilson refused to reappoint him as District Attorney. In 1920 he was nominated for the governorship of Montana but was defeated. In 1922 he was elected to the United States Senate by a large majority. While in charge of the investigation of former Attorney General Daugherty, he was indicted in Montana on a charge of accepting a fee illegally. Although he was exonerated by a special Senate committee, the indictment remained against him. In 1924 he was nominated for the

office of Vice President of the United States on La Follette's progressive ticket.

WHIPPLE, GUY MONTROSE (1876–). An American psychologist, born at Danvers, Mass., and educated at Brown and Cornell Universities. He began teaching in 1902 at Cornell and went to the University of Illinois in 1914. The Carnegie Institute of Technology employed him from 1917 to 1919 as acting director of its bureau of salesmanship and as professor of applied psychology. In 1919 he became professor of experimental education in the University of Michigan. During the War he was a member of the committee on mental examination of army recruits. His writings include: *Questions in School Hygiene* (1909); *Manual of Mental and Physical Tests*, 2d ed. (1914); *How to Study Effectively* (1916); *Classes for Gifted Children* (1919).

WHITAKER, MILTON C. (1870–). An American chemist, born in Frazeysburg, Ohio, and educated at the University of Colorado. In 1903 he became chemist and general superintendent of the Welsbach Company but resigned in 1911 to accept the professorship of chemical engineering at Columbia University. This chair he held until 1917, when he was made vice president of the United States Industrial Alcohol Company and president of the United States Industrial Chemical Company. In 1923 he received the Perkin medal of the American section of the Society of Chemical Industry for his original work on the chemistry and production of alcohol and its derivatives. In 1911–16 he was editor of the *Journal of Industrial and Engineering Chemistry*.

WHITE, JAMES (1863–). A Canadian geographer (see VOL. XXIII). He was chairman of the Advisory Board on Wild Life Protection in 1917 and in the same year won the Alexandre Roquette prize. In 1921 he was employed in the Labrador boundary case and in 1922 became technical adviser to the Minister of Justice.

WHITE, JOHN ELLINGTON (1868–). An American Baptist clergyman and educator, born at Clayton, N. C., and educated at the Wake Forest College. Ordained to the Baptist ministry in 1892, he served as pastor in several churches in North and South Carolina. In 1916 he became president of Anderson College. He was the founder of a system of Baptist schools for the mountaineers and president of the Clifton Conference for negro schools. From 1914 to 1916 he was preacher and lecturer at the University of Chicago. He is the author of *The Silent Southerners* (1906); *The New Task and Opportunity of the South* (1908); *Southern Highlanders* (1913); and *A Yielded Pacifist* (1917).

WHITE, WILLIAM ALANSON (1868–). An American neurologist and alienist (see VOL. XXIII). Since 1914 Dr. White has produced several major works, beginning with the treatise on neurology written in collaboration with Jelliffe, *Diseases of the Nervous System* (1915). The ninth edition of his *Outlines of Psychiatry* appeared in 1923. The following monographs also came from his pen: *Mechanisms of Character Formation* (1916); *The Principles of Mental Hygiene* (1917); *The Mental Hygiene of Childhood* (1919); *Thoughts of a Psychologist on the War and After* (1919); *Foundations of Psychiatry* (1921), and *Insanity and the Criminal Law* (1923).

WHITE, WILLIAM ALLEN (1868–). An American journalist and author (see VOL. XXIII). During the War the American Red Cross sent him to Russia as an observer, and he was appointed a delegate to the Russian Conference at Prinkipo in 1919. His later publications include: *God's Puppets* (1916); *In the Heart of a Fool* (1918); *The Martial Adventures of Henry and Me* (1918); *The Editor and His People*, a collection of editorials (1924).

WHITEHEAD, ALFRED NORTH (1861–). A British mathematician and philosopher (see VOL. XXIII). After terminating his joint inquiry with Bertrand Russell into the foundations of mathematics and logic, he devoted himself to the elaboration of a philosophy of physical science. This philosophy, although conducted on realistic presuppositions, was free from the deterministic dogmatism characterizing so many realistic philosophies. In *The Principle of Relativity*, he presented what he regarded as an alternative rendering of the theory of relativity. He retained the metrical formula of Einstein's special theory but discarded the general theory and so reframed the equations as to maintain the traditional distinction between physics and geometry. His other works since 1914 include *Principles of Natural Knowledge* (1919) and *The Concept of Nature* (1920). In 1924 he was called to the faculty of Harvard University.

WHITEHEAD, JOHN BOSWELL (1872–). An American electrical engineer, born in Norfolk, Va., and educated at Johns Hopkins University. During 1893–96 he was an electrician with the Westinghouse Electric and Manufacturing Company, and during 1896–97 he was similarly associated with the Niagara Falls Power Company. In 1897 he returned to Johns Hopkins as instructor in applied electricity, and in 1910 he was advanced to a professorship. Since 1919 he has also been dean of the faculty of engineering there. His original researches have had to do with such subjects as magnetic effect of electric displacement, single-phase railway system, and submarine detection. During 1917–19 he was a major in the Engineers Corps. Besides many papers on engineering and physical topics, he wrote *Electric Operation of Steam Railways* (1909).

WHITEHOUSE, VIRA BOARMAN (MRS. NORMAN DE R. WHITEHOUSE) (1875–). An American publicist, born in Virginia, and educated at Newcomb College in New Orleans. In 1898 she married Norman de R. Whitehouse of New York City. From 1913 she was an active worker and speaker in behalf of woman suffrage and in 1916 was appointed chairman of the New York State Woman Suffrage party. Mrs. Whitehouse played an important part in securing woman suffrage for that State at the State election on Nov. 6, 1917. In 1918 she was sent to Europe by the United States government to organize publicity to combat German propaganda and to make plain the aim of the American people. In 1920 she became president of the Whitehouse Leather Products Company. She wrote *A Year as a Government Agent* (1920).

WHITE RUSSIAN SOCIALIST SOVIET REPUBLIC. See RUSSIA.

WHITE SLAVERY. See LEAGUE OF NATIONS.

WHITHORNE, EMERSON (1884–). An American composer, born at Cleveland, Ohio.

He studied there with J. Hartmann (piano and harmony) and J. Rogers (composition). From 1904 to 1906 he continued his studies in Vienna under Leschetizky (piano) and R. Fuchs (composition) and spent the following year in Berlin with Artur Schnabel (piano). In 1907–14 he lived in London as a teacher and writer on musical subjects and served as critic of the *Pall Mall Gazette* (1913–14). In 1915 he settled in St. Louis as editor for the Art Publication Society. In 1907 he married the pianist Ethel Leginska, but separated from her in 1909. His works include the symphonic poems, *Ranga, The City of Ys,* and *In the Court of the Pomegranates;* the orchestral suites, *Japanese, Adventures of a Samurai,* and *New York Days and Nights* (also arranged for piano); several minor works for orchestra; three string quartets; a song cycle for vocal quartet, *Songs of Sappho;* piano pieces, and songs. He is the author of *Instruments of the Modern Symphony Orchestra* (1921).

WHITLEY REPORT. See GREAT BRITAIN, *History.*

WHITLOCK, BRAND (1869–). An American author and diplomat (see VOL. XXIII). As United States Minister to Belgium during the War he opposed German aggression with great boldness and considerable success and on many occasions saved the Belgians from the effects of drastic edicts. In 1918 he wrote *Memories of Belgium Under the German Occupation.* He published *J. Hardin and Son,* a novel, in 1923.

WHITMAN COLLEGE. An institution founded in 1859 at Walla Walla, Wash. The student enrollment doubled in the 10 years between 1914 and 1924, increasing from 250 to 504; the faculty grew from 28 to 40 members, and the library from 25,000 volumes to 34,500 bound volumes and 50,000 pamphlets. The endowment increased from $663,493 to $882,924 and the annual income from $70,504 to $170,150. A major examination system, instituted during the period, required that a student must, before receiving his degree, pass an oral examination before a committee of the faculty on the entire work done in his major subject over three or four years of study. The honor system was also adopted for examinations and tests, and a chapter of Phi Beta Kappa was established. A campaign for $1,500,000 for buildings was inaugurated early in 1924, to be completed in June of that year. President, Stephen B. L. Penrose, D.D., LL.D.

WHITNEY, GERTRUDE VANDERBILT (?–). An American sculptress. During the War she founded a hospital in France and labored unremittingly among the soldiers. Her war sculptures are unique in their quality of distinctly feminine sympathy and tenderness for the young soldiers. Among the best of them are "Found," "Engineers," and "Not Yet Discharged." These are all figures and groups of young American soldiers.

WICKERSHAM, GEORGE WOODWARD (1858–). An American lawyer and public official (see VOL. XXIII). In 1915 he was delegate-at-large and chairman of the judiciary committee of the New York Constitutional Convention. From 1914 to 1917 he was president of the Association of the Bar of the City of New York. He was a member and later vice chairman of the District Board of the City of New York under the United States Selective Service Law in 1917–18. In 1920 he was president of the American Prison Association and chairman of the executive committee of the New York Prison Association.

WIDAL, (GEORGES) FERNAND ISIDORE (1862–). A French bacteriologist (see VOL. XXIII). In the decade since 1914 he added to the laurels which he had won in serodiagnosis and in the salt-poor diet for renal dropsy, by innovations in the prognosis of chronic kidney disease by determining the amount of residual blood nitrogen. In collaboration with Roger and Teissier he produced *Nouveau Traité de Médicine* (1920), and with Teissier and others, *Rhumatismes* (1924).

WIDDEMER, MARGARET (MRS. ROBERT HAVEN SCHAUFFLER) (?–). An American author, born at Doylestown, Pa., and graduated from the Drexel Institute Library School in 1909. She wrote poems when a child. A child-labor poem entitled *The Factories,* her first published work, attracted wide attention. Among her writings are: *The Rose-Garden Husband* (1915); *Winona of the Camp Fire* (1915); *Why Not?* (1915); *The Wishing-Ring Man* (1917); *Winona's War Farm* (1918). *The Old Road to Paradise* (1918), which gained her a share of the Pulitzer prize for the best book of poems, in the year 1919; *Graven Image* (1923).

WIEGAND, KARL MCKAY (1873–). An American botanist, born at Truxton, N. Y., and educated at Cornell University. He was assistant and instructor in botany at Cornell until 1907, and from then to 1913 he was associate professor of botany at Wellesley College. From the latter year he was professor of botany and head of the department at the New York State College of Agriculture at Cornell University. Professor Wiegand was the author of over 80 papers on botanical subjects.

WIESBADEN AGREEMENT. See REPARATIONS.

WIGGIN, KATE DOUGLAS (MRS. GEORGE C RIGGS) (1859–1923). An American author (see VOL. XXIII), who died in London in 1923. Among her later stories were: *Bluebeard,* a musical fantasy (1914); *Penelope's Postscripts* (1916); *Ladies in Waiting* (1918); and *Homespun Tales* (1920). Her reminiscences were published posthumously as *My Garden of Memories* (1924).

WILAMOWITZ-MÖLLENDORF, ULRICH VON (1848–). A German philologist (see VOL. XXIII). He translated and edited many Greek classics. His most recent works are *Antike Metrik* (1922) and *Pindar* (1923).

WILBUR, CURTIS DWIGHT (1867–). An American lawyer and public official, born at Boonesville, Iowa. He was graduated at the United States Naval Academy in 1888, resigned from the navy in the same year, and in 1890 began the practice of law in Los Angeles. He was judge of the Superior Court of Los Angeles County from 1903 to 1918 and became justice of the Supreme Court of California in 1919. He organized the Juvenile Court of Los Angeles and drew up several of the juvenile court laws of California. On the resignation of Edwin Denby, Judge Wilbur was appointed Secretary of the Navy by President Coolidge and took office on Mar. 25, 1924.

WILBUR, RAY LYMAN (1875–). An American physician and president of Stanford University (see VOL. XXIII). In 1917 he was

chief of the conservation division of the United States Food Administration and a member of the California State Council of Defense. In 1918 he was a regional director of the Students' Army Training Corps and in 1919 president of the California State Conference of Social Agencies.

WILCZYNSKI, Ernest Julius (1876–). An American mathematician, born in Hamburg in Germany, and educated at the University of Berlin. Coming to the United States in 1897, he became a computer in the office of the United States Nautical Almanac in 1898. In 1898 he was appointed instructor in mathematics at the University of California, where he remained until 1907 and became associate professor in 1906 He then transferred his allegiance to the University of Illinois but resigned in 1910 to accept the chair of mathematics at the University of Chicago, where he has since remained. He is the author of *Projective Differential Geometry of Curves and Ruled Surfaces* (1906); *The New Haven Colloquium*, with E. H. Moore and M. Mason (1910); *Plane Trigonometry and Applications* (1913), and *College Algebra with Applications* (1916).

WILDER, Harris Hawthorne (1864–). An American zoölogist, born at Bangor, Me., and educated at Amherst College and at Freiburg. He taught at the Jefferson High School in Chicago (1886–89), and at the Lake View High School (1891–92) and later became professor of zoölogy (1892–) at Smith College. His most important researches were on the embryology and anatomy of vertebrates, the epidermic markings of the palms and soles of the primates, and the teratology of vertebrates. He published *Invertebrate Zoology* (1894); *History of the Human Body* (1910); *Personal Identification* (1902); and *Manual of Anthropometry* (1920).

WILDMAN, Edwin (1867–). An American editor and author, born at Corning, N. Y., and educated at the General Wesleyan Seminary, Phillips Exeter Academy, and Harvard University. For several years he was editor and proprietor of newspapers in Georgia and New York and was a writer and war correspondent for *Leslie's Weekly* (1897–98). He served as special war correspondent in the Philippines from 1898 to 1900 and was special commissioner with the allied troops in the war in China (1900–01). From 1918 to 1920 he was president and editor of *The Forum* He wrote *Writing to Sell* (1915) · *America's Attitude toward the War* (1917); *American Leaders of Industry* (1919, 1921).

WILES, Irving Ramsey (1861–). An American portrait painter (see Vol. XXIII). His recent portraits, particularly those of women, continue his able, academic manner. In 1919 he received the Maynard Portrait Prize from the National Academy of Design, New York City, and the Lippincott Prize from the Pennsylvania Academy, Philadelphia.

WILEY, Hugh (1884–). An American writer, born at Zanesville, Ohio, and educated in the public schools. From 1902 to 1917 he was an engineer and contractor During the War he served in the Engineers Corps as a captain. Besides contributing many short stories to magazines, he wrote *The Wildcat* (1920); *Jade* (1921); and *Lady Luck* (1921).

WILLARD, Daniel (1861–). An American railway president, born at North Hartland, Vt., and educated at the Massachusetts Agricultural College. He entered the railway service in 1879 and became assistant general manager of the Baltimore and Ohio Railroad in 1899 and its president on Jan. 15, 1910. In 1917 he became chairman of the Advisory Commission of the Council of National Defense and in the next year was made chairman of the War Industries Board. He was commanding colonel of engineers in the United States Army in 1918.

WILLCOX, William Russell (1863–). An American lawyer (see Vol. XXIII). From 1916 to 1920 he was chairman of the Republican national committee. In 1918 he was appointed a member of the Railway Wage Commission.

WILLEBRANDT, Mabel Walker (1889–). An American lawyer, born at Woodsdale, Kan. She graduated from the Tempe Normal School in 1911 and from the law department of the University of Southern California in 1916 After teaching law for several years she was admitted to the bar and practiced in Los Angeles. She acted as public defender of women and was attorney in some 2000 cases. In 1902 she was appointed Assistant Attorney General of the United States, the first woman to fill that office. She was placed in charge of prohibition law enforcement.

WILLETT, Herbert Lockwood (1864–). An American theologian, born at Ionia, Mich., and educated at Bethany College, W. Va., and Yale, Chicago, Berlin Universities. In 1890 he was ordained to the ministry of the Christian Church and for several years was a pastor at Dayton, Ohio. He became associate professor (1896) and later professor of Semitic languages and literature at the University of Chicago The latter post he held from 1915. From 1908 to 1920 he was minister of the Memorial Church of Christ of Chicago. He was well-known as a lecturer and wrote: *Life and Teachings of Jesus* (1898); *Prophets of Israel* (1899); *The Moral Leaders of Israel* (1916); and *Our Bible—Its Origin, Character, and Value* (1917). From 1916 to 1920 he was president of the Chicago Church Federation, and in the latter year became Chicago representative of the Federal Council of Churches of Christ in America.

WILLIAM (Friedrich Wilhelm Victor August) (1882–). Ex-Crown Prince of Prussia and Germany (see Vol. XXIII). At the outbreak of the War he was put in command of the 5th Army on the west which won the battles of Longwy and Longuyon on Aug. 22 and 24, 1914. Later he was nominally in charge of the unsuccessful operations against Verdun. In November, 1918, he followed his father to Holland and took refuge on the island of Wieringen in the Zuyder Zee. On Dec. 1, 1918, he formally renounced his rights of succession to the crowns of Prussia and the German Empire

WILLIAM II (Friedrich Wilhelm Victor Albert) (1859–). Ex-Emperor of Germany and ex-King of Prussia (see Vol. XXIII). At the opening of the War, although professing a desire for peace, he insisted on impossible conditions: Austria must be allowed to deal with Serbia alone, England must observe neutrality, etc. At the opening session of the last Reichstag of his reign, when his armies were already devastating Belgium, his speech breathed fire and slaughter against his enemies, and at its conclusion he shook hands with

each deputy and announced: "Now we will give them a good thrashing." The High Command, however, kept him away from the front, and his part in the War consisted of occasional inflammatory speeches to troops and such utterances as that in which he urged the complete annihilation of Great Britain's "contemptible little army." He was never under fire, unless accidentally from airplanes, and his influence with his people constantly diminished until, at the time of Germany's collapse, the nation broke out in a revolution which had as one of its objects his abdication and the abjuring of his dynasty. Under pressure of his entourage, complying with this demand, he said on Nov. 10, 1918: "To facilitate peace for the nation I will go to Holland." With a few companions in motor cars he fled across the border and took up his residence first at the castle of Amerongen, where he was the guest of Count Godard Bentinck, and afterward at Doorn Castle (June, 1920), which the ex-Kaiser purchased. Here he saw few visitors and occupied himself with sawing wood and writing his memoirs. Here his wife died, after a lingering illness, and in 1922 he married Princess Herminie.

WILLIAM AND MARY, COLLEGE OF. A coeducational State institution at Williamsburg, Va., founded in 1693. The enrollment of students increased 248 per cent, from 242 in 1916 to 845 in the year 1923–24 and 697 in the summer of 1923. The faculty likewise increased from 21 to 46 members and the library from 15,000 to 35,000 volumes. In 1918 women were admitted to the college for the first time, and a dormitory was built for them in 1921. Construction was begun in 1923–24 on a new men's dormitory also, to cost about $200,000, and a gift was received by the college of a $160,000 gymnasium. Courses in commerce, accounting, and other business subjects were offered in 1919. J. A. C. Chandler, LL.D., succeeded Lyon G. Tyler as president in 1919.

WILLIAM JEWELL COLLEGE. A college for men at Liberty, Mo., founded in 1849. The student enrollment increased from 224 in 1914 to 403 in 1923–24, the faculty from 14 to 16, and the number of bound volumes in the library from 24,000 to 30,000. The endowment in 1914 was $258,000, as compared with $700,000 in December, 1923, plus $400,000 additional that was due to be paid in 1924; and the income in the former year was $50,000, as compared with $85,000 in the latter. President, Harry Clifford Wayman, A.M., Th.D., D.Litt., D.D.

WILLIAMS, A. J. (?–). An American naval lieutenant who made three world records. They were for the fastest aërial speeds: 266.59 miles an hour, for 3 kilometers; 243.81 miles an hour, for 100 kilometers; and 243.67 miles an hour, for 200 kilometers. The last two were made in the Pulitzer race at St. Louis, Oct. 6, 1923.

WILLIAMS, CHARLES TURNER (1874–). An American banker and Red Cross official, born at Warrenton, N. C., and educated in the public schools. He began as a stenographer, then became a newspaper reporter, and in 1904 entered the private banking business in Richmond, Va. In 1917 he was appointed captain in the Red Cross Mission to Rumania and crossed Siberia into Russia, thence to Archangel, and carried the first supplies from the United States south to Rumania. In 1918 he was promoted major. In order to take supplies to Archangel, he traveled 1500 miles by sled, mostly within the Arctic Circle. He assisted in the Liberty Loan campaigns and other war activities.

WILLIAMS, RALPH VAUGHAN (1872–). An English composer, born at Down Ampney in Wiltshire. He received his musical education at the Royal College of Music under H. Sharpe and G. Moore (piano), W. Parratt (organ), and Hubert Parry and Charles Villiers Stanford (composition). In 1897–98 he was in Berlin with Max Bruch, and later, developing a strong leaning toward impressionism, he spent some time with Ravel in Paris. With the exception of a short period as organist at South Lambeth Church (1896–99) and extension lecturer at Oxford University, he held no official positions but devoted his entire time to composition. He wrote for orchestra *A London Symphony, Pastoral Symphony, The Solent, Bucolic Suite, Heroic Elegy,* three *Norfolk Rhapsodies, Harnham Down,* and *Boldrewood,* a *Fantasia* for piano and orchestra; the choral works with orchestra, *Toward the Unknown Region, Willow-wood, A Sea Symphony, The Garden of Proserpine, Five Mystical Songs;* incidental music to Aristophanes's *The Wasps* and Ben Jonson's *Pan's Anniversary;* a Mass in G minor; two piano quintets; two string quartets; many part-songs; and songs.

WILLIAMS, SIDNEY CLARK (1878–) An American editor, born at Wells, Me., and educated in the public schools and privately. For several years he was on the staff of papers in Maine and in Boston. From 1912 to 1914 he was literary editor and dramatic critic of the *Boston Daily Advertiser,* and from 1914 to 1919 literary editor of the *Boston Herald.* In 1920 he occupied the same post on the *Philadelphia North American.* He wrote *A Reluctant Adam* (1915); *The Eastern Window* (1918); and *The Body in the Blue Room* (1922).

WILLIAMS COLLEGE. A nonsectarian institution for men at Williamstown, Mass., founded in 1793. The student enrollment increased from 499 in 1914 to 694 in 1923-24, the faculty was increased in the same decade from 59 to 65 members, the library from 78,000 to 115,000 volumes, and the productive funds from $1,842,243 to $4,069,415. The Institute of Politics, which holds its meetings during the summer, was authorized by vote of the trustees of the college in 1913, but the members of the board of advisers were not chosen until 1919, and the first session was held in 1921. See POLITICS, INSTITUTE OF. During the War the president, Harry A. Garfield, LL.D., was made fuel administrator of the United States.

WILLIS, HUGH EVANDER (1875–). An American lawyer and educator, born at Stratton, Vt., and educated at Yankton (S. D.) College and the law department of the University of Minnesota. He was instructor, assistant professor, and professor of law at the University of Minnesota from 1902 to 1913, and from that year to 1915 dean and professor of law at the Northwestern University Law School. In 1917 he became professor of law and in 1920 dean of the law school of the University of North Dakota. He wrote several books on legal subjects, including *Law of Social Justice* (1918).

WILLOUGHBY, WILLIAM FRANKLIN (1867–). An American economist, born in Alexandria, Va., and educated at Johns Hopkins University. During 1901 he lectured on economics at Johns Hopkins and Harvard Uni-

versities, and during 1901–07 he was treasurer of Porto Rico. He was president of the executive council of the Porto Rico Legislative Assembly during 1907–09, when he was appointed assistant director of the United States Census. Two years later he became a member of the President's Commission on Economy and Efficiency. He was called to the chair of jurisprudence and politics at Princeton University in 1911 but resigned in 1916 to become director of the Institute for Government Research. In addition to many reports and special articles he is the author of *Workingmen's Insurance* (1898), *Territories and Dependencies of the United States* (1905), *The Problem of a National Budget* (1918), *The Government of Modern States* (1919), and *Government Organization in War Time and After* (1919).

WILLS, ALBERT POTTER (1873–). An American physicist, born in Waltham, Mass., and educated at Tufts College and Clark University, as well as in Göttingen and Berlin. During 1899–1902 he was an associate in applied mathematics and physics at Bryn Mawr College, after which, during 1902–03, he was physicist at the Cooper Hewitt Laboratory in New York City. He then became instructor in mechanics at Columbia University, where since 1909 he has been professor of mathematical physics. His original investigations have included studies on magnetic permeability, magnetic shielding, magneto-striction, magnetic properties of gases, hydrodynamic analogy to electric and magnetic fields, and other subjects related to magnetism.

WILLSIE, MRS. HONORÉ (?–). An American editor and writer, born at Ottumwa, Iowa, and educated at the University of Wisconsin. She was editor of *The Delineator* in New York City from 1914 to 1919. Her novels portray western life. *Heart of the Desert* (1913) was her first published novel, and won immediate recognition. Others were: *Still Jim* (1915); *Lydia of the Pines* (1916); *Benefits Forgot* (1917); *The Forbidden Trail* (1919); *The Enchanted Canyon* (1921); and *Judith of the Godless Valley* (1922).

WILMINGTON. The largest city of Delaware. Its population increased from 87,411 in 1910 to 110,168 in 1920, and to 119,828 in 1924 by estimate of the Bureau of the Census. In 1921–22 a deep-water terminal costing $3,410,000 was built on the Delaware and Christiana Rivers. It was fully equipped with loading and unloading facilities, railroad sidings, transit and storage sheds, and other facilities for both coastwise and foreign shipping. The value of Wilmington's manufactured products increased from $39,358,000 in 1914 to approximately $100,000,000 in 1923; her building activities rose from $1,731,129 in 1914 to $3,876,950 in 1924; and her bank clearings increased from $91,997,925 in 1914 to $140,527,235 in 1924. A new public library was built in 1923 costing approximately $535,224. As a memorial of the veterans of the War, a reinforced concrete bridge was opened in 1923 over Brandywine Creek. It was 720 feet long and 72 feet wide and was supported by three arches, the longest of which had a span of 250 feet.

WILSON, CHARLES STETSON (1875–). An American diplomat, born at Bangor, Maine. He began his diplomatic career as secretary of legation to Greece, Rumania, and Serbia in 1901. After serving in the legations in many capitals, among them Buenos Aires, Rome, and Havana, he was secretary of the embassy at Madrid (1916–18), and later counselor there and chargé d'affaires at Sofia in Bulgaria (1918–21). He was named Envoy Extraordinary and Minister Plenipotentiary to Sofia in October, 1921.

WILSON, EDWIN BIDWELL (1879–). An American mathematician, born in Hartford, Conn., and educated at Harvard, and Yale Universities, and in Paris. He became instructor in mathematics at Yale in 1900 and assistant professor in 1906; a year later he accepted a call to the Massachusetts Institute of Technology, where he was professor of mathematical physics and head of the department of physics in 1917–22. Since 1922 he has been professor of vital statistics at the Harvard School of Public Health. His original investigations include studies of vector analysis, multiple algebra, geometry, mechanics, and relativity. His publications include *Gibbs Vector Analysis* (1910), *Advanced Calculus* (1912), and *Aëronautics*, Lowell lectures (1920).

WILSON, SIR HENRY HUGHES (1864–1922). A British field marshal, born in Ireland. He joined the army in 1884 and served in Burma and South Africa. Promoted to the rank of colonel in 1904, he later became commandant of the staff college. In 1910 he was appointed director of military operations and in 1914 deputy chief of the general staff and liaison officer between the French and British forces. He commanded the 4th Army Corps in 1915 and in 1917 went to Russia at the head of a military mission. At Versailles he served as British military representative on the new Supreme War Council In February, 1918, he became chief of the Imperial General Staff. He became a general and finally a field marshal, but in December, 1921, he resigned from the War Office and was elected a member of the Northern Irish Parliament in Ulster.

WILSON, (THOMAS) WOODROW (1856–1924). The twenty-eighth President of the United States (see VOL. XXIII). The first two years of President Wilson's administration were marked by noteworthy achievements; the reduction of the tariff, the establishment of the Federal Reserve Bank System (1913), the Clayton Antitrust Act and the Federal Trade Commission (1914), were in large part due to his personal leadership of the Democratic party. The "new freedom" of domestic policy was marked by the keynotes of democracy and justice in foreign affairs. He withdrew from the Chinese financial consortium, deprecated economic imperialism and territorial aggrandizement in Latin America, tried to make amends to Colombia for the Panama Canal seizure, and pursued his course of "watchful waiting" with respect to Mexico, intervening only reluctantly when popular opinion demanded bold action to satisfy the outraged national honor. The outbreak of the War elicited from him an appeal to his fellow-countrymen to "be impartial in thought as well as in action." From the beginning, he believed it would be the mission of the United States to step forward, at the proper moment, as disinterested peace-maker. At times this hope was imperilled; the *Lusitania* and *Sussex* notes brought the United States to the verge of a break with Germany. But he could go to the country, in the election of 1916, on the issue that "he kept us out of war," and his re-election in November, 1916, by a popular plural-

ity of nearly 600,000, seemed to express the nation's approval of his course.

The events of 1917 clearly indicated that the lot of the United States could not remain that of a disinterested spectator. Germany's announced policy of unrestricted submarine warfare, the failure of her leaders to realize that President Wilson's severance of diplomatic relations threatened war, the continuance of submarine outrages, compelled him to ask Congress on Apr. 2, 1917, for a war declaration. Only then did he give full utterance to his belief that German autocracy must be crushed and the world "made safe for democracy." The War was prosecuted to the fullest extent of American resources. The United States under President Wilson gained a material leadership first and then a spiritual one. Wilson's historic "Fourteen Points" speech of Jan. 8, 1918, and his address of Sept. 27, 1918, promising justice even to "those to whom we do not wish to be just," won him so commanding a position as spokesman of the Allies that to him Germany's peace overtures were directed. The calling of the Peace Conference found him ready to attend in person, and the extraordinary enthusiasm with which the peoples of Europe greeted him, as the prophet of justice and the hope of the world, convinced him of the wisdom of his decision. The story of his courageous fight for a just peace and a League of Nations, of his departure for the United States in February, 1919, with the draft of the covenant, of his return to Paris in March, his conflicts with the Italians regarding Fiume, with the French concerning the Rhine, and the Japanese regarding Shantung, and his voyage home at the end of June with the completed Peace Treaty, is told in the article PEACE CONFERENCE AND TREATIES. The making of the peace had estranged him from Colonel House and Secretary Lansing; the opposition of the Republican Senate to the Treaty strengthened his resolve to make plain to the country the nature of his achievement. On Sept. 3, 1919, he began his coast-to-coast tour, but the great strain placed on him compelled him to retire to Washington, a very sick man. The disappointment of the rejection of the Treaty by the Senate in March, 1920, was tempered for him somewhat by knowledge of the instrument's ratification by the European powers and the establishment of the League itself in January, 1920. The last blow showed him how unsympathetic public opinion was: the presidential elections of November, 1920, to which he had looked for a "solemn referendum" on the League, gave an overwhelming majority to the Republican candidate, Warren G. Harding, who opposed the League.

On Mar. 4, 1921, he retired to private life and continued his residence in Washington. He lived to see the League of Nations firmly established, and he continued to deplore America's "sullen and selfish isolation" (speech of Nov. 11, 1923). He died on Feb. 3, 1924. He was survived by three daughters, Miss Margaret Wilson, Mrs. Francis B. Sayre, and Mrs. William G. McAdoo, children of his first marriage, and by his second wife, the former Mrs. Edith Bolling Galt, whom he had married on Dec. 18, 1915. See WAR, DIPLOMACY OF THE; UNITED STATES, *History*.

WILSON DAM. See DAMS.

WINDS. See METEOROLOGY.

WINDWARD ISLANDS. A group of islands in the British West Indies, consisting of Grenada, St. Vincent, the Grenadines (half under St. Vincent and half under Grenada), and St. Lucia. These constitute three separate colonies but are administered by a single governor Total area, 524 square miles; total population in 1911, 157,264; in 1921, 170,581. The leading products were cocoa, lime juice, sugar, rum, cotton. Commercial and financial statistics for 1921 follow (1913 figures in parentheses): imports, £620,761 (£694,219); exports, £611,107 (£756,809); revenue, £225 914 (£193,121); expenditure, £296,118 (£192,353); public debt, £391,350.

WINTER, GEORG (1856–). A German gynecologist and obstetrician, distinguished for his efforts in the prevention of cancer and the falling birth rate. Born in Rostock, he received his medical education at the University of Heidelberg, and in 1897 was made professor of obstetrics and diseases of women in the University of Königsberg and director of the female clinic. In 1896, in collaboration with Rüge, he published his important work, *Lehrbuch der Gynakologische Diagnostik*, which was translated into Russian and English. His small work, *Die Bekampfung des Uteruskrebs*, appeared in 1904. His prolonged study of the subject of falling birth rates led to the publication of two companion books, *Die Indikationen zur Kunstlichen Unterbrechung der Schwangerschaft* (1918) and *Die Indikationen zur Kunstlichen Sterilisation der Frau* (1920). In 1922 a *Festschrift* volume was published.

WIRELESS TELEPHONY. See RADIO TELEPHONY.

WIRTH, KARL JOSEPH (1879–). A German statesman, born in Baden, and educated at the University of Freiburg. He became a teacher of economics at the Technical College in Freiburg in 1908. As a member of the Catholic Centre party he sat in the Diet of Baden in 1913 and was appointed Minister of Finance in 1918. He was elected to the Constituent Assembly by the Reich at Weimar in 1919 and received the portfolio of finance in March, 1920. When the ultimatum on reparations was presented by the Allies in May, 1921, Dr. Wirth was asked to form a new cabinet. He secured the coöperation of Democrats, Catholics, and Socialists. The new ministry then accepted the Allies' reparation terms, and by Aug. 31, 1921, the first half-yearly instalment had been paid. Dr. Wirth stood his ground solidly against various attempts to overturn the German Republic but it did not conceal his fear that the partition of Upper Silesia would render it impossible for Germany to fulfill her obligations.

WISCONSIN. Wisconsin is the twenty-fifth State in size (56,066 square miles), and the thirteenth in population; capital, Madison. The population was 2,333,860 in 1910 and 2,632,067 in 1920, an increase of 12.8 per cent. The white population increased from 2,320,555 to 2,616,938; negro, from 2900 to 5201; native white, from 1,807,986 to 2,156,810. The foreign-born white population, on the other hand, decreased from 512,569 to 460,128. Both urban and rural populations mounted, the former from 1,004,320 to 1,244,568; the latter from 1,329,540 to 1,387,499. The growth of the principal cities was as follows: Milwaukee (q.v.), 1910, 373,-

COPYRIGHT BY HARRIS & EWING

WOODROW WILSON

857, 1920, 457,147; Racine, 38,002 to 58,593; Kenosha, 21,371 to 40,472. Superior's population in 1910 was 40,384; in 1920, 39,671 (a decrease).

Agriculture. As Wisconsin is one of the important grain-growing States, agricultural conditions in the decade 1910–20 were affected largely by the fluctuations in price and production of grain products during the war and post-war periods. This general situation is discussed fully in the article AGRICULTURE and in the articles on various grains, WHEAT, CORN, and others. While the population of the State increased 12.8 per cent in the decade, the number of farms increased 6.9 per cent (from 177,127 in 1910 to 189,295 in 1920); the total area of land in farms increased 5.2 per cent (from 21,060,066 to 22,148,223 acres); the improved land in farms, 4.6 per cent (from 11,907,606 acres to 12,452,216). The percentage of the total area in farms increased from 59.6 per cent in 1910 to 62.6 in 1920; the proportion of improved land to the total area from 33.7 to 35.2. The total value of farm property showed an apparent increase of 89.5 per cent, from $1,413,118,785 to $2,677,282,997, the average value per farm, from $7978 to $14,143. In interpreting these values, however, and, indeed, all comparative values in the decade 1914–24, the inflation of the currency in the latter part of that period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 189,295 farms in 1920, 159,610 were operated by owners, 2427 by managers, and 27,258 by tenants. The comparative figures for 1910 were 151,022, 1451, and 24,654. White farmers in 1920 numbered 188,632; colored farmers, 663. In 1910 white farmers numbered 176,536, colored, 591. The number of farms free from mortgage in 1920 was 57,773; under mortgage, 94,258. In 1910 farms free from mortgage numbered 72,941; mortgaged, 77,129. The total number of cattle in 1920 was 3,050,829 (2,763,483 dairy cattle); in 1910, 2,680,074 (dairy cattle, 1,473,505). This reflects the large growth of the dairy industry, which has made Wisconsin the leading dairy State. Sheep in 1920 numbered 479,991, compared with 929,783 in 1910; hogs, 1,596,419, compared with 1,809,331. The estimated production of the principal farm crops in 1923 was as follows: corn, 90,326,000 bushels; spring wheat, 928,000; winter wheat, 1,122,000; oats, 93,574,000; barley, 13,484,000; rye, 5,062,000; potatoes, 27,287,000; hay, 3,926,000 tons; tobacco, 48,092,000 pounds; and sugar beets, 129,000 short tons. Comparative figures for 1913 are: corn, 66,825,000 bushels; wheat, 3,665,000; oats, 83,038,000; barley, 18,125,000; rye, 7,438,000; potatoes, 32,155,000; hay, 3,848,000 tons; and tobacco, 50,740,000 pounds.

Mining. Wisconsin is not among the States most important in mineral production. Its chief minerals in the order of their value are stone, sand and gravel, mineral waters, and lime. Iron ore also is produced. The iron shipped from mines in 1914 was 591,595 long tons, valued at $1,178,610; 1916, 1,529,459, $3,644,542; 1918, 1,167,640, $3,796,408; 1920, 1,067,159, $4,333,307; 1921, 117,755, $300,954; and 1922, 794,673, $2,455,660. The value of clay products is about $1,000,000 annually. The total value of the mineral production in 1921 was $9,990,961, compared with $19,630,114 in 1920; $18,772,601 in 1919; $20,091,146 in 1918; and $11,140,365 in 1914.

Manufactures. Wisconsin is an important industrial State and its development was steady after 1909. In 1920 it had 21 cities with more than 10,000 inhabitants. These contained 36.6 per cent of the total population and in 1919 reported 63.9 per cent of the State's manufactured products. There were in the State, in 1909, 9721 manufacturing establishments; 1914, 9104; and 1919, 10,393. Persons engaged in manufacture numbered 213,426, 230,273, and 317,899; and the capital invested amounted to $605,657,324, $754,287,116, and $1,361,729,196, in those years. The value of products in 1909 was $590,305,538; 1914, $695,172,002; and 1919, $1,846,984,307. The large increase in value of products from 1914 to 1919 was, however, in great measure due to changes in industrial conditions brought about by the War and cannot properly be used to measure the expansion of manufactures during the period; but the increase in the average number of persons employed and in the number of establishments clearly indicates a decided growth in the manufacturing activities of the State. The principal industry in point of value of products is the manufacture of automobiles and parts. The value of these, in 1909, was $11,440,000; 1914, $18,478,000; and 1919, $119 381,000. Slaughtering and meat packing ranks second in value, with $27,217,000 in 1909; $34,698,000 in 1914; and $106,207,000 in 1919. The leather industries, third in this respect, in 1909 had a product valued at $44,668,000; 1914, $42,204,000; and 1919, $94,762,000. The chief manufacturing cities are Milwaukee, Racine, and Kenosha. There were in Milwaukee, in 1909, 1764 manufacturing establishments, with a product valued at $208,324,000; 1914, 1728 with $223,555,000; and 1919, 2093 with $576,161,000. Racine had, in 1909, 142 establishments, with a product valued at $24,673,000; 1914, 189 with $43,632,000; and 1919, 230 with $120,027,000. Similar figures for Kenosha are: in 1909, 62 with $23,182,000; 1914, 75 with $28,341,000; and 1919, 84 with $103,726,000. Other important manufacturing cities are Green Bay, Beloit, La Crosse, Sheboygan, Superior, and Appleton.

Education. Education in Wisconsin has always been maintained at a high degree of excellence, and great progress was made in the decade 1914–24. Special attention was given to improvement in the administration of elementary schools. Results are shown by the fact that while 49 out of every 100 pupils finished the eighth grade in 1914–16, 60 out of every 100 finished in 1918–20. This increase, indicating an upward trend in the holding power of the elementary school in the State, may be attributed in part to an awakened interest in education on the part of parents, to the enforcement of the compulsory education law, and to changes gradually taking place in the school organization. Special attention was also given during the period to the increased efficiency of the high schools. There are in the State four types of secondary schools, the State graded schools, four-year high schools, junior high schools, and senior high schools. The number of high schools in the State increased from 318 in 1913 to 407 in 1920. State supervision of the public high schools was in charge of five supervisors; the primary purpose of such supervision was to assist local school authorities

and teachers in the improvement of their schools. The junior high school law, enacted in 1919, provided for the establishment of such schools under the required conditions. The State graded schools, created by a legislative act in 1901, had been a feature of the Wisconsin educational system for 20 years. In 1921–22 there were 226 State graded schools of the first class, which means schools of three or more departments; and 352 graded schools of the second class, each of two departments. Every county contained at least one graded school. Vocational work had been carried on since 1913, when the Legislature gave high schools special financial aid to further the introduction and maintenance of certain so-called "vocational training courses," including courses in manual training, domestic science, agriculture, and commercial science; the system was being developed to a high degree of efficiency. The total enrollment in the schools in 1921–22 was 498,398; with 283,889 in the country schools and 214,509 in city schools. The enrollment in rural schools was 26,465 and in city high schools 46,698. The public school enrollment in 1923 was 506,071, compared with 440,103 in 1914. Total disbursements for educational purposes in 1921–22 were $23,182,162. The percentage of illiteracy in the State decreased from 4.2 in 1910 to 3.2 in 1920: in the native white population, from 0.9 to 0.6; in the foreign-born white, from 8.9 to 8.8; and in the negro, from 5.3 to 4.8.

Finance. For finance, see STATE FINANCES.

Political and Other Events. During the decade 1914–24, Senator La Follette remained the conspicuous Republican leader of the State. He was, however, opposed with success both by Governor Philipp, who was three times elected during the decade, and by Senator Lenroot, who was twice elected to the Senate. The formation by Senator La Follette of a new party in 1924 practically removed him from the Republican party in the State. In the elections held in 1914 for governor, other State officers, United States Senator, and Congressmen, the Republican candidate for governor, E. L. Philipp, was elected, while the Democrats elected their candidate, Paul O. Husting, as Senator. Senator La Follette was reëlected in 1916, and so was Governor Philipp, together with all the Republican State candidates for office. In the presidential voting of this year, Charles E. Hughes received 221,323 votes; President Wilson, 193,042. The stand taken by Senator La Follette on government war measures aroused bitter feeling in the State in 1917, and a movement was begun to have him expelled from the Senate. No action was taken. Senator Husting was accidently killed while hunting, in 1917, and in 1918 Irvine L. Lenroot was chosen to succeed him. Governor Philipp was reëlected in 1918. In 1920 the Republicans elected their candidate for governor, John J. Blaine. Irvine L. Lenroot was reëlected to the Senate. In the presidential voting of this year, W. G. Harding received 498,576 votes; J. M. Cox, 113,422. Governor Blaine was reëlected in 1922. Senator La Follette was also reëlected. The Democratic candidate for the Senate at this election was a woman, Mrs. Ben C. Hooper. The presidential primary elections were held in May, 1924. The Republican majority was given to Senator La Follette and the Democratic to Gov. Alfred E. Smith of New York.

Legislation. The eugenic marriage law passed by the Legislature in 1913 was upheld by the Supreme Court in 1914. The Legislature of 1915 defeated measures providing for the submission of a woman suffrage amendment to the people. In 1917 the laws relating to criminal procedure were amended, and provision was made for absentee voting. The banking and insurance laws of the State were also amended. Two sessions of the Legislature were held in 1919. A special session was called, chiefly for the purpose of passing the soldiers' bonus law. This provided for a payment of $10 a month for each month of service. The act was submitted to the people at a special election and was adopted. The labor laws were amended, and a State Board of Conciliation was created. The Legislature of 1921 provided for a juvenile department for the care of dependent, defective, and delinquent children. The school laws were also amended in other particulars, and equal rights were given to women in respect to suffrage, jury service, holding office, and the care and custody of children. In 1923 the Legislature made the sale of narcotics a felony and the possession of drugs illegally obtained a crime. The labor laws were amended by extending a measure limiting injunctions to labor disputes, to apply to any dispute whatsoever concerning employment.

WISCONSIN, UNIVERSITY OF. A coeducational State institution at Madison, Wis., founded in 1848. The student enrollment increased from 4874 in the fall of 1914 to 7632 in the fall of 1923, and from 2599 in the summer of 1914 to 4710 in 1923. In the same period the teaching faculty was increased from 694 to 878 and the library from 483,000 volumes to 667,000 bound volumes and 304,000 pamphlets. The income in 1914 was $2,758,118; in 1923, $5,905,608. A physics building was constructed in 1916, and the student infirmary and Bradley Memorial Hospital were built in 1920. In 1921 work was begun on the Wisconsin State Hospital, for which the Legislature appropriated $1,350,000. A new degree of Ph.B. was established in 1918, with stress on scientific and without foreign language requirements. In 1917–18 a standing university research committee was formed to coöperate with the National Research Council. Charles R. Van Hise, Ph.D., the president, died in 1918, and was succeeded in office by Edward A. Birge, Ph.D., Sc.D.

WISSLER, CLARK (1870–). An American anthropologist (see VOL. XXIII). His most recent works are: *Riding Gear of the North American Indian* (1914); *Costumes of the Plains Indians* (1914); *Harpoons and Darts of the Stefansson Collection* (1916); *General Discussion of the Shamanistic and Dancing Societies* (1916); *The Sun Dance of the Blackfoot Indian* (1917); *The American Indian* (1917); *Archæology of the Arctic Eskimo* (1918); *Indian Bead Work* (1919); *The American Indian: An Introduction to the Anthropology of the New World* (1922); *Man and Culture* (1923).

WODEHOUSE, PELHAM GRENVILLE (1881–). An American author, born at Guildford, England, and educated at Dulwich College. He began his career as a writer of a humorous column in the London *Glove*. He came to the United States in 1909. His publications include: *The Prince and Betty* (1911); *The Little Nugget* (1913); *Uneasy Money* (1916);

Piccadilly Jim (1917); *The Damsel in Distress* (1919); *Their Mutual Child* (1919); *The Little Warrior* (1920); *Indiscretions of Archie* (1921); *Three Men and a Maid* (1922); *Jeeves* (1923); *Leave it to Psmith* (1924). He has also written many musical comedy lyrics and has collaborated in several plays, among the best known being *Kissing Time, The Golden Moth* (1921), *The Cabaret Girl* (1922), and the Princess Theatre musical comedy series with Guy Bolton and Jerome Kern.

WOEVRE PLAINS. See WAR IN EUROPE, *Western Front.*

WOJIECHOWSKI, STANISLAS (1869–). A president of Poland. Exiled as a young man for protesting against Russian oppression, he went to Geneva, Paris, and London. When he returned to Poland in 1904, he definitely broke with international socialism and threw all his efforts into the coöperative movement. When the War began, he made a trip through Poland to urge a united stand against Germany. Driven from Warsaw by the Austro-German invasion, he helped form the Polish legion in France. In 1919 he returned to Poland and was made secretary of state under Paderewski. On Dec. 22, 1922, he was elected president of Poland.

WOLCOTT, JOSIAH OLIVER (1877–). An American jurist and legislator, born at Dover, Del., and educated at Wesleyan University. In 1904 he was admitted to the bar. He served successively as Deputy Attorney General of Newcastle County and as Attorney General of the State. In 1917 he was elected to the United States Senate but resigned in 1921 to accept the appointment of Chancellor of Delaware.

WOLFF, ALBERT (1884–). A French conductor and composer, born at Paris. In 1898 he entered the Conservatoire, where his teachers were Leroux, Vidal, and Gédalge. He began his career as organist at St. Thomas d'Aquin (1907–11). In 1911 he was appointed second conductor at the Opéra Comique and of the Concerts Rouges and in the following year also conducted the orchestra of the Cercle Internationale at Vichy. Until the outbreak of the War he appeared as guest conductor in several cities of France and in Buenos Aires. During the War he served in the French army. After the Armistice he returned to his post at the Opéra Comique. From 1919 to 1923 he was conductor of the French repertoire at the Metropolitan Opera House, from which he resigned because of the demands made on his time by his duties at the Opéra Comique, where, in 1920, he had been appointed Messager's successor as first conductor and general musical director. He wrote the operas *Le Marchand de Masques* (Nice, 1904), *l'Oiseau Bleu* (New York, 1919), and *Sœur Béatrice* (not produced); a ballet, *Kilidja;* a symphonic poem; and a violin sonata.

WOMAN'S RELIEF CORPS, NATIONAL. An auxiliary to the Grand Army of the Republic. During the War the Corps did efficient service. It was estimated that 150,000 members were affiliated with the American Red Cross in 1918. During that year 13 ambulances were purchased, equipped and sent to France, and 35 beds and all their furnishings were given to the United States government for use in reconstruction hospitals. It was voted at the national convention to raise a war work fund of not less than $50,000, to be used exclusively in war relief. This work still continues. During the year 1923–24 over $62,000 was spent in patriotic work and additional sums in war relief and for other purposes. In 1920 was inaugurated the ceremony at naturalization proceedings of pinning on the lapel of the coat of the newly created citizen a small American flag and of presenting him with a somewhat larger flag for his home. Committees on Americanization and child welfare and thrift were established in 1920–21. The convention of 1924 was held in Boston, Mass., and was attended by 593 delegates. The reports of the committees indicated active work throughout the year. The convention held in Boston in 1924 was the largest in the history of the Corps. In 1924 the Corps included 36 departments and 3 provisional departments, with a total membership of nearly 200,000. Since its foundation, it expended a total of more than $6,600,000 for relief purposes. The president for 1924–25 was Mrs. Grace B. Willard.

WOMAN SUFFRAGE. In almost no other movement was the influence of the War so decisively effective as in the struggle for woman suffrage. There was a striking advance between 1914, when the political franchise was exercised by women in only four countries, and 1918, when full suffrage had been granted them in Austria, Canada, Czecho-Slovakia, Denmark, Finland, Germany, Holland, Hungary, Iceland, Ireland, Norway, Poland, Serbia, Sweden, and the United Kingdom. In general, the new countries created by the War incorporated woman suffrage in their constitutions, as in Palestine and the Ukraine and the Baltic states. In the covenant of the League of Nations there was a clause, by no means a dead letter, making women eligible for all appointments under it. By 1922 it was estimated that there were 138,000,000 enfranchised women in the world. Practically every European country, with the exception of Portugal, Greece, Turkey, and notably France, Italy, and Spain, had established the principle, in 1924. There was full suffrage in all the larger self-governing British dominions, with the exception of South Africa. In India the question had been considered and left with the provinces. Women were voting in one of the provinces of China. In Spain the movement, after 1918, took on new impetus; Egyptian women were active politically in the struggle with Great Britain; the idea was growing in Japan. There had been a sudden and sweeping triumph of the principle of full political equality between 1914 and 1924, which, while due in some countries to the general advance of all democratic movements, was the outcome chiefly of the part played by women in the war-time emergency, and the realization of their importance as an economic factor, then, for the first time.

United States. Although presumably the first expression of the desire of women for the franchise was made in the United States, this country was among the last to grant woman suffrage, in 1920, after 70 years' agitation The campaign for the ballot for women had latterly been carried on along two lines: one aiming to secure State action, the other to put through a Federal amendment. By 1914, full suffrage had been granted by 12 States and Territories: Wyoming, 1869; Colorado, 1893; Utah and Idaho, 1896; Washington, 1910; California, 1911; Arizona, Kansas, and Oregon, 1912; Alaska, 1913; Montana and Nevada, 1914. In

1915, it was estimated that about 4,000,000 women in the United States were eligible to vote. By 1920, at the time the Federal amendment passed, full suffrage had already been won in 15 States (New York, 1917; Michigan, Oklahoma, and South Dakota, 1918), presidential suffrage in 13, the vote in primary elections in 2, and municipal suffrage in a few others. The effort to secure Federal action had met with less encouragement. In 1913 a national woman suffrage amendment resolution was defeated on the ground that the question was a State, not a national, issue. This was followed by mass meetings and parades in protest, petitions to Congress, delegations to the President, and a nation-wide demonstration. The movement made evident progress in the next few years. Whereas in 1912 Roosevelt had been the first important presidential candidate to support it, by 1916 all the presidential candidates had declared for woman suffrage, although the Democratic party did not favor Federal action in the matter. In 1918, the same Federal amendment which, in substance, had been 12 times before Congress since 1878 and four times since 1913, came within two votes of passage by the Senate; but even President Wilson's plea for it as a war measure could not bring about the necessary two-thirds vote. In 1919, however, its passage was finally achieved; by March 22, 1920, 35 States had ratified; and the amendment, now being hastened by both Republican and Democratic parties, came into force, with the ratification of Tennessee in August, in time for women to take part in the presidential election of that fall.

The results of this extension of the franchise up to 1924 were not easily to be estimated. As a rule the proportion of eligible women who voted was smaller than that of the eligible men. The women's vote was recognized as an active menace to vice and liquor interests; it was given credit in large measure for such achievements as the Federal bill giving equal rights of citizenship to married women; and its influence was felt in the increasing volume of welfare legislation throughout the States, such as mothers' pension and child labor laws, illegitimacy and age of consent measures, prison reform and protection of women in industry. It seemed evident, however, that little effort was being made to exert influence directly through women legislators or administrators. Although women had had the right to sit in Congress since Wyoming was admitted to the Union in 1890, and Jeannette Rankin had been elected to that body from Montana in 1916, up to 1924 no other women had been seated, with the exception of two who were elected to complete unexpired terms, and Mrs. Felton, appointed to fill an unexpired term in the Senate and holding her seat for only a few hours. In 1923, among the 5000 or 6000 legislators in the 40 State Legislatures which were in session, there were only 76 women, not more than 10 of them senators. A few women were finding office—in the Federal Department of State, one on the Ohio supreme bench, in the "cabinet" of the Governor of Pennsylvania, as Assistant Attorney General, and occasionally in municipal affairs; but for the most part their activities were confined to agitations for welfare or equality laws through support of the regular party male candidates or by lobbying. An effort in 1921–22 to establish a distinct woman's party was without success. In 1924 women participated in both Republican and Democratic national conventions; and Mrs. LeRoy Springs of South Carolina was placed in nomination for the Democratic candidacy for the vice presidency. A conference of the Woman's party was being called in the latter year to launch a drive to elect more women to Congress.

The question of equal rights had lately achieved prominence. Taking the stand that the Nineteenth Amendment, while granting enfranchisement, did not grant women the full civil and legal equality of citizens, such as that given to the negro in the Fourteenth and Fifteenth Amendments, the National Woman's party was concentrating its efforts on an equal rights amendment to the Federal constitution and was meantime working for blanket equal rights bills before State Legislatures. The equal rights law passed by Wisconsin in 1921 illustrates their aim. It provides that "women shall have the same rights and privileges under the law as men, in the exercise of suffrage, freedom of contract, choice of residence for voting purposes, jury service, holding office, holding and conveying of property, care and custody of children, and in all other respects. The various courts, executive and administrative officers shall construe the statutes where the masculine gender is used to include the feminine gender unless such construction shall deny to females the special protection and privileges they now enjoy for the general welfare." The National League of Women Voters, on the other hand, was opposed to the equal rights principle on the ground that such blanket measures would endanger the existing special rights of women in civil law and endanger present and future legislation protecting women in industry (see WOMEN IN INDUSTRY), and it was directing its activities toward a programme of specific State legislation to remove discriminations against women and to advance the general welfare.

Other Countries. In England, after the succession of the unsympathetic Premier Asquith in 1908, sensational violence and vandalism had been resorted to by the militant wing of the woman suffrage movement, in an effort to overcome public apathy. After 1913, the nonmilitant suffragists had thrown their influence solidly to the sympathetic Labor party, in an endeavor to undermine the Asquith government. Between the two forces, the woman suffrage issue had achieved great prominence. On the outbreak of the War, however, all obstructionist tactics were immediately forsworn by the women of both followings, in favor of prompt and full coöperation with the government. This action and the part that women subsequently played in both administration and industry, during the emergency, quickly converted even those most hostile to the cause of political equality. It was not, however, until 1918 that the Representation of People Act was passed; and then, in order to preserve a majority of male voters, the franchise was granted only to women at least 30 years of age. Some acceleration in welfare legislation became evident thereafter, and through the Women's Freedom League efforts were pledged to gain certain legal equalities; but it soon became apparent that British women, without attempting to form a separate party, were concentrating their efforts on electing representatives from among themselves. The right to sit in Parliament

having been granted in 1918, Lady Astor was returned from Plymouth in the following year; in 1921 the widow of a previous member was returned from Louth; in 1923, eight women were seated, after a vigorous campaign, representing all three parties. One woman was given ministerial rank in the government of Ramsay Macdonald. The petition of Viscountess Rhondda to be allowed to sit in the House of Lords, although unsuccessful in 1922, had not been abandoned in 1924. Recognizing that town and county offices were steps toward seats in Parliament, women were seeking these, successfully, in increasing numbers In 1923 a bill proposing to enfranchise all women over 21 passed its second reading in the House of Commons. In Canada, where there had already been some extension of the privilege, except in Quebec, and full suffrage in the three prairie provinces from 1916, the Dominion government granted the full franchise in 1917 to women who had near relatives at the front; then, in 1918, to all women who had reached the age of 21. A woman was returned to the Dominion Parliament from Alberta in 1918; another was in the cabinet of British Columbia in 1921. No woman, however, could become a senator without amendment of the British North America Act. In Australia, where full parliamentary suffrage was granted by the federal government in 1902, there were 1,100,000 women voters in 1916; but although eligible to both federal houses, women were entitled to sit in the state houses of only South Australia and Queensland. In New Zealand, where full suffrage dated from 1893, about 300,000 women possessed the ballot in 1916 and used it in nearly the same relative proportion as men; they were eligible to all offices except seats in Parliament Statistics for Australia and New Zealand indicated that the female vote had noticeably stimulated the percentage of eligible men voting. Finland, the first division in Europe to grant actual full political enfranchisement to women (1906), had 24 women in its Diet in 1917. Norway established full suffrage and eligibility in 1913 Iceland in 1914 granted the suffrage to women 40 years of age and over; in 1924 suffrage was universal at 25 years. The limited female franchise in Denmark was extended in 1915 to equal suffrage; in 1918 there were nine women in her parliament The women of Holland, enfranchised in 1919 and voting for the first time in 1922, sent seven women to a parliament of 100 members. After the provisional government established in Germany in 1918 granted universal suffrage at the age of 20 years, 40 women were elected to the national assembly, which incorporated adult suffrage in the new constitution. In 1922 there were 35 women in the Reichstag and equally strong representations in the various state diets. In Italy, a suffrage bill passed the Chamber of Deputies in 1923 but was opposed by Mussolini, who, however, approved a bill granting women municipal suffrage. With the defeat of a woman suffrage bill in the Senate in 1922, the issue was shelved in France for another three years.

WOMEN IN INDUSTRY. In an analysis of the status of women in industry in the decade 1914–24 it is necessary to take into account the labor conditions accompanying the War, which for a few years exerted an almost revolutionary influence on the position of wage-earning women and which were responsible for some permanent changes in their industrial status. The augmented demand for labor in war industries and the holes eaten into the ranks of workingmen combined to draw women into work in unusual numbers and often in unusual capacities. And while the War thus widened her field and made the woman in industry a factor of great importance, it brought her problems into unprecedented prominence.

In the United States in 1910 the number of women 10 years of age and over engaged for pay in all occupations was 8,075,772; in 1916 the number was placed at 10,000,000; and in 1918 at 11,000,000 or about 30 per cent of the total number of the gainfully employed. While the fact that some 4,000,000 women were employed in war industries gave rise to an impression that vast numbers of women were taking up gainful labor for the first time, it should not be overlooked that a great number of those in war industries were drawn from other occupations, such as domestic service, laundrying, clerking, office work, and various types of manufacturing; many were married women who before marriage had been industrial workers and who took up their former occupations or even new types of work in response to the emergency call. Moreover, it must be remembered that the so-called war industries included such trades as textile, tobacco, garment, and food manufacturing, which in time of peace employ large numbers of women and which during the War manufactured extensively products needed in the maintenance of armies. The employment and substitution of women for men was most marked in the iron and steel industry, in the manufacture of various vehicles, agricultural inplements, airplanes, and lumber products, and in shipbuilding and transportation. According to census figures, in 1914 women constituted 6.5 per cent of the workers in leading war agent and implement industries. Moreover, it was estimated that in 1916 7 7 per cent of the workers in such industries were women, in 1918, after the first draft, 10.6 per cent; later in that year, after the second draft, 13.9 per cent. The 520,093 women revealed by census figures as engaged in such work on Dec. 15, 1919, made up 8.2 per cent of the total number of employees in these industries. Proved efficiency was beyond doubt one reason for the permanence of women in the newer fields; but in many cases their lower wage rate and lack of organization influenced employers to retain them. The cessation of war manufacturing and the business depression in the succeeding years, however, effected a considerable decrease in the number of women workers. The census of 1920 showing 8,549,511 women 10 years of age and over as gainfully employed represented some actual increase in numbers over 8,075,772 in 1910; but if the increase in population is taken into account, the proportion of all women 10 years old and over in gainful employment decreased from 23.4 per cent in 1910 to 21.1 per cent in 1920. On the whole the great change brought about by the War seemed to have been not a vast increase in the number of women workers nor the invasion of entirely new fields, but a decided shift in the distribution of women among the various gainful occupations in which they had already been employed for some years. In agriculture, forestry, and animal husbandry and in domestic service, the number of women workers showed a striking decrease, although the decrease in agri-

culture was due in part to changes in date and methods of enumeration. The nonagricultural pursuits, as a whole, showed a proportional increase of 19 per cent in the number of women employees in 1920 as compared with 1910. The changes within the group indicated a definite contravention of traditions. In 1910 there were 203 occupations in which 1000 or more women were employed; in 1920 the occupations in this group had increased in number to 232, and a very large part of this increase was in occupations in manufacturing and mechanical industries and professional service. Increases of 50,000 or more occurred among women who were clerks in offices, stenographers and typists, bookkeepers and cashiers, teachers, saleswomen, telephone operators, trained nurses, and clerks in stores. Decreases of 50,000 or more occurred among farm laborers (at home), farm laborers (working out), cooks, general servants, laundresses, dressmakers, and seamstresses (not in factory), and milliners and millinery dealers. Within the manufacturing and mechanical industries, increases of more than 10,000 women since 1910 were found among semiskilled operatives in the food, iron and steel, and clothing industries, in silk and knitting mills, and in electrical supply, shoe, and cigar and tobacco factories; among laborers in cotton mills; and among forewomen and overseers in manufacturing. The changes in rate of increase or decrease for the two sexes were entirely disproportionate, and in far the greater number of cases the women took the lead in the rate of increase. It was significant that while women operatives in automobile factories increased 1408 per cent (from 848 in 1910 to 12,788 in 1920), the largest percentage increase for women in any one industry, men operatives in automobile factories increased only 435.4 per cent, from 20,243 in 1910 to 108,376 in 1920. Although the number of married women, 15 years of age and over, at work, rose from 1,890,661 in 1910 to 1,920,281 in 1920, this group constituted in the latter year only 9 per cent of the total number of women and 23 per cent of the number of women in this age group at work as compared with 10.7 per cent and 24.7 per cent, respectively, in 1910. The problems presented by the employment of women in industry were so greatly accentuated by war conditions that progressive measures were given extraordinary impetus. The futility of long hours for women had been demonstrated in England, and while many attempts were made during the emergency to weaken restrictions, these were not successful on the whole. In the United States a definite trend toward the 8-hour day and 48-hour week was noticeable in legislation (see WAGES). Studies of wage rates indicated that women's wages were consistently lower than those of men, without regard for production or efficiency; even on piecework the guarantee for women was less. The question of a minimum wage for women came to great prominence, minimum wage laws were passed in several States and the District of Columbia; wage orders were issued in increasing numbers by the various State boards; the decision of the Supreme Court in 1923 declaring the minimum wage law of the District of Columbia unconstitutional incited a strong movement for a constitutional amendment to permit such State legislation (see MINIMUM WAGE). The employment of women at night, in home work, and in unsuitable and dangerous occupations was subjected to restrictions, and definite improvements were made in the regulation of working conditions. Beginning in 1911, some safeguarding of motherhood was ensured by law in five States by forbidding employment of women in specified occupations within two weeks before and four weeks after childbirth. (See MATERNITY PROTECTION.) Mothers' pensions (q.v.) continued to grow in favor, to eliminate the need for many self-supporting mothers to enter industry.

Latterly an interesting phase of public sentiment became observable. A group of women active in the equal rights movement in American history and objecting to certain existing legal discriminations against women because of sex advocated a constitutional amendment to take the following form: "Men and women shall have equal rights throughout the United States and every place subject to its jurisdiction. Congress shall have power to enforce this article by appropriate legislation." On the other hand, another large group of women, comprising almost every organization of workingwomen and of women concerned with improving industrial conditions in the United States, although they were deeply interested in the question of equal rights and recognized the need of abolishing unjust legal discriminations against women, objected to the proposed amendment on the score that it was ambiguous and likely to jeopardize those labor laws for women enacted during the preceding 70 years in the various States and regulating to some extent conditions of employment for approximately 4,000,000 women. The proponents of the amendment argued that special labor laws for women curtailed their opportunities, but the opponents maintained that actual information concerning women in industry disproved such a theory and that special legislation to control standards of women's employment was essential in the interest of the race, because they had always been in a weaker position economically than men.

An important outgrowth of the War was the Women's Bureau of the Department of Labor, created as the Woman in Industry Service in 1918 and made permanent in 1920. This Bureau, which represents and advises the Secretary of Labor in all matters concerning women in industry, did much to clarify the situation and to organize efforts toward improvement. It conducted various general investigations of women's hours, working conditions, and prevailing wages, of women as an economic factor in the home, and of the social bearing of the "living wage"; carried on research work; made special studies of the census, of domestic service, of industrial accidents among women, and of special industries; and through monthly bulletins or correspondence developed as a clearing house for ideas and experiences in regard to wage-earning women.

Other Countries. In Great Britain, the number of women gainfully employed increased from 3,307,000 in July, 1914, to 4,845,000 in November, 1918; in July of the latter year 1,826,000 were in government work and 1,521,500 replaced men. The situation was marked by a noticeable shifting of women from occupations such as dressmaking, domestic service, and the textile, paper and printing, and clothing industries, commerce, agriculture, transportation, war industries, and government establishments; this change, as well as the actual numerical increase, was in some measure brought about by organized government effort to dilute the labor

supply. In 1920, from July to November, the employment figure fell from 4,051,000 to 3,871,000; but as compared with the 1914 figures, the number of women workers still showed an increase much larger in proportion than the increase among men. Moreover, the decrease in 1920 seemed due to more or less temporary causes; legal compulsion and trade agreements to reinstate men and boys after the War, public sentiment on behalf of returning troops, and the attitude of male workers; while causes tending to the increased employment of women, such as realization of their wider abilities and efficiency and the cheapness of their labor, were permanent forces. Government regulation of women's wages broadened during the period (see MINIMUM WAGE); the same piece and overtime rates were being paid women on men's work in war industries; minimum wages were set in many kinds of women's work; in some trades women were receiving, roughly, equivalent wages for equivalent work. Although in the early months of the War women frequently worked over 70 hours a week, experience showed that shorter hours increased efficiency, and by 1921 the movement for a 48-hour week was assuming definite legislative form. The Health of Munition Workers' Committee, appointed in 1915, had a far-reaching influence on women's working conditions. Reports from all parts of Europe during the War indicated that there remained scarcely any branch of industrial effort into which women had not entered This was true also in Canada and Australia. This virtual revolution was reflected in every industrial nation, including Japan, and in many which were still predominantly agricultural, such as Russia and the South American republics. There was generally observable a tendency under war-time stress to relax restrictions. In Germany, rather early in the War, various establishments were exempted from regulations, on permit, and the factory inspection system was allowed to deteriorate. Following this period in which the problems of women in industry became accentuated, there was everywhere a notable extension of regulation. An order of the French Minister of Munitions in 1917 was particularly comprehensive, fixing an age limit of 13 and a 10-hour day with a rest period, restricting work at night and in dangerous occupations, safeguarding pregnancy and childbirth, and setting detailed sanitary standards. Peru passed a progressive women's and child labor law in 1918. Among efforts to ease labor readjustment, after the return of the troops, and the consequent increase of unemployment among women workers, the German plan was noteworthy. Provision was made to train women for peace work, courses being given in general housework, children's nursing, dressmaking, typing, secretaryship, and similar occupations; all women in receipt of unemployment allowances were obliged to take up some course. A somewhat similar plan was followed in England for unemployed women between the ages of 18 and 35. See LABOR ORGANIZATION, INTERNATIONAL; LABOR LEGISLATION; HOURS OF LABOR.

WOMEN'S CHRISTIAN TEMPERANCE UNION, NATIONAL. This body was organized in 1874 for the purpose of abolishing the legalized liquor traffic; ever since it has continued to "agitate, educate, and organize." During the decade 1914–24 it was especially active. In 1914 definite plans were made for an active campaign for a national constitutional prohibition amendment; one of its spectacular features was the presentation to Congress of a huge petition. When in 1917 Congress passed a resolution for the submission of a prohibition amendment to the States for ratification, and when later 45 of the States or nine more than the necessary number ratified, it was generally conceded by the press and public that great credit for the achievement was due to the Woman's Christian Temperance Union. The National W. C. T. U. was also instrumental during these years in creating sentiment for the passage of a prohibition law for the District of Columbia, and the anti-advertising and war-time prohibition laws In 1918 a memorial promoted by the W. C. T. U. was sent to President Wilson; signed by 6,000,000 of the nation's most distinguished women, it asked that the use of foodstuffs in the manufacture of alcoholic liquors be prohibited

In 1917, the National W. C. T. U., in common with other patriotic societies, organized for war work. It adopted 3000 French war orphans and furnished ambulances and diet kitchens. It made thousands of comfort kits for soldiers and sailors and knitted innumerable socks, scarfs, and sweaters; it maintained resident hospital-mothers in reconstruction hospitals, invested liberally in Liberty Bonds and War Savings Stamps, and was diligent in conserving food and cultivating and canning fruits and vegetables. In 1919, it began a drive for 1,000,000 members and $1,000,000. The $1,000,000 fund was to be used for the promotion of special departments of the organization's work, the Americanization of the foreign-speaking women; the promotion of child welfare, social morality, general health; the education of the people and especially the children in the schools on the truths of science concerning alcohol; the protection of women in industry, and the furtherance of world sobriety. In the interests of the world movement, Anna A. Gordon, national president, was commissioned to visit and make a survey of European countries in 1920, following the World's W. C. T. U. convention in London, England; in 1921, she was sent for the same purpose to South America, and in 1922, to Mexico. Special work was done during the decade, among the young people and children, by the Young People's Branch and Loyal Temperance Legion respectively. The headquarters of the National W. C. T. U. is at Evanston, Ill., on the same lot with the historic cottage which was for many years the home of Frances E. Willard. The officers are: president, Anna A. Gordon; vice president, Mrs. Ella A. Boole; corresponding secretary, Mrs Frances P. Parks; recording secretary, Mrs. Elizabeth P. Anderson; assistant recording secretary, Mrs. Sara H. Hoge; treasurer, Mrs. Margaret C. Munns. The official paper of the National W. C. T. U. is *The Union Signal.* The organization also publishes *The Young Crusader,* a periodical for boys and girls. In its commodious publishing house at headquarters it has a large stock of literature which is widely used in its educational campaigns. The National W. C. T. U. celebrated its fiftieth anniversary in 1924 and held its jubilee convention in Chicago in November, 1924.

WOMEN'S CLUBS, GENERAL FEDERATION OF. An organization established in 1889. Its membership includes women's clubs, State federations, Territorial federations, and kindred organizations. Conventions are held biennially. Much valuable work was done by the women's clubs of the country in connection with the

War Aid was given to the Red Cross, Liberty Loan committees, and other organizations for war relief. In 1918 *The General Federation Magazine* was purchased by the Federation and made its official organ. Special divisions of Americanization, community service, and thrift were established in 1919. At the fifteenth biennial convention, held in Des Moines in 1920, many resolutions were adopted, for the most part reaffirming previous measures deemed necessary to the future welfare of the country. These measures took the form of urging legislation on the government. At this convention the departments of the Federation were reorganized. In 1921 a Committee on International Relations was created Mrs Thomas G. Winter, president of the General Federation, was appointed by President Harding one of the four women on the Advisory Committee of the Washington Conference for the Limitation of Armaments. A Committee on Friendly Relations with the Ex-Soldier did excellent work during 1921. In this year the Federation purchased the home of Gen. Nelson A. Miles in Washington for permanent headquarters, and in 1922 this became the executive headquarters of the Federation. The sixteenth biennial convention was held at Chautauqua, N Y. in 1922. There was discussion on immigration, law enforcement, the arms conference, Pan-American relations, and other subjects of current interest. The Council of the General Federation met at Atlanta, Ga., in May, 1923. The biennial convention was held in Los Angeles, Cal., in 1924. The membership of the Federation is approximately 2,500,000. The president in 1923 was Mrs. T. G. Winter.

WOOD, CLEMENT (1888–). An American author, born at Tuscaloosa, Ala., and educated at the University of Alabama and Yale University. He began the practice of law at Birmingham, Ala., in 1911. After holding the offices of assistant city attorney and recorder of Birmingham, he came to New York City and taught in the Barnard School for Boys from 1915 to 1920 and became vice principal of the Dwight School in 1920. His writings include: *Glad of Earth*, poems (1917); *The Earth Turns South* (1919); *Jehovah* (1920); *Mountain*, a novel (1920); *The Laugher* (1922); *Nigger* (1922); *Poets of America* (1924). He received the first prize of the Newark (N. J.) Committee of 100 in 1916 for his poem *The Smithy of God* and a prize for his *Jehovah* in 1919.

WOOD, ERIC FISHER (1889–). An American author and architect, born in New York City, and educated at Yale and Columbia Universities and in Paris. In 1914 he was civil attaché at the American Embassy in Paris and in 1915 served as an officer in the American Ambulance Corps in France. He was commissioned major in the British Army in 1917 and major in the United States National Army in August of the same year. He acted as assistant chief of staff for the 83rd Division and as Lieutenant-Colonel and assistant chief of staff in the 88th Division. He was wounded in the battle of the Meuse-Argonne. He is the author of *Notebook of an Attaché*, *The Writing on the Wall* (1916), *Notebook of an Intelligence Officer* and *Biography of Leonard Wood* (1920). He also contributed articles to magazines.

WOOD, LEONARD (1860–1927). An American soldier and administrator (see VOL. XXIII). At the outbreak of the War he was given command of the department of the East, which he held till 1917, and was later transferred to the Southeastern Department. He organized and trained the 89th National Army Division, the 10th Division of the Regular Army, and many special regiments and battalions during 1918 and 1919, and commanded the Central Department headquarters in Chicago from 1919 to 1921. He was appointed governor general of the Philippine Islands in 1921. He wrote: *The Military Obligation of Citizenship* (1915); *Universal Military Training* (1917); *Our Military History, Its Facts and Fallacies* (1921).

WOODBURY, HELEN SUMNER (1876–). An American writer, born at Sheboygan, Wis., and educated at Wellesley College. For more than 20 years she has worked with the American Bureau of Industrial Research. During 1906 and 1907 she investigated equal suffrage in Colorado and in 1913 entered the Children's Bureau of the Department of Labor as an industrial expert; she was assistant chief from 1915 to 1918. She visited New Zealand and Australia during 1919–20. Her writings include: *The White Slave* (1896); *Labor Problems*, with Thomas S. Adams (1905); *Equal Suffrage* (1909); *History of Women in Industry*, vol. ix; *Report on Women and Children in Industry*, United States Labor Bureau (1911); *Child Labor Legislation in the United States*, with Ella A. Merritt (1915); *Administration of Child Labor Laws in Connecticut and in New York*, with Ethel E. Hanks (1915; 1916); *History of Labor in the United States*, with John R. Commons and others (1918); *The Working Children of Boston* (1922).

WOODHOUSE, HENRY (1884–) An American aviation expert, born at Turin, Italy. He arrived in the United States in 1904, became contributing editor of *The Air Scout* in 1910, and later founded the aeronautical periodicals, *Flying* and *The Aërial Age*. His contributions to the literature of flying and the enthusiastic pioneer spirit which led him to found the Aëronautical Library in 1914, to build at Atlantic City the first airport in the world, to finance expert research work in aëronautics, to plan and direct the making of the first aëronautic maps in 1913, and to draft the first regulations of aërial navigation, place him among the most notable figures in this new field. Mr. Woodhouse did much toward the organization of aeronautics during the War, prepared the first report on the aircraft situation for the Secretary of War, and assisted the government in investigating war profiteering. His publications include: *The Struggle for World Resources; Textbook of Naval Aëronautics; Textbook of Military Aëronautics; Textbook of Applied Aëronautic Engineering; Textbook of Aërial Navigation; Aëro Blue Book.*

WOOD PULP. See PAPER AND WOOD PULP.

WOODRUFF, EDWIN HAMLIN (1862–). An American lawyer and educator, born in Ithaca, N. Y., and educated at Cornell University and its law department. He was admitted to the bar in 1888, and was instructor in English at Cornell from 1888 to 1890. He was librarian at the Fiske Library in Florence, Italy, in 1890–91. From 1893 to 1896 he was on the law faculty of Stanford University and from the latter date professor of law at Cornell University. From 1914 to 1921 he was dean of the College of Law at Cornell. He wrote several books on legal subjects.

WOODRUFF, HELEN S. (1880–). An American author, born at Selma, Ala., and educated privately. She first became known by her book, *The Lady of the Lighthouse,* which was a "best seller" in 1913. She gave all the royalties from this story to the New York Association for the Blind; the proceeds from all her books go to charity. She has written several plays, among them: *Hurrah for the Girls* (1918), produced at the Forty-fourth Street Roof Garden, New York City; *Kitty, Kitty, Kitty* (1919); *By Love's Speedometer* (1919). Her stories include: *Mis' Beauty* (1912); *Really-Truly Nature Stories* (1913); *The Little House* (1914); *Really-Truly Fairy Stories* (1915); *Mr. Doctor-Man* (1915).

WOODRUFF, LORANDE LOSS (1879–). An American zoölogist, born in New York City, and educated at Columbia University. He was assistant in biology (1903–04) and instructor (1904–07) at Williams College; and instructor (1907–09), assistant professor (1909–15), and professor (1915–) at Yale University. Professor Woodruff's researches were mainly on the protozoa, in connection with which he studied especially the reproductive rhythms and the phenomena of endomixis. He published, in collaboration, *Origin and Evolution of the Earth and Its Inhabitants* (1918), and *Foundations of Biology* (1920). He was also the author of numerous articles in zoölogical journals on the reproductive processes in the protozoa.

WOODS, ALBERT FRED (1866–). An American educator (see VOL. XXIII). From 1917 to 1920 he was executive officer of the Maryland State Board of Agriculture and president of the Maryland State College of Agriculture. He was chosen president of the University of Maryland in July, 1920.

WOODS, CYRUS E (1861–). An American diplomat, born at Clearfield, Pa., and educated at Lafayette College. He began the practice of law in Philadelphia in 1889. He was president of the Pennsylvania State Senate (1905–08), minister to Portugal (1912–15), and Secretary of the State of Pennsylvania (1915–23), but resigned in June, 1921, on his nomination by President Harding as ambassador to Spain. On Mar. 4, 1923, he was appointed ambassador to Japan.

WOODWARD, FREDERICK CAMPBELL (1874–). An American lawyer and educator, born at Middletown, N. Y., and educated in law at Cornell University. In 1895 he began the practice of law in New York City. From 1898 to 1902 he was professor of law at Dickinson College, and from the latter date to 1907 he filled the same chair in Northwestern University. From 1907 to 1916 he was professor of law and dean of the law school of Leland Stanford University and in the latter year became dean of the law school of the University of Chicago. He was the author of several books on legal subjects. During the War he served as major and judge-advocate-general in the United States Army.

WOODWORTH, ROBERT SESSIONS (1869–). An American psychologist (see VOL. XXIII). His books published after 1914 show an attempt to profit by the emphasis of the behavioristic school on external observation, without, however, accepting their metaphysical position These works include *Dynamic Psychology* (1917) and *Psychology a Study of Mental Life* (1921).

WOOLEN AND WORSTED. See TEXTILE MANUFACTURING.

WOOLLCOTT, ALEXANDER (1887–). An American dramatic critic, born at Phalanx, N. J., and educated at Hamilton College and Columbia University. He joined the staff of the New York *Times* in 1909, becoming dramatic critic in 1914. He was also on the editorial staff of *The Home Sector.* He enlisted in the United States Army in 1917 and served in France till May 1, 1919. He was a member of the editorial council of *The Stars and Stripes* and correspondent for that paper at the American front and with the army of occupation in Germany. His writings include: *Mrs. Fiske—Her Views on Acting, Actors, and the Problems of the Stage* (1917); *The Command Is Forward* (1919), and articles in many magazines.

WOOSTER, COLLEGE OF. A coeducational institution founded at Wooster, Ohio, in 1870. The size of the student body increased from 433 in 1914 to 808 in 1924, the faculty from 29 to 43 members, and the library from 37,000 to 51,500 volumes. The endowment rose from $1,174,780 in 1913 to $1,813,886 in 1923 and the annual income from $104,335 to $202,562. The preparatory school connected with the college was discontinued, and the building it had occupied was given over to the departments of mathematics and physics. A girls' dormitory was built, and two private houses were converted into cottage dormitories. In 1924 funds were being made available for a large boys' dormitory and for a social hall. The Rev. Charles F. Wishart, LL.D., succeeded the Rev. Lewis E. Holden, LL.D., as president.

WORCESTER. The second city of Massachusetts. The population increased from 145,986 in 1910 to 179,754 in 1920, and to 191,927 by estimate of the Bureau of the Census for 1923. A new reinforced concrete bridge was built between 1916 and 1919 over Lake Quinsigamond at a cost of $325,000. It was 60 feet wide and had 6 arches and a 100-foot viaduct. The park system of the city was expanded. A comprehensive city plan was developed at a cost to the city of $50,000.

WORCESTER MUSIC FESTIVAL. See MUSIC, *Festivals.*

WORCESTER POLYTECHNIC INSTITUTE. A nonsectarian institution at Worcester, Mass., for the education of men in the professions of engineering and chemistry, founded in 1865. The student enrollment in 1915 was 543, as compared with 520 in 1923–24; the faculty numbered 54 in the former year, as compared with 64 in the latter. In the same period the library was increased from 14,544 to 18,000 volumes and the productive funds from $900,000 to $2,450,000. A new gymnasium was opened in 1916, and some courses in business were offered in 1922. President, Ira Nelson Hollis.

WORK, HUBERT (1860–). An American public official, born at Marion Centre, Pa., and educated at the University of Pennsylvania He began the practice of medicine at Greeley, Colo., in 1885. In 1896 he founded the Woodcroft Hospital for mental and nervous diseases. In 1912 he was chairman of the Colorado Republican State Central Committee and Colorado member of the Republican National Committee. During 1921–22 he was first assistant postmaster general of the United States, and in March, 1922, he became postmaster general. He

received the appointment of lieutenant-colonel in the Medical Corps of the United States Army during the War. He has held offices in various medical societies.

WORKERS' PARTY. See COMMUNISM.

WORKMEN'S COMPENSATION. At the end of the year 1923, compensation laws had been enacted in all the States and Territories of the United States, with the exception of Arkansas, Florida, Mississippi, Missouri, North Carolina, and South Carolina. There was a Federal law covering employees of the United States government but no law covering private employments in the District of Columbia. Most foreign countries likewise had adopted the compensation principle.

While workmen's compensation had been so generally adopted and was so generally approved that it might be considered an accepted part of the fabric of social legislation, the fact that a compensation law was in force in a given jurisdiction did not necessarily mean that the compensation principle was completely applied. The various laws which were on the statute books were in large measure the result of compromise and embodied limitations which seriously impaired their efficacy. There was a wide variation in the extent to which workingmen were covered. It was estimated in 1920 by Carl Hookstadt of the United States Bureau of Labor Statistics that approximately 70 per cent of the employees in jurisdictions subject to compensation actually came within the terms of the compensation acts. The percentage of such employees varied from approximately 20 per cent in Porto Rico to almost 100 per cent in New Jersey. There was also great variation in the liberality of the benefits provided in the various laws, both in the basic percentages of wages which were paid in case of disability and in the limitations on periodical and total payments. In fact, compensation legislation was so diverse in all its parts that any general statement must be so qualified in its application to particular cases as to leave some doubt of what actually constituted the compensation principle.

An analysis of the laws of the States and Territories of the United States (*Digest of Workmen's Compensation Laws in the United States and Territories, with Annotations*, 8th ed., revised to Dec. 1, 1923; Workmen's Compensation Publicity Bureau, New York City) shows that 12 States and 2 Territories had enacted compulsory laws, while 30 States and 1 Territory had enacted elective laws. Elective laws, while ostensibly permitting choice on the part of the employer or employee, in effect made election not to adopt the provisions of the law so disadvantageous that they were in practical effect compulsory. In most jurisdictions it was recognized by requiring insurance deposit of security or proof of financial responsibility that a compensation law should not only provide for payment of compensation to workmen by employers but should in addition require that the employer give evidence of security for such payment. There were, however, 5 jurisdictions in which no such security was required: Alabama, Arizona, Kansas, Louisiana, and Alaska.

The point of greatest controversy in the drafting of compensation legislation was the method of insurance to be furnished employers. In 7 States and 1 Territory monopolistic State-managed funds had been established as exclusive insurers of the workmen's compensation obligation. In 9 States, State-managed funds competed with private insurance carriers, and employers were permitted to select either agency for the insurance of their compensation obligations. In 26 States and 2 Territories the government confined itself to the regulation of private carriers.

The administration of the compensation principle is a specialized problem calling for a high degree of professional ability. This was recognized by 34 States and 2 Territories as well as by the Federal government by the appointment of special administrative officials for this work. Administration of compensation in the ordinary course of business of the court was generally admitted to be impractical. There were still, however, 8 States and 1 Territory which had provided no special administrative facilities. While the principle of compensation was by 1924 accepted practically without question, the problems incident to its application had been solved only to a limited extent. Much remained to be done in the development of statutory provisions and of administrative practice to the end that the application of compensation might be consonant with its underlying theory. Development in the future was expected to take the form of increased liberality to workmen and of perfection of details of legislation and of practice which would eliminate to a considerable degree the existing illogical and unsound discriminations and variations. See LABOR LEGISLATION, *Supreme Court Decisions;* SOCIAL INSURANCE.

WORLD COURT. See LEAGUE OF NATIONS.

WORLD LEAGUE AGAINST ALCOHOLISM. A world-wide movement against the liquor traffic, embracing 16 national organizations in 12 countries. It was established in Washington D. C., in June, 1919. By 1923 it included 48 national organizations representing 31 countries. Triennial conventions are held. The first of these was in Toronto in 1922. Over 1100 delegates representing 66 countries were present. The League coöperates with national temperance organizations through speakers, literature, posters, pamphlets, books, etc. Under its auspices representatives have been sent to the British Isles, and, with a few minor exceptions, to every country of continental Europe, Iceland, China, Japan, the Philippine Islands, India, Ceylon, Australia, New Zealand, the Fiji Islands, South Africa, Rhodesia, Mozambique, Zanzibar, Egypt, Tunis, Algeria, Morocco, several points in West Africa, Chile, Porto Rico, Cuba, and Mexico. A social research office is maintained in New York City, a scientific research department in Boston, a students' department in Washington, D. C.; a Canadian office in Toronto, Mexican and Pan-American offices in Mexico City, a Scandinavian office in Christiania, Norway; a scientific and information department at Lausanne, Switzerland, and an international publicity office at London. The Anti-Saloon League of America is a constituent member of the World League. Its temporary headquarters are at Westerville, Ohio. There were, in 1923, four joint presidents: Anna A. Gordon, for the United States; Robert Hercod, Ph.D., Switzerland; Rt. Hon. Lief Jones, England; and Howard H. Russell, D.D., LL.D., United States. In 1923 the American Bishop James Cannon Jr. was chairman of the executive committee, and Ernest H. Cherrington, LL.D., Litt.D., also an American, was general secretary.

WORLD WAR. See WAR IN EUROPE.

WOUNDS, TREATMENT OF. The experience of the War presumably made some changes in the treatment of wounds in civil and industrial surgery, which were summed up by a Viennese surgeon, Professor Albert, as follows. Mere asepsis or surgical cleanliness was found to be quite insufficient to control war wounds after these had had time to become infected. In other words the original Listerian doctrine of antiseptic treatment, once sidetracked, again took the lead. It was learned that while chemical agencies are unable to arrest infection by destruction of bacterial life, they are still able to antagonize the latter by stimulating the natural defensive forces of the body. As for tissues hopelessly infected, they may be cut away bodily to a certain extent. Ultraviolet light and tincture of iodine are able to destroy a certain number of bacteria. Mechanical resources such as proper drainage and irrigation are incidentally of benefit; gauze dressings exert a suction on the wound surfaces and thus reinforce irrigation. Any wound over eight hours old is regarded as already infected. Wounds which have failed to unite and so become known technically as granulating surfaces may be treated by ointments. In other words, from military experience it was learned that the best treatment of wounds is one which encourages the tissues to fight their own battles. The Carrell-Dakin treatment of wounds by irrigation with a weak sodium hyposulphite irrigation should be one of the best resources for this purpose, although it does not seem to be adapted to cases in which crippling is threatened, for under such circumstances immobilization is desirable, and this can hardly be obtained if the dressings have to be changed frequently.

WRANGEL, PETER NICHOLAIEVITCH (1879–). A Russian general, born at Petrograd, the oldest son of a Baltic nobleman of Swedish descent. He finished a brilliant academic career at the mining institute of Petrograd but later turned to the army, became a private soldier, and rose by merit until in 1915 he commanded a Cossack regiment and later a Cossack division. From its beginning he resisted the Bolshevik revolution. With a volunteer army operating in the Crimea, he severely defeated the Soviet forces, and when finally overwhelmed by superior numbers in 1920, he managed to retreat in good order. After the collapse of the counter-revolution, General Wrangel and a remnant of his men found refuge in Jugo-Slavia and Bulgaria.

WRANGELL ISLAND. Named after the Russian explorer, Ferdinand Wrangell, this island is about 71° north latitude and 180° west longitude, some 80 miles from the Siberian mainland. It is a desolate, valueless island, and is rarely visited because of the impassable ice-pack which usually encompasses it. Sighted by Long and other American whalers in 1867, it was believed by the learned German geographer Petermann to be of continental proportions extending across the Arctic zone. This accepted theory was exploded by the drift of the *Jeannette* to the North. The area of the island is about 2500 square miles, according to Berry, who explored it in 1881, as did Hooper, who named it New Columbia and claimed it for the United States. Wrangell Island remained unoccupied until a private expedition of four men and an Eskimo woman was sent to it in 1921 by Stefansson. Ice conditions prevented their relief in 1922, when local resources also failed. In 1923 the visiting ship found only the Eskimo woman still alive. One white man, Wells, and 12 Eskimos from Alaska occupied the island in the summer of 1923. They were equipped with supplies for 2 years. Furs and an airplane base were their objects. Meantime the Russians, who never even visited Wrangell Island, claimed it as an island possession.

WRESTLING. See SPORTS.

WRIGHT, SIR ALMROTH (1861–). A British physician (see VOL. XXIII). During the War, Wright was consulting physician to the Allied Armies in matters relating to infection, preventive vaccination, etc. In 1915 appeared his monograph *Wound Infection.* In collaboration with Colebrook he published *Technique of the Teat and Capillary Glass Tube* (1921).

WRIGHT, ORVILLE (1871–). An American inventor (see VOL. XXIII). He won the Elliot Cresson Medal of Franklin Institute (1914) and the John Fritz Medal, and the bronze medal of the International Peace Society (1920). He was appointed chairman of the Contest Committee of the National Aëronautic Association, succeeding Col. F. P. Lahm, in 1924. He was made an officer of the Legion of Honor in 1924.

WUNDT, WILHELM (1832–1920). A leading German philosopher of the last generation (see VOL. XXIII). During his last years he terminated his 10-volume *Völkerpsychologie* (1901–20). During the War, he used his pen to defend his fatherland against what he considered the unjust accusations of western writers. He wrote a number of articles, notably in *Scientia,* and also a volume in which he dissected the national psychologies of the warring groups (*Die Nationen und Ihre Philosophie, ein Kapitel zum Weltkrieg* (1915). Wundt's death was internationally mourned. In the United States a large group of psychologists who had been trained in his Leipzig laboratory published testimonials in honor of their master.

WÜRTTEMBERG. Württemberg, always one of the most democratic states of Germany, possessed a fairly liberal constitution. The Weizsäcker ministry, in office during the War, pursued on the whole a rather democratic policy, but was opposed to the demands of the Democratic party for far-reaching parliamentary reforms. Under the influence of the disastrous events in the fall of 1918 this ministry gave way in October to a more democratic government, which in turn was shortly afterward superseded by the Socialist provisional government of the November revolution. King William II, a man of rather democratic tendencies, renounced his throne but continued to reside unmolested within the confines of his former realm. On Nov. 11, 1918, the bourgeois parties, exclusive of the Nationalists, entered the provisional government, from which the Independent Socialists resigned in January, 1919. The Württemberg government which was formed by a coalition of Majority Socialists, Centrists, Democrats, and members of the German People's party was perhaps of all the German governments the most thoroughly republican and democratic. In the succeeding years, thanks to democratic traditions and the existence of a large middle class, this small state was comparatively free from the violent disturbances created in other sections by the monarchist Right and the revolutionary Left. It was for this reason that the republican government of the Reich sought refuge in Württem-

berg during the critical days of the Kapp Putsch in March, 1920.

The elections for the Constituent Assembly in January, 1919, returned 52 Majority Socialists, 38 Democrats, 31 Centrists, 25 Conservatives, and 4 Independent Socialists. On Apr. 26, 1919, the Assembly adopted a provisional constitution, Württemberg being second only to democratic Baden in the drafting of a fundamental law. Since the later promulgation of the constitution of the Reich necessitated many changes, the final constitution was not completed till Sept. 25. 1919. The chief provisions, as in the case of the fundamental laws of all other German states, were strictly circumscribed by the Constitution of the Reich. The supreme power was vested in the people. The people delegated this power to the Diet, which transferred the executive power to the ministry. The government was empowered to refer the question of the dissolution of the Diet to a referendum of the people whenever it saw fit to take such action. A singular feature was the provision for the formation of a new ministry after each election of the Diet. Although the ministry was dependent on the legislative body in any event, this provision was made to prevent any unnecessary delay and dilatory tactics. The minister-president had the title of President of the State and was elected by the Diet. It was his duty to appoint the members of the cabinet in conformity with the wishes of the Diet. The administration of the state was, however, conducted by the ministers individually. Noteworthy also was the provision for the attachment to the ministry of councils representing the various classes in the population. Württemberg's constitution was drafted with careful regard for the practical application of democratic theories, and for this reason, as well as for others, democratic government in Württemberg worked more smoothly than it did in other German states. The first elections for the Diet under the new constitution were held in June, 1920, and resulted in an increase of the representation of the Left and the Right The losses suffered by the republican middle parties were largely due to the unsatisfactory conditions prevailing in the Reich. In consequence thereof the government resigned, and a new ministry was formed by the Centrists and the Democrats, which received the support of the German People's party and the Social Democrats. From 1920 to 1924 no outstanding developments appeared, except that Württemberg, like the remainder of the Reich, experienced further swings to the Right and the Left. See GERMANY.

WYER, RAYMOND (?–) A critic and art director, born in London, and educated in Edinburgh, London, Brussels, and Paris. He became the director of the Hackley Art Gallery at Muskegon, Mich., and continued in that office during 1912–16. He organized exhibits of American and European artists and lectured on art in various cities of the United States He is the author of *Art and the Man, An Art Museum, Its Concept and Conduct, Art and Discrimination,* and an *Inaugural Catalogue of Hackley Art Gallery.* He also wrote a war play in two acts, entitled *The Goal,* and several articles on Armenia.

WYNN, EDWARD (1886–). An American comedian, born at Philadelphia He ran away from home at 15 and went into vaudeville. During 1914–15 he acted in Ziegfield's Follies and in the next year appeared at the Winter Garden in New York City. He became a star in 1918. He wrote the music, lyrics, and book of the *Ed Wynn Carnival* (1919) and *The Perfect Fool* (1921).

WYOMING. Wyoming is the eighth State in size (97,914 square miles), and the forty-seventh in population; capital, Cheyenne. The population increased from 145,965 in 1910 to 194,402 in 1920, a gain of 33.2 per cent The white population increased from 140,318 to 190,-146; the number of Indians decreased from 1486 to 1343, and negroes, from 2235 to 1375. The native white population rose from 113,200 to 164,891; the foreign-born white decreased from 27,118 to 25,255. Both urban and rural populations mounted, the former from 43,221 to 57,-348; the latter from 102,744 to 137,054. There are only two important cities in the State, Cheyenne and Casper. The former increased from 11,320 in 1910 to 13,829 in 1920, and the latter from 2639 to 11,447.

Agriculture. Wyoming, in common with most of the far western States, showed an increase in all agricultural activities in the decade. While the population of the State increased 33.2 per cent, the number of farms increased 43.3 per cent (from 10,987 in 1910 to 15,748 in 1920); the acreage of farms increased 38.2 per cent (from 8,543,010 to 11,809,351); and the improved land in farms 67.3 per cent (from 1,256,160 acres to 2,102,005). The percentage of total land area used for agricultural purposes increased from 13.7 in 1910 to 18 9 in 1920; the proportion of improved farm land from 14.7 to 17 8 per cent. The total value of farm property showed an apparent increase from $167,189,081 to $334,410,590, or 100 per cent; the average value per farm, from $15,217 to $21,-235. In interpreting these values and indeed all comparative values in the decade 1914–24, the inflation of the currency in the latter part of the period is to be taken into consideration. The index number of prices paid to producers of farm products in the United States was 104 in 1910 and 216 in 1920. Of the total of 15,748 farms in 1920, 13,403 were operated by owners, 377 by managers, and 1968 by tenants. The corresponding figures for 1910 were 9779, 311, and 897. White farmers in 1920 numbered 15,-579. 13,306 native, and 2273 foreign-born. There were 169 colored farmers, of whom 134 were Indians. In 1910 the white farmers numbered 10,922 (9019 native and 1903 foreign-born); and in that year, 44 of the 65 colored farmers were Indians. Farms free from mortgage in 1920 numbered 6816, compared with 7815 in 1910; those under mortgage, 5513, compared with 1923. The acreage under irrigation increased from 1,133,302 in 1909 to 1,207,982 in 1919. The number of dairy cows increased from 32,699 to 41,615; and "beef cows" from 307,189 to 392 367; sheep decreased in number from 4,-826,565 to 1,859,775 The estimated production of the principal farm crops in 1920 was as follows· corn, 2,316,000 bushels; spring wheat, 2,-384,000, winter wheat, 225,000; oats, 6,612,000; barley, 363,000; potatoes, 2,107,000, and hay, 1,444,000 tons. Comparative figures for 1913 are· corn, 493,000 bushels; wheat, 2,250,000; oats, 8,360,000; barley, 396,000; potatoes, 1,680,-000; and hay, 912,000 tons.

Mining. Wyoming has very valuable mineral resources which have not yet been fully developed. The most important products in point of value are petroleum, coal, natural gas, and nat-

ural gas gasoline. The growth of the petroleum industry, 1914–24, is indicated by the following production figures: 1914, 3,560,375 barrels; 1915, 4,245,525; 1916, 6,234,137; 1917, 8,978,680, 1918, 12,596,287; 1920, 16,831,000; 1921, 19,332,800; and 1922, 26,715,000 The output of coal also increased during the decade. in 1914 it was 6,475,293 net tons; 1915, 6,554,028; 1916, 7,910,647; 1917, 8,575,619; 1918, 9,438,688; 1920, 9,630,271; 1921, 7,200,666; and 1922, 5,971,724 The State produced also a large amount of natural gas gasoline: in 1920, 8,711,037; 1921, 14,557,684 gallons Among other mineral products are gypsum, iron ore, sand and gravel, and stone The total value of the mineral production in 1921 was $51,365,150, compared with $83,034,397 in 1920; $41,097,209 in 1919; $42,595,812 in 1918; and $12,417,752 in 1914.

Education. The immense area and large rural population of Wyoming bring with them the educational problems associated with these conditions Steady progress was made from 1913 on. In 1913 the Superintendent of Education was directed to prepare a course of study for the elementary schools In 1915 a law was passed requiring physical examination of school children; a State Institute was established, and a law was enacted providing for a school code committee to arrange for a survey by the Federal Bureau of Education. The report of this survey was rendered in 1916. In the following year the Legislature adopted a school code, providing for a State Board of Education, and greatly enlarging the duties and powers of the department, this code was amended in 1918 A director of special classes devoted special attention to the elementary, rural, and high schools of the State and examined children, conducted mental surveys, and reorganized rural schools. The director of vocational education had general charge of this work. The efforts of the Department of Education were centred in later years largely on the rural schools. In July, 1918, a movement was launched for so-called standard rural schools, this resulted in greatly improved conditions. In secondary education the Department of Education aimed at the maintenance of accredited four-year high schools wherever the number of students and the financial support available made it possible. In 1922 there were 38 such schools Vocational education, including courses in agriculture, industrial occupations, and home economics, was carried on with success in spite of great difficulties. It was the desire of the Department of Education to extend vocational education to every young person desiring to enter agriculture, business, or home-making without university training Work was also being carried on under the Federal Vocational Rehabilitation Law of 1920; a State enactment provided coöperation The total enrollment in all the schools of the State in 1912 was 26,502; 1921–22, 47,988 The high school enrollment in the latter year was 5763 The total disbursement for schools in 1922 was $6,404,645 Illiteracy in the State decreased from 3.8 per cent in 1910 to 2.5 in 1920. In the native white population it remained at 0 4 per cent; among the foreign-born, it decreased from 9.5 to 9.2 per cent; among the negro, it increased from 5.3 per cent to 6 1

Finance. For finance, see STATE FINANCES.

Political and Other Events. The political history of Wyoming in the decade 1914–24 was not especially eventful. Elections were held in 1914 for governor and Congressmen. The Democratic candidate for governor, John B. Kendrick, was elected, while the Republicans elected their Representative and the majority in both houses of the Legislature In 1916 the State, up to that time normally Republican, gave its vote to President Wilson, while Governor Kendrick, Democratic nominee, defeated Clarence D. Clarke for the Senate The Republicans, however, carried both branches of the Legislature In the voting for president in that year, President Wilson received 28,316 votes; Charles E. Hughes, 21,698. The Republicans, in 1918, elected their candidate for governor, Robert D. Carey, while Senator Warren, Republican, was reëlected to the Senate. In the presidential voting in 1920, W. G. Harding received 35 091 votes, J. M. Cox, 17,429 Elections were held in 1922 for United States Senator and for State officers The Democrats were in the main successful, electing their candidate for governor, W. B Ross. Senator Kendrick was reëlected to the Senate. On Aug. 14, 1923, an explosion in the coal mine at Kammerer resulted in the death of 100 miners The leasing of oil reserves in the Teapot Dome naval reserve to H. F. Sinclair, by Albert E. Fall, Secretary of the Interior, in 1922, gave rise, in 1924, to the investigation into alleged oil scandals, by a committee of the Senate.

Legislation. The most important acts of the Legislature in the decade 1914–24 are noted below. The Legislature in 1917 amended the laws relating to elections and passed measures providing for the regulation and inspection of the sale of gasoline and similar products. The Legislature in 1919 passed a measure providing for a budget and made provisions for the eight-hour day on public work. On Jan. 16, 1919, the Federal prohibition amendment was adopted In 1921 the Legislature created the State Farm Board and the State Game Commission. It authorized the Board of Education to promote Americanism as defined by law, and it created the office of Inheritance Tax Commissioner. Measures passed in 1923 aimed to extend the taxing power of the State to mineral, oil, and natural gas mines Activities relating to agriculture were assembled into a single department under a board The hours of labor for women were limited, and child labor laws were amended.

WYOMING, UNIVERSITY OF. A State institution at Laramie, Wyo., founded in 1886. The student enrollment increased from 508 in 1914 to 2061 in the year 1923–24, the faculty from 66 to 85 members, and the library from 35,000 to 60,000 volumes The income during the same period was increased from $192,534 to $804,000 In 1917 the music department building and a small model country school were built. In 1921 additional dormitory facilities for women students were provided by the completion of the last units of Hoyt Hall A central heating plant for the campus was also completed in this year. In 1923 was completed a $200,000 library, started in 1922 At the close of 1923, a $500,000 gymnasium-armory was in process of construction. Aven Nelson, Ph.D., succeeded Clyde Augustus Duniway, Ph.D., LL.D., as president in 1917, and was succeeded in turn by Arthur Griswold Crane, Ph.D., in 1923.

YALE UNIVERSITY. A non-sectarian institution at New Haven, Conn., founded in 1701. With the exception of the war years, when it dropped to approximately 2000, the student enrollment increased steadily from 3289 in 1914 to 4869 in 1923-24. During the same period the number of faculty members increased from 460 to 645, the library from 1,000,000 to 1,500,000 volumes, and the productive funds from $15,379,363 to $35,764,883. Certain reorganizations in administration were adopted All graduate work not given under the professional schools was concentrated in the Graduate School under four groups of faculties. A common freshman year for both the College and Sheffield Scientific School was established, under a special dean and faculty, and the Sheffield course was lengthened from three to four years and became purely scientific. During the War the only college artillery school in the country was established at Yale, and the largest college naval unit was organized. Important building operations went on during the decade. The Memorial Quadrangle of dormitories for upper classmen, which covers an entire city square and is one of the finest of such groups in the country, was given by Mrs. Stephen V. Harkness in memory of her son. The Sterling Chemistry Laboratory ($2,000,000) and the Sterling Hall of Medicine ($1,500,000) were completed in 1922 and 1923. The laboratory has a saw-tooth factory-construction glass roof over the central part, in which are located the class laboratories where instruction is given in elementary, physical, organic, qualitative, and quantitative chemistry. The industrial chemistry laboratory is two stories high. There are 35 separate research laboratories, accommodating two men each; 12 classrooms; two lecture theatres, seating 150 and 250 respectively; administrative and individual offices: receiving and storage rooms; and a library. The Hall of Medicine, a four-story building extending along two sides of a city block, contains, besides offices of administration, an auditorium and a library, the departments of anatomy, physiological chemistry, physiology, pharmacology, and toxicology. These buildings were erected with part of the large trust fund left by John W. Sterling in 1919 to be used for buildings, scholarships, fellowships, and lectureships, and for the endowment of professorships and the establishment of special funds for prizes. Sage Hall, containing offices and lecture rooms for the School of Forestry, was opened in 1923, and at the close of 1923 the Lapham Field House was under construction. President Arthur Twining Hadley was succeeded in 1921 by James Rowland Angell, Litt.D., LL.D.

YAMANOTO, COUNT GOMBEI (?-). A Japanese naval officer, a member of the Satsuma clan. He was minister of the navy from 1898 till 1906, and premier during 1913-14. The naval scandals coming to light at that time caused the fall of his cabinet. On the death of Baron Kato, in August, 1923, the Prince Regent instructed Count Yamanoto to form a ministry. Its first meeting took place in the open air, in the midst of the smoking ruins made by the earthquake of September 1, and the new government had to take immediate measures to relieve the unprecedented situation. In December, 1923, Yamanoto and his cabinet resigned because of the attempt on the life of Prince Hirohito.

YAP ISLAND. One of the Caroline group of islands, situated in the Pacific north of the equator, and before the War belonging to Germany. In 1916, by a secret agreement with Great Britain, Japan laid claim, in the event of Germany's defeat, to all of Germany's islands north of the equator, while recognizing the British claims to those south of it. On this basis, the Supreme Council on May 7, 1919, allocated the islands north of the equator, including Yap, to Japan as mandatory power, although not without President Wilson's disapproval. The American interest was plain: Yap was nearer the Philippines than any other of the islands; it was, too, an integral point in the American system of communications in the Pacific, for here were to be found stations of the Pacific cable of the Commercial Cable Company from Hawaii, of an American-British cable extending north to the Bonin Islands, and of British lines to the Chinese coast, as well as a wireless station. During 1920 and 1921 the American point of view was repeatedly stressed, to the discomfiture of Japan and Great Britain and to the greater straining of the bonds of the Allied unity. The American contentions centred in the facts that the United States government had served notice during the Peace Conference that it reserved the right to object to exclusive Japanese control of the cable landings, that as the German islands had been ceded to the Allies by the Peace Conference their disposition was a concern of the United States, and that in view of the property interests of other nations, Yap, as far as it was a cable landing station, ought to be internationalized. The Japanese insisted that Yap was theirs by the edict of the Supreme Council and that therefore the administration of the island was their exclusive concern. On Feb. 21, 1921, the American government dispatched to the Council of the League of Nations a note outlining its position and requestiing a reopening of the question. On March 2, the Council admitted the claims of the United States but declared its inability to act, on the ground of the previous decision of the Supreme Council. This, too, represented the opinion of Great Britain and France. The solution of the difficulty rested on the meeting of the Washington Conference. On Dec. 12, 1921, finally, representatives of Japan

YALE UNIVERSITY

BRANFORD COURT, MEMORIAL QUADRANGLE, SHOWING THE HARKNESS MEMORIAL TOWER

and the United States signed an agreement by which the Japanese mandate was recognized by the United States. Japan, on the other hand, accorded the United States free access, on an equal footing with Japanese and other nationals, to the present cable between Yap and Guam and to any other cables which might be laid by Americans; the right to use the Japanese wireless service, and in case of suspension of this right, to build American stations, and freedom of entry and exit for persons and property. On Mar. 1, 1922, the United States Senate ratified the treaty affecting Yap, and the matter was formally closed. The island had an estimated population of 7155. See JAPAN; WASHINGTON CONFERENCE.

YEATS, WILLIAM BUTLER (1865–). An Irish writer (see VOL. XXIII). He was a fervid nationalist and wrote much topical verse, as well as *Responsibilities* (1914) and *Reveries over Childhood and Youth* (1915). In his poetry he tried to carry out Synge's idea of the poet as one who "uses the whole of his personal life as his material" His poems are therefore very imaginative and individual. His *The Wild Swans at Coole* (1917) reveals his interest in esoteric doctrine; *Michael Robartes and the Dancer* deals with the Ireland of 1916. He was one of the first in England to appreciate the poems of Rabindranath Tagore. Another Oriental preoccupation was the "Noh" drama of Japan Under Japanese influence he wrote *At the Hawk's Well* (1917) and *Two Plays for Dancers* (1919). He was deeply interested in the little theatre movement in Dublin, and worked for an aristocratic theatre for a small audience modeled somewhat on the "Noh" drama of Japan

YELLOW FEVER. Knowledge and control of this affection were much advanced during the decade 1914–24. In 1918 the foci of the disease were limited to Ecuador and Guatemala. The outbreak in Guatemala was serious, with 550 cases and 200 deaths, but the disease was soon stamped out by the local health authorities in cooperation with the United States Public Health Service. At the same time the Rockefeller Foundation sent Dr. Noguchi to study the cases of the disease at Guayaquil in Ecuador; in 1917 this was the only active focus of the disease in the entire world, prior to the Central American outbreak. In 1920 the Rockefeller Foundation formally announced that Dr. Noguchi's discovery of the exciting cause of the disease, a spirochæte, the *leptospira icteroides*, had led to the preparation of a preventive and curative serum. Already people going into yellow fever districts were being immunized in the Broad Street Hospital in New York City. The disease was stamped out in South America, and in 1919 the world was for a time entirely free from it. In 1920 it broke out anew in Yucatan, and Dr. Noguchi was sent to the infected area. Several shipments of the Rockefeller vaccine were also forwarded. Specimens of the spirillum culture were sent from Yucatan to Havana for study, and it was ascertained that the dog can be inoculated with a disease which closely resembles human yellow fever. In 1921 Dr Howard Cross, who was to have taken charge of the bacteriological laboratory at Vera Cruz, fell a victim to the disease.

YEMEN. See ARABIA.

YERKES, ROBERT MEARNS (1876–). An American experimental psychologist (see VOL. XXIII). He was the organizer of the psychological tests for the United States Army during the War. In 1915 he had prepared a point scale for mental ability, and it was this scale rather than the Binet mental-age tests which was found practicable for the stupendous task of cataloguing the abilities of more than 1,000,000 men. Major Yerkes edited the publication of the test results under the titles, *Army Mental Tests* (1920) and *Psychological Examining in the United States Army* (1921). He also edited a volume on *The War and Science* (1920). In 1919 he became chairman of the Research Information Service of the National Research Council, an endowed organization for the promotion of scientific studies. See MENTAL MEASUREMENT.

YON, PIETRO ALESSANDRO (1886–). An American organist and composer, born at Settimo Vittone in Piedmont. At the age of six he began his musical studies with A. Burbatti at Ivrea. In 1900 he entered the Conservatory at Milan, but winning a scholarship in the following year at the Conservatory in Turin, he continued his studies there under da Venezia (piano), Redmondi (organ), and Bolzoni (composition). He then attended for one year the Accademia Santa Cecilia in Rome, where his teachers were Bustini and Sgambati (piano), Renzi (organ), and de Sanctis (composition). He graduated in 1905 as winner of the first prize and of a medal awarded by the Minister of Public Instruction. From 1905 to 1907 he was assistant to his teacher Renzi, organist at St. Peter's, and even then his recitals began to attract attention. In 1907 he settled in New York as organist at St. Francis Xavier's. Frequent and extensive tours of the country soon established his reputation as one of the greatest living organists. In 1921 he was honored by the appointment of honorary organist at St. Peter's in Rome. This was the first time that this distinction had been conferred. His works consist of 17 masses; *Concerto Gregoriano* for organ and orchestra; a concerto for oboe and orchestra; brilliant organ compositions, mostly in larger forms; motets (a cappella and with organ); piano pieces; and songs.

YOUNG, ALLYN ABBOTT (1876–). An American economist, born in Kenton, Ohio, and educated at Hiram College and Wisconsin University. During 1902–06 he taught economics at Wisconsin, Western Reserve, and Dartmouth Universities and then became professor of economics at Stanford. In 1911 he accepted a call to a similar chair at the University of Washington and two years later went to Cornell, where he remained until 1920, when he was called to Harvard. During the War he was director of the bureau of research of the War Trade Board and then was chief of the division of economics and statistics of the American Commission to Negotiate Peace. In addition to many articles and papers on economic subjects, he was one of the authors of *Outlines of Economics* (1908, 1916).

YOUNG, JOHN WESLEY (1879–). An American mathematician, born in Columbus, Ohio, and educated at Ohio State University and at Cornell During 1902–03 he was an assistant at Cornell; during 1903–05 he was at Northwestern University, after which he served at Princeton (1905–08). During 1908–1910 he was head of the department of mathematics at Kansas University; he was then called to Dartmouth,

where he has since remained. Algebra and geometry have been the subjects of his special studies. He was editor of the *Bulletin of the American Mathematical Society*, on whose council he has served since 1911, and in 1918 he was vice president of the Mathematical Association of America. In addition to many papers on his specialties he is the author with O. Veblen of *Projective Geometry* (1910); *Lectures on Fundamental Concepts of Algebra and Geometry* (1911); with A. J. Schwartz, *Plane Geometry* (1915); with F. M. Morgan, *Elementary Mathematical Analysis* (1917); and *Plane Trigonometry* (1919).

YOUNG, Levi Edgar (1874–). An American educator, born at Salt Lake City, Utah, and educated at Utah, Harvard, Strassburg, and Columbia Universities. From 1900 he was professor and head of the department of western history at the University of Utah. Professor Young lectured widely in American universities on the history of that State. He was a member of many historical and scientific societies and of the First Council of 70 of the Church of Jesus Christ of Latter-Day Saints. He wrote *History of the Mormon Tabernacle* (1918) and *The Story of Utah* (1920).

YOUNG, Mahonri (1877–). An American sculptor and etcher, born at Salt Lake City, Utah. He is a grandson of Brigham Young. He studied at the Art Students' League, New York City, and the Julien Academy, Paris. He was for some years instructor in drawing at the Art Students' League and more recently at the American School of Sculpture. He is known chiefly for his figures of laborers, usually small in size, but depicted in an interesting and virile manner. Among his best known works are "Man with Pick" (Metropolitan Museum, New York); Hopi and Apache groups, in the Museum of Natural History, New York; "A Laborer" and "The Rigger," Free Public Library, Newark, N. J., and the sea gull monument in Salt Lake City. He is a National Academician (1923) and a member of the National Sculpture Society.

YOUNG, Owen D. (1874–). An American lawyer, born at Van Hornesville, N. Y., and educated at St. Lawrence University and the law department of New York University. In 1896 he began the practice of law. He was director and official of many important corporations. In 1924 he was appointed by the Reparation Commission as one of the members of the American delegation to investigate the financial condition of Germany. He was credited with having been largely responsible for the Dawes Report.

YOUNG, Stark (1881–). An American author, born at Como, Miss., and educated at the University of Mississippi, where he taught English from 1904 to 1907. He afterward taught English at the University of Texas and at Amherst College. His writings include: *The Blind Man at the Window*, verse (1906); *Guenevere*, a play in verse (1906); *Madretta Addio, The Twilight Saint, The Seven Kings and the Wind, The Queen of Sheba, The Dead Poet*, and *The Star in the Trees*, one-act plays in prose and verse (1911); *Three Plays* (1919); and *The Three Fountains* (1924), a book of colorful sketches with American and European settings.

YOUNG MEN'S CHRISTIAN ASSOCIATION. This movement, having national organizations in 30 countries, showed extraordinary growth and activity during the decade 1914–24. It received great impetus abroad, particularly in Europe, mainly as a result of the war work of the North American Associations. The work of the Y. M. C. A. was extended to the new states of Poland, Czecho-Slovakia, Latvia, and Esthonia, as well as to Greece, Rumania, and Portugal. Europe gained nearly 400 local associactions in the postwar period up to 1924. Others were established in Turkey, Palestine, and Egypt The world total in 1924 was nearly 9000 associations, with more than 1,500,000 members. The Association conducted nine-tenths of the welfare work among the American forces in Europe during the War. Alone among American welfare societies, this organization administered to not less than 19,000,000 of the soldiers of the Allies' armies and extended its help to more than 5,000,000 prisoners of war. The American Y. M. C. A. service in the War actually began in 1914, with work in the prison camps of the opposing forces and with the Allies' armies in France and the Near East. With America in the conflict, work was started in home training camps, all army and navy stations, on troop trains, at ports, and on transports Twelve hundred army and 49 navy associations were operated in the United States. Over $61,000,000 was expended for free welfare service for the American Expeditionary Forces alone. A total of 25,925 men and women served with the American Y. M C. A. in various phases of war work abroad and at home. In 1917 there were gathered in officers' training camps those who were to be junior officers To these camps the Y. M. C. A. sent some of its foremost physical directors for athletics and games After the Armistice athletics proved of extraordinary service, and the interest in them led to the building of the Pershing Stadium and the holding there of the inter-Allied games The Association conducted an immense banking business for the fighting men overseas who placed $21,558,339 with it for transmission home. Of the 351,468 remittances sent through it from overseas, only 41 remained undelivered.

The Y. M. C. A. operated 1397 stations in France before the Armistice and 2009 in the following winter during the period when the soldiers were waiting to go home Leave areas and recreation centres at 47 towns in France, Germany, and England were also operated. The operation of the post exchange or canteen was undertaken by the Y. M. C. A. at General Pershing's request so that the army would be freer for training and fighting. The work was carried forward on the basis laid down in official orders, except that the Association did not include operating costs in the expenses. The total turnover was $37,800 000. A remission by the American and French governments on transportation charges enabled the Association to hand $500,000 to the American Legion to be used at its discretion. The Community Motion Picture Bureau, maintained and operated by the Y. M. C A., supplied all American welfare organizations overseas with films. The funds and management of the Over There Theatre League, for which 1500 professional men and women entertainers were recruited, were furnished by the Y. M. C. A., and four "play factories" were set up. At the height of its activities there were 700 soldier shows and 200 soldier actors in the organization. For the Army of Occupation in Germany, the Y. M. C. A. opened 425 centres, with

service by rolling canteens at 83 out-stations. This work brought from Major-General Allen, commanding the Army of Occupation, the statement that "soldier welfare service never before reached the high standard maintained here." The service from 1917 to 1920 was directed by the National War Work Council, composed of some 200 business and professional men. Its chairman was William Sloane, and its budget and finance committees were headed by Cyrus H. McCormick and George W. Perkins. To this Council the American people committed about $167,000,000. Expenditures of $155,000,000 were reported when the Council disbanded, and the remaining funds were distributed for work with the army and navy, scholarships for ex-service men, work with the armies of the Allies, prisoners of war, and refugees, and a reserve for needs of soldiers and sailors in a national emergency.

From the end of the War to 1924, the Y. M. C. A. furnished educational assistance to more than 100,000 ex-service men studying in colleges, technical, and correspondence schools. Under the Y. M. C. A. Educational Commission, 900,000 soldiers studied in army schools, 6300 at French universities, and 1956 at British universities. The Association worked among the Czecho-Slovak troops who fought their way across Russia and Siberia to Vladivostok to their homeland. It cared for thousands of prisoners gathered in Siberia awaiting transport. It aided Russian prisoners to get back into Russia from Germany and France, and later it carried on refugee work among those who fled before the Bolshevist advance. It opened associations, at governmental request, for the soldiers of Portugal, Poland, Rumania, Czecho-Slovakia and Greece. The Student Relief movement, growing out of economic distress in Europe, has enlisted the activity of the Y. M C. A. in many lands. In 1923 was published a two-volume history of the war work of the Association, called *Service with Fighting Men*, with Ex-President Taft as editor-in-chief. In the same year the World's Conference for Y. M C. A. Workers Among Boys was held at Portschach in Austria, with delegates from 53 countries present. In 1923 also, the associations in America, all of which are self-governed, and which coöperate for national and international service through the agency of the International Committee, formulated a constitution which was ratified by referendum vote in 1924. It provided for an elective National Council, with legislative and elective powers, to supervise their joint activities, and to take over most of the functions discharged by the International Committee since 1857. State committees and agencies are integrated with national under the new plan, which was to become effective in 1925. The national agency under this plan would continue to assist the local associations with research and advice.

The Association's year in 1923–24 revealed an appreciable gain in nearly every department of its work. Official data available on 1693 Y. M. C. A.'s in the United States and Canada show the year to take rank with, and in several important directions to exceed, the record year of 1921. The total membership of the reporting associations is 988,522, a gain of 9.5 per cent over 1922–23. Marked increases were also reported in the number attending Bible classes and camps. The Building Bureau of the International Committee is retained on some 75 building projects. Both railroad work and industrial work were broadened. Endowment funds increased by 8.3 per cent, to $17,308,000, while the property debt increased only 6.6 per cent. An increase of net Association property to $159,521,000 (8.1 per cent in the year) indicates the volume of property additions and is believed to mark the end of the deflation period of 1922–23. There were 359 student associations operating in professional schools and colleges, with a total membership of 76,413. Industrial associations in 2086 plants had 176,767 members. The 34 army, navy, and army and navy stations located at various points in the United States, Hawaii, the Philippines, and China had an average daily attendance of 1117. Service to boys from 12 to 18 years of age was greatly extended. These boys constituted 25 per cent of the entire Association membership in 1924. Hi-Y clubs, formed in High schools, numbered 2064 and had a total membership of 59,000. In foreign countries other than in Europe service was being carried on by 384 associations related to the American movement. These associations had a total membership of 125,000.

YOUNGSTOWN. A city of Ohio, the second largest steel centre in the United States. The population increased approximately 60 per cent, from 83,044 in 1910 to 132,358 in 1920, and to 155,000 by local estimate in 1924. The city government was changed in 1924 to the federal form under home rule. A city planning and zoning system was inaugurated, controlling the height of buildings, parking districts, building lines, etc. The Butler Art Institute was built at a cost of $2,000,000, additional libraries and high schools and the Youngstown School of Technology were opened, and the Stambaugh Memorial Auditorium, to cost $5,000,000, was under way in 1924. Three and a half miles of railroads, providing facilities for the placement of 500 additional industries, and new railroad terminals were constructed; the city transit system came under municipal control on a service-at-cost franchise. The capital invested in manufacturing increased from $123,000,000 in 1915 to $350,000,000 in 1923, and manufactured products rose in value from $92,111,000 in 1914 to more than $300,000,000. Bank clearings, from $76,422,340, became $221,883,443.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION. The branches of the Young Women's Christian Association of the United States are united under a national board, with headquarters at 600 Lexington Avenue, New York City. Its work, during the decade 1914-24, was of the greatest importance. In 1916 the Association had 11 field committees and a staff of 128 headquarters and field secretaries. These promoted such specialized activities as visiting and teaching immigrant women and girls, helping young business women by vocational guidance, establishing club houses for nurses and art students, offering opportunities to colored and Indian students, and interesting women in philanthropic and religious work. The membership in 1916 was 364,673. Immediately following the entrance of the United States in the War in 1917, the Association appointed a War Council and entered on an active campaign in the interest of girls and women in the War. Features of this work were the erection of hostess houses in the army camps throughout the country, emergency

housing for girls employed in military and industrial centres, the formation of the Patriotic League for younger girls and club and recreation centres for colored and white women, and work with foreign-born women in the United States. The Association also instituted industrial clubs for the women of France and Russia and organized social centres for American nurses in France. A war fund of $5,000,000 was raised in 1917–18. By the end of 1918 nearly 100 hostess houses had been organized and built at a cost of nearly $2,000,000 in camps throughout the United States. The Girl Reserves organized by the Association had a membership of 445,300 with 774 units in 47 States A housing committee rented or built vacation houses, dormitories, cafeterias, and hostels in 11 centres for women in industry, at a cost of more than $500,000. In France, 15 hotels and social centres were in operation, 21 huts for nurses in base hospitals, and 18 centres for the French workingwomen. Work in France was carried on for the welfare of women specifically. The Association undertook cemetery work in France, and for the benefit of women who went to France to visit the graves of their soldier dead, centres were provided in 1919 at large American cemeteries Work was maintained during the year in Czecho-Slovakia, Poland, Italy, Russia, Belgium, Rumania, the Near East and elsewhere. The overseas budget for 1917 was $4,128,145. In 1920 the Association had 59 centres in Europe and the Near East, with 118 secretaries; and in the Orient and South America, 32 centres with 118 secretaries. During 1920 the board conducted 40 10-day summer conferences for girls, with a total attendance of 10,840; in 1923 it had 42 with an attendance of 10,581. Under the Continuation Committee of the National War Work Council, there was maintained, during 1921–22, certain war work of postwar significance This was financed from the balance of sums originally appropriated for this work from war work funds. In 1924 the Association had a membership of 545,000. Its real estate was valued at more than $40,000,000, and the gross budgets of the local associations amounted to approximately $25,000,000. Aggressive work continued in its domestic and foreign branches during 1923. The Association has an official monthly publication.

YPRES, Battles of. See War in Europe, *Western Front.*

YSER, Battles of the. See War in Europe, *Western Front.*

YUDENITCH, Nikolai (1862–). A Russian general, educated at the General Staff College. He saw service in Turkestan and in the Russo-Japanese war and acquired a high reputation and gradually rose in rank At the beginning of the War he rendered great service to the Allied cause as commander of Russian forces in the Caucasus, and when in 1917 the revolution caused a complete breakdown of Russia's military organization, Yudenitch by a masterly retreat succeeded in extricating his men from a difficult position. From the Baltic provinces in 1920 he attempted to overturn the Soviet régime but was defeated.

YUGOSLAVIA. See Jugo-Slavia.

YUKON. A territory of the Dominion of Canada, bordering on Alaska. Total area, 207,076 square miles. Population, in 1921, 4157 (1911, 8512; 1901, during the gold boom, 27,219). Capital, Dawson City, with a population of 975 in 1921, as against 3013 in 1911. Mining was the chief occupation. The gold mined from 1885 to 1918 amounted to $198,000,000. In 1922 the gold output was 54,456 ounces, valued at $1,125,705 Other minerals produced in the latter year were silver, lead, and coal; copper production was not reported after 1920. In 1921, the total mineral production was valued at $1,929,000. The fisheries continued to be of some importance. There were 16 fur farms in 1921. Prior to 1920 the Yukon was governed by a gold commissioner and a territorial council of 10 elected members. After that date the membership of the council was reduced to three.

Z

ZAGHLUL, SAAD PASHA (1856–). An Egyptian premier, born at Ibian in the province of Gharbia, and educated at the university at El Azhar, founded by the great Saladin. In 1884 he began to practice law, and in 1892 he was appointed councillor of the Court of Appeal. In 1906 he became an able minister of education. As a prominent member of the Nationalist party, after the signing of the Armistice in 1918 he asked for recognition of Egyptian independence. He based his appeal on the self-determination policy which the British government had followed with regard to other countries liberated from Turkish rule. When he was not allowed to go to London to urge this cause, he and his friends exhibited so hostile an attitude that they were arrested and deported to Malta. This action aroused the country, and many were killed in the subsequent outbreaks. Zaghlul was released after a time and finally was allowed to go to London. When he returned in 1921, however, he was again arrested and deported to Ceylon. On Feb 28, 1922, the British declared Egypt independent, except for certain "reserved points" Zaghlul and his followers demanded complete independence, and in the election of January, 1924, they received a large majority. Zaghlul was made premier on Jan. 28, 1924.

ZAHN, ERNST (1867–). A popular Swiss novelist (see VOL. XXIII). His later publications include: *Einmal Muss wieder Friede Werden* (1916); *Stephan der Schmied* (1917), translated into English in 1920; *Die Mutter* (1917); *Schweizer* (1920); *Lotte Esslings Wille und Weg* (1921); and *Das Licht* (1922).

ZAIMIS, ALEXANDER. See GREECE.

ZANGWILL, ISRAEL (1864–1926). A British author (see VOL. XXIII). He was very active as a speaker and lectured in Great Britain and Ireland, Jerusalem, Holland, and the United States. During the War he was a pacifist. His attempt to combine all the Jewish organizations in a plan to secure the Highlands of Angola as the Jewish national home was unsuccessful, and he later declined to work with the Zionists when the British government supported a plan to set apart Palestine for the Jews. He published *Too Much Money* and *Chosen Peoples* (1918); *Jinny the Carrier* (1919); *The Voice of Jerusalem* (1920); and *Ibn Gabriol's Poems*, from the Hebrew (1923). He also produced the plays, *The Cockpit* (1921) and *The Forcing House* (1922).

ZANZIBAR. A British protectorate of East Africa comprising the island of Zanzibar (640 square miles), the island of Pemba (380 square miles), and several islets. The population of the protectorate was estimated at some 197,000. By the 1921 census there were 24,125 inhabitants not native, including 270 Europeans, 10,000 Arabs, and 12,900 British Indian subjects. Zanzibar town had 35,000 inhabitants. Cloves and copra continued the most important articles of trade. Others were rice and grain, ivory, and raw cotton, all of which entered into the transit trade. Exports steadily mounted; their values in 1913, 1921, and 1922 were £1,048,366, £3,246,405, and £3,045,600. Imports similarly showed increases; their values for 1913, 1921, and 1922 were £1,103,348, £3,223,295, and £2,844,200. Leading articles of import were cotton piece goods, rice and grain, sugar, motor spirits, and petroleum. Of the total trade in 1922, 25 per cent was with India and Burma, 20 per cent with Tanganyika Territory, 14 per cent with the United Kingdom, and 5 per cent with the United States. Imports from the United States in 1922 (1913 figure in parentheses) were worth £52,407 (£28,796), and exports to the United States were £142,163 (£48,317). In 1913, 1,502,920 tons entered; in 1922, tonnage was 788,638. Of late years, the importance of Zanzibar port as a point of transhipment and as a distributing centre decreased, owing to the development of the mainland, the establishment of direct steamer communication between coast ports and Europe, and the growing importance of Aden. The local traffic was retained. Revenues increased from £275,126 in 1913 to £445,594 in 1923 (estimate). For the same years expenditures were £248,000 and £545,121 (estimate). The public debt at the end of 1921 was £100,000. In July, 1913, control over the affairs of the protectorate was vested in the Colonial Office. The reigning sultan, Seyyid Khalifa bin Harud, whose influence over the natives of East Africa was great, aided considerably in keeping the country well disposed toward Great Britain during the War.

ZAYAS, ALFREDO. See CUBA.

ZECKWER, CAMILLE (1875–1924). An American composer, born at Philadelphia. He received his early training from his father at the Philadelphia Musical Academy, then studied for two years (1893–95) under Dvořák at the National Conservatory in New York, and later under Scharwenka in Berlin. In 1915 he became director of the Germantown branch of the Philadelphia Musical Academy. In 1922 he was the first recipient of the newly established $1000 prize awarded annually at the North Shore Festival (Evanston, Ill.). His works include a symphonic poem, *Sohrab and Rustum; Jade Butterflies* (North Shore Festival prize); *Swedish Fantasy* for violin and orchestra; a piano concerto; a piano trio, a piano quartet, a piano quintet, a string quartet, and two violin sonatas; *Sérénade Mélancolique* for violin, 'cello, and piano; *The New Day*, cantata for soli, chorus, and orchestra; piano pieces; choruses; and songs. A three-act opera, *Jane and Janetta*, had not yet been produced in 1924.

ZELENY, CHARLES (1878–). An American zoölogist, born at Hutchinson, Minn., and

educated at the University of Minnesota and the University of Chicago. He was instructor in zoölogy (1904–05), assistant professor (1906–07), and associate professor (1907–09) at the University of Indiana; and assistant professor of zoölogy (1909–10), associate professor (1910–15), and professor (1915–) at the University of Illinois. His published work was mainly on regeneration and experimental embryology.

ZELENY, JOHN (1872–). An American physicist, born in Racine, Wis., and educated at the University of Minnesota and at Berlin and Cambridge. During 1892–96 he was instructor in physics at Minnesota, where he was professor (1908–15) and acting dean of the graduate school (1912–13). In 1915 he was called to the chair of physics at Yale, where he has since remained. Among his original investigations are studies on the conduction of electricity through gases, properties of ionized gases, electrical discharges from liquid surfaces, and propagation of smell.

ZEMSTVOS, ALL-RUSSIAN UNION OF. See RUSSIA, *History.*

ZEPPELIN AIRSHIPS. See AËRONAUTICS.

ZIMMERMANN, ARTHUR (1859–). A German statesman, born at Frankenstein. He entered the Foreign Office in 1902 in a subordinate capacity and in 1910 was made director of the political section. In November, 1916, he became secretary of state and as such attempted to incite Mexico to an attack on the United States and suggested that Mexico should be rewarded by the gift of New Mexico, Texas, and Arizona. Disclosures concerning his activities and those of Bethma-Hollweg caused the downfall of the latter, and Zimmermann was forced to retire on Aug. 5, 1917.

ZINC. In the period between 1914 and 1924 the zinc industry passed through several interesting phases, particularly in the United States, where for a time there was an extraordinary development in production. In 1870 the United States produced about 7000 tons of zinc, but by 1917 its output was almost 100,000. With that amount attained, both the mining and refining of the metal were placed on a highly efficient basis. In the United States there are three principal kinds of zinc ores: first, the zinc lead ores of the Missouri, Kansas, and Oklahoma regions, found in an area of some 3000 miles, located at the point of intersection of these three States, and also the zinc-lead ores of Wisconsin; secondly, the remarkable mine of the New Jersey Zinc Company; and thirdly, the mixed ores, chiefly zinc-copper and zinc-lead, of the Rocky Mountains. It is in this field that the most important new metallurgical developments were made, for practicable methods were devised for concentrating, roasting, and leaching zinc-copper ores and producing zinc from solution by electrolysis; the residues were treated for their copper content. The zinc electrolytic plant of the Anaconda Copper Company at Great Falls, Mont., had in 1924 a capacity of 150 tons of zinc per day, while the Butte and Superior Company, which was the largest individual zinc-producing mine in the United States, concentrated its ores by flotation and then roasted and smelted the concentrates in retort furnaces. The ore handled by this plant was from 10 to 30 per cent zinc, and in 1916 this mine produced 90,000,000 pounds of zinc.

Inasmuch as most of the zinc is utilized for brass, which was extensively required for munitions during the War, it was inevitable that the demand for zinc should be stimulated by the great contest. Early in the War the German armies occupied the zinc-smelting region of Belgium, so that a large fraction of the world's zinc-smelting capacity was eliminated at a time when this metal was most needed. Accordingly the demand for zinc became urgent in the United States, and the price rose to the point where large profits could be made in working the various deposits and smelting the ores.

Notwithstanding increased costs, due to high wages and prices of materials, the scale of operation of American zinc mines and smelters increased, and new companies were started, so that where zinc production in the United States amounted to 353,000 tons in 1914, it increased in 1917 to 669,573 tons. In the mid-continent field natural gas was used, and the new plants, although hastily constructed, involved important metallurgical improvements. Beginning with 1906, zinc ore was imported into the United States for smelting; considerable zinc concentrate was brought to the United States from Australia in 1916. Over 100,000 tons of zinc were made from imported ores smelted in the United States, but by 1918 the production of zinc from foreign ores had declined to 25,000 tons, and by 1921 it amounted to only 2268 tons out of a total production of 218,093 tons.

The zinc industry was also a source of sulphuric acid from the zinc sulphate concentrates, which had to be roasted to convert them to

ZINC PRODUCED IN THE UNITED STATES, 1922 AND 1923

oxide for further treatment. The sulphur dioxide used in this process is commonly converted into sulphuric acid. While most of the zinc produced is utilized in the manufacture of brass, nevertheless the decade 1914–24 saw a considerable increase in the manufacture of rolled and sheet zinc; the latter is manufactured for roofing and also for boxes and various stamped articles, such as jar tops, etc. In addition to the metal there was also a normal increase in the consumption of zinc oxide, through its extensive use in the manufacture of automobile tires, as well as in the more general use of zinc pigments, especially in enamel paints Zinc chloride is used by railroad companies, for the preservation of ties, and by other consumers of timber. The quantity of zinc oxide sold in 1923 was practically the same as in 1922, although the price increased about 5 per cent. The sale of lithopone, on the other hand, showed an encouraging increase, nearly 18 per cent, and an increase in price of 7 per cent

ZINOVIEV, Grihori Ovsei Gershon Aron (1883–). A Russian revolutionary politician In 1907 he attended the London conference of delegates of the Russian Social Democratic Labor party, of which he was an active member. In 1908 he served a term in prison for his revolutionary activities, but in 1909 he made his way abroad and edited *The Social Democrat*, chief organ of his party. After the revolution, Zinoviev became a member of the Petrograd Soviet and in 1918 its president. The newspaper *Den* charged that he had been a police spy, and this was never refuted, yet he advanced and became the first president of the Third (Communist) International He was also president of the Petrograd Extraordinary Commission for combating counterrevolution. As a member of the Cheka (Central Committee) he took a leading part in the effort, begun in 1924, to obtain more freedom of judgment and action within the ranks of his party.

ZIONISM. The outbreak of the War ended the gradual influx of Jewish settlers into Palestine and cut off the funds which had enabled them to maintain themselves and their institutions. The Jewish population, which had reached 100,000 in 1914, began gradually to diminish because of emigration. A Provisional Committee for Zionist affairs was hurriedly organized in America under the chairmanship of Louis D. Brandeis to prevent the disintegration of the settlements already made in Palestine and to assist the settlers until the ending of hostilities In the meantime an intensive propaganda was instituted among American Jews in the effort to raise sufficient funds to compensate for the complete breakdown of the Zionist organization in Europe. In 1916 conversations began between the leaders of the Zionist organization, headed by Dr. Chaym Weitzman, a Russian-born Jew, who had attained a position of prominence in the University of Manchester (England), and the leaders of the British government, relative to the creation of an autonomous Jewish settlement in Palestine. Actuated by the double motive of winning the united sympathies of the Jews for the Allied cause and the creation of a friendly population in Palestine, which borders on the Suez Canal, Lord Arthur Balfour, in November, 1917, declared the attitude of the British government toward Zionism favorable. A special Jewish battalion was organized under the leadership of Col. John H. Patterson to assist in the reconquest of the Holy Land. Shortly after the issuance of the Balfour Declaration, it aided in the capture of Jerusalem. A Zionist Commission was sent to assist the British authorities in the administration of the Jewish homeland In the meantime preparations were begun for creating a large Jewish university on Mt. Scopus, where the language of instruction was to be Hebrew, which had been revived by the incoming settlers.

In 1920, in London, the first Zionist Congress after the War was held Plans were drawn up for the reorganization of the Jews of the world for work in Palestine and for the raising of a fund, called the Keren Hayesod, to begin the work of financing the new settlements. The Balfour Declaration, originally an enunciation of the policy of Great Britain only, was ratified by the Allied statesmen at the Conference of San Remo and in 1922 by the League of Nations. These two decisions marked the stabilization of the Zionist political position and the beginning of a period of intense activity In the summer of 1921 Sir Herbert Samuel, an English Jew of Zionist sympathies, was appointed by the Lloyd George government to the position of High Commissioner of Palestine with the responsibility of maintaining the rights of the various contending parties. Jewish immigrants, chiefly from eastern Europe, at the rate of 1000 a month, were beginning to enter the country, they were financed by the International Zionist Organization. In the meantime a break occurred between the adherents of Judge Louis D. Brandeis in America and those of Dr Weitzman. The official organization, however, remained under the control of the international leaders. In the latter part of 1923 serious work was begun for the extension of the responsibility for the rehabilitation of Palestine, which was borne almost entirely by the Zionist organization and by Baron Edmond Rothschild of Paris. In accordance with the terms of the British mandate, a Jewish Agency was to be organized for the inclusion of Jews who were not members of the Zionist organization. In the early part of 1924, under the leadership of Louis Marshall of New York City, foundations for this agency were laid, as well as for the unification of all Jewry in the work of rebuilding Palestine. During this period the influx of Jewish settlers began to make its mark on the country The cultivation of tobacco was begun; large tracts of land were bought from the Arabs for purposes of cultivation. A number of new schools and cultural institutions and even a Hebrew opera were created. The Rutenberg scheme for the electrification of the country made much progress, and the model township of Tel-Aviv boasted an entirely Jewish population of 20,000 and all modern conveniences. The total Jewish population was in 1924 estimated at 100,000. With the additional funds coming from the new Jewish agency the increase of the Jewish population was expected to be about 20,000 per annum. See Palestine; Jews and Judaism.

ZOÖLOGY. Since Neolithic man had a considerable number of domesticated animals, it may be said that the study of zoölogy began very early in the history of man, and during the following centuries he must have accumu-

lated considerable information concerning the structure and habits of the animals which he encountered. Of these earlier observations, naturally, no records are preserved except insofar as they became incorporated in the folklore and tribal histories of the race, and zoölogy as a science begins with the work of Aristotle (384–322 B.C.) in his *History of Animals*. This *History* is a compilation of what was known about animals up to that time combined with the results obtained by the large number of field naturalists whom Aristotle was able to employ through the financial assistance given him by Alexander the Great. In addition, and this gives the *History* the character of something more than a mere compilation of information, Aristotle attempted a classification of animals, in which he arranged them in groups based on their structural agreements and differences.

In the following centuries zoölogy shared in the fortunes of the other sciences, showing advances when freedom of thought and investigation were allowed, and a degeneration into mere repetition of traditional dogmas when, as in the Dark Ages, conditions were unfavorable for independent investigation. During most of this time, zoölogy was closely bound up with medicine; anatomy was of much importance to physicians, and many important advances in zoölogy were made by physicians. Much of historical interest occurred during this interval, and by the middle of the eighteenth century a considerable body of information had been accumulated, but this was in a very chaotic condition Notable as the first successful attempt to reduce these facts to some order is the work of Linnæus (1758) to whom we largely owe the concept of a "species," as well as the system of nomenclature for species universally employed since then. The Linnæan concept was that at some time in the past there were independently created pairs of individuals, male and female, differing from all other animals in certain definite structural characteristics, and that the descendants of each pair retained from generation to generation the essential specific characters given to their first parents at the time of their creation. Linnæus noted further that the differences between species are not uniform but greater in some cases than in others; the dog and the fox, for example, resemble one another much more closely than either resembles a cow; so it is possible to arrange species into groups of a higher order, the species in each group resembling one another more than they resemble species in any other group. Each of these higher groups he called a genus. According to Linnæus, this grouping of individuals into species and of species into genera was a part of the original plan of creation. For convenience of reference, he proposed to give every animal a double name, of which the first word should indicate the genus, the second the species, to which it belongs. Thus the scientific name of the dog, *canis familiaris*, indicates that it belongs in a genus *canis* to which also belong the fox and the wolf, while its structural differences from them is indicated by its assignment to a distinct species, *familiaris*. This "binomial" system proved to be a tool of the greatest importance for the zoölogist, and in the century following Linnæus an immense number of genera and species were described and named. On the assumption that each of these species represented a distinct act of creation, this recognition and description seemed a sufficient end in itself.

The next date to be considered is 1859, when Darwin published *The Origin of Species*, and the universal acceptance of the evolution hypothesis which followed completely revolutionized zoölogy. Belief that animals have a blood relationship to one another naturally made the recognition of boundaries between species seem of less importance, and taxonomy, or the classification of animals, accordingly fell more or less into disrepute, while morphology, combining the study of adult structure with the embryonic history of the individual, became the chief line of investigation. (See below, *Embryology*)

The next important change in the point of view of the zoologist was the development of the experimental method. No precise date can be assigned to the beginning of this development, but during the last two decades of the nineteenth century and through the first quarter of the twentieth, there has been an increasing use of this method, so that from being largely an observational science zoölogy is rapidly becoming experimental. New fields of research have been opened up, each demanding its own special technique, its own vocabulary, and in many cases its own special journals, so that at the present time few zoölogists are able to claim intimate acquaintance with more than a very limited portion of the field. Points of contact have also been established with other sciences. The zoölogist interested in the study of heredity finds that his interests lie very close to those of the botanist working along the same lines, and he is apt to affiliate with the latter rather than with zoölogists in general; this new affiliation he calls a society of geneticists. (See HEREDITY) In another direction, the zoölogist finds that chemical reactions accompany and probably cause certain life activities, and to understand these he must affiliate with the biochemist. (See BIOCHEMISTRY.) In still other directions the zoölogist finds important openings for research: along economic lines, as in the relations, especially among the protozoa and the insects, to the causation and transmission of disease, or in the control of plant-feeding insects which offer a serious problem to the agriculturalist. As a result, zoölogy at the present time might almost be considered a group of closely related sciences rather than a distinct science. In all of these, there is the unifying principle that all living matter is in the last analysis composed of protoplasm having similar structure and subject to certain fundamental laws wherever it occurs. It will be convenient to consider separately some of the more important of these subdivisions.

Taxonomy. The classification of animals. According to the older notion species are independently created groups. According to the theory of evolution they are related to one another in that they have all descended from a common ancestor, and the degree of structural resemblances between them is, within certain limits, an indication of the nearness of that relationship. Working on this hypothesis, it is obviously of less importance than was formerly thought that we should endeavor to trace the limits of species; the knowledge of a few thousand specific names is no longer the mark of a great zoölogist, and taxonomy has lost its relatively high position among the subdivisions of the science. Where taxonomy still has valu-

able work to do is in determining the arrangement of animals according to their relationships, in describing new forms which are constantly being discovered, and in delimiting the boundaries of species

While it is difficult to formulate an adequate definition of species, no one doubts that groups exist to which this name properly applies, and it seems certain that differences of a fundamental nature (possibly chemical) underlie these visible external differences which are found among species. If this be true, it follows that the experimental zoölogist should know the species with which he is working, and that a confusion of species may introduce as many errors into his results as would follow the use of impure reagents by a chemist. As an illustration of the practical value of the work of the taxonomist may be cited the case of the sanitarian interested in the control of insect-borne diseases. Yellow fever is carried by one genus of mosquitoes and malaria by another, while a third is harmless so far as disease-carrying is concerned. Obviously an accurate diagnosis of these genera is essential to the sanitarian, and for this information he must look to the taxonomist.

In modern classifications the entire animal kingdom is divided into a series of phyla. As might be expected from the theory of evolution, some animals have developed along peculiar lines so that their relationships to others are obscure, and they are grouped differently by different taxonomists; but aside from some minor differences of this sort there is general agreement as to the following classification:

Phylum	Protozoa.	One-celled animals.
Phylum	Porifera	The sponges
Phylum:	Cœlenterata	Hydra and hydroids, jellyfish, and corals
Phylum·	Plathelminthes	The flatworms (Turbellaria), liver flukes, tapeworms, and nemerteans
Phylum.	Nemathelminthes	The threadworms, trichina, hookworm, etc.
Phylum·	Trochelminthes.	The rotifers.
Phylum	Annulata.	The segmented worms, earthworm, marine annelids, leeches, and gephyreans
Phylum:	Molluscoidea.	The bryozoa and brachiopods.
Phylum:	Arthropoda.	Crustacea, insects, spiders, scorpions, and centipedes
Phylum:	Mollusca.	Clams, snails, and cuttlefishes.
Phylum:	Echinodermata.	Starfish, sea urchins, and crinoids
Phylum.	Chordata	
Subphylum:	Enteropneusta	Balanoglossus.
Subphylum:	Tunicata.	The "sea squirts" and tunicates
Subphylum·	Cephalochorda	Amphioxus
Subphylum.	Vertebrata	Vertebrate animals.

Each phylum is further subdivided into classes and these into orders, etc For the smaller subdivisions the reader should consult textbooks See below, *Bibliography.*

Physiology. This is a study of the functions and activities of the organs of the animal body, and thus a dynamic as distinguished from a purely static study of anatomy. Originally quite distinct from anatomy, except insofar as a knowledge of the structure of an animal is an essential preliminary to a study of its activities, the distinction between the two has largely disappeared with the development of the experimental method. When the embryologist applies the experimental method to the analysis of the process of fertilization of the egg or the form-changes going on in the developing embryo, he is using the methods of the physiologist. The physiologist must, on the other hand, rely on the biochemist for aid in answering many of his problems, especially when appealed to for assistance by the morphologist, thus these three meet here on common ground. Important contributions of physiology to zoölogy are, first, the study of the enzymes, a series of organic substances which seem to be similar to if not identical with the catalytic agents of the chemists and which accompany most if not all of the fundamental physiological processes. This similarity to catalytic agents in their mode of working has led to the belief that they are practically the same, and thus that life is merely a series of these catalytic activities. This leads to the mechanistic conception of life as really nothing but a physicochemical process, a theory opposed by the vitalistic school, who hold that the regulative powers possessed by animals and often exhibited in their ability to adjust themselves to new and unusual conditions indicates the presence of a regulative mechanism independent of any chemical or physical activities going on in the protoplasm. This regulative mechanism is admittedly beyond the reach of any scientific analyses, but the vitalist believes that without the assumption of its presence it is not possible to explain animal activities. At present it seems probable that the mechanistic hypothesis is the more generally held.

Another physiological contribution, of especial importance in medicine but having definite applications in zoölogy, is the discovery of the important part played by the glands of internal secretion, i.e. the endocrine glands. The presence in the animal body of gland-like organs possessing no definite ducts has long been recognized, and they have generally been grouped together as the "ductless glands." Until late in the decade 1914–24, their function was largely a matter of conjecture, although it was recognized that disease of these ductless glands was correlated with definite bodily defects. It is now known that some of these glands, possibly all, secrete into the blood substances known as hormones which are carried by the blood to other parts of the body and which govern the proper development or functioning of those parts. Thus, if the pituitary body does not send off the proper amounts of its peculiar hormone, an abnormal development of the skeleton results The development of a tadpole into a frog seems may be prevented by removing the thyroid from the tadpole, while on the other hand metamorphosis will be hastened if extra thyroid be fed to the animal. The development of secondary sex characters at the time of puberty seems to be dependent on the hormones formed in the maturing sex organs at this time and discharged into the blood to be carried to other parts of in the thyroid gland, and this transformation the body; the effects of castration or removal of the sex organs in hindering the development of secondary sex characters is due to the loss of the hormones caused by the operation. In addition to hormones which produce these easily recognizable characters, evidence is accumulating which makes it seem probable that any organ in the body is capable of producing hormones which may exert some influence on any other organ in the same body. This possibility has been considered in recent discussions of the

inheritance of acquired characters (see HEREDITY), for experimental evidence has been presented to show that changes set up in certain organs may produce changes in the sex cells through the action of hormones and in this way may set up changes in the next generation. At the time of writing, research along this line has only just begun, and few definite results are available; but it seems certain that the possi- dependent on the presence of hormones formed other parts through the action of hormones must be considered in future discussions of heredity.

The widespread phenomenon of luminescence in animals has evidently been solved by physiology. A large number of animals, of which the firefly is the most familiar example, are able to produce light often of very considerable intensity, a form of light production different from any artificial methods known to man in that there is no appreciable loss of energy as heat. This has made the study of animal luminescence of interest to practical engineers, in the hope of applying the method to the problem of reducing the cost of the present wasteful methods employed in all artificial lighting. It has been shown that animal light production is due to the oxidation of a substance called luciferin, apparently a protein, by the action of luciferese, an enzyme. This light in the firefly is used as a sex call, while some deep-sea fishes seem to employ it as a flash light to illuminate the bottom of the ocean where no sunlight can penetrate

Tropisms. The study of animal behavior is of interest from two points of view. One is that of the ecologist who considers the purposive character of many animal activities and the way in which these activities relate the individual to its environment, the other that of the physiologist whose problem is to explain the mechanisms employed in these processes. An influential school of physiologists explain animal behavior by the theory of tropisms As a starting-point in the exposition of this theory we may follow Jacques Loeb, who ranks as its leading exponent, in calling attention to what are known as "forced movements," or peculiar behavior shown by animals in which a portion of the brain is injured or diseased If food be held at a distance in front of a normal dog he will, naturally, go directly toward it. If this experiment is repeated on a dog in which a portion of one cerebral hemisphere has been removed he will no longer go directly toward the food, but in attempting to do so, will continually turn toward the injured side and thus will move in a circle The explanation is that while in the normal animal forward movement is produced by the equal contraction of the leg muscles on the two sides of the body, these equal contractions in turn being due to equal stimuli reaching them from the two cerebral hemispheres, in the injured animal stimuli from the abnormal part of the brain are more or less suppressed and so lead to a lesser stimulus on one side than on the other. As a result, the stronger leg movements on one side bend the body toward the injured side. The animal does not circle from any desire to do so, but because if it moves at all its muscles force it to go in this direction.

In the well-known tendency of some insects to go toward a light, the tropism theory recognizes a precise analogy to the forced movements of the injured dog. If the common fruit flies *drosophila* are put in a tube and the tube turned so that only one end is lighted, or one end turned toward the window so that light rays strike that end before they do the other, the flies, if they move at all, will go directly to the end toward the light If the tube is turned through 180° they will again go toward the lighter end. According to the tropism interpretation, these movements are produced as follows: If the insect is facing the light at the beginning of the experiment, light rays fall with equal intensity on the two eyes, equal stimuli are sent from the eyes to the central nervous system and from there to the leg muscles, the muscles of the two sides are equally stimulated, and the animal moves directly forward Should the insect be standing so as not to face the light directly, one eye will receive a stronger stimulus than the other; this unequal stimulus leads eventually to a stronger contraction of the muscles on one side of the body than on the other and thus turns the body toward the less stimulated side. As the body is turned, the eyes are eventually brought to a position where they receive stimuli of equal strength, and the animal then moves toward the direction of the light rays. This is then a forced movement resulting from the action of the light rays on the physicochemical make-up of the animal's body and has nothing analogous to an intelligent desire to go to the brighter region. Similarly the moth, when it flies into a candle flame, does so because the physicochemical composition of its body responds in a precise, mechanical fashion to light stimuli; and the moth if it moves at all, is forced to go in that one direction.

In the illustrations given, the tropism is known as "positive" because the animal moves toward the source of the stimulus. Other animals show a "negative" tropism in that under these same conditions they collect at the place farthest from the source of the stimulus. A reversal of this tropism may appear, however, in that a "positive" animal may become "negative," and vice versa. This reversal is explained by Loeb as due either to a modification of the photochemical processes or to an effect on the nervous system and may be experimentally produced in the laboratory by subjecting the animals to chemical or mechanical treatment. It also frequently occurs in nature as when the larvæ of a barnacle are strongly positive to light at the time of hatching and become equally strongly negative when they are a little older. This reaction to light is called heliotropism. Other tropisms are known as chemotropism, galvanotropism, thermotropism, rheotropism, anæmotropism, stereotropism, and geotropism, according as the stimulating agent is chemical, electrical, heat, current of water, current of air, contact with solid bodies, or force of gravity The responses of animals to these various stimuli are frequently quite marked and are all, according to the tropism theory, purely forced, mechanical movements resulting from the stimuli acting on the physicochemical composition of the complex of structures making up the body of the animal. By Jacques Loeb this tropistic explanation is extended to cover all animal activities even to the so-called higher intellectual and emotional processes in man.

Some experiments on insects are difficult to explain on this theory. According to it, the constantly acting influence of the light rays

keeps an animal turned in the proper direction, and, so to speak, steers it in the way it should go; but a firefly on receiving a flash from his mate will turn and go directly to her, even though the flash is but temporary in duration and the greater part of his journey is carried on in the dark. This observation was recorded by Mast, who has also, as a result of a reëxamination of the "orienting" reactions of insects, concluded that even in these cases the effective stimuli are not symmetrically applied as the tropism theory maintains, and the process of adjustment is really a reflex action. A similar explanation would be given of all of the other tropisms. Students of behavior also, notably those who have worked with the higher *hymenoptera* such as the wasps, are generally agreed that it is impossible to explain their activities as tropisms, in the sense in which the word has been defined above. The term tropism with the appropriate prefix is convenient as a descriptive term and is often so used without necessarily implying the tropistic interpretation of the mechanisms employed. In the recent development of physiology, this tropistic concept has been of very great value as a stimulus to investigation, and its importance as such would not be lessened even if its final conclusions are overthrown

Sex Determination. For practical as well as sentimental reasons the subject of sex determination has received an immense amount of attention. The breeder of cows or the breeder of chickens for egg production could greatly increase his profits if he could control the sex of his animals so as to produce a large excess of females, and in human society desire is often expressed for offspring of one sex rather than another. The generally accepted explanation at the present time is based on the number of chromosomes in the sex cells. In the nucleus of each cell in the body is a substance called chromatin, which, at the time the cells divide, groups into bodies known as chromosomes. The number of these chromosomes is constant in any one species and is generally even. The exceptions to this rule are where in a number of animals one sex is found to have regularly one more chromsome than the other. In the best-known cases, those of some of the insects, the female has an even number and the male one less, or an odd number. Ordinarily the chromosomes occur in definite pairs, and this odd one, in the case cited, is recognizable as equivalent to one of a certain pair in the female. These are known technically as the "X" chromosomes, so that the female has two X's, the male only one. In other cases the number in the male is even, due to the presence of a "Y" chromosome, which, however, does not act as a mate to the X, so that so far as the X is concerned, its presence or absence seems a matter of indifference. In the peculiar series of processes known as maturation through which the sex cells pass before they unite, division is such that each mature egg cell contains only one X, while among the spermatozoa one-half have one X, and the rest have none. If a spermatozoön with one X fertilizes an egg, the result is a cell with two X's, and a female results. If the egg is fertilized by a spermatozoön having no X, the resulting individual is male. If this explanation is correct it follows that sex is determined at the time of fertilization of the egg and not by later agencies operating on the developing embryo. In some other animals this chromosomal action is reversed in that it is the male who has the even number, one more than the female. Recent work indicates that this is not due either to a greater or less quantity or to peculiar quality of the X chromatin but rather to a certain proportion between the number of chromosomes and the other chromosomes or "autosomes." Observations by Bridges on the fruit fly show a positive correlation between the varying numerical proportions of these two kinds of chromosomes and the normal and abnormal sex conditions in the adult flies.

Embryology. Reproduction in animals is accomplished by both asexual and sexual methods. In the former case, there is either a growth of a bud from the surface or a division of the body into two parts, followed by a growth of the bud or separated portions until the full adult size is reached. Sexual reproduction is the development of a new individual from a specialized cell, the ovum or egg, derived from the ovary of the female, and this egg either develops without further treatment, a condition known as parthenogenesis and of frequent occurrence among insects, or in the vast majority of cases fuses with a spermatozoön derived from the testis of the male, and this product, the fertilized ovum, is the starting-point of the new individual. By repeated divisions of this fertilized egg and its descendant cells a many-celled body is formed in which differentiations arise, and finally the completed animal with its complex of organs appears. Observations on the developing embryo in the hen's egg are easily made and were described as early as 1621 by Harvey, whose dictum, "Omne ovum ex ovo," dates from this time. The foundation of modern embryology was laid by von Baer, who discovered the mammalian ovum in 1828. In his completed work, published in 1834, von Baer demonstrated the existence of the primary "germ layers" which occur in all of the metazoa. In this same work he announced the discovery, since known as von Baer's law, that in passing from the egg to the adult state the embryo of a higher form goes through stages in which it resembles the embryo of lower forms.

Louis Agassiz pointed out that in thus passing from the one-celled egg to the adult condition an embryo passes through a series of stages in which it resembles a series which would be formed if we arranged adult animals in order of increasing structural complexity from the simple protozoa to the higher metazoa, and he argued that this and the series of von Baer were prearranged by the Creator at the beginning in order to demonstrate his plan of creation. A different interpretation was later put on these facts by the evolutionists, who recognized in these series of embryonic stages a recapitulation of the ancestral history of the race. The German zoölogist Haeckel was the most prominent advocate of this theory, and largely through his influence it was generally believed that a fairly accurate history of the ancestry of an animal could be obtained through a study of its embryonic stages. During the 1870's and 1880's, this belief was the inspiration of a great deal of descriptive embryology, but this phase of the subject has been very largely given up, partly because of the discovery that may embryonic characters are newly acquired and not ancestral, and partly because of the shifting of interest to the experimental method.

This law of von Baer is by no means abandoned, but embryologists generally recognize that its application is limited to more generalized characters and does not extend to the finer details.

By the end of the nineteenth century embryologists were divided into two groups, descriptive and experimental. The descriptive embryologists, following the lines laid down by von Baer, were studying with constantly improving technique the normal development of animals and had accumulated much information of a purely descriptive character. A speculation as to the real composition of the fertilized egg arose from this work The egg appears to be perfectly homogeneous, but out of it, after repeated divisions, arises a differentiated body. Is the homogeneity merely apparent and does the egg contain materials of different kinds which are separated from one another by the division processes, or is it real and does differentiation depend on the position of the cell in the complex and its relation to surrounding cells? This and similar questions led to experimental embryology, and while with the twentieth century descriptive embryology has brought out much new information about the normal development of animals, the experimental method has largely overshadowed it in interest. One answer to the question was sought through the method of cell lineage. This consists in following the developing egg cell by cell until different regions or organs of the adult body are outlined. From learning in this way the origin and fate of each cell, it was found that in many cases the pattern of the cleavage is so regular and the relation of certain cells to certain organs so definite and certain as to indicate that cleavage is really a separation of different kinds of material from one another. In some animals this conclusion seems the more certain, because from the beginning certain portions of the eggs differ from the remainder in color and apparently follow definite and prearranged paths until they give rise to definite organs in the new individual. Even where there is not this visible distinction the regularity of the divisions indicates a similar though invisible condition.

A second line is more definitely experimental. Developing eggs are mutilated in various ways, as by the separation of the cells from one another in the early cleavage stages, and a study is made of the behavior of the resulting separated blastomeres. Others are treated chemically in such a way as to alter the osmotic pressure or the chemical nature of the environment. In this fashion an experimental analysis of the forces at work in and on the embryo may be made. In later stages operative interference with normal developmental processes is employed for the same purpose. These later methods are such as removing the spinal cord of an amphibian embryo and replacing it end for end, or removing arms from similar embryos and grafting them into other parts of the body. The general purpose of all of these experiments is to secure data bearing on the question of how far an organ is self-differentiating, and how far its differentiation is a result of influences brought to bear on it from neighboring organs. For a discussion of the results obtained by these experiments consult titles given in the bibliography

Some eggs, as in many insects, develop parthenogenetically, while others normally require fertilization by a spermatozoön. In many eggs of this latter type, it has been found possible to induce parthenogenesis by artificial means. The agent employed may be a change in the chemical composition of the surrounding medium; for example, adding certain chemicals to the water in the case of water-living animals, or by mechanical means such as shaking; and Jacques Loeb has succeeded in producing parthenogenetic development in the frog up to sexually mature individuals by simply pricking the egg with a needle. It would appear that one function of the spermatozoön is to stimulate the egg to develop, and this function may be replaced by other agents. There is reason to believe that even in the mechanical stimuli a chemical change is the ultimate cause of the development, and Lillie has recognized this chemical process in the working of a substance called fertilizin which is secreted by the egg and which when it comes in contact with a spermatozoön sets free a substance acting as a stimulus to development. Loeb, on the other hand, considers that anything which can produce an egg membrane is an efficient stimulus and will start the developmental process.

Evolution. Darwin succeeded where his predecessors failed, partly because of his formulation of the theory of natural selection as a factor in evolution, but it seems probable that his successors overemphasized the severity of the struggle for existence and the consequent importance of natural selection. In more recent times the validity of this hypothesis as the chief factor in evolution has been seriously called in question, even to the extent of its abandonment. While this latter position is certainly too extreme, it is true that there are many difficulties in the way of explaining how slight variations could have, as Darwin supposed, selective value; and it seems reasonable to believe that while natural selection can operate on variations after they have appeared, it is not a valid explanation of their appearance. A widespread and unfortunate misunderstanding arose through the assumption by the strict natural selectionists of the name "Darwinian." Since in the popular mind Darwinism and evolution are synonymous, rejection of Darwinism by zoölogists is understood to mean rejection of evolution. Used in this sense, Darwinism means merely one explanation of evolution, and that not the most widely held.

A large number of zoölogists join with botanists in ascribing the origin of new species and new adaptations to mutation, a position which we very largely owe to the work of the botanist De Vries. Any group of plants or animals, considered with respect to any particular character, will show a considerable range of variability for that character, varying in both directions, above and below the mean or average. Darwin thought that selection of extreme variates above or below the mean and a breeding from these variates would result in a new range of variability in the selected direction and the establishment of a new mean. Practically all the results obtained by experiment along these lines have negatived this conclusion, and it generally happens, if not always, that the offspring of an extreme variant normally arrange themselves around the mean of the whole race irrespective of the degree of variation of the parent. The mutation theory supposes that from some cause which is not un-

derstood but which certainly exists, there appear at intervals changes in the hereditary material such as to lead to the establishment of a new mean with a new range of variability. Such a change is called a mutation. A mutation may be very slight in amount, so as to resemble a mere individual variation, or it may be large as in the fruit fly, when the normal red eye is replaced by a white one. In any case it is recognizable by its heritability and its establishment of a new mean. It is believed that natural selection first operates after this mutation has appeared and determines whether or not it shall survive. Natural selection, then, as De Vries has expressed it, "has nothing to do with the *arrival* of a species but determines its *survival.*"

The Lamarckian theory of the inheritance of acquired characters, so widely accepted by most post-Darwinian writers, was as a result of the work of Weismann largely abandoned; but later experiments indicated that it might possibly be rehabilitated as a factor in evolution. (See HEREDITY.) Some observers secured results which seem to indicate that instead of variations appearing as Darwin supposed, in all directions around a mean, they have occurred only in certain definite lines as if predetermined from the beginning; i.e. as if the composition of the germ-plasm of the race is such that variations can only occur in a few limited directions. Eimer, working on insects, and Whitman, on the development of the color pattern of pigeons, got evidence in favor of this theory, called orthogenesis. An illustration of the supposed working of this factor would appear in the case of the Irish elk, extinct apparently because of the overdevelopment of its horns, which became so large and unwieldy as to lead to the death of the animal. Spencer cited this as a case of inheritance of acquired characters where the horns eventually became large through much use and proved a fatal handicap in the struggle for existence. Since serious difficulties appear in the way of accepting the Lamarckian hypothesis, orthogenesis is proposed as an alternative explanation.

Histology. With increasing perfection of microscopic technique, anatomists studied more and more thoroughly the finer details of animal and plant structure, and this microscopic investigation eventually developed into a distinct subdivision of anatomy called histology. This concerns itself very little with the structure of protoplasm or of the undifferentiated cell but deals mainly with the differentiated condition of cells as they appear in combination to form the various tissues of the body. This study may be directed toward the normal structure of tissues, or it may deal with their appearance under abnormal or diseased conditions. In the diagnosis and treatment of many diseases, a comparison of the normal with the diseased condition is often of very great practical importance.

Cytology. More recently cytology, or the division of miscroscopic anatomy which studies especially the undifferentiated protoplasm and the structure of the simple cell, has received especial attention. While the earlier cytologists thought they recognized visible structures in protoplasm, the later tendency was to regard most of these structures as artefacts or abnormalities resulting from the manipulation to which the material must necessarily be subjected in order to study it, and to think of protoplasm as a complex colloidal compound which may in whole or in part change from a sol to a gel condition and back again, these changes being in some way connected with the life manifestations of the protoplasm. Two kinds of material are recognizable in the cell, the nucleoplasm inside and the cytoplasm outside of the nucleus, differing from one another in their physicochemical composition and containing different kinds of materials. In the nucleus is the chromatin which has been shown to have very great importance in the life of the cell and is an important agent in the transmission of hereditary qualities. More than any other portion of the cell the behavior of this chromatin during cell division by mitosis has attracted the attention of cytologists. Still later, attention was turning to the study of cytoplasmic inclusions known as chondriosomes and Golgi apparatus, structures which lie in the cytoplasm and which, owing to concentration of attention on the chromatin, were largely ignored by earlier cytologists. Opinions differ as to whether these are merely temporary structures in the cytoplasm or permanent organs with some possible function in heredity.

Ecology. This is a study of the living organism in its natural environment with especial reference to the reasons why it should be in that environment rather than in some other. In the environment of an animal would be included climatic conditions, chemical composition of the water or soil in or on which it lives, location of its food, presence or absence of enemies, and conditions governing mating and care of the young. Adams divides the subject into three aspects: individual, in which a particular kind of animal is studied throughout its range of distribution; aggregate, where the taxonomic unit or family is traced throughout its early history; and associational, in which the animal or group of animals is studied with reference to its association with other organisms. Ecology as thus defined has received little consideration as compared with the amount of research devoted to morphology, embryology, and physiology. A rather cheap criticism, frequently expressed in this connection, is apparently based on the assumption that studying an animal under a microscope or in a laboratory in some way alters its character, so that what is there seen is unnatural and abnormal. The absurdity of this extreme position is sufficiently obvious, but it is certainly true that the point of view of the old time naturalist has been too much ignored and that its reappearance under the newer name of ecology is a sign of progress.

It seems probable that associational ecology offers the most interesting field. A study of this sort would include, first, a list of the species of animals and plants living in a given locality, and then a consideration of the various factors that have brought them together. The climatic and the soil conditions would be of much importance, but the main interest would lie in a study of the relationships existing between the component species of the association. These relationships may be hostile, as where one animal feeds on another; mutually beneficial or symbiotic as in the case of the sea anemone carried on the shell of a crab; commensal as in the small crab living in the oyster shell, where neither animal is benefited; or parasitic, where one lives permanently attached to the body of the other; or they may merely amount to an occupation of the

same general territory without the animals' having any very definite influence on one another. The breeding habits of component species would also be considered in reference to their modification through the association. It is not to be understood that in all cases definite and precise reasons can be assigned for the distribution of animals, for because of their locomotor powers their appearance in a given locality might be quite accidental Carefully conducted observations should, however, separate the accidental from the definitely significant distributions. A study of this sort might cover a considerable area, or it might be quite limited, as for example, the ant colonies studied by Wheeler, where in a very restricted area associations exist between a considerable number of animals, and complicated ecological conditions result.

Death. A question to which biologists devoted much attention is whether death is an inevitable and necessary process, or whether, given a continuous optimum adjustment of internal to external conditions, any organism might, barring accident, be immortal. Protozoa reproduce by transverse fission. The body of the parent divides into two, usually equal, parts, each of which in its growth comes to resemble the parent in size and form. Each of these later divides, and this is continued indefinitely, no portion of any generation dies unless by accidental injury. It is evident that in this process which began with the first protozoön and will continue to the last, we have a true bodily immortality. Further, Carrel has been able to keep portions of the heart of an embryo chick alive in artificial culture media for a period several times the normal length of life of the fowl, and there seems no reason why this might not be continued indefinitely. Similar results have been reported by others, and the conclusion must follow that there is nothing inherent in protoplasm itself which inevitably leads to senescense and death.

When, however, we combine these individually potentially immortal cells into a system of tissues and organs making up the body of a complex animal or plant, death appears as an apparently inevitable process at the end of a period which is, roughly speaking, characteristic for each race, although length of life varies in different families within a race and is undoubtedly an inherited trait Several explanations for the senescense and death of many-celled organisms have been given, some referring them to changes in the relative sizes of nucleus and cytoplasm in the cell, others to a decrease, with advancing differentiation, of ability to assimilate nutrition and to eliminate waste, and still others to the fact that the combination of highly differentiated cells into tissues and their relations to one another make up so complicated a bit of machinery that failure to function normally in one part disorganizes the whole mechanism. It would appear, from any or all of these suggestions, that death is the price we pay for the differentiation of tissues making possible the efficiency of our highly organized bodies, and that had we been content to remain protozoa, we might all be immortal.

Economic Zoölogy. Important economic applications of zoölogy appear along both medical and nonmedical lines. Some protozoa cause disease, some Plathelminthes and Nemathelminthes are dangerous parasites, and some insects carry disease-producing organisms from one animal to another These are obviously conditions of interest to physicians and sanitarians, who derive their information concerning the anatomy, life histories, ecology, and methods of combating these organisms from the researches of the zoologists. In addition the physician gets from the same source his knowledge of normal anatomy and embryology. Most of the nonmedical applications have to do with the production and preservation of man's food and clothing. Among the invertebrates the most important are the insects, for while only a few of these produce food (e.g. the honeybee), and others material for clothing (e g. the silkworm), a large number, which appears to be increasing, cause serious losses through their attacks on commercially valuable plants. An appreciable proportion of the cost of production of food and clothing is due to the expense involved in fighting the insect enemies of the plants from which these materials are obtained. In the United States the boll weevil which is attacking the cotton crop, and the gypsy moth attacking shade and fruit trees are striking examples of this situation Less spectacular but similar problems arise in all parts of the country, and large amounts of money are spent annually in attempting to solve them; this work is largely under the supervision of State and Federal entomologists. Similar work is under way in other countries, although insect pests seem to be much more numerous in North America than in any part of Europe. Other applications of economic zoology are in the propagation of edible mollusca, crustacea, fish, terrapin, etc , in the study of fur-bearing animals such as seals, and in devising means of protection against predatory animals other than insects.

ZORN, ANDERS LEONARD (1860–1920). A Swedish painter and etcher. The last years of his life were spent entirely in Sweden. His exhibitions showed a curious juxtaposition of portraits of men and women in irreproachable society dress and strikingly realistic nudes. He continued the production of etchings of the old technical excellence and produced several fine pieces of sculpture, including "The Broken Pitcher" (1920).

ZSIGMONDY, RICHARD (1865–). An Austrian chemist (see VOL. XXIII). He invented the *Membranefilter* in 1917 and wrote *Lehrbuch der Kolloidchemie* (1920).

ZUKOR, ADOLF (1873). An American motion-picture official, born at Riese in Hungary, and educated in Hungary and in the schools of New York City. He came to the United States in 1888. For several years he engaged in business in New York City and Chicago and was later the owner of several vaudeville and motion-picture theatres in New York City. He founded the Famous Players Film Company in 1912 and later became president of the Famous Players-Lasky Corporation.

ZWEIG, STEFAN (1881–) An Austrian writer, born at Vienna, where he studied philosophy at the university He wrote poetry, fiction, plays, essays, and many translations, and is the author of *Silberne Saiten* (1901); *Die Fruhen Kranze* (1907); *Tersites* (1907); *Das Haus am Meer* (1911); *Der Verwandelte Komodiant* (1913); and the tragedy *Jeremias* (1918). He also wrote *Die Liebe der Erika Ewald* (1894), *Erstes Erlebniss* (1911), *Fahrten* (1920), and essays.

COURSES OF READING AND STUDY

Preface

THE purpose of the present volume, as its name suggests, is to offer help towards self-instruction in the various arts and sciences, utilizing the *New International Encyclopædia* as a general text-book. There is little need to emphasize in this place the rôle of popular educator played by a work like the Encyclopædia. This has been long recognized; and, from a mere work of reference consulted at odd moments for fragments of information, the modern Encyclopædia has become in thousands of homes a source of common culture, the basis of a thorough training in the principles and facts of History, Law, Literature, the Fine Arts, Religion, Biology, Engineering, Physics, Chemistry, or Agriculture. Especially where access to large libraries is difficult or impossible, its value is apparent. In every department of human knowledge, it speaks with a copiousness unequalled in the average text-book and a degree of authority attainable only when every department, and subdivision of a department, is covered by an acknowledged specialist in the field.

A glance at any chapter in the book will show the method pursued. The aim has been to make every chapter a complete summary of the subject with which it deals by arranging the material as the reader or student would find it arranged in a systematic treatise on the subject. The amount of text in each chapter has necessarily been reduced to a minimum, only so much being given as is essential to trace the connection between the successive groups of titles. But, when it is considered that every title in every group represents from two or three hundred to fifteen thousand words of text, the completeness of treatment will be realized.

Within the chapter the material has been divided and subdivided in such a manner as to facilitate study on special topics. If the reader, for instance, desires to make himself particularly well acquainted with a certain period in American History, he need but turn to the proper section in Chapter I., where the subject of American History is outlined in five sub-headings with as many groups of titles; and at the end of the section on American History he will find a list of authorities in whose works he may carry on supplementary reading to any extent. In the same manner, a person interested in the ceremonial or hymnology or clerical vestments of the Roman Catholic Church will find these topics treated in related groups of titles as a section in the chapter on Religion. Under Chemistry one may study the entire subject, carefully outlined for such a purpose, or may concentrate on the acids or the salts or the fats. In every chapter, the technical exposition is supplemented by comprehensive lists of biography wherein the historical aspect of the subject finds complete treatment.

In quoting titles in the lists, the form given is that, of course, which appears in the Encyclopædia; as, CRUELTY TO CHILDREN, PREVENTION OF; or, MACHINERY, ECONOMIC EFFECTS OF. Where reference is made to a long article, the particular section is indicated; as, "See section *The Renaissance* under SCULPTURE," in which case, the reader will turn to Sculpture in the Encyclopædia. In the biographical

titles, the full Christian name, or the corresponding initials, is given as a rule; as ADAMS, SAMUEL; ADAMS, H., KIPLING. The alphabetic arrangement of titles in the Encyclopædia makes reference to volume and page obviously superfluous.

It is in its orderly marshalling of the material contained in the Encyclopædia that we believe the value of this book consists. It is quite unlikely that the average reader, left to his own guidance, will plan his course in such a manner as to produce the fullest results with the least waste of time. Where the subject is unfamiliar, he is as apt at the start to hit upon the middle of it as upon the beginning, and, in passing from article to article, there is always the danger of his missing the logical sequence of topics. A mere index would here be useless. What is necessary is a carefully planned outline that shall lead the reader, step by step, from elementary principles to the most specialized treatment. Such a guide this Outline aims to be.

The preparation of this volume, carried on under the supervision of the Editors, has been in the direct charge of Mr. SIMEON STRUNSKY, of the staff of the *New International Encyclopædia*, and the supervision of the revision for the second edition under the charge of Mr. IRWIN SCOFIELD GUERNSEY.

Chapter 1. History

HISTORY, which we may define as the record of man's life on earth and the sum of his achievements, would include in its broadest aspect the entire story of human development from Palæolithic man to the present day. As a matter of convenience, however, in this book we shall leave the beginnings of associated human life to be treated under the heading of Anthropology and Ethnology, where, too, will be found the material for the stories of those peoples and tribes which to the present day have remained without the pale of our civilization. Here we shall take up the narrative at a point in time when we first catch a glimpse of the nations whose culture, evolved during thousands of years, and passed on from hand to hand, has become the heritage of the present day. The traditional division into Ancient, Mediæval, and Modern history is followed, and in accordance with custom the account begins with the nations of the Mesopotamian region, and passes on through Persia and the empire of Alexander into Rome, where also the course of Egyptian, Jewish, Phœnician, and Greek history, taken up in turn, leads us. With Rome, Ancient history ends. India, China, and Japan, though their history goes back to a past coeval with the period we call ancient, are treated apart because of their far less intimate connection with the civilization of Europe, wherein our interest is centered. Mediæval history takes up the story at the fall of Rome, traces the amalgamation of the old world with the new, the growth of the Church, the rise of States, and the transition, through inward development and outward contact with Asia and America, to modern times. There European history becomes largely the story of nations and their conflicts. One by one due treatment is accorded them, the field widening as Australia, Africa, and Asia come within the scope of European interests. The record ends with a section on the history of the United States outlined with greater detail than the account of other lands.

First some conception of the methodology of historical writing and a bird's eye view of the history of the world may be useful, for which see:

A. Ancient History

1. Babylonia, Elam, and Assyria.

Archæological research has carried back the origin of Sumerian and Akkadian civilization to the fifth millennium B. C., given us a fairly continuous history of Babylonia, Elam, and Assyria, and revealed something of the literature, science, art, laws, and social life of these countries. Babylonia was ruled at times by Gutians, Elamites, Kassites, Assyrians, and Chaldæans, but always exercised a power-

ful cultural influence. The Assyrians established an empire that finally included Elam, Mesopotamia, Syria, and Egypt. A part of it fell to the Chaldæan kingdom, which was conquered by Cyrus in 539 B. C. See:

2. Egypt.

From the monuments it is evident that the Egyptian civilization was in its origin independent of the Babylonian and goes back to as early an antiquity. From primitive times when the land was divided into two sections, the Delta and the South, we pass through many dynasties of pyramid and temple building kings to a time of subjugation by foreign invaders, of conquests in Palestine and Asia Minor, of decline, and of reduction by the Persians, by Alexander of Macedon, and by Rome. A cheerful people, influenced greatly by their priests, submissive to their kings, worshiping many gods and animals, they left behind them massive structures of which we have not yet the secret. Their

priests read the stars and knew geometry, speculated on the soul, and probably passed on to the Phœnicians the alphabet which was to be ours. (?— B. C. 30) See:

3. Phœnicia and Asia Minor.

What is now Syria and part of Asia Minor was in the earliest times debatable ground between Egypt and the Mesopotamian monarchies. On the Palestinian coast the Phœnicians, with little territory, developed a splendid industry and commerce and in their ships carried the seeds of Babylonian and Egyptian civilization over the Mediterranean basin. Later, when the

Hyksos were invading Egypt, a people known as the Hittites appear, stout fighters who render a good account of themselves against the Assyrians and Egyptians. Their homes were in Northern Syria and in Eastern Asia Minor, but about B. C. 700 they disappeared, leaving little trace behind them. See:

4. The Jews.

The Jews form the third in the group of peoples lying between Egypt and Babylonia and affected by the influence of both. The Hebrews, a Semitic tribe of nomads, after wandering through the land of Canaan, enter the land of Goshen, a territory belonging to Egypt, are there held in bondage, and, hammered into a nation by persecution, escape, conquering for themselves the land of Canaan and passing thereby from the nomad into the agricultural stage. See:

Zebulun
Ephraim
Benjamin

Ruled by warrior leaders for a long period, the people finally obtain a king, but after a hundred years the nation breaks into two, the northern, Israel, falling to Assyria, the southern, Judah, 150 years later to Babylonia. The Babylonian exiles return and re-establish the Jewish state in the form of a theocracy based on a purified Yahwe worship. See:

The reëstablished State passes from the suzerainty of Persia to that of Macedonia, the Seleucid kings of Syria, and Rome, rising against whom, Jerusalem is taken (A. D. 70), the Temple destroyed, and the greater part of the nation scattered over the Roman world. The insurrection of Bar-Kokba in the second century is the last forcible assertion of the national spirit. The Jews now enter upon their historic rôle of wanderers, subject alternately to persecution and favor at the hands of rulers and peoples, and held together as a folk by the Law and the Talmud. See:

5. PERSIA.

In northeastern Iran, a people, the Medians, shake off the yoke of Assyria in the eighth century B. C. and soon attain power over their former masters, but fall themselves under the domination of the Persians and Cyrus, who brings under his sway all of Mesopotamia and Palestine. Under his successors Persia becomes the greatest empire of pre-Alexandrian times, spreads to the Mediterranean, and enters Egypt, but fights vainly against the Greeks and is conquered by the young

hero of Macedon. The empire falls apart, the heart of it, Persia proper, passing in turn to the Parthians, Arabs, Turks, Mongols, and Turks again, till it remains what it is at the present day, a piece in the game between England and Russia in Asia. See:

6. Greece.

The seeds of culture brought to Greece by the Phœnicians from Babylon, Egypt, and Asia Minor, developed into a new civilization, the highest in many respects the world has as yet seen, which influenced mightily the history of future ages. The legendary accounts, in the tales of heroes and gods, probably reflect historical conditions. See:

Mythology
Danaüs
Cadmus
Hercules
Theseus
Minos
Argonauts
Trojan War
Agamemnon
Ulysses
Achilles

Greek history begins with a succession of great migrations from the mainland eastward towards Asia Minor. When authentic history begins, Greece appears as an agglomeration of small independent states, in a state of transition from the monarchical form of government into tyrannies, oligarchies, and democracies. See:

The Greeks, after a long, successful struggle against Persia, won national greatness. Democratic Athens first takes the lead among the Greek city states and for a half century plays a brilliant part, then succumbs to Sparta, which in turn falls before Thebes. Disunion brings Greece under the sway of Macedon, whose young king, Alexander the Great, conquers Persia and Egypt and spreads the Hellenic culture in his new realm. Greece proper is ruled by Macedon till it falls with Macedon under the power of Rome. See:

In the Greek city states the problems of democracy were well worked out, and politics became an exact science. The principles of democracy were carried over the basin of the Mediterranean and the Black Sea, wherever the Greeks, the successors of the Phœnicians as traders and colonizers, went. See:

7. Rome.

Greek civilization was imposed on the peoples of Europe, Northern Africa, and Western Asia by the armies of Rome, whose origin goes back to a settlement of Latin outlaws and shepherds on one of the seven hills south of the Tiber. A legendary kingdom gives way, about the beginning of the sixth century B. C., to a republican

form of government. A long contest between privileged and non-privileged classes results in the elaboration of a splendidly efficient system of municipal government. See:

With her internal problems settled, Rome enters upon a career of foreign conquest and by means of her splendid military art and unscrupulous diplomacy makes herself mistress of Latium, of Italy, and, after a struggle with Carthage, with Macedonia, and with Syria, of the Mediterranean basin. Unchecked power, however, brings corruption within the State, republican institutions tend to become empty forms, factional strife breaks out, the Senate rules for a while and then succumbs to the ambition of masterful politicians; in the conflict of parties the Republic meets its end. The Roman Empire, established by Augustus before the beginning of the present era, attained its greatest extent in the early years of the second century of that era and entered on its decline towards the end of the same century. At its height it embraced within its limits the classic world. Peace, excellent means of communication, and an unrivalled administrative system brought the different parts of the Empire close together and facilitated the spread of Greek culture and later of Christianity. The decline of the Empire, due to the decay of old age and the onset of the barbarian tribes of Northern Europe, is arrested by the reforms of Diocletian and of his successor Constantine the Great, who, in the beginning of the fourth century, makes Christianity the State religion. See:

Prætorian Guard
Constantine the Great
Christianity

After Constantine the decline is precipitate. The ancient Roman prowess is gone, and the defence of the Empire is entrusted to barbarian mercenaries; the task of government becomes too heavy for one man, and the Empire is divided in two. The wave of barbarian migration breaks with full force upon the Western Empire, and the last emperor of Latin Rome is dethroned in 476. See:

Honorius
Augustulus
Aëtius

The Romans were preëminent for their political genius; their literature, in part, their philosophy, and their art were copies of the Greek, and the general culture at the time of the Empire's zenith was Hellenistic; their gods, too, were largely borrowed or adapted from the Greek pantheon; but in administration and law they were unexampled innovators and in these fields they influenced subsequent European civilization mightily. B. Mediæval History

1. The East Roman or Byzantine Empire continued to exist for a thousand years. Within the limits of the Western Empire the Germanic tribes settled as masters, and from their gradual amalgamation with the conquered Roman provincials date the beginnings of the modern peoples of Europe. The most powerful of the barbarian kingdoms, that of the Franks, attained imperial extension under Charles the Great, who, by his alliance with the Pope, established the connection between Empire and Church, which was to become one of the most powerful determinants of events in the Middle Ages. See:

2. On the death of Charles the Great the Frankish Empire falls apart. Two great kingdoms arise, France and Germany. The Germans make their power supreme in Central Europe and in Italy, and a German king is crowned Holy Roman Emperor, reviving the connection between Church and State established by Charles the Great. A second Teuton stock, the Northmen, appear as conquerors in France, England, Italy, and Russia. The growth of nations proceeds rapidly, and from the relations between conqueror and conquered develops Feudalism. The young nations are brought into conflict with the growing power of the Church, which, under the leadership of the Bishop of Rome, seeks to raise the ecclesiastical power above the secular. The break-up of the Mediæval ages begins with the Crusades. See:

3. The Crusades were followed by a great increase in the commerce of Western Europe and the rise of an influential burgher class, with whose aid the kings succeeded in making themselves independent of the feudal nobility. With the growth of centralized kingdoms the power of the Papacy declines. Contact with the East and the ancient world stimulated the European mind, and the Revival of Learning, the succession of great geographical and astronomical discoveries, and the invention of gunpowder and printing hasten the transition from the Middle Ages to modern times. The uniformity of European society, characteristic of the Middle Ages, is broken up by the Reformation. See:

C. Modern History

At the opening of the modern era the process of State formation in Europe had resulted in the establishment of firmly centralized nations in England, France, and Spain. Germany and Italy, on the contrary, were disunited, and destined so to remain till the later years of the nineteenth century. The conflicts of States and nationalities is one of the great features of modern times; till 1648 religion is a fruitful cause of external warfare and civil strife; after 1648 wars are fought on political and commercial grounds. The disappearance of a common Church and of Latin as the common vehicle of communication among the higher classes tended to intensify the differentiation of national characteristics. The burgher class, which had begun to assert itself in the period after the Crusades, rose to full recognition in the life of the State and in turn was forced to render recognition, after the French Revolution, to the lowest classes in the State, artisans and peasants. The Church loses control over the temporal affairs of its members, and even in the spiritual field its authority is subordinated to that of the State. Life takes on a predominantly secular tinge; science broadens the intellectual horizon, and commerce and colonization bring the non-European part of the Eastern Hemisphere within the sphere of European influence. The history of modern times is best studied in the history of the various nations.

1. England.

The Britannia of the Romans is overrun in the age of migrations by Teutonic tribes from Jutland and the northwest of Germany, who, receiving a new infusion of kindred blood from the Danes, are conquered in the eleventh century by a more remote kinsfolk, the Normans—Gallicized Teutons from France. Saxons and Normans are blended into one before 1400, by which time a constitutional system of government, worked out in the course of long conflicts between rulers and subjects, is in force, based on the supreme legislative authority of a Parliament, representing the different estates. Wales and Ireland have been subdued, and Scotland has ceased to be a dangerous rival. Feudalism, never so strong in England as on the Continent, is practically destroyed during the Wars of the Roses in the fifteenth century, and the modern era may be dated from the accession of the Tudors in 1485. Tudor

Under the Tudors the power of Parliament greatly declined. The Reformation, initiated by Henry VIII, soon spread beyond the limits the King would set to it, and England became Protestant. Under Elizabeth it was forced to contend against Spain, the champion of Catholicism. With the defeat of Spain, England enters on her career as ruler of the seas and begins the work of founding a new English-speaking nation across the Atlantic. The death of Elizabeth, the last of the Tudors, gives England and Scotland a common sovereign. A revived Parliament asserts its rights successfully against the absolutism of the Stuarts, dethrones them, recalls them, and drives them as enemies of Protestantism once more from the throne, bestowing the crown upon a prince of Dutch blood. The crowns of England and Scotland are united. On the Continent, England takes a leading part in the overthrow of Louis XIV of France and comes out of the struggle more powerful than ever upon the seas. See:

With the accession of the House of Hanover, the supremacy of Parliament is firmly established; cabinet government is developed, and the rule of party is the order—by the Whigs, roughly speaking, to the French Revolution, by the Tories to 1832, by the two or their successors since then, in comparatively rapid alternation. France is defeated and deprived of her Indian and American possessions, but almost immediately England suffers an irreparable loss in the defection of the thirteen colonies. Partial compensation, however, is found in India, where English adventurers build up a new empire. After the French Revolution and the Napoleonic Wars, comes strife between the advocates of reaction and the rising forces of democracy, stimulated by the great industrial revolution. The latter win in 1832, and the subsequent history of England is one of democratic progress within, of conquest and commercial expansion abroad. See:

2. FRANCE.

Upon the dissolution of the Frankish Empire in the ninth century, descendants of Charles the Great continue to rule over the land of the Western Franks with a population predominantly Celtic and a language derived from the Latin. This is the beginning of France. The weak Carolingians are replaced by the energetic house of Capet, under which the unification of the country is carried on by such able rulers as Philip II, Louis IX, and Philip IV. The Hundred Years' War is disastrous to the kingdom, but its recovery is rapid under Charles VII and his son, Louis XI, who leave the power of the crown firmly established. Religious wars in the sixteenth century become a factor for anarchy, but feudalism is definitely crushed by Richelieu, and absolutism is established by Louis XIV, under whom France is for fifty years the overweening power in Europe. Absolutism breaks down under Louis XIV's unworthy successors, and the entire ancient fabric of society is swept away by the French Revolution. See:

The abolition of feudalism by the French National Assembly is followed by the overthrow of the monarchy. Assailed by the rulers of Europe, France retaliates, and its conquering armies carry the gospel of democracy over the Continent. Under Napoleon, France dominates Europe until, defeated by a rising of the European peoples, it is compelled to take back its Bourbon kings. Reaction struggles with the advancing ideals of political and social revolution, and the country witnesses within the century the overthrow of three dynasties and the establishment of two republics. Under Napoleon III, France regains for a brief period its ascendency in European politics, but suffers overwhelming defeat at the hands of a new-created Germany. Her latest history has to do with the slow grounding of republican principles, the adjustment of relations between Church and State and the great war which began in 1914. See:

3. Germany.

German history, like the history of France, may be dated from the dissolution of the Frankish Empire. Unlike France, Germany knew no unity until the very latest times. The establishment of the Holy Roman Empire in the tenth century connected the political fortunes of Germany with those of Italy and the Papacy, and the history of the empire is but the history of the separate states within the empire. After 1273, the imperial dignity is held, as a rule, by members of the house of Hapsburg, and the imperial interests become more and more Austrian. Disunion is fostered by the Reformation and perpetuated by the Thirty Years' War. In the eighteenth century, Prussia enters into competition with Austria for leadership in the empire, which, after existing for more than eight hundred years, is dissolved by Napoleon in 1805. The quarrel between Prussia and Austria is fought out in the nineteenth century, and the former triumphs. A new German Empire is formed, differing from the Holy Roman Empire in its national character, and, as the strongest military power on the Continent, occupies a leading place in the European system. 4. AUSTRIA-HUNGARY.

Austria-Hungary is a political unit merely and in no sense a national State, and its history is largely that of the several states that compose it. The relationship to European affairs resulting from the close connection between the house of Austria and the Holy Roman Empire, for five centuries, is best traced under GERMANY, which see. Here, the internal affairs alone will be touched upon, and the history may be summed up in the history of a family, the Hapsburgs, that, starting with small territorial possessions in the Swabian mountains, brought under its sway by conquest or marriage the heart of Central Europe, from the Carpathians to the Alps and from the Vistula to the Danube and the Adriatic Sea. 5. The Iberian Peninsula.

One of the richest regions of the Roman Empire, Hispania, was wrested from the Romans by successive waves of barbarian invaders in the fifth century of our era. The Christian Gothic kingdom was overthrown by the Arabs, who developed in the peninsula a civilization that was long the highest in Europe. The remnants of the Christian inhabitants rallied in the northern mountains and a slow but steady process of reconquest was begun, hastened by the dissolution of the Arab Caliphate, retarded by strife among the various Christian kingdoms, completed before the end of the fifteenth century, when the greater part of the peninsula had been brought under one crown. Portugal alone preserved its independence of Castile. Enriched by the wealth of a newly discovered world and her Lowland possessions, Spain, in the sixteenth century, plays the leading rôle in European affairs and then enters on a course of political and economic decline which has continued to the present day. Portugal and Great Britain have been friends since the beginning of the eighteenth century. See:

6. Italy.

The fall of the Western Empire was followed by a struggle between the

Goths and the Byzantines for the possession of Italy. The latter held the south while the north passed from the Goths to the Lombards and the Franks. Constituted with Germany into a shadowy Holy Roman Empire, Italy enters upon a period of utter disunion with the Papal power established in the centre of the peninsula, the north parceled out into independent principalities and republics, the south ruled by Normans, Saracens, French, and Spaniards. The Italian cities rise to great prosperity after the Crusades and become the cradle of the Renaissance. The state of political disintegration continues till the later part of the nineteenth century and Italy suffers from internal strife and foreign domination, Spain and Austria playing the master in the greater part of the peninsula. Union comes to the country from the house of Savoy, whose power, spreading over Sardinia and Piedmont, after a contest with Austria, the Papacy, and Spain, spreads over the entire peninsula. Early Italian history is best studied in the story of separate states and celebrated families. See:

7. The Slav Empire.

The Slav inhabitants of the plains south of the Finnish lakes received in the ninth century a ruler of Scandinavian stock, whose successors extended their sway to the southern rivers. The Byzantine civilization and religion are introduced. The unity of the country disappears after the tenth century, and its independence is swept away in the thirteenth by Mongol invaders from the east. The power of the Mongols breaks up in the fifteenth century and a new empire is created by the grand princes of Moscow, whose rule is steadily extended to the south and west at the expense of Poland and the Baltic powers. Peter I brings Russia within the sphere of European politics and gains for his country a predominant place among the northern powers. With the Baltic reached, Russia turns once more to the south and driving the Turks before her, she reaches the Black Sea and seeks to press into the Balkan peninsula. The jealousy of the powers halts her progress and her advance assumes a new direction—eastward and southward in Asia, where the beginnings of her power had been made in the sixteenth century. In her attack on the integrity of the Chinese Empire, she finds a formidable rival in Japan. Internally, after Peter's time, a struggle goes on between the Eastern and Western civilization, which, at the beginning of the twentieth century, finds Russia still a despotism. Poland, at one time the greatest power in central Europe, fell through disunion and its territory was absorbed by Austria, Prussia, and, to the largest extent, by Russia. See:

8. The Balkan Peninsula.

The Byzantine Empire, successor to the Roman Empire in the eastern Mediterranean, after a thousand years' existence, fell before the Turks, whose power, spreading northward beyond the Danube, extended over Hungary and threatened the Austrian dominions. The rapid decline of the Turks begins with the eighteenth century and has continued to the present day, resulting in the restriction of the Ottoman power to but a fraction of its once vast territories. Russia and Austria have stead-

ily pressed the Turkish power backward, and only the jealousy of the Western powers, England primarily, has preserved the integrity of the Empire. Part of the territory wrested from Turkey has been erected into independent Christian States. In 1908 the Young Turk movement overthrew the old order of things and established a constitutional government. In the Great War Turkey divorced herself from England and cast in her lot with the Teutonic allies. See:

10. South America and Mexico.

Beginning with Mexico in 1519, the great regions of Central and South America were rapidly brought under Spanish rule, Portugal, however, held sway in Brazil, and in Guiana small portions fell to other European nations. The harsh Spanish rule led to bitter but unsuccessful uprisings among the Indian tribes of Peru and Chile. The first quarter of the nineteenth century witnessed the successful revolt of the Spanish dependencies, aided in their struggle by the decidedly

friendly attitude of Great Britain and the United States, of whom the latter now assumes the rôle, largely, of protector over the newly established republics. A decided inaptitude for self-government is evinced by these, and chronic disorder checks national development. Chile, Argentina, and Mexico are, however, prominent exceptions. Brazil, after living tranquilly as an independent empire, enters upon the troubled career of republican politics towards the end of the nineteenth century. The influence of the United States in South America becomes an important factor with the completion of the work of building the Panama Canal. See:

(2) China. China presents the spectacle of a nation which, having attained a high degree of civilization at a time when Europe was still barbarian, has been content to remain quiescent while the world has moved forward. In spite of its vast latent strength, it seems destined to become the prey of European ambitions, unless the example of its kindred nation, Japan, should lead it to recognize the civilization of the West, and to observe the preponderant rôle that should be its own in the Orient. See:

Tze-hsi
Yuan Shih-kai

For the Philosophy and Religions of China, see Chapter on Religion.

(3) Japan. Among the nations of the East, Japan stands forth as an amazing exception to Eastern immobil

ity. The political balance in the Pacific has been quite upset by the appearance of this new power, which, in less than four decades, has passed from feudalism and Oriental seclusion to a constitutional government and the skilful utilization of the sciences and wisdom of the West. Japan's triumph over China in 1894-95 first marked strength; its magnificent struggle against Russian aggression in China and its participation in the Great War raised the possibility of a quite unexpected development in the relations between Europeans and Mongolians. 12. The United States.

Norse explorations in North America, about the year 1000, led to no result, and Europe, before the time of Columbus, had no knowledge of a world beyond the Atlantic. The discovery, in 1492, was followed by a period of exploration, in which Spanish, French, English, and Dutch participated. Settlement follows, and poverty and religious persecution in Great Britain stretches a chain of English speaking colonies along the eastern coast of what is now the United States. Swedes and Dutch give way in time, and with Spain restricted to Florida, England enters into a struggle for possession of the interior with France, whose rule has meanwhile been extended over the basins of the St. Lawrence, the Mississippi, and the Great Lakes. England triumphs, and brings under her authority the disputed territory east of the Mississippi. See:

England's triumph over France is followed almost immediately by the irreparable loss of the thirteen colonies. The injustice of Parliamentary taxation stirs the colonists to resistance, and the memory of their triumph over the French lends them courage for the struggle. See:

Declaration of Independence

The thirteen colonies, having vindicated their independence in a protracted war, are impelled for the defence of their now won liberties, and the furtherance of their common welfare, to organize themselves into a federal republic with a written constitution, in nature essentially a compromise between the ideas of local liberty and efficiency of the central authority. The Liberator of the nation is also its first executive. His death is followed by a struggle between the two constitutional principles. The advocates of "strict construction" triumph, and, in the person of Thomas Jefferson, the Republican-Democratic Party assumes power to hold it uninterruptedly for forty years. The

boundaries of the Union are extended by the admission of new States, and the national territory is enormously increased by the acquisition of Louisiana and Florida. Party differences disappear, for a while, after a second war with Great Britain, but a new cause of dissension appears in the form of the slavery question, which replaces constitutional politics by sectional. The Democratic Party in the course of time did not fail to adopt many of the principles of the old Federalists, among them notably the national encouragement of internal improvements and the creation of a Government bank. The tendency on the part of a faction to lay stress on these functions of the Government led to the dissolution of the Democratic Party. The Whigs now appear, historically the successors of the Federalists and the predecessors of the Republican Party. The hierarchic succession of presidents ends in 1828, and the Western Democracy triumphs in the person of Andrew Jackson. Sectional feeling, fostered by growing economic differences between North and South, is intensified by the rise in the North of an outspoken spirit of opposition to the institution of slavery. The two political parties for a time eagerly ignore the issue, and Southern statesmen, armed with the threat of a disruption of the Union, succeed in coercing the conservatives in the North.

Territorial expansion, however, forces the slavery question into the foreground; the Whig Party, unwilling directly to challenge the issue, is succeeded by the Republican Party, which will. The Democratic Party is broken in two. With the triumph of the anti-slavery party in 1860, the South secedes from the Union. See:

(*d*) Emancipation Declaration
Draft Riots

Four years of civil war established the principle that the United States, once perhaps a federation, is now a nation. Slavery is abolished and a partisan Congress, under the stress of circumstances, gives the ballot to the liberated bondsmen. Reconstructed, the Southern States devote themselves to the task of rebuilding their wasted fortunes on old ruins and new conditions. The South recognizes the lesson of the war in its bearing on the nature of our Government, but refuses to recognize the capacity for political and social equality in the negro, and in the last

years of the nineteenth century enters upon a deliberate policy of negro disfranchisement through State legislation. In the North and West, the era is one of extraordinary material growth, and political questions of the time are largely economic—currency, tariff, labor, and monopoly. With the acquisition of the Spanish possessions in the Pacific, and the assumption of the task of building the interoceanic Panama Canal, the United States begins its career as a world power. See:

Chapter 2. Law and Political Science

NATIONAL or Municipal law is commonly divided into two general classifications, Substantive Law, and Adjective or Remedial Law. Substantive Law prescribes and defines the normal relations of social and political life, that is, legal rights, obligations, and privileges, as distinguished from violations of the normal, legal order. (See Substantive Law.) Adjective or Remedial Law deals with abnormal conditions, such as crimes, and with the methods of enforcement of legal rights. Both of these classifications are severally divided into Public Law and Private Law. The title, Public Law, is applied to those subjects which have to do with the relations of individuals to the various branches of government. Private Law includes the rules governing the relations of individuals to each other, and their rights in and over property. While, for some purposes, Substantive and Remedial Law are so closely connected that a complete knowledge of one is not possible without an acquaintance with the other, yet, in general, it may be said that, for practical purposes, the average layman is concerned chiefly with the rules of Substantive Law, except, perhaps, Public Remedial Law—the Law of Crimes. For example, it is quite necessary that a person in business be somewhat familiar with the ordinary principles of the Law of Contracts, but it is not necessary that he should know how to proceed in law to obtain redress for the breach of a contract.

International Law is distinguished from Municipal Law, in that the former deals with the relations of nations with each other, and such rules of law as will be recognized by nations in dealing with the citizens of each other, while the latter deals with the relations of one nation to its citizens, and the relations of the citizens with each other. International Law is administered, generally, in the various courts of each nation when applicable, but the refusal of a nation to recognize any of its principles could only be met by a declaration of war on the part of the aggrieved nation or nations, whereas the sovereign power of a nation sanctions and enforces Municipal or National Law. Therefore, to avoid confusion, topics in International Law are placed in a separate classification.

For a General Discussion of the Nature and Purposes of Law, see:

Law
Jurisprudence
Substantive Law
International Law
Municipal Law
Mercantile Law
Military Law

A. Substantive Law

I. Public Substantive Law.

This branch of substantive law is commonly divided into two general classifications, Constitutional and Administrative Law. Constitutional law deals with the nature and powers of the Government, and correlatively with

the rights and privileges of citizens with reference to the Government. The name, ADMINISTRATIVE LAW, is applied to that portion which controls and regulates the enforcement of the will of the Government, as expressed by constitutions, statutes, etc.

II. Private Substantive Law

For convenience this portion of the substantive law is divided into two classifications, the Law of Persons and the Law of Property.

1. Law of Persons:

In law, both natural persons and those creations of the law, such as corporations, known as legal entities, or juristic persons, are classed together in the Law of Persons, as the same general principles apply to them. Under the title Natural Persons, are grouped titles dealing with the peculiar privileges and disabilities of married women, infants, and persons of unsound mind. Topics dealing with the family relation are for convenience grouped together.

(*a*) *Natural Persons*:

I. Persons Exercising Incomplete or Special Rights:

Infant
Minor
Legitimacy

Joint Stock Company
Limited Companies
Limited Liability
Regulated Companies
Stock Company
Dividend
Director
Trust
Trust Fund Doctrine

2. LAW OF PROPERTY:

The term property includes everything that is the subject of possession and ownership, whether tangible or intangible. The various kinds of property are naturally divided into two classifications, REAL and PERSONAL. Real Property includes lands, tenements, and hereditaments, and interests therein. Subjects dealing with the disposition and incumbrance of real property *inter vivos* are also placed under this title. Personal Property includes all movable objects of property, commonly known as chattels, and such claims, obligations, and rights of action as are the subject of transfer. Topics treating of the transfer of property, both real and personal, by will or descent, are classed under the title, SUCCESSION AND INHERITANCE.

II. Private Remedial Law.

This division of Remedial Law includes the law of Torts and Civil Practice and Procedure. Torts are

wrongs other than those arising out of contract, for which the injured party has a right of action. A tort action is not assignable and is not strictly a property right, and, therefore, the law of torts is properly considered remedial law. Under the title, Civil Practice and Procedure, are grouped all topics dealing with the enforcement of civil rights of action of a private nature.

1. Torts, or Civil Wrongs.

Conversion
Trespass
Assault
Trover
Fraud
Fraudulent Conveyance
Infringement
Slander of Title

Accident
Injury
Misrepresentation
Nonfeasance
Nuisance
Negligence
Malfeasance
False Imprisonment
Malicious Prosecution
Mayhem
Pollution of Watercourses
Criminal Conversation
Employer's Liability
Fellow-Servants

2. Civil Practice and Procedure.

In English jurisprudence, three distinct systems of procedure, corresponding and adapted to distinct systems of jurisprudence, were developed respectively by the courts of common law, the courts of chancery, and the courts of admiralty. The common law procedure is much older than the procedure in either equity or admiralty, as practiced by the English courts, the *curia regis*,—which was the forerunner of the English Courts of Exchequer, Common Pleas, and King's Bench, in which the common law procedure was developed,—having been established in the early part of the twelfth century. Procedure in equity is much simpler than procedure at common law. Its essential characteristics are based on the fact that the sole power of that court is to command things to be done, and not directly to transfer or otherwise affect the rights of litigants. Procedure in admiralty was founded upon the Roman law and corresponds in many particulars to the equity system. The embarrassment experienced as a consequence of the technical character of the common law procedure has led to many reforms by legislation.

C. International Law

The subjects or persons of International Law are independent sovereign States or nations. The community constituting such State is permanently established for a political end, is possessed of a defined territory, and is independent of external control. If one or more of these elements be lacking, the community is not a State in the sense of International Law. Individuals choose their associates, and States likewise determine whether and when they wish to maintain relations with a newcomer. A fundamental proposition of International Law is the equality of States, of which Chief Justice Mar-

shall said: "No principle of general law is more universally acknowledged than the perfect equality of nations. Russia and Geneva have equal rights. It results from this equality that no one can rightfully impose a rule on another." See:

Chapter 3. Sociology

Sociology

SOCIAL science presents a theoretical and a practical aspect, of which the latter, at the present time, is the more important. Speculation on the origins of social life, the evolution of social institutions, and the nature of existing social bonds has been rich in theories, diverse in view, but casting light on all the course of human development. Society has been variously regarded as an aggregate, an organization, or an organism, and accordingly as it has been regarded its rights and duties as against the individual have been outlined. The influence of the collective body and the collective mind on the body and mind of the individual forms one of the most fascinating topics of sociology, fascinating because of the close connection that may be established between individual and social progress. But as yet scarcely sufficient material has been collected to make social theory strictly scientific, and the greater interest, probably, attaches to what has been called the practical aspect of social science, the study, namely, of contemporary social conditions and the problems which they create. Thus it would not be far from the truth to call practical sociology, social pathology, for as a matter of fact the attention of the working sociologist is directed, in greater part, to the study of the ills of the social body, a study of those individuals and classes of individuals whose presence in the midst of society is a burden or a source of danger to society or the cause of misery to themselves. In this respect social science deals with the helpless and the vicious and is largely coincident with humanitarianism. Theoretical sociology is most closely allied to Anthropology and History, going to the latter for its evolutionary data and to the former for origins. Practical sociology depends very largely on statistics.

I. The methods and theories of sociology are treated at length under that heading, supplemented by minor articles on subsidiary topics. This article, therefore, should be made the starting point on reading. See:

Sociology
Man, Science of
Anthropo-geography
Acclimatization
Environment
Standard of Living
Crowd

A discussion of various social institutions which form part of the data of the sociologist, such as the Family, Marriage, the Tribe, etc., will be found in the chapter on Anthropology and Ethnology.

II. 1. Taking human aggregates as its subject matter, practical sociology draws the greatest uses from statistics. The gathering of statistical data is being initiated wherever governments have as yet failed to assume the office, and where official enumerations prevail their scope is constantly being widened. The study of population is now well advanced. See:

Demography
Census
Population
Vital Statistics
Births, Registration of
Illiteracy
Transportation, Penal
Immigration
Emigration
Migration
Colony
Oriental Immigration
Naturalization
Suicide
Infanticide
Divorce
Marriage
Statistics

2. "Dependents, Defectives, Delinquents," adequately describes the subjects dealt with by the social pathologists. In this immensely broad field, private efforts coöperate with State activity, the former through investigations and advocacy largely, the latter through remedial legislation and the use of State resources. For a study of the dependent and defective classes, see:

Dependents, Defectives, Delinquents
Social Debtor Classes
Debt
Pauperism
Poor Laws
Poor Rate
Casual Poor
Mendicancy
Eugenics
Tramp
Vagrant
Unemployment

Degeneracy
Jukes, The

3. Of dependent classes, children, naturally, absorb a large share of the attention of the sociologist and the charity worker. The mission here is not one of relief only, but of redemption, and successful effort in this field discounts future dangers to society. See:

Dependent Children
Foundling Hospital
Penology
Crèche
Marbeau, J. B.
Infant School
Ragged Schools
Rauhes Haus

George Junior Republic
Parks and Playgrounds
Juvenile Court
Juvenile Offenders
Lindsey, B. B.
Children, Societies for
Cruelty to Children, Prevention of
Children's Aid Society
Schools
Wirt, Wm. A.

4. Sufficient reason exists for speaking of a criminal class to make Criminology an independent branch of investigation with something of the methodology of a science. The delinquent, the criminal, is regarded as at war with society. The causes that have changed the course of nature in him and made him anti-social may be heredity or environment or both. The prevention and punishment of crime and the possible reformation of the criminal form the subject matter of the "science." See:

Criminology
Lombroso, Cesare
Bertillon System
Finger Prints
Punishment
Corporal Punishment
Flogging
Penology
Capital Punishment

6. The problem of remedying social evil has drawn the attention of men in all ages, and thinkers have been fond of busying themselves with the construction of ideal forms of society since the days of Plato. More than philosophers' dreams, however, are the great social movements of modern times, whose aim is the reorganization of society on a different basis than that of the present—private property.

Worms, René

Chapter 4. Political Economy

Political Economy

Political Economy has been briefly defined as the science of wealth, but this definition requires a further explanation of the peculiar sense in which the term wealth is employed. Wealth has been defined as the body of things that have value, but here again value in the economic sense has a narrower meaning than in ordinary use. Value, in economic discussion, usually means power in exchange, that is, the power of a commodity to command other commodities in exchange. Such attempts at brief definition, however, are not satisfactory, since each primary concept of the science is itself the text for long discussion. The best introduction to the subject will be found in the article, POLITICAL ECONOMY, which outlines clearly the content or scope, the relation of political economy to other branches of study, and the methods of investigation or arrangement that it employs.

I. The fundamental principles should then be studied by reference to the following articles:

Wealth
Production
Labor
Division of Labor
Industrialism
Wages
Money
Bank, Banking
Standard of Living
Capital
Interest
Usury
Rent
Tax
Single Tax
Métayer
Profit
Monopoly
Speculation
Consumption
Value
Coöperation
Distribution
Exchange
Tariff

The history of economic thought should be studied next. In ancient and mediæval times political economy was not marked off from other branches of learning, and no attempt was made to study it systematically. From the historical paragraphs in the article, POLITICAL ECONOMY, it will be seen that to the Greek and Roman philosophers, as well as to the mediæval churchmen, the laws of trade were of interest mainly in their moral bearings. Even in the eighteenth century, when some of its principles were understood, and something like a systematic study was attempted, its scope and importance were not realized. It was regarded as a branch of statecraft. Not private wealth, but the best means of increasing financial power of the state was the main object of investigation. For an account of the various systems of economic thought, and the contributions of individual economists, see the following:

Mercantilism
Physiocrats
Laissez-Faire

Manchester School
Free Trade
New Freedom
Open Door
International Trade
Protection
Balance of Trade
Navigation Laws
Tariff
Quesnay, F.
Smith, Adam
Ricardo, D.
Malthus, T. R.
Thünen, J. H. von
Say, J. B.
Carey, H. C.
Bastiat, F.
Mill, J. S.
Cairnes, J.
Jevons, W. S.
Walker, F. A.
Marshall, Alfred
Boehm von Bawerk, E.
Clark, J. B.
Wagner, Adolf
Schmoller, G.
Menger, K.
Nicholson, J. S.
Patten, S. N.

Obviously the study of past economic conditions is essential to an understanding of the present. On the general subject of Industrial Evolution consult the following:

Manufactures
House Industry
Mir
Guild
Hanseatic League
Merchants Adventurers
Mercantilism
Physiocrats
Industrial Revolution
Factories and the Factory System
Cartwright, E.
Open Field System
Agriculture

Standard of Living
Union Label
Interlocking Directorates
Boycotting
Lockout
Picketing
Labor Problems
Labor Colonies
Labor Congresses
Contract Labor Law
Labor Day
Labor Legislation
Labor, Department of
Labor Church
Industrial Revolution
Sweating System
Employment Bureau
Labor Exchanges
Labor, Bureaus of
Child Labor
Employers' Liability
Workingmen's Compensation
Accidents, Industrial
Factory Inspection
Social Democracy
Shops
Injunction

3. Governmental Regulation and Encouragement of Commerce and Industry:

Protection
Customs Duties
Tariff
Drawback
Warehousing System
Mercantilism
Industrial Commission
Latin Union
Hamilton, Alexander
List, Friedrich
Balance of Trade
Corn Laws
Anti-Corn-Law League
Cobden Club
Reciprocity
Shipping Subsidies
Coasting Trade
Monopoly
Trusts
Trust Fund Doctrine

4. Money and Credit:

Money
Precious Metals
Foreign Money
Bullion
Coinage
Numismatics
Index Numbers
Tabular Standard
Bimetallism
Latin Union
Monetary Conferences
Monetary Commission
Gresham, Sir Thomas
Gresham's Law
Greenbacks
Currency
Greenback Party
Specie Payments, Suspension and Resumption of
Fiat Money
Credit
Credit, Letter of
Crisis, Economic
Interest
Bank, Banking
Land Banks
Clearing-House
Trust Companies
Bill of Exchange
Exchequer Bills
Crédit Foncier
Mortgage Banks
Rural Credit
Reserve Bank, Federal

5. Taxation and Finance:

Finance
Tax, Taxation
Debt, Public
Independent Treasury
Repudiation
Tariff
Customs Duties
Excise
Internal Revenue System
Budget
Income Tax
Land Tax
Special Assessment
Single Tax

See also sections on *Finance* under the various countries, as United States, Great Britain, Brazil, etc.

6. Insurance and Savings Institutions:

Insurance
Life Insurance
Fraternal Insurance
Fire Insurance
Marine Insurance
Friendly Societies
Workingmen's Insurance

Tontine
Underwriter
Annuity
Savings Banks
Post Office Savings Bank
Trust Companies
Building and Loan Associations

7. Among prominent economists, in addition to those already named in the lists, are the following:

Achenwall, Gottfried
Adams, H. C.
Aguado, A. M.
Anderson, James
Ashley, W. J.
Astor, John Jacob
Atkinson, Edward
Bagehot, Walter
Baring
Baring, A.
Bastable, C. F.
Bastiat, F.
Bates, Joshua
Baudrillart, H. J. L.
Baxter, Robert D.
Beckmann, Johann
Bemis, Edward W.
Biddle, Nicholas
Blanqui, J. A.
Block, Maurice
Bodin, Jean
Boehm von Bawerk, E.
Boisguilbert, P. le P.
Brentano, L. J.
Cairnes, John E.
Carey, Henry C.
Carli, G. R.
Cernuschi, Henri
Chevalier, M.
Child, Sir Josiah
Clark, John B.
Cobden, Richard
Cohn, Gustav
Cooke, Jay
Cossa, Luigi
Courcelle-Seneuil, J. G.
Cournot, A. A.
Decker, Sir Matthew
Dewey, Davis R.
Drexel, Anthony J
Ely, Richard T.
Engel, Ernst
Farr, William
Farrer, T. H.
Faucher, J.
Fawcett, Henry
Ferraris, C. F.
Field, Cyrus F.
Fisher, I.
Fisk, James
Fix, Théodore
Frick, H. C.

Wolowski, L. F. M. R.

8. For Economic and Social Reform Movements, see section 6 of the preceding division (Sociology).

Chapter 5. Anthropology

TAKEN in its broadest signification, Anthropology, the science of Man, would include within its scope all the sciences and arts as dealing with particular phases only of the history of human life on earth. Physiology, Psychology, Philosophy, Linguistics and Literature would then be proper fields of study for the anthropologist, as to a large extent they are. But the field of human knowledge is so broad, and the scope of every particular science in fact so extensive, that in the nature of things no single mind can at the present day carry on the work of scientific investigation in more than a limited field of inquiry. Practically, therefore, anthropology, with its allied science of ethnology, has become the study of a man as a zoölogical genus, and secondly, the study of the origins of culture as deduced from ancient remains and the testimony afforded by surviving savage races whose life has as yet undergone no such differentiation as to put it beyond the study of a single mind. Among them are sought the germs of present institutions and beliefs, which are followed up until they become the things of which history takes cognizance. Primitive life, then, is largely the subject of anthropology which deals also with survivals of primitive modes of life and methods of thought in our own times. Thus the topic of Folklore and Customs falls fairly within its field. See:

Man, Science of
Anthropology
Ethnography

1. The study of human anatomy and physiology is of primary importance in the science of man. On the basis of morphological and physiological peculiarities, various classifications of mankind have been made, and our knowledge of prehistoric man is largely a matter of skulls and thigh bones. The measurement of the human body has become a science in itself. See:

Somatology
Craniometry
Skin
Mongolian Spots
Anthropometry
Melanism and Albinism
Hair
Giants
Dwarf
Skull

2. Remains of prehistoric man have been found in both hemispheres, but most plentifully in Europe. Ingenious comparative studies allow us to arrive at a fair conception of the physical characteristics of the earliest inhabitants of the world. See:

Barrow
Mound-Builders
Megalithic Monuments
Dolmen
Avebury
Stonehenge
Spy
Chelléan
Cro-Magnon
Furfooz Race
Hallstatt Epoch
Madeleine, La

Mousterian Epoch
Neanderthal Man
Lansing Man
Kitchen-Midden

3. For the great divisions of mankind determined on the basis of physical characteristics and geographical distribution, see:

Caucasian Race
Europe, Peoples of
Mediterranean Race
Mongolian Race
Negro
Indian Peoples
Malayan Peoples
Melanesians
Indians, American
Mixed Races

4. On the question of the origin of mankind there has been much disputation among anthropologists with little positive results. See:

Evolution
Pithecanthropus

5. Man has nowhere been found in complete isolation. From the first he appears as the social being with his life conditioned by the co-existence of others of his kind. Co-existence meant likeness of thought and experience and the necessity of intercommunication. Our interest, therefore, turns to language. See:

Language
Philology
Gesture Language
Sign Language
Writing
Hieroglyphics
Cuneiform Inscriptions
Wampum

6. In common with the animals man is early engaged in a struggle for the material needs of existence, with greater needs to satisfy, however, than the animals, and consequently with growing resources.

(*a*) The desire for food is the primal motive in life. See:

Cannibalism
Geophagy
Cookery
Pottery

(*b*) According to the nature of the physical conditions amidst which he dwelt, man found shelter for himself. See:

Tent
Wigwam
Cave-Dwellers
Cliff-Dweller
Mesa
Earth Lodge
Lake Dwellings
Archæology, American
Casa Grande
Oaxaca, Ruins of
Palenque
Nomad
Gypsies

(*c*) Dress, it is well established, came from no need of protecting the body, but had its origin in ornament. See:

Dress
Tattooing
Headdress
Hairdressing

7. Man entered upon a rapid course of development when, in his search for sustenance and shelter, he began the use of tools. See:

(*a*) For Implements:
Flint Implements

Celt
Stone Age
Bronze, Age of
Archæology, American
Paleolithic Period

(*b*) For Weapons:

Arrow
Blowgun
Tomahawk
Boomerang
Scalping

For the beginnings of the agricultural stage, see:

Agriculture
Plow
Domestic Animals

8. The religion of primitive man is essentially the belief in a universally animated world, a world of spirits, to combat and placate whom is the business of his life. See:

Animism
Totemism
Superstition
Religion, Comparative
Magic
Necromancy
Oracle
Nature-Worship
Fire-Worship
Phallicism
Fetishism
Shamanism
Amulet
Manitou
Demonology
Demoniac
Satanism
Voodoo
Ghosts
Fast
Sacrifice

9. Birth and death are naturally portentous phenomena to the primitive mind, and are marked, death especially, by various ceremonies. In case of death the rites connect themselves with the belief in existence beyond the grave. See:

Couvade
Circumcision
Teknonymy
Infanticide
Mortuary Customs
Burial
Cist-burial
Suttee
Coffin

10. The origin of the family relation is a subject of much controversy; and the older view that, preceding the present organization of the family under the authority of the father and conditioned by the element of property, mankind passed through a stage in which the family centered around the mother, in whom authority was vested, and from whom descent was traced has been abandoned. See:

Marriage
Matriarchate
Partriarchate
Polygamy
Polyandry
Levirate Marriage
Clan
Tribe
Totemism
Caste
Exogamy
Miscegenation
Slavery

11. Primitive morality is often regarded as ultilitarian and narrow in the scope of its application; but a

great deal of data has accumulated to negate this interpretation. In primitive life the social group is independent politically and, hence, frequently hostile with its neighbors, but this is not essentially different from civilized governments. Internally each of these primitive groups is governed by a legal code. Primitive law is summed up in custom. See:

Law
Custom
Taboo

12. Energy not directed towards the direct satisfaction of material wants finds expression among savages in games and sports. Æsthetics, modern research goes to show, had its origin in play. See:

Art, Primitive
Æsthetics
Swastika
Festivals
Dancing
Corroboree
Sun Dance
Snake Dance
Music
Areois
Potlatch

13. The survival of primitive thought in custom, legend, superstition, and common practices shows how continuous is the line of development from the mental life of primitive man to our own. For the entire subject of folk lore, see:

Folklore
Nursery Lore
Nursery Rhymes
Superstition
Magic
Witchcraft
Incantation
Vampire
Werwolf
Griffin
Dragon
Unicorn
Mermaid
Fairy
Morgan, the Fay
Avalon
Goblins
Oberon
Puck
Robin Goodfellow
Baring-Gould, S.

14. The data of anthropology have been collected from many sources, and the outline of the principles of the science may be filled in with concrete detail, by referring to the many descriptive articles on the primitive peoples. Of the most interesting primitive groups for the anthropologists, a partial list would be the following:

(*a*) For America, see INDIANS, AMERICAN, an elaborate study which may be carried into great detail by following out the cross references to every tribe of North, Central, and South America. See also ESKIMO.

(*b*) For Asia:

Philippine Islands
Aino
Andamanese (under Andamans)
Sundanese (under Sunda Islands)
Dyak
Gonds
Gurkhas
Khonds

Karens
Mois
Miao-Tse
Shans
Thai
Todas
Veddas
Baluchis (under Baluchistan)
Bhil
Bedouin
Kurds
Buriats
Giliaks
Kalmucks
Golds
Kirghiz
Koriaks
Ossetes
Tchuktchi
Tchuvashes
Tatars
Ugrians
Uzbeks
Vedahs
Yakuts
Yukagirs
Malayan Peoples
Polynesians
Melanesians
Micronesians
Negritos

(*c*) For Africa:

Akka
Bantu
Bejas
Berber
Kabyles
Bushmen
Hottentots
Kafirs
Dinka
Fellah
Masai
Hausa (under Hausa States)
Niam Niam
Somali
Yolof
Yoruba
Zulus (under Zululand)

(*d*) For Australasia:

Australians (under Australia)
Maoris
Tasmanians (under Tasmania)

(*e*) For Europe:

Europe, Peoples of
Basque Race
Gypsies
Lapps (under Lapland)

15. A partial list of well-known anthropologists would include the following names:

Andre, R.
Bandelier, A. F. A.
Bastian, A.
Beauchamp, W. M.
Berendt, K. H.
Boas, F.
Brinton, D. G.
Broca, P.
Catlin, G.
Cushing, F. H.
Faidherbe, L. L. C.
Flower, W. H.
Fritsch, G. T.
Furness, W. H.
Gatschet, A. S.
Haddon, A. C.
Hale, H.
Hartmann, R.
Hodge, F. W.
Holmes, W. H.
Kanitz, F. P.
Kroeber, A. L.
Laufer, B.

Lubbuck, J.
McCurdy, J. F.
McGee, W. J.
McLennan, J. F.
Mallery, G.
Mantegazza, P.
Mason, O. T.
Mooney, J.
Morgan, Jacques de
Morgan, L. H.
Mortillet, L. L.
Pilling, J. C.
Powell, J. W.
Prichard, J. C.
Putnam, F. W.
Quartrefages, J. L. A.
Ranke, J.
Ratzel, F.
Reinach, S.
Ripley, W. Z.
Rivers, W. H. R.
Schoolcraft, H. R.
Sergi, G.
Smith, Buckingham
Squier, E. G.
Topinard, P.
Tylor, E. B.
Ujfalvy, C. E.

Chapter 6. Religion

OF THE numerous classifications of religion, none of which is free from many serious objections, we may adopt as the most practical that which divides creeds into monotheistic and non-monotheistic; and though here, too, we are confronted by the difficulty that certain faiths are neither one nor the other, completely, we may apply the former term to the three great religions of Judaism, Christianity, and Mohammedanism, and classify under the second heading all beliefs whatsoever, from primitive animism through the various national mythologies to the great moral and philosophic systems of the East. The starting point should be the comprehensive article on RELIGION, COMPARATIVE. The subject may be then pursued through such general articles as BELIEF, WORSHIP, RITE, PRAYER, SACRIFICE, PRIEST, etc. Additional titles, in great number, will naturally suggest themselves to the reader. The field, indeed, is extensive and touches intimately on the domains of Anthropology, Psychology, Philosophy, and History. This will be found especially true in the religions of the East, where philosophy and mythology or religion are practically one.

A. Polytheistic Religions

1. The beginnings of religion, as studied in the beliefs of primitive races, will be found treated in the chapter on Anthropology, where appear such titles as

Man, Science of
Nature-Worship
Fetishism, etc.

The subject is carried on in the special articles dealing with individual tribes and nations, of which a list appears in the same chapter.

2. The religions and mythologies of Babylonia, Assyria, Egypt, Greece, and Rome are discussed in the chapter on History, in the various sections devoted to those countries. The intimate connection of the religions and the political life in the ancient world has made this division seem desirable.

3. The mythology of the Scandinavian and Teutonic races differs from that of Greece in its pervading atmosphere of gloom and the foreboding of fate. The northern divinities lack the joyous grace and humanity of the Olympian pantheon, and the powers of darkness, cold, and death play a far more conspicuous part. See:

Mythology
Polytheism
Scandinavian and Teutonic Mythology
Edda
Aesir
Asgard
Bifröst
Yggdrasil
Mimir
Norns
Odin
Tyr
Thor
Bragi

Balder
Loki
Freyja and Frigga
Ragnarök
Fenrir
Walhalla
Hel
Niflheim

4. We leave pure polytheism in passing to the great religions of India. It, there, evolves with time into complex systems of mythology modified by pantheism and agnosticism.

(*a*) Brahmanism.

Brahmanism may go back to the second millennium before the Christian era, and comprises the mass of beliefs and institutions originated or elaborated from a primitive nature-worship, by the Brahmans, who constitute the dominant class among the Hindus. It is essentially a legislative system, with a vast and minutely outlined ceremonial. In its later development, it is characterized by pantheism, the doctrine of Karma, and metempsychosis. See:

Brahmanism
Aryan
Veda
Brahmana
Upanishad
Manu
Brahma
Varuna
Agni
Indra
Ushas
Maruts
Pitris
Sankhya

Śaivas
Śâktas
Pārvatī
Kali
Lakshmī
Hanumān
Ganesa
Śraddha
Caste
Henotheism
Karma
Metempsychosis
Theosophy
Sikhs

(*b*) Buddhism.

Buddhism antedates Christianity in its origin, and its adherents are second in number only to those of the Christian faith. Taking its rise in Hindustan, it has spread over China, Indo-China, Japan, Tibet, and the plains of Northern and Central Asia. In that continent, its mission as a bearer of civilization and morality has been not unlike the rôle played by Christianity in Europe and America. See:

Buddhism
Pitaka
Asoka
Metempsychosis
Karma
Nirvana
Śravaka
Shin-Shu
Bonze

For a Variant of Buddhism, see
Lamaism
And, for an Allied Creed, see
Jainism
See also Brahmanism, above.

5. Zoroastrianism.

In the great religion of Iran, we may find the earliest traces of primitive Aryan belief. Zoroastrianism is important for the influence it exercised on Judaism and Christianity, to which it contributed the great dualistic principle of the conflict between good and evil. See:

Zoroastrianism
Zoroaster
Avesta
Gâthâs
Pahlavi Language and Literature
Magi
Parsis
Ghebers
Ormazd
Ahriman
Mithras
Asmodeus
Saoshyant

6. The prevailing religion in China and Japan is Buddhism. The native religious systems of China are in reality moral philosophies. In Japan, however, we find a peculiarly national religion, influenced to some extent by Chinese and Buddhistic elements. See:

(*a*) Confucius
Mencius
Chu-Hi
(*b*) Taoism
Lao-tse
(*c*) Shintō
Kōbō Daishi
Fox-deity
Bushido

B. Monotheistic Religions

I. Judaism.

The history of the Jewish people, who claimed to be the nation specially favored of the One God, and the sole depository of His revelation, will be largely found in the historical chapter of this book; but here a few further indications may be given of some of their peculiar institutions. Their worship, in its earlier form, is described under Tabernacle, then under Temple, and in a special section of the article Sacrifice, and a still later development is treated under Synagogue.

Special observances at particular seasons are treated under:

Passover
Purim
Atonement, Day of
Pentecost
Dedication Feast
Weeks, Feast of
Tabernacles, Feast of
Sabbath
Jubilee, Year of

On their sacred writings, besides the articles on each book of the Old Testament, see:

Talmud
Targum
Midrash
Gemara
Mishna

The functionaries of their religion and justice come under:

Priest
High Priest
Levite
Scribe
Rabbi
Sanhedrin

Other characteristic customs and usages:

Circumcision
Tithes
Unction
Proselyte
Urim and Thummim
Phylactery

The sects and parties which developed in course of time among the race are detailed under JEWISH SECTS, and specially in the following articles:

Pharisees
Sadducees
Essenes
Chasidim
Frank, Jacob

II. CHRISTIANITY.

1. FOUNDATIONS. The history of Christianity is so diversified, and so intimately bound up with the development of European civilization, that a large amount of space is necessarily accorded to it. The most convenient division will begin with the foundations, including under that head the articles centring around its Founder and the history and worthies of the first few centuries of the Christian era, before Europe was submerged in the chaos which resulted from the barbarian invasions. See:

Christianity
Creeds and Confessions
Fundamentals of Christian Doctrine
Development of Doctrine
God
Jesus Christ
Incarnation
Hypostatic Union
Atonement
Intercession, Doctrine of
Resurrection
Miracles
Holy Ghost
Filioque
Trinity, Doctrine of the
Nicene Creed
Prayer
Providence
Predestination
Foreknowledge and Foreordination
Sin
Original Sin

Besides the article under the title ESCHATOLOGY, several others which follow deal with the problems which have so exercised the mind of man as to his ultimate destination after the short period of life in this world. See:

Immortality
Judgment, Final
Millennium
Second Advent of Christ
Apocalyptic Literature
Antichrist
Annihilationism
Heaven
Beatific Vision
Hell
Probation after Death
Purgatory
Limbus

The following articles deal with the organizations by whose means the religion of Christ was spread throughout the world, and with early records of its faith and practice:

Church

Council
Synod
Missions, Christian
Apostle
Doctors of the Church
Fathers of the Church
Persecutions of the Christians
Lapsed
Catechumens
Disciplina Arcani
Agapæ
Teaching of the Twelve Apostles
Apostolic Constitutions
Apostolic Fathers
Jerusalem, Councils of
Nicæa, Councils of
Constantinople, Councils of
Ephesus, Councils of
Council of Chalcedon (under Chalcedon)

For the great figures of the period of foundation and dissemination, see:

Lawrence
Martin of Tours
Patrick
Prudentius, Aurelius Clemens
Theodore of Mopsuestia

2. Early Sects and Heresies. No sooner had the Christian Church been fully organized and entered upon its mission of converting, than the infinite diversity of human minds im-

pelled different men to emphasize disproportionately some one aspect of the faith which all at first held in common. This was especially the case during the first three centuries, while Christianity had its chief stronghold in the East, the speculative and dialectical minds of whose people were naturally inclined to minute questions of abstract theology. The heresies which took their rise in the West were of a more practical kind, dealing, like Montanism, with the severity of discipline, or, like Pelagianism, with the freedom of the human will. Those who wish to trace the abstruse questions which threatened to divide the Church even before it had emerged from the shadow of persecution, may consult especially the following articles:

Adiaphorists
Adoptian Controversy
Arius
Aëtius
Agnoetæ
Alogians
Apollinaris
Celsus
Cerdonians
Cerinthus

Nicolaitans
Novatian
Origen
Patripassianism
Paulicians
Pelagianism
Sabellius
Semi-pelagianism
Valentinians
Vigilius

3. Traditional Christianity. The latter history of Christianity may be most conveniently divided into two main heads—according as the various Christian bodies have adhered, to a greater or less extent, to the older usages or beliefs, or have broken away from them, and evolved new ones of their own. Of these two divisions, the former is inevitably much the larger, covering a much greater extent of time and a wider range of subjects. The naturally unchanging East has been less affected by the currents of thought, and the many practical problems, which have introduced many changes or developments in the western world. The articles Papacy, which traces the history of the central see of Christendom, down to the Council of Trent; Roman Catholic Church, which includes the subsequent history of the churches in communion with it; and Gallican Church, give a large part of the general institutional development; and the biographies of nearly all the Popes, contain valuable indications of the policy which has at different periods guided the larger part of Christendom. The article, Church History, contains an account of the principal

writers who have narrated this development; and the following articles contain detailed information on all the more important points.

(*a*) For Church Organization, see:

Benediction
Rosary of the Blessed Virgin Mary
Tenebræ

(*c*) Under COSTUME, ECCLESIASTICAL, a full account will be found of the historical development of ecclesiastical vestments and their use at the present day in various parts of Christendom. A number of other articles also give details as to specific vestments and articles used in divine worship. See:

Tiara
Pallium
Mitre
Crosier
Stole
Maniple
Surplice
Flabellum
Altar
Tabernacle
Incense
Censer
Cross
Chalice
Corporal
Agnus Dei

(*d*) The Christian religion, at least in its ancient and traditional form, is essentially a sacramental one. In other words, it provides for the two-fold nature of man—body and soul—by using outward and visible signs to convey inward and spiritual grace. A large number of important subjects, accordingly, fall under the heading Sacrament. See:

Sacrament
Baptism
Clinic Baptism
Heretic Baptism
Sponsors
Confirmation
Lord's Supper
Transubstantiation
Viaticum
Penance
Confession
Absolution
Orders, Holy
Marriage
Extreme Unction
Sacramentals
Holy Water

Jubilee
Pilgrim
Stations
Image-Worship
Foot-Washing

(*e*) Very early in the history of the Christian Church, special observances began to be connected with certain days—weekly, and annual commemorations of events in the life of its Founder, and anniversaries of the chief worthies who adorned its history. These are treated under:

Sunday
Friday
Festivals
Fast
Christmas
Epiphany
Candlemas
Annunciation
Ash-Wednesday
Lent
Holy Week
Maundy Thursday

Good Friday
Easter
Ascension Day
Pentecost
Trinity Sunday
Corpus Christi
Assumption of the Virgin Mary
All-Soul's Day
Ember-Days
Angel
Michael
Gabriel
Saint
Martyr
Canonization
Beatification
Advocatus Diaboli
Acta Sanctorum

(*f*) It is scarcely necessary to enumerate the separate books of the Bible, on which every organization of Christians professes to base its creed. Under each of their titles, the history and purport of every book may be studied, as well as the most approved conclusions of the most recent scientific criticism. Questions relating to the Bible as a whole are discussed at great length in the main article BIBLE; and reference may be made to the following subsidiary titles:

Inspiration
Revelation
Canon
Biblical Criticism
Bible Archæology
Textual Criticism
Tübingen School
Concordance
Apocrypha
Deuterocanonical Books
Bible Society
Bible, Curious Editions of

4. THE MONASTIC LIFE. As the civilized world, under the later Roman empire, grew more and more corrupt, the feeling gained ground that the surest way to escape from the wrath to come was to flee into the desert, and by prayer and mortification to avert the divine displeasure. The monastic life, therefore, considered as the most perfect carrying out of the counsels of Christ, took firm root in the Church. General details of its spirit and organization will be found under:

Monasticism
Asceticism
Vow
Monastery
Laura
Hermit
Recluse
Pillar Saint
Abbey
Abbot
Canon
Brothers, Lay
Brotherhoods, Religious
Tertiary
Monastic Art

The earlier monastic ideal was that of absolute separation from the world, considered as an inherently wicked place; and all the older orders, though frequently of the greatest service to society and civilization by their preservation of learning, and by their diligent labors in agriculture and the like, approach more or less the type known as cloistered orders. Of these the principal ones follow in chronological sequence, with their founders, where these have separate articles:

Antony

Paul
Basilian Monks
Augustinians
Benedictines
Benedict
Cluniacs
Camaldolites
Carthusians
Bruno
Chartreuse, La Grande
Charterhouse
Cistercians
Bernard
Premonstratensians
Gilbertines
Beguines
Carmelites
Servites
Celestines
Brigittines
Bridget
Ursulines
Angela Merici
Trappists
Rancé, Armand de

As modern society gradually became organized on more stable foundations, and men whose temperaments and habits were peaceful could be safe under its protection, another type came forward, whose fundamental idea was not retirement from the world, but an effort to sanctify it, by mingling more or less with it. Under the head of what may be called missionary communities, the following are to be noted:

Sisterhoods
Trinitarians
Franciscans
Francis of Assisi
Clares, Poor
Clare
Dominicans
Dominic
Minimites
Francis of Paola
Barnabites
Theatines
Capuchins
Jesuits
Ignatius of Loyola
Oratory, Congregation of the
Philip Neri
Oblates
Borromeo, Carlo
Piarists
Visitation, Sisters of the
Francis de Sales
Chantal, Jeanne Françoise
Lazarists
Vincent de Paul
Sulpicians
Olier, Jean Jacques
Brothers and Sisters of Charity
Brothers of the Christian Schools
La Salle, Jean Baptiste de
Passionists
Paul of the Cross
Redemptorists
Liguori, Alfonse Maria di
Sacred Heart, Ladies of the
Mercy, Fathers of
Paulists

5. Mediæval Period. The religious aspect of the Middle Ages will be found represented in nearly every article in the foregoing section; but certain others may be added which give an account of significant developments taking place within this period. Thus we have the formal organization of a whole logical system of dogmatic theology and philosophy (see Scholasticism), and of a parallel system of ethics or moral theology (see Casuistry). The story of the Crusades is of great importance, supplemented

under JERUSALEM by the history of the kingdom and patriarchate there established. The crucial controversies between Church and State which persisted throughout the Middle Ages are treated under INVESTITURE and REGALIA as well as under PAPACY. (See also in the chapter on history the section dealing with the Mediæval Ages.) Under SCHISM, WESTERN, we may follow the division within the Church caused by the pretensions of rival popes. The efforts made to secure unity of faith and discipline appear under:

Lateran Councils
Basel, Council of
Ferrara-Florence, Council of
Pisa, Council of
Lyons, Councils of
Inquisition
Torquemada

The story of those who in this period broke away from that unity is told under:

Cathari
Fraticellians
Albigenses
Waldenses
Brothers and Sisters of the Free Spirit
Apostolic Brethren
Lollard
Abélard
Berengarius of Tours
Gottschalk
Wiclif

Other topics of special mediæval interest are:

Joan, Pope
Feast of Fools
Biblia Pauperum
Pseudo-Isidorian Decretals
Fulda, Monastery of
Saint Gall
Monte Cassino

The great names in the theology, philosophy, and mysticism of the Mediæval Ages include:

Adalbert
Ailly, Pierre d'
Albert, Count of Bollstädt
Alexander of Hales
Anselm
Aquinas, Thomas
Becket, Thomas à
Bede
Bonaventura
Catharine of Siena (under Catharine)
Clémanges, Nicolas de
Columba

Occam, William of
Peter Lombard
Peter the Hermit
Rabanus Maurus
Savonarola, Girolamo
Tauler, Johann
Teresa, St.
Wadding, Luke
William of Saint-Amour
William of Wykeham

6. THE REFORMATION PERIOD. A special section may well be devoted to the period of unrest and disruption commonly known as the Reformation.

All over Europe there was a movement, more or less general and permanent according to local circumstances, towards throwing off the authority of the Pope, simplifying faith and worship, and returning to what were assumed to be primitive beliefs and usages. See:

Reformation
Counter-Reformation
Utraquists
Communion in Both Kinds
Brethren, Bohemian
Augsburg Confession
Interim
Concord, Book of
Corpus Doctrinæ
Magdeburg Centuries
Epistolæ Obscurorum Virorum
Antinomianism
Bartholomew's, Massacre of Saint
Dort, Synod of
Reformed Churches
Trent, Council of

For the Men of this Period, see:

Albert (of Magdeburg)
Baronius, Cæsar
Bellarmine
Beza, Théodore
Bucer, Martin
Bugenhagen, Johann
Cajetan, Thomas

Philip the Magnanimous
Reuchlin, Johann
Sarpi, Paolo
Tetzel, Johann
Vermigli, Pietro Martire
Wishart, George
Zwingli, Ulrich

7. Before proceeding to a review of the Reformed Churches of modern times, the history of Eastern Christianity, separate from that of the Roman Catholic Church since 1054, may be studied under the following titles:

Greek Church
Filioque
Quinisext
Photius
Lucaris
Nikon
Raskolniki
Dukhobortsy
Molokani
Skoptsy
Stundists

8. Modern Reformed Churches.

(*a*) Anglican. The article under the title, Anglican Communion, explains the extent and relations of the various churches in communion with the Church of England, which represent characteristically the more conservative elements in the religion of the English-speaking races. Though as organizations they owe their origin to the great upheaval of the sixteenth century, their doctrine and usages are

largely in harmony with those which prevailed before the Reformation, and will be found treated in many instances under titles which include the ancient and modern Roman Catholic belief or practice. The following articles, however, may be consulted for specifically Anglican points:

England, Church of
Ireland, Church of
Episcopal Church
Articles, The Thirty-nine
Prayer-Book
Homily
Lambeth Conference
Church Congress
Supremacy, Royal
Ecclesiastical Commissioners
Vestry
Warden, Church
Parish

III. MOḤAMMEDANISM.

The history of Islam is closely connected with the history of the nations which adopted it as their creed. Though the spread of Mohammedanism has at all times been to some extent due to missionary zeal, its extension has largely been coincident with conquests. The political aspect of Moslem history may be best studied under the names of Mohammedan nations, dynasties, and rulers, such as ABBASIDES, OMMIADS, SELJUKS, TURKEY, ARABIA, etc. Here are only given the leading titles dealing with the religious development and present character of the faith.

For the Rise of Islam, see:
Mohammed
Mohammedanism
Mohammedan Sects
Islam
Mecca
Medina
Hejira
Ayeshah

For the successors of Mohammed and early conquerors who spread the gospel of Islam in Asia, Africa, and Europe, see:
Caliph
Abu-Bekr
Omar

Othman
Ali
Ommiads
Khalid
Musa ibn Nusair
Amr ibn al-Asi
Tarik
Idrisites
Aghlabids
Fatimites
Almoravides
Almohades

For the tenets and practices of the faith, in addition to the titles already quoted, see:

Koran
Sunna
Hadith
Kaaba
Hajj
Hajji
Fast
Ramadan
Beiram
Muharram
Kiblah
Houri
Jinn
Iblis
Imam
Mufti
Muezzin

Sufiism
Senussi

For Mohammedan Theologians:

Abu Hanifah
Ibn Hanbal
Ibn Tumart
Ghazali

Chapter 7. Education

THE study of the science of education is peculiarly related to the study of the growth and development of the intellectual, moral, and spiritual life of the human race. Every department of knowledge is necessarily in some way connected with the science of education. Most of the great thinkers of all ages have contributed to the literature of the science, and consequently many names must be included in our list of educators which appear, as well, in some other field. As part of some one philosophical system or another, education goes back to early times, but its history as an independent science, separated from philosophy or theology, is quite recent. Its problems, too, have grown immeasurably more complex with the progress of democratic ideals and the widening of its sphere of interest. More even than national defense, the fostering of public education has come to be the great function of the modern State; and, though differences of opinion prevail as to how far this obligation extends in practice, in all progressive countries there is no class of men whom the government, in one way or another, does not attempt to supply with the means of education.

There are three sides from which students may approach the study of the science: the historical, the psychological, and the pedagogical.

The History of education is outlined in the Article EDUCATION, which traces its development from the dawn of civilization to the present day. A more detailed study of the subject may be systematically pursued in the following lists of articles. The subject is usually divided into four periods: Pre-Christian (including the Oriental and the Classical types), Early Christian, Mediæval, and Modern.

I. THE PRE-CHRISTIAN PERIOD.

(*a*) The several types of Oriental education are discussed in the following articles:

Confucius
Buddhism
Caste
Jews
Talmud
Rabbi
Mohammedanism
Ulema
Mufti
Madrasah

(*b*) The aims of Greek and Roman educators, and the methods by which they strove to attain their ideals, are discussed under the following heads:

Sophists
Socrates
Plato
Aristotle
Xenophon
Cyropædia
Sparta
Games
Plutarch
Quintilian

II. THE EARLY CHRISTIAN PERIOD.

The part played by the early Christian Fathers in the furtherance of education and the establishment of schools will be found under:

Catechumens
Catechetical Schools
Chrysostom
Basil the Great
Clement of Alexandria
Origen
Theodore of Mopsuestia

For the struggle between the pagan and early Christian educators, see:

Tertullian
Augustine

These bring the student up to the Mediæval period.

III. The Mediæval Period.

In the series of articles dealing with this period, the student will find an account of the efforts made by the Church to promulgate education throughout Christendom, and will be led up to the modern movement, which properly co-extends with the movement that led up to and through the Reformation. See:

Monasticism
Benedictines
Arts, Liberal
Quadrivium
Trivium
Scholasticism
Charles the Great
Alcuin
Alfred the Great
Abélard
Chivalry
University

IV. The Modern Period.

Educational progress was hastened and turned into varying channels by the revival of the old learning. The Reformation initiated the separation of education from theology, and, by breaking up the unit of European culture, gave rise to national systems of education and the use of the national vernaculars as the medium of instruction. For the early educational reformers, see:

Renaissance
Humanism
Dante
Petrarch
Boccaccio
Poggio Bracciolini
Pico della Mirandola
Poliziano
Reuchlin
Erasmus
Budæus
Scaliger, J. J.
Scaliger, J. C.
Casaubon, I.
Hardouin, J.
Reformation, The Protestant
Luther
Melanchthon
Sturm, Johannes
Ascham, Roger
Rabelais
Montaigne
Bacon, Francis
Induction
Ratichius
Comenius
Orbis Pictus

The efforts of the Catholic Church to counteract the effects of the Reformation may be studied in the following articles:

Ignatius of Loyola
Jesuits
Ratio Studiorum
Jansenism
Port-Royal-des-Champs

For the activity of the Church in supplying education to the very young, see:

La Salle, Jean Baptiste de
Brothers of the Christian Schools

For writers who contributed to the advancement of the science of education, see:

Milton, John
Locke, John
Fénelon, François

The realistic movement in education begins with FRANCKE, and the Realschule had its inception in his efforts. The movement culminates in the thorough sweeping away of old methods and ideas in education, foreshadowed in Rousseau's protest in his *Emile*. See:

Francke, A. H.
Rousseau
Emile
Basedow
Pestalozzi
Girard, J. B.
Jacotot
Fröbel
Kindergarten
Herbart
Mann, Horace
Spencer, Herbert
Arnold, Thomas
Bell, Andrew
Lancaster, Joseph

The systems of education prevalent in Europe and America are treated with great minuteness in the article on NATIONAL EDUCATION, SYSTEMS OF. The subject is further amplified in the sections on Education of the articles on the various countries of the world, wherein the statistical side is emphasized. The various phases of State activity receive full attention in the following articles:

Schools
Public Schools
Evening Schools
Secondary Schools
High Schools
Grammar Schools
Gymnasia
Realschule
Women, Education of
Negro Education
Industrial Schools
Vacation School
Education, Colonial

V. PEDAGOGY.

Pedagogy is that branch of the science of education which deals with the methods and means of carrying out educational ideas. The old and the new educational methods receive comprehensive treatment in the article PEDAGOGY, which is amply supplemented by the following articles:

Nature-Study
Child Psychology
Object Teaching
Curriculum
Kindergarten
Physical Education
Manual Training
Normal School
Education, Commercial
Technical Education
Professional Education
Theological Education
Medical Education
Legal Education
Agricultural Education
Seminar
Privat-Docent
Reading
Spelling

VI. EDUCATIONAL INSTITUTIONS.

The growth of colleges and universities in Europe and America is treated from the general standpoint in the

article on UNIVERSITY. This is supplemented by separate accounts of all of the important colleges and universities in the world. The list of American colleges and universities is especially complete; to such an extent, indeed, that mention may be made of only a few of the most prominent. See:

University
College
Colleges, American
Carnegie Foundation
General Education Board
Curriculum
Elective Courses
Degree
Diploma
Examination
Fellowship
University Extension

New York Public Library
Book
Alexandrian Library
Bodleian Library
British Museum
Bibliothèque Nationale
Library of Congress

(*b*) Museum

8. Philosophy and Psychology

THOUGH great diversity exists as to the meaning and scope of the term Philosophy, two definitions may be given as representative. The more modern view regards philosophy as the sum of all scientific knowledge, or the systematization of results obtained in the individual sciences; the historical and more prevalent view looks upon philosophy as the search for the ultimate nature and meaning of the universe, and especially of human life. Embracing at one time the totality of scientific knowledge, the field of philosophy has steadily grown narrower with the erection of independent sciences, until at the present day it includes the studies of metaphysics, logic, ethics, and æsthetics. Psychology is the latest branch of investigation to achieve its emancipation from philosophy, whose methods, historically, have been quite different from those that prevail in the scientific world to-day.

I. 1. The problems of philosophy are best studied, perhaps, historically. A brief summary, however, in necessarily technical language, will serve to present the main outlines of the subject in the form in which they have appeared to thinkers of different ages. Generally, then, the problems of philosophy are divided into three classes: those which deal with the ultimate nature of the universe, grouped under the heading METAPHYSICS; those which deal with the forms of human knowledge and its relation to reality, known as epistemology, or the theory of knowledge; and those dealing with human conduct, included in the science of ethics. See:

Philosophy
Metaphysics
Knowledge, Theory of
Ethics

2. The inquiry into the nature of reality takes on two forms: that concerned with the ultimate nature of things, and that dealing with the connection between things, or the architectural plan of the universe.

(*a*) For the First, see:

Ontology
Dualism
Monism
Materialism
Mechanism
Realism
Idealism

(*b*) For the Second, see:

Atomism
Theism
Transcendentalism
Pantheism
Body and Mind
Parallelism
Substance
Form
Causality
Time
Space
Teleology
Infinite
Absolute

3. In connection with our knowledge of the universe, two questions arise: (a) Taking the conglomeration of ideas we call knowledge, is there an outside Reality corresponding to them,

or are they Reality itself; and (b) are these ideas in origin the result of experience, or are they independent of experience? See:

(*a*) Realism
Idealism
Skepticism

(*b*) Empiricism
Rationalism
A priori
Dialectic
Category
Induction
Deduction

II. 1. The history of European philosophy begins with the Greeks, in whom, however, strong Oriental influences are traceable. Their earliest philosophy was a nature philosophy, and its two great problems were those of Being and Becoming. See:

Greek Philosophy
Thales
Anaximander
Anaximenes
Eleatic School

Gorgias
Heraclitus
Pythagoras
Pythagoreanism
Neo-Pythagoreanism
Archytas
Metempsychosis
Empedocles
Anaxagoras
Atomism
Leucippus
Democritus

2. In the second period, the main interest of philosophy becomes anthropological or ethical, the tendency being most fully apparent in the figure of the great teacher Socrates, from whom descend the great schools of the Hellenistic world, Platonists, Stoics, Hedonists, Cynics. Plato and Aristotle by their genius moulded almost the channels in which philosophic thought was to flow in the future. Greek philosophy, toward its end, exerted a powerful influence on Christianity. See:

Sophists
Protagoras
Socrates
Hedonism
Cyrenaic School
Aristippus
Hegesias

Skepticism

Neo-Platonism
Philo Judæus
Ammonius
Plotinus
Porphyrius
Iamblichus
Proclus
Boëthius
Anima Mundi
Logos
Eclecticism
Cicero

3. From the Platonic philosophy, as contained in the writings of the Christian Fathers, mediæval philosophy developed into the system known as Scholasticism, which in its fullest development, however, became Aristotelian, through the influence of the Arabian philosophers. Philosophy became the handmaiden of theology, and it supported the mysteries of the Christian faith by means of a subtle dialectic. The downfall of scholasticism began with the fourteenth century, and was hastened by the Revival of Learning. See:

Bacon, Roger
Lully, Raymond
Cusa, Nikolas
Renaissance

The Revival of Learning brought about a temporary revival of the classic philosophies, but these served only to bridge over the chasm between the ancient thought and the modern philosophy, whose beginning dates from the establishment of Empiricism by Bacon and Rationalism by Descartes. The subjects of Substance and Causality now assume leading importance. Cartesian rationalism ends in dogmatism on the Continent; empiricism ends in skepticism in England. See:

Stewart, Dugald
Hamilton, William

The critical philosophy of Kant sought to mediate between Rationalism and Empiricism by assigning to either its proper function in the mental life; and, though Kantianism was followed by the rise of great rationalistic systems in Germany, in which the balance was overthrown anew, the teachings of the Königsberg philosopher have shown the greater vitality as being in consonance with the spirit of the growing sciences. Reaction against unrestrained idealism led to Positivism, in which philosophy becomes a correlation of sciences. Materialism, after a brief popularity, seems to have passed away forever. See:

Kant
Herder
Jacobi, F. H.
Hamann, J. G.
Krause, K. C. F.

Ripley, G.
Alcott, A. B.
Channing, W. E.
Thoreau, H.
McCosh, J.
Harris, W. T.
Royce, J.
James, Wm.
Ladd, G. T.
Dewey, J.

Every well-rounded philosophical system has its logic, ethics, and æsthetics, and strictly speaking these cannot be divorced from the discussions of purely metaphysical problems. Nevertheless, as important subdivisions of philosophy, they have received an amount of attention that give them independent consideration.

A. The problems of human conduct are discussed minutely in the general article on ETHICS, and further differentiated in subsidiary articles. See:

Ethics
Will
Free Will
Casuistry
Chance
Fatalism
Determinism
Indifferentism
Egoism
Altruism
Energism

Eudæmonism
Intuitionism
Categorical Imperative

Identity, Law of
Fallacy
Dilemma
Mill J. S.
Jevons
Whately, R.

C. The separate science of æsthetics dates only from the eighteenth century. Its latest development has been along experimental and anthropological lines. See:

Æsthetics
Æsthetics, Experimental
Baumgarten, A. G.
Lessing, G. E.
Shaftesbury, third Earl of
Hogarth
Bain
Bosanquet
Santayana, George

D. The psychology of the present differs from earlier investigations of the human mind in its application of a more rigorous scientific method. It assumes no metaphysical substratum for mental life, but is content to take experience as its ultimate fact and to study its forms and manifestations. Though the science is to be dated only from the latter half of the nineteenth century, it has already been found necessary to divide the field of investigation for the purpose of the more effective study of the mind of the adult, the child, and the abnormal individual, and the collective mind of the crowd. The method of psychology is ultimately introspective, but it is introspection carefully pursued and corrected by the standard of the scientific average. For classification and methods, see:

Psychology

Individual Psychology
Genetic Psychology
Child Psychology
Social Psychology
Folk-Psychology
Insanity
Psychology, Experimental
Psychological Apparatus
Psychophysics
Introspection
Phrenology

With mental experience as basis for analysis, psychology finds that the analytical element of mental life is sensation, and sensations depend on bodily processes set in motion by external stimuli. Sensations are classified according to the organs whose stimulation they accompany. For mind in general, and its relation to body, see:

(*a*) Mind
Elements, Conscious
Mental Process
Self
Self-Consciousness
Unity of Consciousness
Double Consciousness
Sleep
Dreaming
Hypnotism
Autosuggestion
Somnambulism

Smell
Taste
Touch
Cutaneous Sensations
Static Sense
Muscle Sense
Muscle-Reading
Pain
Fatigue
Common Sensation
Organic Sensations

From simple sensations the higher intellectual processes (perception, idea, association of ideas, etc.) are synthetized. A corresponding process has

been brought forward as the analytical element of our emotional life, and has been denominated Affection. From a combination of sensational and affective elements arise the various processes classified under the general designation, Will. It is thus that the new psychology improves upon the threefold division of Intellect, Reason, and Will in the older psychology. See:

Affection
Conation
Attention
Effort
Interest
Tendency
Disposition
Faculty
Mental Constitution

Antipathy
Fear
Anger
Belief
Expectation
Expression
Laughter
Language
Gesture

(*c*) For the Will Processes:

Will
Action
Instinct
Impulse
Desire
Habit
Practice

In the field of experimental investigation, Germany holds the first rank. Excellent work has been done in France, especially in the field of abnormal psychology, and in England and America, where German thought has blended with the native empiricism. See:

B. Literature

Literature, which is the expression, more or less permanent, in language, of human thought and emotions, would include in its widest sense every written record of man's activity, the university man's dissertation on the Coleoptera no less than Shelley's "Ode to the Skylark." Such a wide connotation of the term would render any classification within reasonable space limits impossible, and in the present chapter the matter has been restricted to the treatment of what we ordinarily call Belles-lettres. The great works in history and the various fields of science and philosophy will be accounted for in the chapters with the subject matter of which they are more intimately connected. A more considerable difficulty than that of settling limits to the scope of the term literature is that of determining a reasonably fixed standard of classification, owing to the twofold aspect under which every literary monument presents itself —as form or matter. Taking, for instance, any specific department of literature, such as satire, we find that our satirist may be, as regards form, a lyrist, novelist, essayist, or dramatic writer. The man we call poet may, in the same manner, have turned the poetic form to the uses of comedy or of the lyric spirit. Again, commonly, a literary artist will have attained eminence in different categories of literature, as the drama, say, criticism, and poetry, and the necessity arises of partially and often arbitrarily characterizing such a man. A certain measure of violence is, therefore, unavoidable when the attempt is made to cast any great literary figure into a rigidly labeled department; but there is sufficient justification for the scheme in the fact that, as a rule, the great literary figure does stand out preeminently in one department of the art,

and, remembering that the line of division is by no means rigid, we may classify him accordingly.

The historical study of literature may be pursued in two ways. There is the vertical order, as it may be called, in which we take up the national literatures one by one, a method of study in which the various literary genres are considered at the same time, and wherein the formal side is naturally subordinated to the investigation of the development of national character as revealed in the national literature. There is also what may be called the horizontal order, where our attention is confined to one kind of literature at a time, whose development is traced from the beginning to the present day, across national boundaries, the process essentially being one of thematic unity, as compared with the preceding method of national unity. Either method has its advantages, and the material in the *New International Encyclopædia* has been so treated as to lend itself to either form of study; but, whereas the student or reader who would devote himself to the study of national literatures may be left to his own resources in view of the obvious classification followed, the need for guidance is apparent in the second. Emphasis, therefore, in the present chapter is laid on the formal development of the literary form, the underlying principle being the belief that the larger number of students are apt to turn to a specialized subject, like the history of the novel or the epic, rather than to the expanded story of an entire national literature.

I. The National Literatures.

II. The Literary Forms. The broadest subdivision in literature according to form is that into prose and poetry; and, though it is often very difficult to differentiate one from the other in fact, and always hard to describe the distinction between them in theory, the common definitions of prose as the ordinary mode of speech and poetry as speech figurative, cadenced, and cast within certain comparatively rigid forms, may be followed safely enough for practical purposes. Either, taken in itself, may be subdivided into forms of narrower connotation, such as essay and novel under prose, epic and lyric under poetry. Here, however, appears the inconsistency already mentioned as inherent in literary classification; for the earliest scientific essays of the Greeks were written in verse, while Walt Whitman's lyric spirit finds expression in a medium closely akin to Ruskin's fervid prose. Again, the drama is probably nowadays regarded as a prose form, though as a matter of fact the world's greatest plays bear the poetic form. Poetry, then, if we exclude the drama, embraces the two subdivisions of the epic and the lyric. In the history of literary development, poetry precedes prose, and of the two poetic forms the epic, as a rule, antedates the lyric.

1. Epic Poetry. The epic may be defined as a lengthy narrative in verse, dealing with a subject of great magnitude in character, national or descriptive of a great movement. A distinction may be made between the epic which is the spontaneous expression of national life, constructed at an early period in national development out of pre-existing minor poetic forms, and the artificial epic of a more advanced cultural stage, which is the work of a single mind and in consequence purposive in its nature rather than spontaneous. Mention should also be made of the mock or beast epic, in nature largely satirical. See Epic Poetry; and, for the great epics and epic poets of the world's literature, the following titles:

Sanskrit:

Milton

THE BEAST EPIC:
Homer; Greek Literature
Reynard the Fox

2. THE LYRIC. Lyric poetry, as the expression of personal feeling, is the most subjective of all literary forms. Originally written to be sung, the lyric has remained the nearest approach in literature to absolute music. Its scope is as wide as human emotion, broadening in the course of its development with the expansion of human sympathies. Its formal variations are numerous. See:

Lyric Poetry
Versification
Sonnet
Ode
Ballade
Rondeau
Madrigal
Canzone
Rhyme
Vers Libre

Lyric poetry attained great perfection in ancient Greece, though its field was narrower than that of modern poetry for comparative lack of the nature element, which, with us, is so conspicuous a feature of lyric expression. The Roman genius was, on the whole, unfavorable to the fostering of the lyric spirit. In the East, Persia produced a succession of poets of great excellence. See, for the great names in the realm of lyric poetry:

SANSKRIT:
Kalidasa

PERSIAN:
Nizami
Omar Khayyam
Sadi
Hafiz
Jāmi

LATIN:
Catullus

Solon

Alcæus
Sappho
Anacreon
Theognis
Hipponax
Pindar
Bacchylides
Timotheus
Theocritus
Bion
Moschus
Herondas

The lyric poetry of the Middle Ages was largely ecclesiastical, the Latin hymns of the period being especially marked by extraordinary effects of rhyme. The court singers of France and Germany, however, fostered the love theme assiduously. With the Revival of Learning came a great impetus to the poetic expression of secular emotions, Italy being the first to feel the impulse of the new movement. Lyricism languished during the domination of classical ideals in the seventeenth and eighteenth centuries, but, freed from the bond of artificiality, entered upon an unprecedented development towards the end of the latter century. See:

The origins of the English lyric poetry may be traced back, if it be so desired, to early Anglo-Saxon times. The continuous history begins with Chaucer. Some of the most beautiful lyrics of the language are embodied in the works of the Elizabethan dramatists, after whom, and Milton, the art declines and hardens until revived by Burns and Wordsworth. English lyric in the nineteenth century has covered the field of human sympathies, from Blake's unseen world to Tennyson's studies in evolution and Kipling's in machine construction. See:

3. The Drama. The Drama has been placed high among mimetic forms, because of the contribution it lays on the other arts, thus combining within itself their several qualities. Action and character are the subject matter. The means are bodily motion, which gives the sculptor's effect; language, which is the instrument of the poet; music, and scenery, and costume, to which painting and architecture give their share. The origins of the drama are to be found, most probably, in early religious ceremonial. Festivals marked by singing and dancing, the latter more or less symbolic in character, are common to peoples in a primitive stage; and the line of progress is along the development of the action and the spoken dialogue, at the expense of the chant, to complete secularization of the drama. The principles of the drama as propounded by Aristotle have remained for the most part the same; the mechanical technique has varied widely from original conditions. See:

Prologue
Epilogue

Greek drama had its origin in the worship of Dionysus. With Æschylus, tragedy is profoundly religious, and the actor's speeches are still subordinated to the choruses; Sophocles strengthened the element of action; Euripides thoroughly humanized tragedy. Attic comedy was fierce in personal satire and unbridled in speech. The Latin drama was sedulously modeled on the Greek. The origin of the Sanskrit drama is disputed, some deriving it from the Greek, others assigning it an independent development. See, for writers and plays:

Sanskrit:
Sūdraka
Kalidasa
Bhavabhuti
Śakuntalā
Mricchakatika

GREEK:
- Æschylus
- Phrynichus
- Sophocles
- Euripides
- Aristophanes
- Agathon
- Epicharmus
- Eupolis
- Menander

LATIN:
- Plautus
- Terence
- Seneca

In Mediæval times, practically the only species of dramatic performance was the religious spectacles of the Church, in which the purpose was didactic. See: MIRACLE PLAY; MORALITY; INTERLUDE; PASSION PLAY.

Out of the religious performances of the Middle Ages the modern drama developed. In France, which served as a model to the Continent, an elaborate system of rules was built up, supposedly bringing the drama into conformity with the standards of the classic age. The classic ideals, with their restriction of human emotions to kings and nobles, were overthrown on the Continent in the first half of the nineteenth century, since when the scope of the drama has been widened to embrace the entire complex of society. Like the novel, the drama of the latest days has become largely purposive. See, for the writers:

While Continental Europe was enslaved by the rigid formulas of the classicists, in England the Romantic drama flourished from the beginning. The Elizabethan age is the golden age of the drama of the world. Following the Elizabethans came the decline, arrested partially by the talent of Dryden and Congreve during the Restoration, and of Goldsmith and Sheridan in the later part of the eighteenth century. In the nineteenth century, England brought forth no dramatic writer of conspicuous genius. See:

4. THE NOVEL. The novel, at present the most flexible of literary forms, though of recent date in its present character, traces back to early and multiple sources. The beast tale, common to all nations, the narrative of adventure, and the story of things supernatural, were the precursors of the novel. The love element becomes pronounced in the old Greek romances and assumes primary importance in the romances of the Middle Ages. The romance, it may be broadly put, passed into the novel, when the tale began to assume the character of a picture of contemporary life, a development to be assigned to the sixteenth century. See the article NOVEL.

The geat monuments and figures of pre-modern story-telling are the following:

SANSKRIT:

Dandin
Subandhu
Baṇa

ARABIC:

Arabian Nights

GREEK AND ROMAN:

Heliodorus
Ephesiaca
Daphnis and Chloe
Apuleius
Apollonius of Tyre
Petronius

In Mediæval times, the romance flourished, combining in itself elements of the epic, the beast fable, and the tale of adventure and of love. Materials were largely drawn from ancient history, and the stories gathered around great figures of antiquity and the early Middle Ages. See:

Romance
Fabliaux
Gesta Romanorum
Alexander, Legend of
Charlemagne Cycle of Romances

Chrestien de Troyes
Wace
Roman de la Rose
Perceval
Tristram
Lancelot of the Lake
Malory
Grail, The Holy
Merlin
Chaucer
Morte d'Arthur
Euphues
Amadis of Gaul

Romance lacked characterization and reality. With the appearance of tales embodying observation of real types and description of manners, the novel as it is to-day begins. The origin is generally placed in Spain, where the rise of the picaresque tale marks the first step in character delineation. The subsequent development is rapid to present conditions, when the novel has become the all embracing term for all prose fiction, realistic, romantic, adventurous, or didactic. See for the writers:

Defoe began the line of great English novelists with what is still the greatest story of adventure in our literature. Fielding then perfected the form. Manners were acutely studied by a succession of women writers, who bridged the eighteenth and nineteenth centuries. Barren practically of the drama, the latter century found expression in the novel to as fully great an extent as in lyric poetry. See:

5. CRITICISM AND ESSAY.

1. The principles underlying artistic endeavor have been discussed since early Greek times, and may be divided into two classes, the universal laws of artistic expression, which have always been accepted, and the minor theories, more limited in scope and applying generally to individual arts, which never have been accepted by all, and never will be. Plato first studied in a thorough manner the relations of art to reality. Aristotle's *Poetics* laid down the principles that have undergone no essential change since his time. On the other hand, the blending of the classic spirit with the Teutonic, and the subsequent rise of chivalry and romance, produced differences of opinion regarding subject, scope, and manner that are in full force at the present day. See:

Criticism
Realism and Naturalism
Romanticism
Impressionist School of Painting
Décadents
Symbolists

2. Criticism in the beginning found expression in both prose and verse; the modern tendency has been decidedly towards prose, though there is not wanting a Pope's *Essay on Criticism* to continue the succession from Horace's *Ars Poetica*. The usual form, then, in which criticism at present finds expression is the Essay. See: ESSAY, and for the writers:

6. MORALISTS, SATIRISTS, AND HUMORISTS.

The study of human character and conduct has at all times received the attention of great minds, and what may be called ethical literature forms a very important part of the literature of the world. Near to constructive moralists, like Epictetus or Carlyle, stands the satirist, whose mission it is to combat the evil of degenerate times. The contemplation of the petty faults and incongruities of human character and action, so portrayed as to arouse laughter without arousing deep emotion of any kind, has always been a universal source of amusement. 7. ORATORY.

The art of eloquent persuasion is found among all primitive peoples where social bonds have become of some importance. Oratory attains its fullest development in the Greek democracies, where the citizen was called upon to take so considerable a share in the public life. The political and juristic genius of the Roman was likewise favorable to the development of the art. Pulpit eloquence had some of its greatest masters among the early Fathers of the Church, which has never been wanting in masterly exponents of its doctrines. A great period in the history of oratory was the age of the French Revolution, when, contemporaneously in England too, a succession of great orators lent lustre to the reign of George III. In the United States, the revolutionary period, and the period of rapid national growth, produced a brilliant series of orators, culminating in the classic triad, Clay, Webster, and Calhoun. At present oratory may be considered a declining art, especially as related to secular affairs; and, though its power over the multitude may still be felt in electoral campaigns, its influence in legislative bodies has largely passed away. See ORATORY; and, for the great orators of all ages:

Chapter 10. The Fine Arts

(Architecture)

THE study of the fine arts may be approached from one of three different points of view. The first of these is the historical, in which the student desires to obtain a comprehensive view of the art of a nation or of an entire period, its general characteristics and development. Another is the artistic, in which knowledge of a particular art or of some of its aspects is desired. A third is the biographical, in which the interest centres about an individual artist. To meet the first point of view, the *New International Encyclopædia* contains general articles treating the architecture, sculpture, painting, and minor arts of certain nations and periods. These general articles may best be divided into two groups: those treating the art of Oriental nations, whose artistic devlopment is remotely or not at all concerned with the general European evolution; and those dealing with the great periods of artistic development participated in by the Occident in general. This division obviates the necessity for general articles on the art of separate European countries, as, for instance, French art, which will be found treated under ROMANESQUE, GOTHIC, and RENAISSANCE ART, and in the general articles ARCHITECTURE, SCULPTURE, PAINTING. The artist's point of view is represented by general articles on Painting, Sculpture, and Architecture, and by articles on the various schools, and on technical terms and processes. The biographical side is fully dealt with in the lives of all the principal artists. The art museums are usually described under the titles of the cities in which they are situated; but a few are of sufficient importance to require separate articles. The principal schools of design are described in the general article upon that subject and in special articles on the more important schools. The description of celebrated representations in painting and sculpture is usually given in the biography of the artist who produced them. The article MYTHOLOGY IN ART gives a general treatment of such representations in Classic Art, which are further treated under the names of the subjects represented, as JUPITER, HERCULES, ACHILLES. The article ICONOGRAPHY similarly treats Christian Art, and there are special articles on a number of important themes of artistic treatment, such as CHRIST IN ART and MADONNA.

A. General Articles

I. INTRODUCTORY:

Art
Art, Primitive
Æsthetics

II. ORIENTAL ART:

Egyptian Art
Babylonian Art
Assyrian Art
Jewish Art
Phœnician Art
Mohammedan Art
Persian Art
Indian Art
Chinese Art
Japanese Art

III. European Development:
- Greek Art
- Etruria
- Roman Art
- Christian Art
- Byzantine Art
- Monastic Art
- Romanesque Art
- Lombard Art
- Gothic Art
- Renaissance Art

IV. Art Museums, Societies, and Schools:
- Design, Schools of
- École des Beaux-Arts
- National Academy of Design
- Society of American Artists
- Royal Academy of Arts
- Saint Luke, Academy of
- British Museum
- Louvre
- Luxembourg Palace
- Pitti Palace
- Uffizi

B. Architecture

In its widest sense, Architecture includes any kind of construction; but, in the *New International Encyclopædia*, the term is usually restricted to building which attains the dignity of art. Purely technical and utilitarian phases of architecture are treated under Building, Fireproof Construction, Masonry, and similar titles. (See the chapter on Manufactures and Engineering.) The three principal varieties of architecture are civil, religious, and military; and under these heads will be found their chief subdivisions. A few of these call for more detailed treatment of the component parts, and these are best enumerated below in connection with that style under which they were principally developed; as, for instance, Temple under Greek Architecture, Church under Early Christian, Monastery and Castle under Romanesque. Most celebrated works of architecture are treated in the articles on those cities in which they are situated; but a number of buildings of especial interest are treated separately, and in the following scheme of study, such buildings are enumerated under the different styles of architecture of which they are representative. For example, Parthenon, Erechtheum, etc., appear under Greek Architecture, Notre Dame de Paris and Westminster Abbey under Gothic.

I. Civil Architecture:
- Municipal Architecture
- Forum
- Palace
- Fountain
- Villa
- Mausoleum
- Theatre
- Amphitheatre
- Circus
- Bath
- Town Hall
- Arch, Triumphal
- Aqueduct
- Bridge

II. Religious Architecture:
- Temple

Church
Cathedral
Monastery
Oratory
Baptistery

III. Military Architecture:

Acropolis
Citadel
Castle
Camp
Fortification

IV. Technical Terms.

A large number of architectural terms deserve special treatment. Some of these, which are general in their application, are enumerated below, while others, the application of which is restricted to a particular style, are enumerated under that style; as, for example, Mosque under Mohammedan. See:

Ornament
Panel
Pendentive
Pilaster
Pillar
Porch
Portal
Roof
Spire
Tower
Tracery
Window

V. Historic Styles and Biography.

Architecture is the most ancient and, perhaps, the most important of the fine arts. In most artistic developments, both painting and sculpture have been subordinate to it. Its historical treatment, therefore, forms an extensive and important part of the general department of architecture in the Encyclopædia. A general historical sketch of its development, from the most ancient times to the present, is given in the article Architecture. This should be supplemented by the copious articles on the great historic styles, with the biographical additions given in the following list. Our treatment will outline the salient features of the different styles, beginning with those Oriental nations whose architecture lies remote from the European development—such as China, India, and Japan. We then proceed to those ancient nations, like Babylonia and Egypt, which materially influenced the Greek architecture. From Greek architecture, is descended the Roman, and from the Roman, the Mediæval and Renaissance styles, and finally the architecture of the present day.

1. *India.*

The architecture of India begins with the Buddhist style (b. c. 300-a. d.

700), whose buildings are of three classes: stupa or tope (a mound enclosing a relic); rock temples (chaityas); and monasteries (viharas). The Neo-Brahmanic style (beginning A. D. 700) comprises many varieties, including the so-called Jaina and Dravidian. It developed the architectural detail, the over-rich ornamentation, the pagodas and gopuras of the South. The Mohammedan architecture of India, differing materially from these styles, is best treated under MOHAMMEDAN ART. See:

Indian Art
Tope
Vihāra
Ellora
Vijayanagara
Boro Buddor
Elephanta
Mohammedan Art

2. *China and Japan.*

The most characteristic feature of Chinese architecture, which begins in the first century B. C., after the advent of Buddhism, is the tiled roof of tent-like form. Others are the pagoda, the pail-loo (a monumental gateway), and elaborately colored surface decoration. Japanese architecture, which begins with the seventh century A. D., is even less massive. It makes more of timber construction, and spends more upon roof effects than the Chinese. See:

Chinese Art
Japanese Art
Pagoda

3. *Babylonia and Assyria.*

The earliest dated architectural remains are those of the Babylonians, from as far back as B. C. 6000. Their building material was brick, and they were the first to construct vaults and arches. Their most important buildings were the temples, which were stepped pyramids of great height, brilliantly colored with glazed tiles. Their city walls were of amazing height and thickness.

Assyrian architecture was derived from the Babylonian, but was more secular in character, the chief buildings being the royal palaces, in which it perfected decorative relief sculpture of a high order. See:

Babylon
Babel, Tower of
Nippur
Erech
Ur
(*b*) Assyrian Art
Nineveh
Nimrud
Khorsabad
Koyunjik

4. *Persia, Phœnicia, Judea.*

The Babylonian-Assyrian influence was determinative for the architecture of the Hittites, and for the utilitarian art of the Phœnicians, who built for Solomon the Temple at Jerusalem. Ancient Persian architecture shows a mingling of Babylonian with Egyptian and Greek influences; but, under the Parthian and Sassanian dynasties, it reverted to purer Oriental types. See:

Hittites

Jewish Art
Temple at Jerusalem
Persian Art
Ecbatana
Susa

Pasargadæ
Firuzabad

5. *Egypt.*

The architectural monuments of the Old Empire (B. C. 4500-2160) are chiefly sepulchral—pyramids, mastabas, and tomb-temples. Temple architecture took on a new development with the Middle Empire (B. C. 2160-1788), and attained its highest development under the New Empire (B. C. 1588-1150), which followed the disastrous interruption of the Hyksos invasion. After a long decline, there was a brilliant revival under the Ptolemies in the third century B. C. The temples were often, like the Ramesseum, sepulchral; some were rock-cut, as at Abu-Simbel; some partly hewn and partly constructed, as at Deir-el-Bahri. The greatest temples are those of Karnak, Luxor, Medinet-Habu, Abydos, the Ramesseum, and the Ptolemæe and Roman temples of Denderah, Philæ, and Edfu. For descriptions, consult the section *Architecture*, under EGYPTIAN ART. See:

Denderah
Philæ
Beni-Hassan

6. *Greece.*

The Mycenæan architecture in Greek lands, sometimes known as the Ægean style, is described under ARCHÆOLOGY, and in the articles on the principal sites of this culture. From the main hall of the Mycenæan palace was evolved that marvelous structural masterpiece, the Greek Temple, the final type of which appears in the seventh century B. C. For a description of this temple, which is the central figure of Greek architecture, consult GREEK ART. The origin and development of the two principal styles of temple architecture, Doric and Ionic, are treated under ARCHITECTURE and ARCHÆOLOGY. The earliest examples of the Doric are in Sicily and Southern Italy, and it attained perfection during the fifth century, in buildings like the Parthenon and Theseum at Athens, and in the temples of Pæstum. The Ionic order was increasingly used in the fourth century B. C., as at Miletus and Ephesus, the Corinthian being as yet used for small monuments only. The Hellenistic age saw a great development of architecture of a private, civil, and sepulchral character, like the stoa, propylæa, theatre, odeon, and mausoleum.

Mnesicles

7. *Rome.*

For a general view of Roman architecture, the student is referred to ROMAN ART. The early architecture of Rome is practically Etruscan, and to this people the Romans owe their knowledge of vaulting and the arch. At the close of the republican epoch, they adopted Greek orders, evincing special preference for the Corinthian, which they developed into an independent order, and from which they evolved the so-called composite. These forms were decoratively used as adjuncts of construction. The principal works of Roman architecture were great civil structures, like the fora, triumphal arches, amphitheatres, thermæ, aqueducts, besides many superb temples. The highest development was during the first 150 years of the empire, after which came the decline. See:

(*b*) Biography:

Apollodorus

8. *Early Christian.*

Early Christian architecture is an adaptation of the declining Roman to the needs of Christian worship. The requirement was a large interior for many worshipers, resulting in the development of the basilical construction, which became typical for church build-

ing. The component parts of the basilica are discussed in the articles listed below under Basilical Construction. The article CHURCH gives the general development of the church building. To this is added a list of other terms of ecclesiastical architecture.

(*a*) Basilical Construction:
- Basilica
- Apse
- Transept
- Atrium
- Nave
- Altar
- Choir
- Confessional

(*b*) Church, etc.:
- Church
- Catacombs
- Chancel
- Chapel
- Crypt
- Font
- Reredos
- Sacristy

9. *Byzantine.*

In the eastern half of the Roman Empire, the Byzantines developed the domical construction, inventing the pendentives to support the dome. Byzantine architecture was also characterized by rich mosaic decoration. Its great masterpieces are the Church of Saint Sophia at Constantinople and Saint Mark's at Venice. It prevailed throughout the Eastern Empire until its destruction by the Turks; in Southern Italy, Sicily, Venice, and Ravenna; in Armenia, the Balkans, and wherever else the Greek Church prevailed. Russian architecture is a development of the Byzantine. See:

- Byzantine Art
- Mosaic
- Dome
- Pendentive
- Saint Sophia
- Saint Mark's Church
- Anthemius (of Tralles)

10. *Mohammedan.*

Coincident with the Mohammedan conquests, a style of architecture arose based upon the Byzantine and Persian. Its golden age began with the tenth century, and the final types were attained in the eleventh. The ultimate type of the mosque was built on the court-plan, with pointed arches, highly colored geometrical ornament, and dome vaulting. The principal schools were the Moorish (Spain), Egyptian, Turkish, Persian, and the Mohammedan styles that grew up in India. All these are described in MOHAMMEDAN ART, besides which there are articles upon the most prominent features of Mohammedan architecture. See:

- Mohammedan Art
- Mosque
- Minaret
- Tekiyé
- Bazar
- Caravanserai
- Alhambra
- Taj Mahal

11. *Romanesque* (A. D. 800-1200).

In Middle and Western Europe, Early Christian architecture was succeeded by the Romanesque, which was pre-eminently the art of the monastic orders and of feudalism. Among its innovations were the cruciform plan, the developed crypt, and the incorporation of bell-towers with the church building. But the principal achieve-

ment of Romanesque architecture was the perfection of vaulting,—the dome and tunnel vault in Southern France, and the groined vault in Lombardy, the Rhinelands, Normandy, and England. It thus led the way to the development of the pointed arch and Gothic architecture. The basis of the study of Romanesque architecture should be the appropriate section of ROMANESQUE ART. See:

Romanesque Art
Lombard Art
Norman Architecture
Vault
Crypt
Bell-Tower
Castle
Keep
Bailey
Tower
Bastion
Barbican
Wartburg
Monastery
Cloister
Chapter-house
Dormitory

12. *Gothic.*

Gothic architecture is the development of Romanesque groined vaulting. By means of the pointed arch, the most characteristic feature of the system, the vertical strains are concentrated in powerful piers, the horizontal thrusts on flying buttresses, permitting light walls, huge windows and an infinite wealth of statuary and tracery. Gothic architecture originated in France in the twelfth century, and there it also attained its most perfect development in the thirteenth, declining into the Flamboyant style of the fifteenth century. Spanish Gothic of the thirteenth century is second only to the French, though later debased by too much ornament. In England, a peculiarly national style arose, which should be studied under the headings by which three varieties are usually known, EARLY ENGLISH, DECORATED, and PERPENDICULAR. At its best, the German Gothic is noted for its beautiful tracery and spires. In Italy, the Gothic style is purely decorative, and it produced a charming style of civic buildings, especially in Tuscany and Venice. The basis of study should be the article, GOTHIC ARCHITECTURE, supplemented by the articles on special churches, and the descriptions in the articles on the cities, a few of which are appended. See:

13. *Renaissance.*

(*a*) Italy.

Renaissance architecture is the adaptation of classical forms, as they survived in Roman remains, to the architectural needs of the day. The Early Renaissance (fifteenth century) originated in the works of Brunelleschi at Florence, whence it was introduced into the rest of Italy. Its work was decorative in character, the constructive side being rather developed by the Roman school, headed by Bramante. The tendency was increasingly towards the formal classicism evinced in the works of Palladio and Vignola. As a reaction, came the freer but exaggerated Barocco of the seventeenth and eighteenth centuries. The basis of study should be the section *Architecture,* under RENAISSANCE ART.

Longhena, Baldassare

(*b*) Other Countries.

Outside of Italy, the most important development of Renaissance architecture was the French. Its most original type was the mediæval castle transformed into the palace of the Renaissance. There was constant influence from Italy, but the later French Barocco is superior to the Italian. In Germany, the Gothic elements survived late, and materially influenced the incoming Renaissance. A similar development occurred in other European countries. Spain made use of much elaborate decorative detail. The Renaissance appeared latest of all in England in the seventeenth century. A kind of Palladian High Renaissance, adopted by Inigo Jones, and developed by Wren, retained a purifying influence during the eighteenth century, until the advent of classic revival.

14. *Nineteenth Century.*

The reaction against the exaggerated styles of the eighteenth century was an imitation of classical forms. In France, Roman forms were predominant in the great structures of the Republic and first Empire; but, in England and Germany, Greek forms were more closely followed. About 1830 came the Gothic revival, which attained especial development in England, in such buildings as the Houses of Parliament and numberless churches. The present tendency is towards Renaissance forms and greater freedom from tradition.

The tasteful colonial architecture of the United States followed English models, but the early republic adopted the classic revival (Capitol). The period of the Civil War (till 1870) was singularly unfruitful; but between 1870 and 1880 there was a revival of the artistic spirit. The problem of the artistic treatment of the skyscraper with the steel-frame construction is as yet unsolved; but constant improvement is being made. The basis of study should be the section on the *Nineteenth Century.*

Chapter 11. The Fine Arts
(Sculpture and Painting)

(Read general introduction at the opening of preceding chapter.)

A. Sculpture

The study of sculpture centres about the general article on that subject. In this article will be found sections on the technical processes and materials, especially the modern, and on the different forms of sculpture, and a sketch of the history of sculpture, containing a description of the characteristics and the development of the different schools, as revealed in their principal artists. The study of the technical forms and processes of sculpture should be supplemented by the special articles enumerated below, which also contain historical sketches of these subjects; that of the history by those on the different schools and epochs of art, and above all by the biographies of the artists, some of which are enumerated below.

I. Branches and Technique of Sculpture.

Carving
Chasing
Founding
Relief Sculpture
Equestrian Statue
Bronze
Chryselephantine
Goldsmith's Work
Terra Cotta
Ivory
Metal Work
Wood-carving
Stucco

II. Greek and Roman Sculpture.

The sculpture of Oriental countries is decorative in character, and therefore best considered in connection with their architecture, under the titles of the division Oriental Art, enumerated in Chapter 9, Section A. Among the Greeks, sculpture first attained the dignity of an independent art, and achieved the highest ideal perfection in the world's history. The study of the separate epochs of Greek sculpture should be based upon the articles Archæology and Greek Art. Its rude beginnings date from the seventh century B. C., and by the end of the archaic period (B. C. 480) the emancipation was well advanced. The Attic period (480-323), during which the chief art centre was at Athens, witnessed the highest development of Greek art. It is ushered in by a period of transition (till about 450), in which great progress was made towards mastery of technique. The last half of the fifth century, the age of Phidias, begins the golden period of Greek art. The greatest technical knowledge was subordinated to idealism and self-restraint, and to the utmost nobility of conception. The golden age continued during the epoch of Praxiteles and Scopas, which, though still ideal, was more realistic and interested in individual traits and features. It succeeded especially well in portraiture, and attained the highest mastery of technique. During the Hellenistic age (323-146), the centres of art passed from Greece to Asia and Egypt, to

Pergamus, Rhodes, and Alexandria. Art came more into the service of individuals, and, notwithstanding the highest technical skill, it often sought sensational or trivial subjects. Roman sculpture is, for the most part, copied from the Greek, and shows little originality except in a fine realistic rendition of portraiture, and in pictorial relief-sculpture. See:

III. Mediæval Sculpture.

The decorative sculpture of the Middle Ages can best be studied in connection with the architecture of the period, under the titles of the mediæval epochs enumerated in Chapter 9, Section A. The history of modern sculpture begins with the Italian revival of the thirteenth century. Nicola Pisano found his models in the antique, but his son Giovanni reverted to the Gothic, and his naturalistic, dramatic style prevailed in Italy. The Pisan School was the mother of those of Florence and Siena. The former was superior in technique and composition, the latter was rather picturesque and narrative in character. During the entire Middle Ages, and to some extent during the Renaissance, the usages of Church worship furnished abundant opportunity for the sculptor's art. See:

IV. The Renaissance.

The sources of inspiration during the Renaissance were the study of nature and of the antique, as it survived in ancient statues. The chief characteristic of the Early Renaissance is a healthy naturalism. It attained a high perfection, in relief as in statuary, and excelled equally in bronze, marble, and terra cotta. The centre of the art was Florence, and the dominant figure during the fifteenth century, amid a brilliant array of artists, was Donatello. The school of Siena was more sentimental in feeling and elaborate in decoration; those of Lombardy and Venice were luxuriant in decoration, the former being more vigorous in form. The High Renaissance is characterized by a deeper knowledge and greater influence of the antique and by a more universal style, notably in works of its greatest master, Michelangelo; but these qualities afterward degenerated into a mannered imitation, and later into the extravagances of the Baroque.

The sculpture of France in the fifteenth century was at first influenced by that of Flanders, but the native style soon became transformed by Italian grace and beauty. Even the Baroque of the seventeenth century here exhibits a certain classical restraint. During the eighteenth exaggerated form gave place to the more delicate and decorative treatment of the Rococo, which excelled especially in statuettes. A fine, healthy realism ultimately prevailed. In Germany, Gothic forms lingered throughout the fifteenth century, and when, during the sixteenth, the Italian influence arrived, it was less important than in other countries and confined to the South. A native naturalistic art dominated the Netherlands during the fifteenth century, but, in the seventeenth, the Italian Baroque entered, and, in the eighteenth, sculpture declined. A similar development occurred in Spain, where wood sculpture found great employment in altars, retables, reredoses. Its apogee was a realistic reaction in the seventeenth century, with centre at Seville. See Section *The Renaissance*, under Sculpture.

V. Modern Sculpture.

The reaction upon the extravagances of Baroque sculpture, at the close of the eighteenth century, took the form of a return to classic simplicity, and the antique was imitated more closely than ever before. In France, this classicism was followed by a Romantic tendency, corresponding to a similar movement in painting, and by a more important naturalistic reaction. In the second half of the nineteenth century, classicism and naturalism ran parallel, with an increasing influence of the latter, which now prevails. England had a similar classical period, and a subsequent transition to naturalism; but since 1870 a great change, both in conception and treatment, has come over English sculpture chiefly through the effort of great English painters and the French influence. The German reaction against classicism resulted in the historical school of Berlin, whose work tended toward naturalism, and in the romantic school of Munich; not until the end of the nineteenth century did naturalism prevail. In other European countries the development has been similar to that general evolution described above. After some ineffectual early attempts, America also had its classical school, with a number of important artists. Since the last quarter of the nineteenth century the tendency has been entirely naturalistic, and an array of talent has appeared which compares favorably with that of other countries. See:

B. Painting

A series of special articles treats the technical side of painting, the different varieties, the painter's implements, and the qualities by which a picture should be judged. The history of the different schools is comprehensively described under PAINTING. This article should form the basis of the study of any given school; it should, however, be supplemented by the articles on separate schools and the biographies of the artists, of which only the principal are contained in the following lists.

I. TECHNIQUE AND ALLIED ARTS.

1. *Varieties:*
   - Mural Decoration
   - Genre Painting
   - Portraiture
   - Landscape
   - Still Life

2. *Technical Processes:*
   - Fresco
   - Tempera
   - Oil Painting
   - Pastel
   - Water-Color Painting
   - Encaustic Painting
   - Stereochromy

3. *Implements:*
   - Canvas
   - Easel
   - Mahlstick
   - Ground
   - Painters' Colors

4. *Technical Qualities:*
   - Drawing
   - Line
   - Perspective
   - Chiaroscuro
   - Color
   - Composition
   - Proportion

5. *Analogous Arts:*
   - Mosaic
   - Stained Glass
   - Decorative Art
   - Sgraffito

II. GREEK PAINTING.

The decorative painting of Oriental countries is treated under the different titles of the subdivision Oriental Art, in the introductory section of the preceding chapter. Greek painting was the first to rise to the dignity of an independent art. The transition from the painting of Cretan and Mycenæan decorations, which show considerable technical skill and a high power of invention, to that of the fifth century B. C. can be studied only in vase-painting (see VASE). In the fifth and fourth centuries B. C., Greek painting attained its highest development. The older Attic School, with Polygnotus as its founder and Athens as a centre, brought the art to a high state of development in the years following the Persian wars. Its decorative work was practically great, colored, outline drawings, noble in composition and expression. Perspective and shading were discovered by Agatharchus of Samos, a scene painter, and applied to panel-painting by Apollodorus of Athens. In the later fifth century flourished the Ionian School of Zeuxis and Parrhasius, which substituted realism for the old idealism and excelled in delicate drawing and chiaroscuro.

In the early fourth century, the centre of painting shifted to Sicyon, where systematic drawing and chiaroscuro were further developed, and the process of encaustic painting was invented. The Theban-Attic School (second half of the fourth century) was devoted to impassioned subjects, like battle pieces, and even to genre, and the highest technical perfection was achieved by the younger Ionian School in the persons of Apelles and Protogenes. In the Hellenistic age painting increased the range of its expression, including even the landscape, but it declined in artistic quality. The decorative and less important painting of the Roman epoch is treated under ROMAN ART. See:

2. *Greek Painters:*

Polygnotus
Micon
Agatharchus
Apollodorus
Zeuxis
Parrhasius
Pamphilus
Pausias
Apelles
Protogenes
Aldobrandini Marriage

III. MEDIEVAL PERIOD.

The origins of Mediæval painting were conditioned by the Mosaic style, as it prevailed in Early Christian and Byzantine art. Its growth was dependent upon the development of architecture in Church worship, and it consequently remained decorative. At the close of the Gothic period, the emancipation of painting began in Italy, and individual artists arose. The chief centres were Florence, where Giotto founded a powerful school of mural painting, and Siena, which developed panel painting under strong Byzantine influence. See:

IV. THE RENAISSANCE.

Naturalism dominated the painting of the Early Renaissance in Italy, the classic influence appearing only in the decorative motifs. Our study begins with Florence, where the great technical problems were solved for future painting. The High Renaissance combined the achievements of the Early with a profounder knowledge of the Antique. The Florentine school ranked highest in everything but color, in which the Venetians excelled, as did the Umbrians in religious sentiment. In Northern Europe the Renaissance, entirely naturalistic in character, but

Gothic in sentiment, first appeared in Flanders, whence its influence extended to Holland and Germany. Later the Italian influence transformed for the worse the art of the Netherlands, but aided to produce a national school in Germany. See:

Theotocopuli (called El Greco)

V. Seventeenth and Eighteenth Centuries.

The seventeenth century saw the rise of the Eclectic and Naturalist schools in Italy, and of a courtly art, based upon the classic, in France, whose art ists in Italy also perfected the classic landscape. It was the golden age of painting in Spain, Flanders and Holland. Spain developed a great religious art, combining Catholic devotion with a trenchant realism, and a marvelous portraitist in Velazquez. The Flemish School was also realistic, but more influenced by Italy, and less religious in character. In Holland, a highly developed national realism, practically uninfluenced from without, found expression in panels of portrait, genre, landscape, animal, and still life. The eighteenth century witnessed in France the light, graceful and decorative painting of the Rococo, and the rise in England of a bourgeoise art, showing a curious admixture of Eclectic Italian influence with realism, and foreshadowing that of the nineteenth century. See Section *Seventeenth and Eighteenth Centuries* in the article on Painting.

VI. Modern Painting.

1. *France.*

During the nineteenth century the hegemony of Europe in the fine arts belonged to France. Rococo art was succeeded in the last part of the eighteenth century by Classicism, which found the chief beauty of painting in form, as revealed in ancient sculpture. The reaction upon Classicism was Romanticism (from c. 1830), which used painting as an expression of the artist's emotional nature, and placed the chief emphasis upon color and natural truth. The Barbizon School represents the emotional impulse of Romanticism, as applied to landscape, animal painting, and peasant subjects. The third great factor in French painting is Realism, advocating the abolition of academic law and sentiment, and the exact presentation of natural truth. Then came Impressionism (1874), so called from a tendency to render momentary impressions, but which sought,

above all, to paint evanescent effects of light. Post Impressionism is a reaction on both Impressionism and Realism, which endeavors to paint pure feeling in purely abstract form and color. See:

(*a*) Classicists:

David, Jacques Louis
Prudhon, Pierre
Gros, Antoine Jean
Ingres, Jean Auguste Dominique

(*b*) Romanticists:

Moreau, Gustave
Gérôme, Jean Léon
Vollon, Antoine
Bonheur, Rosa
Bastien-Lepage
Dagnan-Bouveret
Lhermitte, Léon

2. *Germany* (*including Austria*).

In Germany the reaction against Classicism first took the form of an imitation of Italian masters of the fifteenth century (Nazarenes). Extensive demand for mural decoration at Munich produced the so-called cartoon (q. v.) style, in which color was neglected. The Düsseldorf School represented the romantic tendencies of German art, chiefly in panel-painting. About 1850 a great change was effected by French and Belgian colorists; since 1870 Realism and since 1880 Impressionism have found entrance. The

most recent tendencies have been very radical (see SECESSION) and decorative in character, especially in Vienna. See:

Zügel, Heinrich
Stuck, Franz

3. *Great Britain.*

The chief aim of British art during the early nineteenth century was historical pictures of an academic order. Landscape painting culminated in Turner and Constable. A reaction against the academic came about through the Pre-Raphaelites (q. v.), who introduced spiritual and realistic elements. The chief influence in recent years has been French. See:

Raeburn, Sir Henry
Lawrence, Sir Thomas
Hoppner, John
Haydon, Benjamin Robert
Eastlake, Sir Charles
Blake, William
Wilkie, David
Turner, J. M. W.

(*c*) Spanish, etc.:

Fortuny, Mariano
Sorolla, Joaquin
Segantini, Giovanni

5. *United States.*

During the Colonial period and immediately after the Revolution, British influences prevailed in the United States, with an inclination to follow the Italians in larger subjects. An indigenous art began with the self-taught Hudson River School, about 1825. Then came the foreign influence, and, since 1875, French methods have been quite generally adopted, the natural characteristics revealing themselves in choice of subject and conceptions.

VI. Pastel, Water-Color, and Miniature Painting.

The basis of study should be the general articles on these three varieties of painting, which discuss their technique and history and enumerate the principal artists. The most important of the latter are treated as special titles, to which reference should be made.

Chapter 12. The Minor Arts

A. Engraving

Engraving is the art of producing on a hard surface, such as stone, metal, or wood, incised or relief designs. These may be for purposes of decoration, as in the case of engraved bronzes and silverware, or for stamping a soft substance, as seal rings. But engravings are usually made for the purpose of printing upon paper, and it is this variety with which we are chiefly concerned.

Printing is done either from incised designs to which the ink is applied, or from relief designs, which thus produce the image. In the first process, metal plates, usually of copper, are used; the principal varieties are Line-Engraving and Etching, to which may be added Dry Point, Manière Criblée, and Stipple. The chief form of Engraving in relief is Wood-Engraving; and there are mixed processes, like Aquatint, Mezzotint, and Soft-Ground Etching. The trial impressions upon paper are called the proofs, and the final result the print. The article ENGRAVING contains a general sketch of the subject. See also:

Line Engraving
Etching
Dry Point
Manière Criblée
Stipple
Wood Engraving
Aquatint
Mezzotint
Soft-Ground Etching
Print Proof

I. LINE ENGRAVING.

Line Engraving is done with the burin, usually upon a copper plate. It originated simultaneously in Italy and Germany during the early fifteenth century, probably with the goldsmiths, from the custom of printing trial impressions of niello plates. (See NIELLO.) The earliest line-engravings are mere outline drawings without light or shade. In the early sixteenth century, the art culminated in the works of Albrecht Dürer in Germany, Lucas van Leyden in Holland, and Marcantonio Raimondi in Italy. During the seventeenth century, especially under Louis XIV, France was predominant. But artists devoted themselves increasingly to the reproduction of great paintings instead of original designs. For this reason, the art has gradually sunk into disuse, its place being taken by photographic processes. See:

Line-Engraving (basis of study)

Gaillard, Claude Ferdinand

II. Etching.

In etching, the plate is covered with the ground, usually a varnish, into which the design is scratched with an etching-needle. The plate is then immersed in an acid, which eats the design into the metal. The finishing touches are often done by the dry-point process, a simple scratching of the plate without the use of ground or acid.

Etching upon steel armor, etc., was practiced in the Middle Ages. Dürer was one of the first to use etching for printing purposes, and the art reached its highest development in Holland during the seventeenth century. Many eminent painters practiced it, among whom was the greatest etcher of all times, Rembrandt. Next to Holland, etching was principally cultivated in France, beginning with Claude Lorrain's landscapes. The art found a revival in the nineteenth century, especially in France, but also in England, Germany, and the United States. The following list cites only the principal etchers and a few of the important painters who have practiced etching. See ***Etching*** (basis of study):

1. *Netherlands:*

Lucas van Leyden
Velde, Esaias van de
Rembrandt
Ruisdael, Jacob
Potter, Paul
Van Dyck, Anthonis

2. *France:*

Gelée, Claude (Claude Lorrain)
Flameng, Leopold
Rajon, Paul
Méryon, Charles
Jacquemart, Jules Ferdinand
Legros, Alphonse
Helleu, Paul

3. *Germany:*

Hollar, Wenzeslas
Unger, William
Klinger, Max
Thoma, Hans
Liebermann, Max

4. *Spain:*

Goya, Francisco

5. *England:*

Geddes, Andrew
Wilkie, Sir David
Turner, J. M. W.
Hamerton, Philip Gilbert
Haden, Francis Seymour
Menpes, Mortimer
Brangwyn, Frank

6. *United States:*

Whistler, James Abbott McNeil
Pennell, Joseph
Moran
Parish, Stephen
Platt, Charles A.
Webster, Herman A.

III. Wood Engraving.

In early Wood Engraving, the de-
ing, and the early wood engraving at-

block, and all the wood was cut away except the design, which remains in relief. The process is of peculiar importance because it can be used in connection with printing from movable types.

Crude outline prints from wood-cuts were common in Southern Germany and the Netherlands in the early fifteenth century. The art received an impetus from the invention of printing, and the early wood-engraving attained its most perfect development during the early sixteenth century in the works of Albrecht Dürer and Hans Holbein in Germany. It was introduced by German artists into Italy; but here only the chiaroscuro process attained a high degree of proficiency. (See paragraph *Chiaroscuro* under Wood Engraving.) Wood engraving flourished also in the Netherlands and in France.

Modern wood engraving is done on the cross-grain of boxwood, and with a graver instead of the knife. The design is cut away instead of being left in relief, appearing in white lines. The father of the art was the Englishman, Thomas Bewick (died in 1828), although his pupils achieved much as book illustrators. The art has, during late years, succumbed in England to the more accurate photographic processes. Present German wood engraving is, generally speaking, precise and careful in execution; but the French school has attained the highest artistic perfection.

Before the Civil War, America produced several prominent wood engravers whose work resembled contemporary British. But after 1870, in connection with the popular magazines, a school, headed by Timothy Cole, arose which reproduced the effect of paintings, drawings, etc., with remarkable fidelity, and used the technical proficiency acquired to render portraits and landscapes. Since the perfection of the photographic processes, wood engravers have returned to a more legitimate practice of their art wood engraving. See:

1. *Germany:*
   - Dürer, Albrecht
   - Burckmair, Hans
   - Schäuffelein, Hans
   - Holbein the Younger
   - Lützelburger, Hans
   - Cranach, Lucas
   - Altdorfer, Albrecht
   - Beham, Hans Sebald
   - Aldegrever, Heinrich
   - Baldung, Hans
   - Menzel, Adolf
   - Richter, Ludwig
2. *France:*
   - Cousin, Jean
   - Charpentier, François
   - Bracquemond, Joseph Auguste
   - Johannot, Tony
   - Grandville
   - Gavarni
   - Doré, Gustave
3. *Italy:*
   - Carpi, Ugo da
   - Andreani, Andrea
4. *England:*
   - Bewick, Thomas
   - Blake, William
   - Linton, William James
5. *United States:*
   - Anderson, Alexander
   - Smillie, James D.

BIOGRAPHY.

A selected list of the world's great composers would include the following names:

Adam, A. C.
Agricola, M.
d'Albert, E.
Allegri, G.
Anerio, F.
Animuccia, G.
Arcadelt, J.
Arne, T. A.
Auber, D. F. E.
Bach, J. S.
Bach, K. P.
Balfe, M. W.
Barnby, J.
Beethoven, L.
Bellini, V.
Benedict, J.
Bennett, W. S.
Berlioz, H.
Bizet, G.
Boieldieu, F. A.
Bononcini, G. B.
Brahms, J.
Bruneau, A.

Bull, J.
Buxtehude, D.
Caccini, G.
Cambert, R.
Carissimi, G.
Cavalieri, E.
Cherubini, M. L.
Chopin, F. F.
Cimarosa, D.
Clementi, M.
Corelli, A.
Cornelius, P.
Couperin, F.
Cui, C.
David, F. C.
Debussy, C.
Deprès, J.
Donizetti, G.
Durante, F.
Dvorák, A.
Elgar, E.
Enna, A.
Festa, C.
Field, J.
Flotow, F.
Franck, C.
Franz, R.
Frescobaldi, G.
Froberger, J. J.
Gabrieli, A.
Gabrieli, G
Gade, N. W
Gibbons, O.
Giordano, U.
Glinka, M. I.
Gluck, C. W.
Goldmark, K.
Gossec, F. J.
Goudimel, C.
Gounod, C. F.
Graun, K. H.
Grétry, A. E. M.
Grieg, E.
Halévy, J. F.
Handel, G. F.

Hérold, L. J. F.
Hiller, J. A.
Hofhaimer, P.
Humfrey, P.
Hummel, J. N.
Humperdinck, E.
d'Indy, V.
Ippolitov-Ivanov, M.
Isaak, H.
Isouard, N.
Jommelli, N.
Keiser, R.
Kiel, F.
Lalo, E.
Lasso, Orlando di
Leo, L.
Leoncavallo, R.
Le Sueur, J. F.
Liszt, F.
Logroscino, N.
Lortzing, G. A.
Lotti, A.
Lully, J. B.
MacDowell, E. A.
Mahler, G.
Marschner, H.
Mascagni, P.
Massenet, J. E. F.
Mendelssohn-Bartholdy, F.
Meyerbeer, G.
Monteverde, C.
Morley, T.
Mozart, W. A.
Mussorgsky, M.
Nanini, G. M.
Offenbach, J.
Okeghem
Pachelbel, J.
Paisiello, G.
Palestrina, G. P.
Pergolese, G. B.
Piccini, N.

Ponchielli, A.
Porpora, N. A.
Prätorius, M.
Puccini, G.
Purcell, H.
Raff, J.
Rameau, J. P.
Reger, M.
Rimski-Korsakov, N.
Rossini, G. A.
Rubinstein, A.
Sacchini, A. M.
Saint-Saëns, C. C.
Scarlatti, A.
Schubert, F.
Schumann, R.
Schütz, H.
Sibelius, J.
Sinding, C.
Smetana, F.
Spohr, L.
Spontini, G. L.
Strauss, J.
Strauss, R.
Sullivan, A. S.
Suppé, F.
Tchaikovsky, P. I.
Thomas, A.
Tartini, G.
Verdi, G.
Viotti, G. B.
Volkmann, R.
Wagner, R.
Wallace, W. V.
Weber, K. M.
Willaert, A.
Wolf, H.
Zingarelli, N. A.

NOTE—The names of famous operas, oratorios, symphonies, dances, and national hymns have been omitted from the above classification. In the majority of cases, they will be found under their own proper titles, although brief mention of them would also be found in the general articles OPERA, ORATORIO, SYMPHONY, and NATIONAL HYMNS. The same is true of the scores of musical instruments and musical directions whose names will be found under the general articles ABBREVIATIONS, MUSICAL INSTRUMENTS and TEMPO.

Chapter 14. Mathematics

ROUGHLY defined, mathematics is the science of forms and number. A few of the definitions given by eminent mathematicians are found in the general article MATHEMATICS, which is, therefore, a suitable introduction to the subject. The article gives a condensed history of mathematics, from earliest times to the present, together with a logical classification of the various branches of mathematics.

Mathematical science naturally falls into two main subdivisions: Pure Mathematics and Applied Mathematics. With this division as a basis, various classifications have been attempted. The best classification for the purpose of systematic reading is the one usually followed in the school curriculum, or in the text-books. In accordance with this, we may subdivide Elementary Mathematics into the following branches:

Arithmetic
Algebra
Geometry
Trigonometry
Analytic Geometry
Calculus

1. ARITHMETIC involves three phases: The conception of number, the representation of number by symbols, and the principles and methods of computation. A general discussion of these phases, together with their history, is given in the article ARITHMETIC, which, therefore, should be read as an introduction to this branch.

A more modern phase of arithmetic is computation by calculating machines. This process has already to a large extent replaced computations by hand, and seems to be destined to do so even more in the future.

The general articles bearing on this branch may be conveniently read in the following order:

(*a*) *Principles and Methods of Computation:*

Addition
Subtraction
Multiplication
Division
Arithmetic Signs
Fraction
Involution and Evolution
Proportion
Checking in Arithmetic
Calculating Machines
Slide Rule

(*b*) *Symbols, Representation, and Scales:*

Symbols
Numerals
Decimal System
Scales of Notation

(*c*) *Theory of Numbers:*

Number
Irrational Number
Complex Number

The detailed history of these topics is given separately in each article.

2. ALGEBRA is universal arithmetic, and has many features in common with arithmetic. The fundamental operations are the same, with the exception that algebra takes up the more general cases. The limitations of algebra are brought out in the general article ALGEBRA, where also a history of this branch is given. Since algebra and

arithmetic are so closely related, the fundamental operations are best treated together, and so the general articles bearing on the fundamental operations in algebra have been given under arithmetic. Those belonging almost exclusively to algebra are best taken up in the following order:

Coefficient
Factor
Exponent
Associative Law
Polynomial
Negative Quantity
Binomial
Binomial Coefficients
Binomial Theorem
Remainder Theorem
Equation
Elimination
Substitution
Diophantine Analysis
Series
False Position, Rule of
Cubic Equation
Biquadratic Equations
Permutations and Combinations
Probability
Determinants
Logarithms
Analysis

3. GEOMETRY is the science of form, and geometric concepts arise from the consideration of forms of objects just as numerical concepts arise from considering a collection of objects. Geometry is independent of algebra, and may be studied before or after algebra, but preferably after. The physical scientist considers only the space we live in, while the mathematician considers all possible spaces. Accordingly, we have many different kinds of geometry. A general classification and discussion of the several geometries is given in the article GEOMETRY. Although algebra and geometry are independent, a correspondence may be set up between them. This is brought out in the article CORRESPONDENCE. The general articles are best read in the following order:

Euclid
Axiom
Theorem
Problem
Corollary
Angle
Arithmetic and Geometric Signs
Equiangular
Equilateral
Congruence
Duality
Construction
Locus
Triangle
Circle
Quadrilateral
Polygon
Circumscribed and Inscribed Figures
Contact
Perimeter
Transversal
Antiparallels
Concurrence and Collinearity
Maxima and Minima
Similarity
Symmetry
Plane
Octahedron
Polyhedron
Projective Geometry
Projection
Homology
Perspective
Isoperimetric Figures
Engineering Instruments
Surveying

Planimeter
Mensuration
Protractor
Vernier
Quadrature
Weights and Measures
Duplication of Cube (under Cube)
Quadrature of Circle (under Quadrature)
Trisection of an Angle

4. TRIGONOMETRY in elementary mathematics deals with the study of triangles, and the measurement of their sides, angles, and areas. This is, however, only a part of the general subject. Under the article TRIGONOMETRY, almost a whole text-book treatment is given, together with a short history of the subject from earliest times. As an introduction, read the article LOGARITHMS. An elementary knowledge of algebra and geometry is, however, necessary before the study of trigonometry can be taken up.

5. ANALYTIC GEOMETRY is the application of algebra to geometry, and the combination of the two is the most powerful tool of the modern mathematician. More general results may be deduced, and better classification effected, by means of analysis. In the general article ANALYTIC GEOMETRY, the aim and general method of procedure is given, together with a short history of the subject. The other articles may be conveniently read in the following order:

Coördinates
Graphic Method
Curve
Analysis
Cartesians
Parameter
Locus
Contact
Normal
Tangent
Conic Sections
Circle
Pole and Polar
Parabola
Ellipse
Hyperbola
Surface
Cone
Conoid
Spheroid
Generation

Higher Plane Curves:

In these, are included all transcendental and all algebraic curves above the second order. As an introduction, read the article CURVE. Some of the most important articles are:

Cardioid
Catenary
Cissoid
Conchoid
Curve of Sines
Cycloid
Logarithmic Curve
Spiral
Lemniscate
Loxodrome
Witch

6. CALCULUS. This term usually refers to Differential and Integral Calculus. Differential Calculus deals with the relation between indefinitely small quantities or infinitesimals, and is of great service when the quantities under consideration are constantly changing. The problem of Integral Calculus is the inverse of that of Differential Calculus. Integral Calculus also deals with the application of calculus to mechanics and geometry.

In the general article CALCULUS, the methods and applications of calculus are illustrated by the solution of practical problems. As a historical introduction, read:

Indivisibles (under Cavalieri)
Fluxions

The general article CALCULUS, should also be preceded by:

Analysis
Limits, Theory of
Infinity and the Infinitesimal

and followed by:

Maclaurin's Theorem (under Maclaurin)
Curve
Osculation
Quadrature
Differential Equations (under Equation)

7. HIGHER MATHEMATICS is a collective term for all branches of mathematics that follow calculus. Most of these branches are based on calculus, but some, like the theory of numbers and group theory, are independent of calculus. The following articles will furnish an introduction to some of the branches of higher mathematics:

Forms
Functions
Modern Geometry (under Geometry)
Non-Euclidean Geometry (under Geometry)
Quaternions
Substitution
Theory of Numbers (under Number)

8. APPLIED MATHEMATICS deals with the application of mathematics to related sciences, like Mechanics, Astronomy, Physics, etc. See these departments in this work.

9. BIOGRAPHY. Mathematical knowledge dates back to the Egyptian and Babylonian civilizations, but the real development begins in Greece. This was chiefly in the realms of geometry. Later it inclined toward arithmetic. The Romans did nothing for mathematics, and the Arabs very little more than to translate and preserve the Greek learning. Through them it was introduced into the cloisters in Europe during the Middle Ages. The modern period in the history of mathematics begins with Descartes's invention of analytic geometry. The following is a list of the most eminent mathematicians, arranged according to their nationality or period:

(*a*) *Greek:*

Thales
Pythagoras
Aristotle
Plato
Euclid
Archimedes
Diocles
Nicomedes
Hippias of Elis
Menelaus
Apollonius of Perga
Hero of Alexandria
Ptolemy
Diophantus
Pappus

(*b*) *Arab:*

Al-Khuwarizmi
Al-Battani

(*c*) *Hindu:*

Aryabhatta
Brahmagupta

Bhaskara
Mahavir

(*d*) *Persian:*

Omar Khayyam

(*e*) *From the revival of Mathematics in Europe to the middle of the 17th century:*

Gerbert [under Sylvester (Pope)]
Fibonacci
Jordanus
Peuerbach
Regiomontanus
Paccioli
Tartaglia
Cardan
Viète
Napier
Descartes

(*f*) *From the middle of the 17th century to the present time:*

Desargues
Cavalieri
Pascal
Boscovich
Fermat
Wallis
Barrow, I.
Leibnitz
Newton
Bernoulli, Jakob
Bernoulli, Johann
Bernoulli, Niclaus
Bernoulli, Daniel
Maclaurin
Taylor
Euler
D'Alembert
Monge
Laplace
Lagrange
Legendre
Fourier
Gauss
Poisson
Poncelet
Chasles
Steiner
Cauchy
Möbius
Lobachevsky
Bolyai
Abel
Dirichlet
Hamilton
Jacobi
Plücker
Grassmann
Galois
Cayley
Eisenstein
Weierstrass
Riemann
Smith, H. J. S.
Sylvester
Clebsch
Lie, Sophus
Reye

Chapter 15. Astronomy

ASTRONOMY is the science which treats of the heavenly bodies—the sun and moon, the planets and their satellites, comets and meteors, the stars and nebulæ. Astronomy is usually divided into many branches; these branches, however, are not distinct and separate, but overlap in all directions, so that no convenience as regards treatment is gained. The arrangement of the articles in the following lists is not according to branches, but in accordance with the order in which they may be conveniently read.

A general history of the progress of astronomical discovery is given in the general article ASTRONOMY, which, therefore, forms a suitable introduction to the subject. For a knowledge of a few of the elementary terms used in astronomy, see:

Zenith
Horizon
Equator
Ecliptic
Pole
Azimuth
Altitude
Declination
Latitude and Longitude
Parallels
Meridian
Diurnal Motion
Culmination

1. ASTRONOMICAL OBSERVATIONS.

Astronomical observations are principally of two kinds: To determine distance, linear and angular; and to study the physical conditions of the heavenly bodies.

(*a*) *Instruments:*

Telescope
Sextant
Transit Instrument
Meridian Circle
Equatorial
Zenith Telescope
Micrometer
Chronograph
Chronometer
Spectroscope

(*b*) *Corrections to Astronomical Observations:*

Depression
Parallax
Refraction
Twilight
Aberration

(*c*) *Time:*

The determination of time is one of the most important problems in astronomy, and is effected by observing the time of transit across the meridian of some celestial object. For the determination of time, read:

Transit Instrument
Sextant
Chronometer
Ephemeris
Equation of Time

Various ways of reckoning time have been used in history. Some of the principal ways used by the ancients, and also those used at present, are given in the following articles:

Period
Chronology

Calendar
Hour
Week
Day
Month
Year
International Date Line
Prime Meridian Conference
Time Signals
Time, Standard

2. The Solar System.

The solar system consists of the sun as a central body, around which revolve the planets with their satellites, some periodic comets, and meteoric swarms. In addition to these permanent members, the system is occasionally visited by other comets, which move in parabolic orbits. As a historical introduction, read:

Ptolemaic System
Copernican System

Of the members of the solar system, the planetary system is of most immediate interest to us, since our earth is a member of this system. The sun and the planets, with their satellites and their interrelations, are treated in the following articles:

Sun
Planets
Solar System
Planetoids
Satellites
Vulcan
Mercury
Venus
Earth
Mars
Jupiter
Saturn
Uranus
Neptune
Eros
Moon
Gravitation
Parallax
Lunar Theory
Nutation
Perturbations
Precession
Tides
Latitude, Variation of
Seasons
Orbit
Elements
Eclipse

Comets are usually very small in mass, though this has great extent. They move in very eccentric orbits about the sun, and the planes of their orbits present a great variety. The constituent parts and physical characteristics, the mass, the spectra, the number, discoveries, the capture theory, and origin of comets are treated in the article Comet.

Meteors are masses of stone or iron, which sometimes are seen to fall to the earth from the sky. The circumstances of the fall, the meteoric showers, the probable cause, the matter, path, and number of meteors are treated in the articles:

Meteors
Aërolite

3. The Stars.

These bodies are usually called fixed stars, owing to the idea of the ancients that they were without motion. The fixity is, however, now disproved, and observations with the spectroscope show that they are moving with velocities comparable to those of bodies belonging to the solar system. Owing to

their immense distance, they appear, however, to keep their relative positions and configurations unchanged. This is only apparent, and there are stars whose displacement amounts to as much as 1″ a year. In magnitude and physical condition, the stars are comparable with our sun, and many of them greatly exceed our sun in brightness and magnitude. The designation, magnitude, nature, and number of stars, the constellations, stellar parallax, proper motion, spectra, photometry, variable stars, double and multiple stars, binary stars, etc., are treated in the following articles:

Star
Constellation
Culmination
Pole Star
Zodiac
Galaxy
Parallax
Variable Star
Astro-Photography

THE NEBULAE are faintly shining cloudlike patches of matter in the sky, scattered among the stars. They are supposed to be stars under formation. The nature, forms, and magnitudes of nebulæ, the spectra, distribution, distance, etc., are treated in the article NEBULAE.

4. ASTRONOMICAL OBSERVATORIES are buildings where the instruments and machinery necessary for the observation of the heavenly bodies are kept. The equipment, location, etc., together with a description of some of the largest observatories in the world, are treated in the following articles:

Observatory
Lick Observatory
Naval Observatory
Pulkova
Yerkes Observatory
Greenwich Observatory
Harvard College Observatory
Mount Wilson Solar Observatory

5. COSMOGONY deals with the theory of operations by which the present condition of the universe came about. Various systems of cosmogony have prevailed at different times. See:

Cosmogony
Nebulæ

6. ASTROLOGY deals with the supposed influence of the heavenly bodies upon human affairs and the drawing of horoscopes. Astrology was the forerunner of astronomy, and for centuries astronomical observations were made mainly to supply data for astrology. See ASTROLOGY.

7. BIOGRAPHY.

Observational astronomy dates back to the Chinese and Chaldæans, but the first real attempt to explain the movements of the heavenly bodies is due to the Greeks. The ideas of the Greeks held sway till Copernicus substituted a more harmonious system. Gravitational astronomy begins with Newton, who made it possible to explain the movements of the heavenly bodies, while Galileo's invention of the telescope gave a means of finding out what they are in themselves. The following is a list of the most prominent contributors to astronomy:

Hipparchus
Ptolemy
Brahe
Kepler
Galileo

Galileo
Newton
Bradley
Halley
Roemer
Cassini, Jacques
Cassini, G. D.
Flamsteed
Herschel, Sir William
Herschel, Sir J. F. W.
Laplace
Bessel
Bode
Delambre
Olbers
Piazzi
Pond
Baily
Hansen
Struve, F. G. W.
Encke
Leverrier
Adams, J. C.
Airy
Rosse
Rutherford
Struve, Otto
Galle
Huggins
Lockyer
Gill, Sir David
Pickering
Hale, G. E.

Chapter 16. Physics

IN undertaking systematic reading in any particular science, it is well at the outset to realize the province and limitations of that science, as they have been determined and observed in the past by its devotees, and what, if there have been changes, is the modern conception of the scope of the particular department of knowledge so known. With this especial object, the article on PHYSICS has been written, and serves to introduce the reader to the subject, as discussed in more detail under the broad subdivisions of ACOUSTICS, ELECTRICITY, HEAT, LIGHT, MECHANICS, LABORATORY, MAGNETISM and RADIOACTIVITY. Taking up these subjects separately, and also the article on LABORATORY, we shall find in each case the general article referred to, and such minor articles as are demanded.

1. ACOUSTICS.

Dealing with theoretical questions, the more important topics on the nature and theory of sound are included in the following list:

Acoustics
Section *Origins* under Music
Diatonic Scale
Phonetics
Resonance
Resonator
Node

For special purposes and investigation dealing with the production and propagation of sound waves, there has been devised much interesting apparatus, certain forms of which, as the telephone, phonograph, megaphone, etc., have found their way into universal application. See:

Siren
Speaking Trumpet
Megaphone
Ear-Trumpet
Acoumeter
Phonograph
Talking Machine
Graphophone
Telephone
Tuning-Fork
Organ

2. ELECTRICITY.

To supplement the general article ELECTRICITY, and those of a theoretical nature treating Ionization and Electrons, it is desirable to consult articles dealing with the generation of the current, as DYNAMO-ELECTRIC MACHINERY, the VOLTAIC CELL, the DRY PILE, THERMO-ELECTRICITY, and also study the effects of INDUCTION and self-induction. We can learn how the magnetic strength of a solenoid is influenced by the number of AMPERE TURNS. As supplemental, then, to the article on electricity, the following articles may be cited:

(*a*) *Fundamental Phenomena:*
Current
Conductor
Resistance
Shunt
Electrostatics (under Electricity)
Condenser
Ampere Turns
Solenoid
Induction
Induced Electric Currents (under Electricity)
Foucault Currents

(*b*) *Electrical Units:*
Electrical Units

Ampere
Volt
Ohm
Henry
Farad
Coulomb
Watt

(*c*) *Electrostatic Apparatus:*

Electrophorus
Electrical Machine
Electroscope
Leyden Jar (under Condenser)
Barometric Light
Brush
Elmo's Fire, Saint

(*d*) *Measuring Instruments:*

Galvanometer
Ammeter
Voltmeter
Voltameter
Wheatstone's Bridge
Electrometer
Electric Meters
Induction Balance

(*e*) *Discharge in Gases or in Vacuo:*

Anode
Discharge through Gases (under Electricity)
Geissler's Tubes
Crookes Tube
X-Rays

(*f*) *Electric Currents:*

Galvanic Battery
Voltaic Cell or Battery
Dry Pile
Storage Battery
Dynamo Electric Machinery
Thermo-Electricity
Thomson Effect

3. HEAT.

Following the arrangement already specified for the study of heat, reference should be made to CALORIMETRY to ascertain how the amount of heat possessed by various bodies is measured, and to THERMOMETRY to learn how the temperature or degree of heat is determined. THERMODYNAMICS enables us to consider the relation between heat and work. See:

Heat
Calorimetry
Thermometry
Diathermancy
Regelation
Radiation
Thermodynamics
Spheroidal State

Of a more practical character, are those articles involving the consideration of methods and apparatus, such as those which discuss the LIQUEFACTION OF GASES and FREEZING MIXTURES. A list of this kind would include:

Cryophorus
Freezing Point
Freezing-Mixtures
Liquefaction of Gases

4. Magnetism.

Complete articles on Magnetism in general and on Terrestrial Magnetism, with charts, leave but little to be said in addition. The instruments used in studying magnetism, and especially the ship's compass, with its important adjustments, are also the subjects of further description. See:

Magnetism
Terrestrial Magnetism
Diamagnetism
Compass
Declination
Declinometer
Dipcircle
Inclination
Isoclinic
Isogonic
Magnetometer
Magnetic Elements
Magnetic Equator
Magnetic Observatory
Armature
Alloys, Magnetic
Astatic Needle

5. Light.

In the study of optics, there are numerous opportunities to branch off from a general treatment and carry on independent investigation in a particular field. Starting with the motion of the ether, known as light, we are able to study its Velocity and also the intensity. For the latter, photometers are employed, and the subject of Photometry presents a record of many different instruments and methods. The useful application of light is included under Illumination. By reason of its wave motion when Diffraction and Interference take place Fringes are formed, and also there results the phenomenon known as colors of thin plates. This principle of interference is the basis of one process of Color Photography; several processes are described under that title. In fact, numerous other examples could be cited, but reference to the following list will clearly indicate the extent of the range of subjects:

(*a*) *Light:*
Light
Velocity of Light
Ether
Diffraction and Diffraction Gratings
Interference
Fringes
Colors of Thin Plates (under Light)
Newton's Rings
Photometry
Reflection
Caustic
Refraction
Polarization
Prism
Dispersion
Color
Complementary Colors
Achromatism
Rainbow
Lens
Foci
Aberration, Chromatic
Aberration, Spherical
Spectroscopy
Fluorescence
Phosphorescence
Zeeman Effect
Mirage
Fata Morgana

(*b*) *Optical Instruments:*
Telescope
Opera Glass

Field Glass
Object-Glass
Eyepiece
Field of View
Microscope
Solar Microscope
Camera Lucida
Camera Obscura
Aplanatic Lens
Spectroscope
Stereoscope
Magic Lantern
Moving Pictures
Kinetoscope
Dissolving Views
Diaphragm
Polariscope
Nicol Prism
Analyzer
Polar Clock
Kaleidoscope
Chromatrope
Zoëtrope
Fluoroscope
Diaphanoscope
Cyanometer
Dioptometer
Magic Mirror of Japan

(c) *Photographic Processes:*

Photography
Photo-Chemistry
Negative
Ambrotype
Daguerreotype Process
Copying
Color Photography
Photo-Engraving
Calotype Proccess
Cyanotype Process
Ferrotype
Fothergill Process
Photolithography (under Lithography)
Gelatin Process

6. MATTER AND MECHANICS.

Under this head, we may include a consideration of matter, including its general properties and the theories advanced to explain it, as well as the questions concerned with the motion of matter, and the methods and units employed to measure this motion. Considering the first subdivision, it is necessary to concern ourselves with the following titles:

Matter
Vortex
Molecules
Inertia
Porosity
Ductility
Elasticity
Flexure
Viscosity
Gases, General Properties of
Effusion
Cohesion
Adhesion

The science of mechanics deals with the motion of matter. After reading the fundamental article MECHANICS, the reader will be prepared to appreciate the associated articles as well as those dealing with the various stages of applied mechanics. Included in the former class, are the following:

Mechanics
Dynamics
Kinetics
Kinematics
Statics
Moment
Momentum
Velocity
Acceleration
Force
Potential

Central Forces
Couple
Energetics
Centre of Gravity
" " Gyration
" " Inertia
" " Oscillation
" " Percussion
" " Pressure
Aerostatics
Aerodynamics
Pneumatics
Hydrostatics
Hydrodynamics
Vortex
Waves
Stability
Impact
Gravitation
Falling Bodies
Vector
Capillarity
Mechanical Powers
Inclined Plane
Lever
Wheel and Axle
Pulley
Pendulum
Projectiles, Motion of

In order to measure motion and its effect, there are required systems of units, and these are usually arranged on such a basis that they are parts of a symmetrical system, such as the C. G. S. (Centimeter, Gramme, Second) system. This matter is fully explained in the following articles:

C. G. S.
Mechanical Units
Dimensions
Dyne
Erg
Foot-Pound
Joule
Watt
Kilowatt
Horse-Power

For the measurement and study of matter and its motion and other properties, numerous important pieces of physical apparatus have been devised. Thus, to measure the pressure of the atmosphere, or a gas, we have the BAROMETER and the MANOMETER. To remove the air from a vessel, the AIR PUMP is applied. For the linear measures, we have scales constructed with the DIVIDING ENGINE and compared with standards on the COMPARATOR. Instruments of such nature are included in the following list:

Air Pump
Barometer
Barometer, Water
Aneroid
Manometer
Magdeburg Hemispheres
Specific Gravity
Hydrometer
Jolly Balance
Balance
Spring Balance
Weighing Machine
Torsion Balance
Weights and Measures
Metric System
Dividing Engine
Comparator
Atwood's Machine
Barker's Mill
Hero's Fountain

7. MODERN THEORIES.

Modern Physics has many recent developments to record in the field of theory and many of the ideas once considered fixed and definite have been put to the test severely under later

conditions. Even GRAVITATION, whose laws were once considered fundamental, has been considered in the light of modern thought, while the recognition of the ELECTRON and the part played by IONIZATION has modified our original idea of ELECTRICITY and the ETHER. Furthermore, we have the new conception of RELATIVITY. Whatever the existence of matter and its explanation, yet when electrical oscillations take place or material bodies emit energy, or as it is termed, RADIATION, a wide range of phenomena is produced ranging from the Electromagnetic waves used in WIRELESS TELEGRAPHY and TELEPHONY to the waves of light. When the radiations are produced by the discharge of electricity through a vacuum we have the phenomena of the X-rays, while if the radiations are furnished spontaneously, as by such radioactive elements as RADIUM, THORIUM, etc., there are afforded the varied series of phenomena that would seem to indicate transformation of one element to another and bear an important relation to the theory and explanation of matter. Accordingly, in this connection, one could read with profit the articles on:

Ether
Gravitation
Relativity
Radiation
Radiation Pressure
Radium
Radioactivity
Electricity
Light
X-rays
Waves

RADIOACTIVITY, by reason of its relation to theories of matter and the involved phenomena, both physical and chemical, is now entitled to stand as a distinct Department of Physics, in so far as the physical phenomena are concerned.

The main article on this subject deals with the theories which have been advanced to explain the many interesting phenomena of the Radioactive substances. Accordingly one should read, in addition to this article, those on the various Radioactive elements, such as:

Radium
Uranium
Actinium (particularly)
Thorium
Polonium

The biographies of the leading workers in this field, such as the Becquerels, Sir William Crookes, Professor and Madame Curie, Ernest Rutherford, Frederick Soddy and J. J. Thomson. and others referred to in the various articles. should also be read.

8. BIOGRAPHIES OF PHYSICISTS.

Some of the greatest achievements in that branch of science which is now known as Physics have been the work of philosophers who have also accomplished much in other fields, and consequently it is impossible, particularly in the case of ancient and mediæval scientists, to term them physicists, and include them in such a list. Also, in modern times, the work of the chemist, of the engineer, of the meteorologist, of the astronomer, and of other scientific workers, closely approaches or actually transgresses the limits which the physicist has set for himself. Therefore, the following list does not include all the principal workers, but a

certain number who primarily are distinguished for their work in physics.

Abney, W. de W.
Amici, G. B.
Amontons, G.
Ampère, A. M.
Arago, D. F.
Archimedes
Atwood, George
Bache, Alex. D.
Bacon, Roger
Becquerel, A. C.
Becquerel, A. E.
Becquerel, A. H.
Bell, A. G.
Biot, Jean B.
Boyle, Robert
Brewster, Sir D.
Bunsen, R. W.
Cailletet, L. P.
Carhart, H. S.
Carnot, N. L. S.
Cavendish, H.
Chladni, E. F. F.
Clausius, R. J. E.
Coulomb, C. A.
De la Rive, A. A.
Dollond, John
Dove, H. W.
Edison, T. A.
Ewing, J. A.
Fahrenheit, G. D.
Faraday, M.
Ferrari, G.
Fleming, J. A.
Forbes, J. D.
Foucault, J. B. L.
Fraunhofer, Joseph von
Fresnel, A. J.
Galvani, L.
Gauss, K. F.
Gay-Lussac, J. L.
Geissler, H.
Gilbert, W.
Glazebrook, R. T.
Gray, Elisha
Grove, Sir W. R.
Guericke, O. von
Haidinger, W. von
Halley, E.
Hauksbee, F.
Helmholtz, H. von
Henry, Joseph
Hero of Alexandria
Herschel, Sir W.
Hertz, H.
Hittorf, J. W.
Holtz, W.
Hopkinson, J.
Huygens, C.
Jenkin, H. C. F.
Jolly, P. von
Joule, J. P.
Kater, H.
Kirchhoff, G. R.
Kohlrausch, F.
Kundt, A.
Laplace, P. S. de
Leslie, Sir J.
Lodge, Sir O. J.
Magnus, H. G.
Malus, E. L.
Mariotte, E.
Mascart, E. E. N.
Maxwell, J. C.
Mayer, A. M.
Mayer, J. R. von
Mendenhall, T. C.
Michelson, A. A.
Morse, S. F. B.
Newton, Sir Isaac
Nichols, E. L.
Oersted, H. C.
Ohm, G. S.
Ostwald, W.
Papin, D.
Pictet, R.
Plateau, J. A. F.

Pupin, M. I.
Quincke, G. H.
Rankine, W. J. M.
Rayleigh, J. W. S.
Réaumur, R. A. F. de
Regnault, H. V.
Roentgen, W. K.
Rowland, H. A.
Rühmkorff, H. D.
Sabine, Sir E.
Siemens, Sir W.
Somerville, Mary
Steinheil, K. A.
Stevin, S.
Stokes, Sir G. G.
Tait, P. G.
Tesla, N.
Thompson, S. P.
Thomson, Sir J. J.
Thomson, William (Lord Kelvin)
Torricelli, E.
Trowbridge, J.
Tyndall, J.
Van't Hoff, J. H.
Violle, J.
Volta, A.
Watt, J.
Weber, W.
Wheatstone, Sir Charles
Wiedemann, G.
Wilde, H.
Woodward, R. S.
Wroblewski, Z. F.
Young, T.

Chapter 17. Aëronautics

IN only a very recent work of reference would it be possible to assemble a number of articles dealing with the modern theory and art of aërial navigation. Indeed, the practice of aëronautics has been so affected by the great War in Europe that the military and naval aspects of the matter have become predominant, and while the mechanical features are closely connected, yet the general reader at the present time is likely to be more concerned with the use of the aëroplane and dirigible in warfare.

In the NEW INTERNATIONAL ENCYCLOPÆDIA the student will find first a general article on AËRONAUTICS, in which the history of the evolution of the dirigible or airship from the balloon and of the aëroplane, from the earliest attempts at securing flight with a machine heavier than the displaced air, is traced. He will also find in the article on GASES, GENERAL PROPERTIES OF, the fundamental theory involved, and in the articles on MILITARY and NAVAL AËRONAUTICS the applications to warfare. In the section on *Aërial Operations*, in the long article on the WAR IN EUROPE, will be found a discussion of the use made of these machines in reconnaissance and combat.

The successful evolution of machines that could navigate air also has brought about legal problems and indicated changes both in international law and in other statutes or principles of law involved in the rules of the road and other obvious practices. Accordingly, a list of useful articles for one engaged in research in this field would be the following:

Aëronautics
Aërodynamics
Aërostatics
Military Aëronautics
Hangar
Navigation, Aërial, Law of
International Law
War in Europe (Section on Aërial Operations)
Gases. General Properties of
Internal Combustion Motors
Military or Man-Raising Kite
Kite

Chapter 18. Chemistry

THE importance, for practically everybody, of acquiring a knowledge of chemistry hardly needs to be emphasized. Chemical facts and principles are involved, to a considerable extent, in every science and in every branch of industry, and chemical questions come up often in nearly every sphere of human activity.

In the NEW INTERNATIONAL ENCYCLOPÆDIA the science and applications of chemistry are treated in a large number of articles, many of which were written so as to serve a double purpose: first, to supply information on their special topics, without reference to chemical science as a whole, or to any other chemical topic; secondly, to form integral parts of an exposition of chemistry, for those who may desire to use the Encyclopædia for the acquisition of a general acquaintance with the subject. To serve the second purpose, they were written from a single viewpoint—on the whole, that of the German school of physical chemistry, now all but universally recognized as the best founded and most fruitful mode of viewing chemical phenomena. To serve the first purpose, which is all-important in a work of reference, each article (with few unavoidable exceptions), besides being written in simple terms, is supplied with all the information that is necessary to an understanding of the subject it treats, so that in most of the articles, no preliminary chemical knowledge is pre-supposed. But even in those articles in which the assumption of some preliminary knowledge could not, for obvious reasons, be avoided, no information was pre-supposed beyond what may be readily found in the Encyclopædia itself. Furthermore, in most of the articles the more essential information is concentrated in the opening paragraphs, the more technical and less essential in later parts of the article; so that glancing over the first paragraph alone may be sufficient for many purposes. If the end in view be the acquisition of some general knowledge of chemistry, the articles should be read entirely and carefully and the leading points briefly noted down, so as to afford, at any time of the reading, a clear retrospect over the ground covered.

For purposes of systematic reading, the chemical articles in the Encyclopædia may be grouped as follows: 1, Those dealing with general fundamental principles; 2, those dealing with the principal classes of carbon compounds; 3, those dealing with the theories of physical chemistry; 4, those articles, or sections of articles, dealing with the history of chemistry; 5, articles on the chemical elements; 6, articles on the principal compounds occurring in the living organism; 7, articles on other substances, inorganic and organic, presenting either theoretical or practical interest. In the following chapter devoted to INTERNATIONAL CHEMISTRY, as well as in the section on *Manufactures*, will be found listed and discussed the articles that deal with modern industrial processes and their products.

The order of this classification is based on the relative importance, to the general reader, of principles and facts. Should the course of syste-

matic reading be interrupted at some stage, a knowledge of at least some of the principles of chemistry ought to be much more valuable than a knowledge of some data concerning individual compounds, such as would be acquired if, following the usual order of chemical studies in schools, the course should be commenced by a perusal of the descriptive articles on the elements and their principal inorganic compounds.

1. Fundamental Principles and Phenomena.

Chemistry
Analysis, Chemical
Atomic Weights
Avogadro's Rule
Molecules
Periodic Law
Spectrum Analysis
Reaction, Chemical
Decomposition
Dissociation
Catalysis
Nascent State
Combustion
Spontaneous Combustion

2. Carbon Compounds.

The compounds of carbon, numbering roughly 150,000, form the subject of organic chemistry, one of the most extensive and important branches of modern chemical science. In this branch the atomic and other theories have found a field for some of their most useful applications; and it is, therefore, advisable to acquire some knowledge of it at any early stage in chemical reading. The following is a list of the principal articles dealing with this branch; to be supplemented, of course, on the practical side by those dealing with industrial processes as given in the following chapter:

Carbon Compounds
Stereo-Chemistry
Alcohols
Mercaptans
Ethers
Aldehydes
Ketones
Amines
Amides
Ureas
Valence
Carbohydrates
Phenols
Organo-Metallic Bodies
Alkaloids

3. Physical Chemistry.

Within recent years, physical chemistry has attained a degree of importance which makes some knowledge of it indispensable.

It is believed that this justified the introduction in the Encyclopædia of a somewhat extensive treatment of the subject. Following is a list of the principal articles, in the order in which it would seem advisable to read them:

Avogadro's Rule
Boiling-Point
Freezing-Point
Melting-Point
Solution
Dissociation
Colloids
Thermo-Chemistry
Phase Rule
Electro-Chemistry, General
Photo-Chemistry
Critical Point
Evaporation

Distillation
Sublimation
Radioactivity

4. History of Chemistry.

The history of a great science, if studied after some knowledge of the principles and problems of the science has been acquired, has in itself a fascination for almost every mind. But, in the case of chemistry, many authorities have maintained that a knowledge of the history is not merely interesting, but absolutely indispensable to a thorough understanding of the science itself. In the Encyclopædia, a simple presentation of the development of chemical thought, and the gradual elimination of past errors of principle and method, will be found in the general article Chemistry. Further historical information will be found in the article Alchemy, in the articles on physical chemistry, in those describing the elements and many chemical compounds, and especially in the biographies of celebrated chemists. Following is a list of some of the best-known names in the history of chemistry:

Helmont, J. B. van
Becher, J. J.
Stahl, G. E.
Black, J.
Priestley, J.
Cavendish, H.
Lavoisier, A. L.
Klaproth, M. H.
Dalton, J.
Wollaston, W. H.
Berzelius, J. J.
Davy, H.
Berthollet, C.
Avogadro, A.
Gay-Lussac, J. L.
Mitscherlich, E.
Liebig, J.
Wöhler, F.
Chevreul, M. E.
Dumas, J. B.
Laurent, A.
Gerhardt, K. F.
Gmelin, L.
Sainte-Claire Deville, H. E.
Cannizzaro, S.
Graham, T.
Kolbe, H.
Bunsen, R. W.
Roscoe, H. E.
Berthelot, P. E. M.
Wurtz, C. A.
Hofmann, A. W.
Regnault, H. V.
Pasteur, L.
Mendeléeff, D.
Schorlemmer, C.
Baeyer, A.
Fischer, E.
Van't Hoff, J. H.
Ostwald, W.
Nernst, W.
Arrhenius, S.
Curie, M. S. and P.
Crookes, W.
Ramsay, W.

5. The Chemical Elements.

The articles on the chemical elements will be found to contain descriptions, not only of the elements themselves, but also of their principal compounds, so that each article forms a chapter of inorganic chemistry. Following is a list of some of the principal articles in a recognized order of arrangement:

Hydrogen
Oxygen
Nitrogen
Carbon

Chlorine
Bromine
Iodine
Fluorine
Sodium
Potassium
Lithium
Magnesium
Calcium
Strontium
Barium
Zinc
Cadmium
Mercury
Boron
Aluminium
Silicon
Tin
Lead
Zirconium
Thorium
Phosphorus
Arsenic
Antimony
Bismuth
Sulphur
Selenium
Tellurium
Chromium
Molybdenum
Tungsten
Uranium
Manganese
Iron
Cobalt
Nickel
Platinum
Palladium
Copper
Silver
Gold

Articles on the rest of the elements, including the rare gases ARGON, HELIUM, NEON, KRYPTON, and XENON, and of the radioactive elements, including RADIUM, POLONIUM, ACTINIUM, and THORIUM, will be found in their proper places. In connection with the radioactive elements, reference should be made to the article on RADIOACTIVITY. A list of the elements, with their chemical symbols and atomic weights, will be found in the article ATOMIC WEIGHTS.

6. COMPOUNDS OCCURRING IN LIVING ORGANISMS.

Physiological chemistry deals with the individual compounds forming the chemical ingredients of the materials of which living organisms and their products (*e. g.*, milk) are made up. A knowledge of the chemical and physical properties of those compounds is indispensable in the study of chemical physiology, and hence of physiology in general. The following is a list of the more important physiological compounds described under their names in the Encyclopædia:

Albumen
Allantoïn
Carbohydrates
Cellulose
Carnin
Casein
Cerebrin
Chitin
Cystin
Elastin
Fats
Fibrin
Gelatin
Globulins
Glycogen
Guanin
Hypoxanthin
Keratin

Kreatin
Kreatinin
Legumin
Leucin
Ossein
Proteins
Starch
Syntonin
Taurin
Urea
Uric Acid
Hæmatin
Hæmoglobin

7. Other Important Articles on Chemical Subjects.

(*a*) *Metallic Alloys:*

Alloy
Amalgam
Babbitt Metal
Brass
Britannia Metal
Bronze
Fusible Metal
German Silver
Phosphor-Bronze
Pewter
Pinchbeck
Platiniridium
Spence's Metal

(*b*) *Bases:*

The inorganic bases, *i. e.*, metallic oxides and hydroxides, are mostly described in connection with the metallic elements. Important special articles are:

Ammonia
Lime
Soda

The articles on organic bases include:

Amines
Ethylamine
Trimethylamine
Aniline
Pyridine
Quinoline
Alkaloids
Ptomaines

The article Alkaloids contains a list of the important members of this class of substances, with their principal characteristics. More extensive descriptions are given in the special articles on all the more important alkaloids.

(*c*) *Acids:*

All the more important acids are described in special articles under their names. Many acids of secondary importance are mentioned in connection with their characteristic elements. Following is a partial list of important articles on acids:

i. General:

Acids
Phenols

ii. Inorganic:

Sulphuric Acid
Hydrochloric Acid
Nitric Acid
Sulphureted Hydrogen
Phosphoric Acid
Hydrobromic Acid
Hydriodic Acid
Hydrofluoric Acid
Chloric Acid
Perchloric Acid
Hypochlorous Acid
Nitrous Acid
Hyponitrous Acid
Phosphorous Acid
Hypophosphorous Acid
Manganic and Permanganic Acids

iii. Organic:

Acetic Acid
Benzoic Acid
Butyric Acid
Caproic, Caprylic, and Capric Acids
Carbolic Acid
Carbonic-Acid Gas
Cinnamic Acid
Citric Acid
Cyanic Acid
Cyanuric Acid
Formic Acid
Fumaric and Maleic Acids
Gallic Acid
Glycin
Hippuric Acid
Hydrocyanic Acid
Hydroferricyanic Acid
Hydroferrocyanic Acid
Lactic Acid
Lauric Acid
Malic Acid
Margaric Acid
Meconic Acid
Myristic Acid
Œnanthylic Acid
Oleic Acid
Oxalic Acid
Palmitic Acid
Picric Acid
Stearic Acid
Succinic Acid
Tannic Acid
Tartaric Acid
Uric Acid
Valeric Acid

An important "homologous series" of acids, included in this list, is constituted by the following so-called "fatty acids":

Formic
Acetic
Butyric
Valeric
Caproic
Caprylic
Capric
Senanthylic
Lauric
Myristic
Palmitic
Margaric
Stearic

Allied to the last-named is Oleic Acid.

The acid anhydrides are mostly mentioned in connection with the metalloid elements.

(*d*) *Salts:*

Salts are mostly described in connection with either the acids or the bases combined in them. The following are a few special articles on salts:

Alum
Borax
Cream of Tartar
Epsom Salt
Glauber's Salt
Iodides
Rochelle Salt
Ichthyol
Saltpetre
Soda

Bases, acids, and salts constitute together the so-called "electrolytes." Their peculiar behavior in aqueous solutions has led to the formulation of the now well-known theory of electrolytic dissociation, which may be found treated in the articles Solution, Dissociation, and Acids.

(*e*) *Hydrocarbons*:

Hydrocarbons
Methane

Ethane
Propane
Butane and Isobutane
Ethylene
Acetylene
Benzene
Naphthalene
Anthracene

Further information concerning hydrocarbons may be found in articles on such products as oils (volatile), paraffin, ozokerite, petroleum, benzine, rubber, gutta-percha, gas (illuminating and natural), etc.

(*f*) *Other important compounds:*

Water
Hydrogen Dioxide
Ozone
Alcohol
Methyl Alcohol
Glycerin
Mannite
Aldehyde
Chloral
Acetone
Almonds, Volatile Oil of
Acrolein
Acetone
Ether
Chloroform
Iodoform
Nitro-Benzene
Carbides
Calcium Carbide
Carbon Disulphide
Carbonic Oxide
Cyanogen

(*g*) *Pigments, Dyestuffs, and Allied Subjects:*

Paints
Mineral Colors
Vegetable Colors
Dyeing
Mordants
Coal-Tar Colors
Tar
Coal Tar
Indigo
Alizarin
Purpurin
Aurin
Rosolic Acid
Archil
Arnotto
Carmine
Cochineal
Flavin
Fustic
Henna
Indian Yellow
Lac Dye (under Lac)
Litmus
Madder
Orcin
Orcein
Logwood
Murexid
Phenicin
Quercitron
Green
Brunswick Green
Turkey Red
Cinnabar
Blue
Indigo
Lampblack
White Lead

A list of the widely used coal-tar colors ("aniline dye-stuffs"), with their principal characteristics, will be found in the article COAL-TAR COLORS.

(*h*) *Waxes, Fats, Oils, and Soap:*

Waxes
Beeswax
Spermaceti

Fats
Palmitin
Stearin
Olein
Oils
Almonds, Expressed Oil of
Almonds, Volatile Oil of
Canada Balsam
Castor Oil
Cod-Liver Oil
Croton Oil
Garlic, Oil of
Grass-Oil
Gurjun Balsam
Lemon Oil
Menthol
Petroleum
Turpentine
Wintergreen, Oil of
Soap

All the typical waxes and oils are described in the general articles under these names. Paraffin, which is sometimes spoken of as "paraffin wax," is described in an article under its own name.

(*i*) *Gums and Resins:*

Gums
Resins
Amber
Ammoniac
Anime
Arabin
Copal
Bassora Gum
Bdellium
Catechu
Dragon's Blood
Gambir
Gamboge
Gum Arabic (under **Gums**)
Kino
Mucilage
Olibanum
Podophyllin
Rosin
Sandarac
Scammony

Camphor, which is sometimes spoken of as "gum camphor," is described under its own name. "British gum," a substitute for gum arabic, is described under DEXTRIN.

(*j*) *Explosives:*

The chemistry of EXPLOSIVES, both those employed for military purposes and in mining and other industries, represents a field in which the theoretical and technological advances have been extraordinary, and the new compounds that the chemist has invented have played their part in peace and war. In no department of chemistry have there been more interesting developments than in the theory of Explosives and the various groups into which modern Explosives are classified all present interesting theoretical considerations for the chemist.

Accordingly, the student interested in the history, classification and theory of Explosives, and wishing to learn of the various explosive mixtures, of the nitrates, of the chlorates and perchlorates, and compounds derived by nitro-substitution, and those compounds known as nitro-derivatives, as well as smokeless powders, nitroglycerin, fulminates and amides, should read the article on EXPLOSIVES, which not only discusses theory, but the growth of the industry in the United States and the use of Explosives in industry, such as for blasting and mining, and the regulations attending their transportation and stor-

age. Of course, the older forms of Explosives are discussed under gunpowder, while GUNCOTTON, NITRO-GLYCERIN and NITRO-CELLULOSE show the application of these substances to this branch of chemistry. *Dynamite* is typical of the articles on high power explosives, while the article on TRINITROTOLUENES describes one of the latest of the powerful military explosives.

An appropriate list for careful reading in this department would be as follows:

Dualine
Dynamite
Extralite
Explosives
Emmensite
Nitroglycerin
Guncotton
Gunpowder
Melinite
Lyddite
Magazine
Nitrocellulose
Pyroxylin
Stemming
Trinitrotoluenes

(*k*) *Waters:*

Water
Ice
Distilled Water
Aërated Waters
Carbonated or Acidulous Waters
Chalybeate Waters
Mineral Waters
Selters Water
Apollinaris Water

Many of the foregoing articles are concerned either with theory or with the nature and composition of various chemical elements or substances, apart from their uses in the arts, where the labors of modern research chemists have found wide and useful application. Accordingly, the following chapter on INDUSTRIAL CHEMISTRY will take up some of the more important substances and processes that enter into modern technology.

Chapter 19. Industrial Chemistry

HAVING mastered the underlying principles and more important facts of chemistry, such as the nature of the various elements, the conditions under which they exist and the laws under which they combine, and the most generally and commonly employed chemical substances, the reader interested in the practical applications of this vast field of theoretical science naturally will desire information as to the extent to which scientific chemistry figures in the arts, and some description of the various technological processes involved in wholesale production. Methods of manufacture representing theory reduced to practice often involve the results of the most refined research and scientific investigation, by which everyday materials are produced for general use and the benefit of mankind. Vast industries involving both inorganic and organic chemistry have been built up on the labors of the scientist, and as trade follows the flag so manufacturing prosperity follows and in large measure depends on the labors of the industrial chemist.

The reader of this department in THE NEW INTERNATIONAL ENCYCLOPÆDIA, who first has studied the leading articles of the last chapter, probably would be best served by taking up first the articles dealing with the various processes of industrial chemistry, noting especially how the methods of the factory differ from those of the laboratory.

Leading articles in this field would be:

Lixiviation
Evaporation
Distillation
Sublimation
Filter and Filtration
Filter Press
Bleaching
Calcining
Refrigeration
Roasting
Electro-Chemistry

FUEL.

Then, as heat plays an important part in all industry, chemical and other, a study of fuels would be next in order. Fundamentally and generally these are discussed in the article on FUEL. There are articles on the various solid and liquid fuels to which reference should be made for the important by-products involved, as in the case of the coal-tar colors, ammonia, hydrocarbons and other substances from the coal gas plants and coke ovens. These represent quite an important field of chemistry. Therefore, it may be suggested that the articles be taken up as follows:

Solid Fuels:

Charcoal
Coal
Anthracite
Bituminous Coal
Tar
Lignite
Coal Tar
Coke
Peat

Liquid Fuels:

Alcohol

Petroleum
Kerosene
Oil

Gaseous Fuels:

Gas, Illuminating and Fuel
Acetylene
Calcium Carbide
Gas Engine
Internal Combustion Engine
Motor Vehicle

WATER.

The Industrial Chemist after fuel is next concerned with Water. It may be hard or soft, saline or alkaline, suitable or unsuitable for use in a boiler, or having special properties making it desirable in the manufacture of such beverages as beer and ale. Its purification may require a wide range of special processes ranging from chlorination to distillation. Accordingly, a suitable line of reading would be somewhat as follows:

Water
Water Supply
Water Purification
Water Works
Distillation
Filter and Filtration
Boiler
Boiling Point
Mineral Waters
Bottling

COMMON CHEMICALS.

In Industrial Chemistry there are a number of rather common chemicals, but with a vast economic importance, for they enter so largely into manufacturing that they are always in constant demand and use. A few of these groups may be studied at some length. Thus—Sulphur, whose mining, extraction and purification are all problems in chemical engineering, has a number of important compounds. of which the best known industrially are found in the accompanying list:

Sulphur
Sulphureted Hydrogen
Sulphuric Acid
Sulphurous Acid
Thiosulphuric Acid

Found widely in nature, SALT is an important substance and common salt or Sodium Chloride is used not only for food, but in the manufacture of Soda Ash, Sodium Carbonate, and other substances. Consequently, the articles

Sodium
Salt
Soda

should be read, it being noted that under these a number of Sodium compounds are treated.

The Chlorine industry involves the preparation of substances used extensively in the arts as a bleaching or oxidizing agent, and the liquid chlorine in addition has been employed extensively as an asphyxiant in the great European War. See:

Chlorine
Chloric Acid
Chlorites
Chlorimetry
Hydrochloric Acid
Hypochlorous Acid
Sal Ammoniac
Mercuric Chloride
Mercurous Chloride
Bleaching Powder
Chloridizing
Chlorination

The various compounds of calcium supply to the arts a large number of important materials, including MARBLE and other BUILDING STONES, LIMESTONE for iron and lead smelting, GYPSUM or PLASTER OF PARIS (Lime Sulphate), CEMENT, in which Lime is the principal ingredient, BLEACHING POWDER or CHLORIDE OF LIME, MORTAR, in which Lime enters largely, and so on through an extensive list. In practically all of these purposes there is work for the industrial chemist, whether it involves the calcining of the material in a kiln to form cement or the study of concrete, now used so largely for structural work. Consequently, the reader who follows through the various articles on Calcium and its compounds as given below will realize their industrial importance:

Lime
Limestone
Marble
Building Stone
Marl
Chalk
Calcite
Iceland Spar
Gypsum (Lime Sulphate)
Bleaching Powder (Lime Chloride)
Cement
Kiln
Mortar
Concrete
Masonry
Plaster of Paris
Plaster, Lathing and Plastering
Calcium Carbide
Fertilizers
Manures and Manuring
Iron and Steel, Metallurgy of

The Destructive Distillation of wood affords a number of important products, among which is acetic acid, largely used in the manufacture of acetates. There are also a number of other or related substances, so that if we examine a rather broad group we find a number of valuable materials included. These may be embraced in the following list:

Distillation
Acetic Acid
Acetine
Methyl Alcohol
Tar

The Destructive Distillation and other treatment of bones also affords useful chemical products. The use of bone products as fertilizers, the employment of bone black as a decolorizing agent in filtration, as in sugar refining, are specially important. The connection tissue in skin and bones is used in making gelatine, and the bones themselves are employed in making glue. Accordingly, if the articles enumerated below be consulted a substantial idea of this field of chemical technology will be gained:

Bone
Bone Black
Bone Fertilizers
Gelatin
Glue

The industrial chemist has important work in connection with the manufacture of various artificial fertilizers which modern intensive agriculture demands. Naturally, this branch is closely connected with scientific agriculture and agricultural chemistry. Consequently, one will find in the accompanying list of articles much that will indicate how the chemist is assist-

ing the processes of nature. Such articles would be:

Manures and Manuring
Bone Fertilizers
Peat
Ashes
Phosphate
Potash
Kelp
Cyanamid

INORGANIC INDUSTRIES.

In Industrial Chemistry the great division of inorganic and organic chemistry can be observed in considering the products of various industries. A certain number containing various groups have been entered specifically on these lists, but the main topics involved can be indicated together and then the reader can pursue his investigations further, depending both on the list in this Guide and on the elaborate cross references given with the articles. Under Inorganic Chemistry reference profitably can be made to the following main and more prominent articles:

Sulphur
Sulphuric Acid
Salt
Hydrochloric Acid
Soda
Sodium
Chlorine
Nitric Acid
Ammonia
Potash
Bromide
Iodine
Phosphorous
Boric Acid
Arsenic
Oxygen
Peroxides
Sulphates
Alum
Cyanides
Carbon
Carbon Disulphide
Carbon Monoxide

MINERAL COLORS.

An important series of industries in Inorganic Chemistry involve the manufacture of pigments. The various chemicals entering into the more important of the pigments are discussed largely under MINERAL COLORS and separately as follows:

White:
White Lead
White Chalk
Lithopone
Gypsum
China Clay

Blue:
Ultramarine
Smaltite
Copper Indigo

Green:
Ultramarine
Brunswick Green
Chrome Green
Malachite Green
Verdigris
Paris Green

Yellow:
Chrome Yellows
Cadmium
Litharge
Gamboge
Indian Yellow or Purree

Orange:
Chrome Orange

Red:

- Red Lead
- Chrome Red
- Red Ochre
- Vermilion
- Realgar
- Antimony Red
- Carmine

Brown:

- Umber
- Sepia

Black:

- Lampblack
- Bone Black
- Charcoal
- Graphite

ORGANIC INDUSTRIES.

Industrial Chemistry is so closely connected with manufacturing and manufacturing processes that in any classification such as could be observed in an encyclopædia, it is very difficult to draw any satisfactory line of demarkation. Particularly is this the case in the large number of industries where organic chemistry plays an important part and underlies the various processes of manufacture.

Accordingly, the reader should refer to the chapter on MANUFACTURES AND ENGINEERING, where, under these various industries and products often the chemical technology is discussed. Such a list of organic industries would be as follows:

- Distillation
- Gas, Illuminating and Fuel
- Coal Tar
- Coal-Tar Colors
- Mineral Oils
- Petroleum
- Waxes
- Fats
- Oils
- Soap
- Candle
- Glycerine
- Gums
- Resins
- Starch
- Dextrin
- Glucose
- Sugar
- Fermentation
- Distilled Liquors
- Beer
- Brewing
- Explosives
- Fibres
- Dyeing
- Paper
- Leather
- Glue

MINERAL OILS.

The preparation and refining of Mineral Oils has produced a wealth of materials aside from the fuel oils proper, and one interested in this field after reading the comprehensive discussion on PETROLEUM will turn to other articles dealing with allied topics, as contained in the accompanying list:

- Petroleum
- Naphtha
- Paraffin
- Petrolatum
- Vaseline
- Shale Oil
- Ozokerite
- Mineral Tallow
- Asphalt

Chapter 20. Home Economics and Domestic Science

IT is but natural that the modern tendency to secure increased efficiency and, consequently, increased comfort and convenience should be manifested in the home through the application of scientific management and devices no less than in commerce and industry. In its latest aspects this finds full expression in the NEW INTERNATIONAL ENCYCLOPÆDIA. Modern science has done much for the housekeeper, securing more nourishing and more economical foods, as well as as various labor-saving devices—such as SEWING MACHINES and VACUUM CLEANERS—that materially cut down the effort necessary to maintain and operate a domestic establishment. This concerns the small as well as the large householder, for electric light, gas heating and plumbing are all but universally found, and economic methods have been devised for the small city apartment or the isolated farm whereby the maximum well-being, comfort and economies generally can be obtained.

Modern *home economics* is not concerned alone with Food and its Preparation. The intelligent woman of to-day, managing a home, often arranges for its building, for the carpentry, heating, plumbing, wall paper, furniture and carpets and rugs, or for its lease if a rented dwelling, or a portion of an apartment house or hotel. If sufficiently large, the dwelling may involve electric heating, including electric cooking, vacuum cleaners or laundry machines, and in many of the modern homes may involve an organization as complex as a small business, and this involves a number of employees—male and female—to whom the principles of Master and Servant must apply. In a large part, however, Domestic Science has to do with food and its preparation, for it is here that the chemistry of nutrition has been brought to bear, and the wholesome and economical preparation of food is one of the main objects of the modern science of Household Chemistry.

Considering, therefore, the articles already suggested and others arranged in a convenient list for ready reference, we should have first the following, dealing with the home and its material equipment:

House
Apartment House
Tenement House
Hotel
Building
Carpentry
Heating and Ventilation
Plumbing
Electric Heater
Electric Lighting
Lighting
Illumination
Vacuum Cleaner
Water Supply
Filter and Filtration
Laundry Machinery
Sewage Disposal

On the legal side, the householder should know something of the law dealing with such subjects as:

Deed

Title
Lease
Master and Servant

Supplied with a proper house and concerned with its management or with the management of an institution where features of home life and home conveniences must apply, one would be concerned with the articles on

Home Economics
Management, Home and Institution
Coöperation
Marketing Associations, Agricultural

It is, however, on food and food supply that intelligent interest centers, for it is here that the high cost of living first makes itself apparent, not to mention that the appetite may prove the shortest road to a man's well being if not to his mind. One concerned with modern scientific food studies realizes that chemistry and physiology figure actively, so that a range of articles are available that are indeed comprehensive.

Food
Fish as Food
Diet
Digestion
Nutrition
Infants, Feeding of
Cookery
Baking
Baking Powder
Fireless Cooker
Food Preservation
Sterilized Food
Packing Industry
Slaughterhouse
Adulteration
Pure-Food Law

Prepared by the preceding rather general articles on Foods and Food-Stuff, the reader in this department will be ready to take up specifically a number of classes of Foods, or, in some cases, definite food substances. Such a list would include the grains and their products:

Barley
Buckwheat
Rye
Wheat
Maize
Rice
Flour
Bread

There would also be such important foods as

Milk
Cream
Butter
Butter Color
Butter Making
Oleomargarine
Cheese
Eggs
Meat
Meat Extract
Nuts
Fruits
Vegetables

Chapter 21. Interior Decoration and Decorative Art

WITHIN a few years there has developed in connection with, yet at the same time apart from, architecture and the fine arts increased interest in those æsthetic forms of expression that are found in the home or dwelling. While always recognized on its artistic side, home decoration has now become a practical art requiring systematic training on the part of those by whom it is practised, and having secured for itself general public recognition as distinct from architecture or mere trade activity in the supply of the articles necessary for the home.

With the growth of civilization the decoration of the home, be it a hut, cave, cottage, or palace, has always appealed directly to its owner or occupants, and their taste has found expression in combining beauty with utility. As a result there is to be seen decorative activity ranging from a most humble scale to securing the work of the greatest artists of the period for ornamental purposes. It is only recently that the proper and most advantageous uses of articles of decorative value have been recognized, and with the growth of luxury and comfort there has been, on the whole, a corresponding growth in good taste. In large part, this has been due either to artist, craftsmen of rare talents or to those who have studied the various æsthetic elements involved in house decoration, recognizing the cardinal principle that a home is designed for habitability. From such study encouraged by museums and collections there has grown up a school of decorative art known as interior decoration, which aims to cultivate public taste to appreciate the artistic and to make the home conform to the accepted canons of good taste, where the work not only of artists but of skilful craftsmen and artisans will be appreciated.

This movement involves both a general manifestation of progressively better taste and the activities of those trained professionally in schools of fine arts or design to practice the art of interior decoration and to advise persons who need such assistance. Just as the ordinary person requires the service of an architect to design or remodel a house or apartment, so when its decoration and furnishing are involved there is no less a call for the services of a trained interior decorator, rather than a mere painter, upholsterer or tradesman. To this profession many women, as well as men, are now devoting themselves with marked success, and to learn of their training and their work one can turn to the article on INTERIOR DECORATION. Here will be found, also, a broad view of the development and scope of the modern art, and if read in connection with the more formal article on DECORATIVE ART, with attention also to ORNAMENT and ARCHITECTURE, a good idea will be gained of the modern status of this important field. Naturally, there are subsidiary to it a number of subordinate articles—thus, FURNITURE is an important part of Interior Decoration, and in its development may be traced the

general progress of the beautiful with the practical, though retrogression in taste unquestionably is to be noted with the increase of mechanical facility in production and otherwise. Likewise, in CARPETS and RUGS decorative impulse finds expression, and floor coverings represent a wide diversity of artistic ideas, depending upon their service, from the hand looms of the Orient to the modern carpet factory. Again, in the decoration of the surfaces of walls from the older tapestries to the WALL PAPER of the day, a distinct artistic development is represented. In TEXTILE PRINTING also modern art has brought about a wide range of decorative material for the modest householder.

Therefore, with the citation of such main titles, a consideration of a somewhat fuller list will show the interrelation of the articles in this and allied departments, and how advantageously they fit into a comprehensive reading scheme. The list might be taken up in the following order:

Interior Decoration
Decorative Art
Ornament
Architecture
Mural Decoration
Painting
Sculpture
Illumination
Furniture
Chippendale Chairs
Chippendale, Thomas
Hepplewhite, George
Sheraton, Thomas
Boulle
Veneer
Wall Paper
Paper Hanging
Textile Printing
Tapestry
Gobelin
Carpet
Rug
Lamp
Lacquer Work
Pottery
Armor
Metal Work

Chapter 22. Geology

GEOLOGY covers a broad field. Its primary object is to explain the origin and development of the earth and the inhabiting life forms. It is concerned thus on the one side with inorganic nature—the character of the materials which constitute the earth's structure, the formation and classification of rocks, the forces of uplift that have produced mountains and continental lands, the agencies that work to modify surface features, the phenomena of earthquakes and volcanoes, and all processes of change operative from the beginning; in another aspect it is allied to the biologic sciences for which it endeavors to find an explanation for the present distribution of plants and animals in the evidences afforded by fossils which have been preserved in the superficial layers of the earth.

Because of its wide scope, geological science has been separated into a number of departments, each with its distinct formations, but none the less closely related to all the others. Of fundamental importance is Petrology, the branch which considers the nature of rocks and the methods of their origin. This branch is one of the last to have attained a real scientific basis. The arrangement of the rocks as they appear at the surface—often quite different from their original attitudes—and the significance of the arrangement in relation to past events, constitute the subject matter of Structural Geology. The great changes which have taken place and are still in progress belong to the field of Dynamical Geology, which considers the action of the atmosphere, water, igneous activity and crustal strains in modifying the earth's features. Its study is essential to the proper understanding of physical geography, particularly the modern development of that subject known as physiography. Consequently the references to physiographic articles will be included under its head. Stratigraphical Geology has for its particular province the investigations of the order and chronological classification of the strata and the study of the geography of the earth in past ages. It has a valuable adjunct in Paleontology, which is the study of fossils and their interpretation in the light of evolution. Geology has many practical bearings, and its application to mining, agriculture and engineering is considered under the head of Economic Geology.

We shall now guide the reader to the articles relating to those several divisions of the subject. For the general article, see GEOLOGY.

A. Petrology

For the more comprehensive articles in this field, see:

Petrology
Mineralogy
Crystallography
Rock

The various large groups or classes of rocks are described under the following titles:

Igneous Rocks
Aqueous Rocks
Æolian Accumulations
Clastic Rocks
Plutonic Rocks
Metamorphic Rocks
Crystalline Rocks
Arenaceous Rocks
Argillaceous Rocks
Calcareous Rocks

For the more important specific kinds of rocks, see:

1. Igneous (Massive) Rocks:

Granite
Rhyolite
Porphyry
Syenite
Trachyte
Phonolite
Diorite
Dacite
Felsite
Gabbro
Pyroxenite
Hornblendite
Peridotite
Diabase
Basalt
Melaphyre
Felsite
Trap
Obsidian
Pitchstone
Lava
Tuff

2. Sedimentary (Stratified) Rocks.

(*a*) *Mechanical Sediments:*
Sand
Gravel
Sandstone
Conglomerate
Breccia
Clay
Shale
Silt
Loess
Boulder Clay
Drift

(*b*) *Chemical Sediments:*
Limestone
Dolomite
Travertine
Gypsum
Salt
Geyserite
Bog-Iron Ore
Clay Ironstone

(*c*) *Organic Sediments:*
Limestone
Coquina
Chalk
Coral
Marl
Diatomaceous Earth
Phosphate Rock
Peat
Lignite
Coal

3. Metamorphic (Foliated) Rocks:

Marble
Quartzite
Slate
Schist
Gneiss
Amphibolite
Mica Schist
Eclogite
Serpentine
Talc
Soapstone
Chlorite Schist

B. Structural Geology

The broader features of geological structure are described in the articles:

Bed
Formation
Conformity
Unconformity
Laccolite
Batholite
Boss
Dike
Sill
Veins

The smaller elements of structure which pertain to the above larger forms are explained in the articles:

Joints
Foliation
Lamination
Schistosity
Stratification

The effects of uplift and disturbance upon rocks are described in the articles:

Continent
Mountain
Anticline
Syncline
Monocline
Dip
Strike
Fault
Clinometer

C. Dynamic Geology and Physiography

The general subject of dynamic agencies operative within the earth is discussed in the articles:

Crust of the Earth
Elevation and Subsidence
Metamorphism
Cataclysm
Volcano
Earthquake
Geyser
Refrigeration of the Earth

For the evolution of the topography of the earth's surface, see:

Physiography
Erosion
Continent
Island
River
Valley
Plateau
Lake
Glacier
Glacial Period

D. Stratigraphical Geology

The rocks composing the outer solid structure of the earth are separated according to their position and relative age into large divisions which are designated as groups. Each group represents a long interval of time or era during which the strata were accumulated. The different groups and

their corresponding eras are described under:

Archeozoic Era
Proterozoic Era
Paleozoic
Mesozoic Era
Cenozoic

These main divisions are further subdivided into systems, or, according to the time element, into periods. The several systems are described in the following articles:

1. *Archeozoic and Proterozoic:*

Pre-Cambrian Formations

2. *Paleozoic:*

Cambrian System
Ordovician
Silurian System
Devonian System
Carboniferous System
Permian System

3. *Mesozoic:*

Triassic System
Jurassic System
Cretaceous System

4. *Cenozoic:*

Tertiary System
Quaternary System

The broader scheme of classification as outlined above is of general application. Further subdivision becomes necessary in the study of particular areas, for the individual strata change in character and often in fossil content, as they are traced from place to place. To identify the minor units, geologists usually employ local names which have currency only within a single country or among such countries as have very similar stratiographic development. Some of the more important minor divisions in the United States are described in the articles:

Pre-Cambrian:

Keweenawan Series

Cambrian:

Potsdam Sandstone

Ordovician:

Calciferous
Trenton
Hudson River Beds

Silurian:

Medina Series
Clinton Stage
Niagara Series
Salina Stage

Devonian:

Oriskany
Lower Helderberg
Chemung Formation
Catskill Formation

Carboniferous:

Millstone Grit
Pottsville Conglomerate
Burlington Limestone

Triassic:

Newark Series

Jurassic:

Liassic
Oolite

Cretaceous:

Potomac Formation
Dakota Stage
Niobrara Stage
Laramie Stage

Tertiary:

Eocene Epoch
Oligocene Epoch
Miocene Epoch
Pliocene Epoch

Quaternary:

Columbia Series
Drift
Glacial Period
Recent Period

E. Paleontological Geology

Paleontology is the study of the nature and distribution of the life forms imbedded in the rocks of the earth's crust. Viewed from the standpoint of biological science, it is a part of zoology and botany; but it is so intimately connected with the study of the rocks themselves that it may properly be considered a part of geology. The general articles on the subject are:

Paleontology
Paleobotany
Fossil
Fossiliferous Rocks
Contemporaneity
Homotaxy
Ichnology
Fossil Forests

From a biological point of view, the proper method of classifying fossil forms would naturally follow the same principles that guide the classification of living plants and animals. But in studying paleontology as a part of geology, the geological classification is preferable; indeed, the two systems would, to a certain extent, coincide. We shall, therefore, refer the reader to the characteristic fossils of each geological epoch. Most of the larger classes and orders of fossil forms are still represented by living species, and general discussions of these classes will be found in the articles given in the chapters on Botany and Zoology.

1. The only fossils found in the Pre-Cambrian Formation are described in the article ANTIKOKANIA:

2. CAMBRIAN FOSSILS:

(*a*) *Plants:*
Oldhamia

(*b*) *Animals:*
Protospongia
Dictyonema
Agnostus
Paradoxides
Dikellocephalus
Olenellus
Trilobita
Lingula
Obolella
Hyolithes
Nautiloidea

3. ORDOVICIAN AND SILURIAN FOSSILS:

(*a*) *Invertebrates:*
Brachiospongia
Stromatopore
Graptolite
Monograptus
Favosites
Olenus
Chonetes
Asaphus
Polyzoa

Fenestella
Atrypa
Orthis
Spirifer
Pentamerus
Bellerophon
Pteropoda
Orthoceras
Tentaculites
Eurypterus

(*b*) *Fishes:*
Pteraspis
Cyathaspis

4. Devonian Fossils:

(*a*) *Invertebrates:*
Atrypa
Cyathophyllum
Phacops
Ammonoidea
Pleurotomaria
Murchisonia
Clymenia
Goniatites
Bactrites
Heliophyllum

(*b*) *Fishes:*
Holoptychius
Osteolepis
Dipterus
Coccosteus
Dinichthys
Cephalaspis
Chirolepis

5. Carboniferous Fossils:

(*a*) *Plants:*
Neuropteris
Calamites
Asterophyllites
Annularia
Lepidodendron
Sigillaria
Stigmaria
Cordaites
Carpolith
Trigonocarpus

(*b*) *Invertebrates:*
Fusulina
Chonetes
Productus
Proetus
Eurypterus

(*c*) *Fishes:*
Megalichthys
Cestraciont

(*d*) *Reptiles:*
Stegocephalia

6. Permian Fossils:

(*a*) *Fishes:*
Palæoniscus

(*b*) *Reptiles:*
Rhynchocephalia

7. Triassic Fossils:

(*a*) *Plants:*
Equisetum
Cycadaceæ

(*b*) *Invertebrates:*
Terebratula
Ceratites
Ammonites

(*c*) *Reptiles:*
Mastodonsaurus
Theromorpha
Dinosauria
Anchisaurus
Labyrinthodon
Dicynodon

(*d*) *Mammals:*
Microlestes
Microconodon

8. Jurassic Fossils:
(*a*) *Invertebrates:*
Gryphæa
Trigonia
Belemnites

(*b*) *Fishes:*
Chondrosteus
Hybodus

(*c*) *Reptiles:*
Teleosaurus
Ichthyosaurus
Plesiosaurus
Pterodactyl
Dimorphodon
Diplodocus
Megalosaurus
Brontosaurus
Stegosaurus
Titanosaurus
Cynognathus
Baptanodon
Camptosaurus
Ceratosaurus

(*d*) *Birds:*
Archæopteryx

(*e*) *Mammals:*
Ctenacodon

9. Cretaceous Fossils:
(*a*) *Invertebrates:*
Foraminifera
Globigerina
Ventriculites
Hippurites
Radiolites
Inoceramus

(*b*) *Reptiles:*
Chelonia
Iguanodon
Mosasauria
Elasmosaurus
Hadrosaurus

(*c*) *Birds:*
Bird, Fossil
Hesperornis
Ichthyornis

10. Eocene Fossils:
(*a*) *Invertebrates:*
Nummulites

(*b*) *Reptiles:*
Zeuglodon

(*c*) *Mammals:*
Coryphodon
Hyracotherium
Horse, Fossil
Palæotherium
Anchitherium
Anoplotherium
Lophiodon
Creodonta

11. Miocene Fossils:
(*a*) *Mammals:*
Mastodon
Dinotherium
Helladotherium
Machærodus
Elotherium
Halitherium
Hyracodon
Oreodon
Titanotherium

12. Pliocene Fossils:

(*a*) *Plant:*
Dæmonelix

(*b*) *Mammals:*
Sivatherium

Hipparion
Sabre-Toothed Tiger

13. Quaternary Fossils:

(*a*) *Birds:*
Æpyornis
Moa

(*b*) *Mammals:*
Elasmotherium
Megatherium
Glyptodon
Diprotodon
Mammoth
Mastodon
Pithecanthropus

F. Economic Geology

This department considers the application of geological facts and principles to industry and technology. The service of geology to mining is especially important and has been recognized very generally by the organization of public surveys to furnish information about the occurrence and distribution of the mineral resources. With this function is usually combined the study of underground waters, a branch that has gained prominence quite recently through the development of the arid tracts of the western United States. Geology also affords useful guidance in the conduct of engineering construction, and of course is the basis for the investigation of the formation and distribution of soils.

The mineral materials that find employment in the arts or industry are of great variety and exhibit wide differences in their methods of occurrence. Some are used in the form in which they exist in nature, or require only a mechanical process of purification or preparation. Such are exemplified by building stones and coal. A large class of minerals, however, have no value in their natural state, but contain valuable elements that can only be released by some metallurgical or chemical treatment. They are illustrated by the compounds containing metals, which in their natural state are called ores. The mode of occurrence of the ores, as well as of the non-metalliferous minerals, is the proper field of study of Economic Geology, while the methods employed in their production belong to Mining and Metallurgy.

I. The forms and occurrence of the larger rock masses have already been referred to under Petrology and Structural Geology. The other non-metallic substances will be described in the articles on each specific substance. It is, therefore, only necessary to give as introductory articles those descriptive of the occurrence of the ores. See:

Ore
Ore Deposits
Gangue
Footwall
Hanging Wall
Pinch
Dike
Vein
Lode

II. The Metalliferous Ores:

1. *Iron Ores:*
Limonite
Hematite
Magnetite

Siderite
Franklinite
Bog-Iron Ore
Blackband Ironstone
Pyrite
Pea Ore

2. *Gold Ores:*
Gold
Calaverite
Hessite

3. *Platinum*

4. *Silver Ores:*
Silver
Argentite
Pyrargyrite
Cerargyrite
Proustite
Stephanite

5. *Copper Ores:*
Chalcopyrite
Cuprite
Malachite

6. *Lead Ores:*
Galena
Anglesite
Cerusite
Pyromorphite

7. *Zinc Ores:*
Blende
Willemite
Zincite
Franklinite
Smithsonite
Calamine

8. *Mercury Ores:*
Cinnabar
Calomel

9. *Manganese Ores:*
Pyrolusite
Manganite
Psilomelane

10. *Aluminum Ores:*
Cryolite
Gibbsite
Bauxite

11. *Tin Ore:*
Cassiterite

12. *Nickel Ores:*
Millerite
Pyrrhotite

13. *Antimony Ore:*
Stibnite

III. The Carbon Minerals:

1. Coal
Anthracite
Bituminous Coal
Jet
Lignite
Torbanite
Peat

2. Petroleum
Gas, Natural

3. Asphalt
Bitumen
Albertite
Grahamite
Gilsonite
Maltha

4. Ozocerite
Asphaltic Coal
Mineral Tallow

5. Graphite

IV. Building Materials:

Building Stone
Granite
Sandstone

Limestone
Freestone
Marble
Onyx Marble
Flagstone
Caithness Flagstone
Slate
Bath Stone
Caen Stone
Brownstone
Puzzuolana

V. Soils, Clays, Fertilizers, and Waters:

1. Humus
   Soil
   Loam
   Loess
2. Clay
   Potters' Clay
   Fire Clay
   Pipe Clay
   Brick Clay
   Kaolin
3. Gypsum
   Apatite
   Phosphorite
   Marl
   Guano
4. Mineral Waters
   Spring
   Artesian Wells

VI. Salts:

Salt
Bay Salt
Borax
Bromine
Iodine

VII. Precious Stones:

Diamond
Corundum
Quartz
Emerald
Ruby
Beryl
Chrysoberyl
Sapphire
Aquamarine
Tourmaline
Spodumene
Amethyst
Opal
Alabaster
Chalcedony
Carnelian
Sardonyx
Aragonite
Agate
Jasper
Chrysolite
Turquoise
Topaz
Garnet
Rhodonite
Chrysocolla
Catlinite
Benitoite
Smithsonite

VIII. Abrasives:

Abrasives
Diamond
Grindstone
Buhrstone
Oil-Stone
Novaculite
Emery
Corundum
Carborundum
Garnet
Diatomaceous Earth
Tripolite
Pumice

IX. Pigments:
- Mineral Paints
- Graphite
- Ochre
- Umber
- Burnt Sienna
- Chalk
- Hematite
- Slate

X. Minerals Used in Various Arts:
- Lithographic Stone
- Solenhofen Lithographic Stone
- Talc
- Soapstone
- Mica
- Feldspar
- Fluorite
- Sulphur
- Asbestic
- Asbestos
- Magnesite
- Fuller's Earth
- Monazite

G. Biographies of Eminent Geologists

Barrande, J.
Beyrich, H. E. B.
Bishop, K. G.
Brongniart, A.
Buch, L. von

Chapter 23. Meteorology

METEOROLOGY is the study of the atmosphere, its static conditions and appearances, and the changes and movements of all kinds which take place in it. The two principal constituents of the atmosphere are the air and the moisture in various forms which the air holds in suspension. Weather and climate are principally determined by the conditions under which these two constituents exist, at any particular time or habitually. The static conditions of the air which mainly affect the weather are its temperature and its pressure; its movements come under the general term wind. The moisture of the atmosphere, unlike the bulk of the air, is continually changing its identity. It is raised from surface waters by evaporation, held for a time in suspension under various forms, and then returned to the earth's surface by various modes of precipitation.

Besides these two sets of phenomena, the electrical conditions of the atmosphere form an important element of the weather. Other causes sometimes bring about peculiar or unusual weather conditions, and, aside from weather in its strict sense, meteorology takes cognizance of the peculiar optical appearances which the atmosphere presents. These considerations, together with the fact that the practical aspects and practical rather than theoretical investigations hold, perhaps, a more prominent place in meteorology than in other natural sciences, serve to indicate the main divisions of the subject. A considerable number of instruments are used in meteorological investigations, and the articles describing these will be referred to in connection with the appropriate subdivision.

I. General Principles of the Science. See:

Meteorology
Atmosphere
Polarization of Sky Light
Dust
Climate
Weather

II. Temperature and Pressure.

1. The theory and investigation of temperature and its causes are treated under:

Temperature, Terrestrial
Cold Wave
Frost
Snow Line
Actinometry
Thermometry
Seasons

2. The instruments used in measuring temperature and radiation are described under:

Thermometer
Actinometer
Actinograph
Radiometer
Pyrheliometer

3. For atmospheric pressure and the instruments used in measuring it, see:

Barometer

III. Winds.

1. There are certain general forms of wind movements recognized without reference to localities. See:

Wind
Storm
Whirlwind

Tornado
Waterspout
Gale

2. On the other hand, in certain parts of the world peculiar local conditions produce winds which have received local names. See:

Doldrums
Calm Latitudes
Blizzard
Chinook
Etesian Winds
Harmattan
Hurricane
Mistral
Sirocco
Monsoon
Simoom
Equinoctial Storm

3. For the instruments and methods used in measuring or observing the winds, see:

Anemometer
Anemograph
Anemoscope
Beaufort Scale

IV. Evaporation and Precipitation.

1. See the general article:

Evaporation

2. The various forms in which moisture is held suspended are described under:

Humidity
Haze
Fog
Cloud

3. For the various forms of precipitation, see:

Dew
Hoar Frost (under Frost)
Rain
Cloudburst
Snow
Hail

4. For the instruments used in measuring or observing the moisture of the atmosphere, see:

Hygrometer
Drosometer
Nephoscope
Rain Gauge

V. Electrical Conditions Affecting the Weather. See:

Atmospheric Electricity
Lightning
Lightning, Accidents from
Lightning, Protection from

VI. Peculiar or Unusual Weather Conditions are Described in the Articles:

Dust
Dark Day
Black Rain
Blood-Rain
Indian Summer

VII. Other Phenomena of the Atmosphere Belong Mainly to Optical Appearances or Electrical Displays. See:

Rainbow
Fog-Bow
Halo
Scintillation
Mirage
Fata Morgana
Aurora Borealis
Elmo's Fire, Saint
Castor and Pollux

VIII. Practical Investigations in Meteorology are Generally Conducted by Government Bureaus. See:

Weather Bureau
Signal Corps, U. S. Army

These bureaus warn the public by a system of signals. See:

Storm and Weather Signals

And in this connection also:

Fog Signals

They also issue daily weather maps. See:

Isothermal Lines
Isobarometric Lines
Isograms
Isabnormal Lines
Isanomalous Lines

IX. For Biographies of the Most Prominent Meteorologists, see:

Abbe, Cleveland
Espy, James Pollard
Fonvielle, Wilfrid de
Maury, M. F.
Pernter, J. M.
Wild, H.

Chapter 24. Geography

GEOGRAPHY is the description of the surface of the earth in all its aspects. Just as the place where the atmosphere is where the lithosphere meets the hydrosphere, so do the sciences of METEOROLOGY and GEOLOGY meet in that of GEOGRAPHY, and the last to a certain extent encroaches upon the fields of the other two. The subject is very wide, covering a regional study of the upper layers of the earth's crust, a regional study of the atmosphere, or the climatic conditions prevailing on the various parts of the surface. Thus, in the consideration of any region on the earth, we should study the character of the land configurations, the bodies of water (rivers, lakes, seas, etc.) and their influences, the flora and fauna and their relationship to the other physical features, and, finally, the human inhabitants, their character and activities. Of course, we should also consider region as a whole and its relationship to other parts of the earth.

The whole subject may be broadly divided into three main branches: Mathematical Geography, which deals with the form, dimensions, and position of the earth, and the methods of its delineation; Physical Geography, which is a general discussion of the various natural features of the earth's surface, and Political, Regional, or Descriptive Geography, which gives detailed and specific descriptions of the separate parts of the earth's surface, generally as its human inhabitants have divided it among themselves, all their varied activities, and all the artificial changes which they have made, and the structures which they have built.

A. Mathematical Geography

I. GENERAL. See:

- Earth
- Pole
- Equator, Terrestrial
- Meridian
- Latitude and Longitude
- Degree of Latitude
- Degree of Longitude
- Tropics
- Geography
- Zone

II. METHODS OF DELINEATION. See:

- Map
- Chart
- Globe
- Coast and Geodetic Survey
- Geodesy
- Surveying

III. TERRESTRIAL MAGNETISM. See:

- Magnetism, Terrestrial
- Declination
- Dip
- Isoclinic
- Isogonic Lines
- Isodynamic Lines
- Compass
- Theodolite
- Sextant

B. Physical Geography

Under this head will be given the articles dealing with geographical features that are due to various geological or climatic causes. The articles on the causes themselves are referred to under Geology and Meteorology. At the end of each subdivision are given the articles on the most remarkable examples of the features discussed. In connection with this section the departments of Zoölogy and Botany should also be consulted.

I. General Article. See:
- Physiography

II. Oceanography:
- Oceanography
- Ocean
- Deep-Sea Exploration
- Sounding
- Abysmal Accumulations
- Oceanic Deposits
- Ocean Currents
- Tides
- Bore
- Channel
- Shore
- Gulf Stream
- Atlantic Ocean
- Pacific Ocean
- Indian Ocean

III. General Land Forms:
- Aiguille
- Archipelago
- Butte
- Cordillera
- Continent
- Island
- Isthmus
- Mountain
- Valley
- Plateau
- Sierra
- Basin
- North America
- Australia
- Himalaya
- Malay Archipelago
- Panama, Isthmus of
- Sierra Nevada

IV. Hydrography:
- Hydrography
- Bayou
- Bog
- River
- Divide
- Waterfall
- Inundation
- Flood Plain
- Delta
- Reef
- Bar
- Lake
- Floating Island
- Mississippi River
- Amazon River
- Nile
- Great Lakes

V. Geographical Features Due to Movements of the Earth's Crust:
- Beaches, Raised
- Earthquake
- Estuary
- Fiord
- Coastal Plain
- Great Rift Valley

VI. Features Due to Volcanic Action:
- Volcano
- Crater

Geyser
Dike
Laccolote
Vesuvius
Etna (Ætna)
Krakatoa
Pelée, Mont
Hecla
Mauna Loa
Kilauea
Soufrière, La
Popocatepetl
Yellowstone National Park
Palisades
Giant's Causeway
Staffa

VII. Features Due to Erosion:
Erosion
Piedmont Plain
Bad Lands
Cliff
Talus
River Terraces (under Terrace)
Cañon
Mesa
Sink Hole
Cave
Karst
Delaware Water Gap
Colorado River
Niagara River and Falls
Victoria Falls
Mammoth Cave
Luray Cave
Natural Bridge
Yosemite Valley

VIII. Features Due to Glacial Action:
Glacier
Moraine
Iceberg (under Ice)
Avalanche
Drumlin
Eskers
Giants' Kettles
Rocking Stones
Mer de Glace
Gorner Glacier

IX. Features Due to Wind Action:
Dune
Medano
Musical Sand

X. Features Due to Peculiar Soil or Climatic Conditions:
Desert
Oasis
Prairie
Savannas
Steppe
Tundra
Downs
Llanos
Pampas
Karroo
Sahara
Gobi

XI. Features Due to the Action of Animals:
Coral Island
Atoll
Barrier Reef

C. Political or Regional Geography

This is by far the most important part of geographical study, and, taken as a whole, is probably the largest and most valuable department of the New International Encyclopædia. Lack of space makes it impracticable to enumerate all of the important articles in the work connected with a study of Political Geography. The next best thing would be an outline of geograph-

ical history and knowledge, which would of itself suggest further fields of investigation.

The earliest geographic knowledge dates back to about 600 B. C. Hecataeus was one of the first cartographers, and at about 500 B. C. made a map of the world as known then, showing the existence of two continents. Herodotus distinguished three continents, Aristotle demonstrated that the world was round, and Eratosthenes computed the length of the earth's circumference to be 25,000 miles. Ptolemy extended the knowledge of the world by a vast amount and drew maps that were used by Columbus over thirteen centuries later.

In the line of exploration, the Phœnicians were the first nation of discoverers. With the Carthaginians and the Egyptians their trading brought them into many unknown regions, which they frequently colonized. The Arabs contributed a large amount of geographic knowledge during the Middle Ages and the Norsemen colonized Iceland and Greenland and explored the northern seas.

The names connected with geographical knowledge up to the fifteenth century, when the period of modern explorations began, are in the following list:

I. ANCIENT:

- Hecatæus of Miletus
- Herodotus
- Eratosthenes
- Pythagoras
- Ptolemy
- Aristotle
- Strabo
- Tyre
- Pytheas of Marseilles
- Alexander the Great
- Masudi
- Edrisi
- Ibn Batuta
- Ericson, Lief
- Benjamin of Tudela

II. MEDIÆVAL:

- Rubruquis
- Polo, Marco
- Clavijo
- Conti, Niccolò dei

Modern exploration dates from the fifteenth century, particularly from the time of Prince Henry of Portugal. The discovery of the Cape of Good Hope and the utilization of the magnetic compass lent impetus to the navigation of the high seas and consequent discoveries. These were at first confined to Africa, in a search for an all-water route to India. Then came Columbus, who discovered the West Indies (America). This marked the beginning of a series of discoveries that resulted in the uncovering of the entire Western Hemisphere and the establishment of the main features of the globe on both land and sea. With this accomplished, the attention of the world turned to the opening up and development of the newly discovered lands. North and South America, Africa, Asia, Australia, and many of the Pacific Islands were all fields of endeavor in the search for growth of trade and wealth. Many places were discovered and explored by men of different countries and disputes frequently arose over their possession. All of the maritime nations, particularly Portugal and Spain, took part, the names of hundreds of men finding their way into the annals of history.

In the following list are men prominent in early exploration and discovery. The names will suggest articles on the regions explored and other places affected.

Men and places involved in early discovery and exploration:

I. South America:

Pizarro, Francisco
Drake, Sir Francis
Hawkins, Sir Richard
Magalhães, Fernão de

II. North America:

Columbus, Christopher
Vespucius, Americus
Cabot, John
Cabot, Sebastian
Balboa, Vasco Nuñez de
Cortés. Hernán
Soto, Hernando de
Cartier, Jacques

III. Africa:

Cadamosto
Días de Novæs, Bartholomeu
Gama, Vasco da
Henry the Navigator

IV. South Sea and Pacific Ocean:

Tasman, Abel Janszoon
Cook, Capt. James
Entrecasteaux, Joseph Antoine
Bruni, Chevalier d'

Exploration in Africa, at first entirely confined to the Portuguese, became the attention of other nations toward the end of the 18th century, when James Bruce, an Englishman, seeking the source of the Nile, discovered the Blue Nile. He heads a very long list of African explorers, more prominent among whom are Mungo Park, Heinrich Barth, David Livingstone, H. M. Stanley, Gerhard Rohlfs. There are still parts of this continent, South America and Asia, which are quite unknown. These are slowly being uncovered by men who are accomplishing difficult and arduous tasks with little or no glory.

The main attention of the world in modern times has been directed toward the explorations of the Polar Regions. At first actuated by purely commercial incentives, the efforts of explorers today are directed in the interest of science. The earliest explorations in the North Polar regions, however, were caused by the search for the Northwest Passage to the Orient. The men prominently connected with this in particular were the Cabots, Henry Hudson, Parry, Cook, Rae, Simpson, Franklin and McClure. The Antarctic has received less attention than the northern fields on account of its remoteness, and it is only recently that any valuable work has been done there. In this connection Shackleton, Scott and Amundsen stand out prominently among the few South Polar explorers.

Recent successes in the Polar Regions are directly attributable to the lessons learned in early work there and to the advance in scientific knowledge, which gave to the men advantages never had by early explorers. Both Poles have finally been attained, the North Pole by Peary (April 6, 1909), and the South Pole by Amundsen (December 4, 1911) and Scott (January 18, 1912). See articles Polar Research, Northwest Passage.

Polar Explorers. See:

Amundsen, R.
Back, G.

Baffin, W.
Barents, W.
Bering, V.
Cook, J.
Franklin, J.
Greely, A. W.
Hudson, H.
Kotzebue, O. von
McClure, R. J. le M.
Mawson, D.
Nansen, F.
Nordenskiold, N. A.
Parry, W. E.
Payer, S.
Peary, R. E.
Ross, J. C.
Ross, J.
Scott, R. F.
Shackleton, E. H.
Stefansson, V.
Sverdrup, O.
Vancouver, G.
Vilkitsky, B. A.
Wellman, W.
Weyprecht, K.
Wilkes, C.

Lack of space forbids anything like an enumeration of even the more important articles describing the various parts of the earth and their inhabitants. The bulk of minor gazetteer articles are intended only for incidental reference, when information about a particular locality is desired. Nevertheless, it would be possible to plan a very instructive and interesting course of systematic reading in descriptive geography.

One way would obviously be to read first the articles on the larger divisions of the earth, EUROPE, ASIA, AFRICA, AMERICA, AUSTRALIA, ARCTIC REGION, and ANTARCTIC REGION, and, in the latter connection, the article on POLAR RESEARCH. These articles give, besides, a general geographic and ethnographic description, and a history of exploration and discoveries from ancient to recent times. They also refer to the separate divisions of the larger land areas, and, by reference to the articles on these divisions, the reader will be carried successively into narrower and narrower fields with more and more detailed description.

The story of explorations and discoveries, and of the science of geography, may also be carried further by means of the following names and titles:

Andrée, S. A.
Baker, S. W.
Barth, H.
Behaim, M.
Borchgrevink, C. E.
Brazza, P.
Burckhardt, J. L.
Burton, R. F.
Chancellor, R.
Flinders, M.
Gray, R.
Hakluyt, R.
Hedin, Sven
Johnston, H. H.
Kane, E. K.
Kiepert, H.
Kingsley, M. H.
Kohl, J. G.
La Hontan, A. L.
Lander, R. L.
Lapérouse, J. F.
Lockwood, J. B.
Major, R. H.
Malte-Brun, K.
Markham, C. R.
Przhevalski, N. M.
Ratzel, F.
Ravenstein, E. G.

Reclus, E.
Rennel, J.
Ritter, K.
Speke, J. H.
Sturt, C.

Still an other method of carrying on the study of geography would be to study the maps, and, wherever a particular region found there excites the reader's curiosity, turn to the appropriate article. Many other ways will suggest themselves, according to the individual's tastes, inclination, or requirements, and it will be found that an encyclopædia is the best means of gaining, not only a minute knowledge of any particular locality on the earth's surface, but also a broad perspective view of the whole field of human activity. For the gazetteer articles are not to be regarded merely as dealing with topics in geography. Taking any of the articles on the various countries of the globe, as the UNITED STATES, or JAPAN, such article may be made to supply detailed information on whatever topic may be the subject of study or reading: Zoölogy, Geology, Statistics, Finance, Education, Industry, or Transportation. To quote these articles and the accompanying maps would be to encumber the book with enormous lists of names, which the reader may be trusted readily to select for himself.

Chapter 25. Botany

BOTANY is the science that deals with plants in all their aspects.—their origin and development, nature, structure, life processes, classification, and distribution. The nature and origin of plants will be discussed in the general articles given below. All considerations of the form and structure of individual plants may be broadly classed under the general term Structural Botany, or Plant Anatomy. The study of the processes which constitute the life of a plant and the conditions which affect those processes is called Physiology. These two branches of the science are sometimes united under the term General Botany, as distinct from Specific or Systematic Botany, also called Taxonomy, which deals with the classification and description of the various kinds of plants. A somewhat recently established branch of the science is that of Ecology, which deals with the distribution of plants in general. Another branch represents the practical aspects of botany by a particular investigation of the plants which can be made to enter into human economy. This is Economic Botany, the science which has the closest bearing on the arts of agriculture and horticulture. For a general discussion of botanical science, see:

Botany
Biology
Evolution
Heredity

For General Methods of Botanical Investigation, see:

Botanical Laboratories (under Laboratory)
Botanic Garden
Herbarium
Index Kewensis

A. Structural Botany

This subject deals with the form and structure of individual plants, of the plant body as a whole, of its separate limbs and organs, of the various tissues of which these are composed, and of the minute structures of the cells which compose the tissues. The study of the individual cell has recently received so much attention that it has been elevated from a branch of Histology, which deals with the microscopic nature of tissues, to the separate science of Cytology. The study of the varying types of organs has been called Morphology, and this branch may be divided into the morphology of the sterile or vegetative organs and the morphology of the reproductive organs.

For General Articles on Structural Botany, see:

Vegetable Tissue
Anatomy of Plants
Growth (in Plants)
Morphology

I. Cytology. A description of the general structure and contents of the cell is given in the articles:

Cytology

Cell (in Plants)
Intercellular System
Protoplasm
Nucleus
Osmosis
Plasmolysis
Movement
Rotation

For the composition of the cell wall, see:

Cellulose
Lignin
Lignification
Micellar Theory

For the structure of the nucleus, see:

Nucleolus
Linin
Chromatin
Chromosome
Centrosome

For the cytoplasm, see:

Microsome
Plastids

The protoplasmic contents include a considerable variety of coloring matter. See:

Color in Plants
Chromoplast
Chromatophore
Endochrome
Chloroplast
Anthocyan
Chlorophyll
Leucoplasts
Elaioplasts
Erythrophyll
Etiolin
Etiolation
Carotin
Cyanophyll
Phycoerythrin
Phycophaein
Pyrenoid

Besides the protoplasm the cell often contains crystals and other bodies. See:

Raphides
Aleurone
Inulin
Starch

Finally the various constituents of the sap, digestive ferments, and secretions:

Sap
Sugar
Glucose
Enzyme
Diastase
Cytase
Lipase
Invertase
Oxidase
Pectase
Zymase
Latex

The mechanics of cell division are described under:

Mechanics of Development
Fission
Mitosis
Karyokinesis
Blepharoplast

II. HISTOLOGY. A general discussion of plant tissues is given in the article HISTOLOGY, section on *Histology of Plants.*

Tissues are variously classified. According to their general nature, the two most important kinds are described under:

Parenchyma
Collenchyma

In higher plants, the tissues are gen-

erally differentiated into three main systems. See:

Pith
Wood
Cortex

The general articles on woody tissue are:

Alburnum
Duramen
Vascular Tissue
Conducting Tissue
Mechanical Tissue
Mestome
Plerome

For the special structure of wood, see:

Fibrovascular Bundle
Fibre
Phloem
Bast
Hadrome
Leptome
Tylosis
Tracheæ (under Anatomy of Plants)
Tracheid
Sieve Vessels
Cambium
Pericycle
Medullary Ray

The various tissues found in the cortex are described in the articles:

Meristem
Epidermis
Cuticle
Endodermis
Hypodermis
Periblem
Dermatogen
Bark
Cork
Phelloderm
Phellogen

Other special forms of tissue are:

Aërenchyma
Palisade Cells
Mesophyll

III. Morphology of the Vegetative Organs.

For the general forms of plant bodies, see:

Thallus
Herb
Shrubs
Tree
Juvenile Forms

Some of the special forms or organs of fungi are described under:

Hypha
Mycelium
Plasmodium
Pileus

Higher plants are generally differentiated into stem, root, and leaves, all of which may carry minor organs or appendages. See:

Stem
Root
Leaf

For special forms of stems, see:

Tuber
Corm
Internode
Fasciation
Phylloclad

For their mode of branching:

Branching
Monopodial Branching
Dichotomy

For the forms and appearance of leaves, see:

Frond
Pinnule
Phyllodes

Petiole
Venation
Variegation
Anisophylly
Heterophylly

For their arrangement in the bud, see:

Leaf-Buds (under Bud)

The forms and appendages of the roots are described in the articles:

Root
Rhizoids
Root Tubercles

For the organs of respiration and exudation, see:

The Aërating System (under Anatomy of Plants)
Stomata
Lenticels
Hydathode

For the organs of support and similar use, see:

Tendril
Haustoria

Other appendages of plants are described under:

Trichome
Gland
Cilia of Plants
Bloom

IV. Morphology of the Reproductive Organs.

The vast majority of plants produce at certain periods of their life-history two sets of reproductive organs, the sexual and the asexual; and, in all plants above the algæ and fungi, these follow each other regularly in alternate generations. (See the general articles on sexual processes referred to under Physiology.) In this section, only those articles will be given which describe the sexual and asexual reproductive organs. These organs are present in some form throughout large classes of plants. Special morphology will be discussed under the appropriate heads in Systematic Botany.

Asexual reproduction is effected by spores and by vegetative off-shoots. For the latter, see:

Bud
Gemmæ
Bulb

For the organs of spore-reproduction, see:

Spore
Intine
Homospory
Heterospory
Microspore
Megaspore
Sporangium
Microsporangium
Megasporangium
Sporophyll
Microsporophyll
Megasporophyll

The organs of sexual reproduction are:

Gamete
Generative Cell
Oösphere
Sperm
Antheridium
Archegonium
Oögonium
Paraphyses
Oöspore

In the higher plants (Spermatophytes), the two sets of reproductive organs, sexual and asexual, are enclosed together in the flower. See:

Flower
Seed
Fruit

For the various modes in which flowers are arranged on the plant, see:

Inflorescence
Panicle
Cyme
Corymb
Ament
Disk

The parts of a flower are described in the articles:

Involucre
Calyx
Pappus
Corolla
Petal
Ligule
Nectary
Pistil
Ovary
Carpel
Ovule
Placenta
Stamen
Anther
Pollen
Epigyny
Hypogyny
Perigyny

The articles on the seed are:

Seed
Endosperm
Perisperm
Ovule
Nucellus
Embryo
Suspensor
Cotyledon
Hypocotyl

For the various kinds of fruits, see:

Achene
Berry
Capsule
Caryopsis
Drupe
Drupelet
Follicle
Glume
Legume
Nut
Pome

B. Physiology

Physiology is the science which deals with all the processes that constitute the life of an individual plant, the conditions, both internal and external, which affect plant life, and all the phenomena attending such processes and conditions. Just as we distinguish between vegetative and reproductive organs of a plant, so we may also distinguish between vegetative and reproductive life processes; and the former may be divided into the regular and constant processes, which maintain the life of a plant, and the more occasional responses to stimuli. Abnormal and pathological conditions also come within the scope of physiology. See Physiology of Plants.

I. In all perfect plants, there is a series of regular mechanical processes by which raw food material is brought to the digestive organs in the form of gases from the atmosphere, or of minerals dissolved in water from the soil; by other processes the digested food is carried to places of storage or growing

points, and the waste products are expelled from the system. See:

Respiration (in plants)
Aëration
Absorption (in plants)
Transpiration
Potometer
Imbibition
Osmosis
Turgor
Root Pressure
Conduction
Storage
Excretion
Secretion (vegetable)

II. The phenomena of digestion and growth are described in the articles:

Digestion in Plants
Food of Plants
Nutrition (in plants)
Mycorrhiza
Photosynthesis
Etiolation
Metabolism
Katabolism
Anabolism
Fermentation
Assimilation
Regeneration
Parasite, Plant
Saprophyte
Carnivorous Plants
Insectivorous Plants
Energy of Plants
Growth (in plants)
Auxanometer
Enzymes
Chloroplasts
Carotin
Etiolin

The various movements which plants are capable of are described under:

Movement
Moving Plant
Motor Organ
Locomotion
Nutation (in plants)

Plants are also capable of reacting to a great variety of stimuli. See:

Irritability
Stimulus
Tropism
Phototaxis
Heliotropism
Photoepinasty
Apheliotropism
Paraheliotropism
Nyctotropic
Sleep of Plants
Geotropism in Plants
Apogeotropism
Diageotropism
Hydrotropism
Aphydrotropism
Aërotropism
Rheotropism
Thermotropism
Chemotaxis
Chemotropism
Electrotaxis
Electrotropism
Traumatropism
Sensitive Plant
Hyponasty
Epinasty
Clinostat
Tendril
Lianas

Reproductive processes may be divided into those which take place within the individual plant, and those which are affected by the relation of the individual plant to its environment. The latter are referred to under Ecology (see C below), while only the former are described in the following articles:

Reproduction (in plants)
Vegetative Propagation

Sex in Plants (under Sex)
Conjugation
Rejuvenescence
Isogamy
Apogamy
Parthenogenesis
Vivipary
Fertilization
Germination
Alternation of Generations
Gametophyte
Sporophyte

A discussion of the abnormal and pathological in plant life is given in the articles:

Teratology
Monstrosity
Malformation
Abortion in Plants (under Abortion)
Vestigial Structures
Concrescence
Galls

C. Ecology

Ecology is the science that deals with the relation of a plant to its environment. This relation may be that of sexual intercourse, relation to the soil, situation, climate, moisture conditions, relation to other plants and to animals, and any other external conditions that affect the situation of a plant, its growth, or the length of its life, either in the individual or in the species or race. Ecology is thus the study of the distribution of plants in the broadest sense. See:

Ecology
Distribution of Plants
Bionomics
Floristics
Dysteleology
Adaptation
Epharmony

1. The relations of the reproductive functions of a plant to the environment are discussed in the articles:

Pollination
Pollen
Hybrid
Dispersal

The special arrangements which affect cross-pollination are described under:

Cleistogamy
Allogamy
Geitonogamy
Monœcism
Diœcism
Dichogamy
Entomophilous Plant
Anemophilous Plants
Hydrophilous

For the relation of plants to the soil, see:

Humus Plants
Lime Plants
Clay-Plants
Nitrophilous Plants
Halophyte
Dune Vegetation
Rock Plants
Epiphyte

For the relation of plants to genera localities, see:

Autochthonous
Endemism
Naturalization
Migration of Plants

and, to specific situations:

Mountain Plants
Alpine Plant
Cliff-Plants
Beach Plants
Ruderal Plants
Hylophytes
Benthos
Enalids
Plankton

For the relation of a plant to moisture and climate, see:

Hydrophytes
Hygrophytes
Mesophyte
Amphibious Plants
Xerophytes
Desert Vegetation
Arctic Plants (under Arctic Region)
Acclimatization
Phenology

The relation of a plant to other plants, and to animals, may be considered under two aspects:

(*a*) There is often a close sympathetic relation between individual plants, and between an individual plant and animals. See:

Symbiosis
Endophyte
Epiphyte
Parasite, Plant
Obligate Plants
Faculative Plant
Entomophilous Plant
Myrmecophytes
Phycomycetes

(*b*) There is also a general relation due to soil, climate, struggle for existence, etc., between large numbers of individuals growing together and constituting what are known as plant societies. See:

Distribution of Plants
Form
Formation
Forest
Jungle
Thicket
Grasslands
Savannas
Steppe
Prairie
Llanos
Pampas
Meadow
Tundra
Swamp
Mangrove Swamp
Cypress Swamps

The nature of plant societies is also largely affected by the vegetative duration of its members. See:

Duration
Annuals
Biennials
Perennials
Æstival
Vernal Grass
Deciduous Plants
Evergreen
Geophyte

D. Systematic Botany

This branch of the science of Botany comprises the classification of plants, the description of every known species and of the larger divisions—genera, families, orders, classes, etc.—into which all species are grouped. Sys-

tematic Botany also includes the study of the relationships between the various groups and species of plants, and of their geographical distribution. It is obviously impossible here to refer to all the articles on even the more important genera; but, as the representative genera of each order are referred to in the article on the order, it is sufficient to give only the latter and the higher groups. For a general article on systematic botany, see TAXONOMY.

The whole vegetable kingdom is generally divided into four sub-kingdoms. See:

Thallophytes
Bryophytes
Pteridophytes
Spermatophytes

I. The Thallophytes are divided into two parallel series. See:

Algæ
Fungi

1. The Algæ are generally grouped into four classes. See:

Cyanophyceæ
Chlorophyceæ
Phæophyceæ
Rhodophyceæ

2. For the main divisions of the Fungi, see:

Myxomycetes
Schizomycetes
Ustilaginales
Phycomycetes
Ascomycetes
Uredinales
Basidiomycetes
Lichens

II. The Bryophytes are grouped in two main divisions. See:

Hepaticæ
Musci

III. The living Pteridophytes fall into three main groups, the last two of which are generally called "the higher fern." See:

Fern
Equisetum
Lycopodiales

IV. The Spermatophytes, or seed-plants, form the bulk of the vegetation which covers the earth. They are divided into two classes. See:

Gymnosperms
Angiosperms

1. The living Gymnosperms are grouped into four orders. See:

Coniferæ
Cycadaceæ
Gnetaceæ
Ginkgo

2. The Angiosperms consist of numerous orders, which fall into two natural sub-classes. See:

Monocotyledons
Dicotyledons

(*a*) The principal orders of Monocotyledons are described under:

Pandanaceæ
Typha
Gramineæ
Cyperaceæ
Palm
Arum
Bromeliaceæ
Liliaceæ
Smilaceæ
Amaryllidaceæ
Dioscoreaceæ
Iridaceæ
Musaceæ
Zingiberaceæ
Orchid

(*b*) The following are the most important orders of Dicotyledons, arranged in their order of relationship. Important genera of orders not separately described are inserted in their proper places.

Archichlamydeæ:

Mainly Apetalous. Chiefly Trees:
- Piperaceæ
- Juglandaceæ
- Willow
- Poplar
- Birch
- Alder
- Cupuliferæ
- Moraceæ
- Urticaceæ
- Elm

Chiefly Weeds:
- Polygonaceæ
- Chenopodiaceæ
- Amarantaceæ
- Mesembryaceæ
- Caryophyllaceæ

Mainly Polypetalous. Buttercup Types:
- Nymphæaceæ
- Magnolia
- Ranunculaceæ
- Berberidaceæ
- Lauraceæ

Poppy Types:
- Papaveraceæ
- Fumariaceæ
- Cruciferæ

Insectivorous Plants:
- Sarracenia
- Sundew

Rose Types:
- Saxifrage
- Plane
- Rosaceæ
- Leguminosæ

Geranium Types:
- Geranium
- Zygophyllaceæ
- Polygala
- Euphorbiaceæ

Maple Types:
- Burseraceæ
- Anacardiaceæ
- Holly
- Maple
- Sapindaceæ
- Horse-Chestnut

Buckthorn Types:
- Rhamnaceæ
- Vitaceæ

Mallow Types:
- Tiliaceæ
- Malvaceæ

Violet Types:
- Ternstrœmiaceæ
- Violaceæ

Cactus Type:
- Cactus

Myrtle Types:
- Lythraceæ
- Myrtaceæ

Carrot Types:
- Umbelliferæ
- Dogwood

Sympetalæ:

Heath Types:
- Ericaceæ
- Huckleberry

Primrose Type:
- Primulaceæ

Ebony Types:
- Sapotaceæ
- Ebony

Gentian Types:
- Loganiaceæ
- Gentianaceæ
- Apocynaceæ
- Asclepiadaceæ

Phlox Types:
- Convolvulaceæ
- Polemoniaceæ
- Boraginaceæ
- Labiatæ
- Solanaceæ
- Scrophulariaceæ
- Bignonia

Madder Types:
- Rubiaceæ
- Caprifoliaceæ

Bell-Flower Types:
- Cucurbitaceæ
- Campanulaceæ
- Compositæ

E. Economic Botany

In its narrow sense, viewed as a strictly botanical science, economic botany is the study of those plants which are, or can be, used for some purpose in human economy. If we inquire further into the methods by which these plants are made available, we enter upon the fields of agriculture, pharmacy, mechanical arts, etc. By the above definition, economic botany includes a study of the common cultivated plants, such as the cereals, but, to avoid repetition, the cultivated plants are referred to only in the chapter on Agriculture, Horticulture, and Forestry. We shall therefore confine ourselves here to the articles describing the important wild, or not commonly cultivated, economic plants, classified according to their uses.

I. Plants Used for Food:
- Adansonia
- Areca
- Banana
- Brazilnuts
- Breadfruit Tree
- Butter-Tree
- Caryocar
- Caryota
- Cashew Nut
- Cherimoyer
- Cocco
- Cocoanut
- Euryale
- Fungi, Edible
- Granadilla
- Grass-Tree
- Hog-Plum
- Iceland Moss
- Jubæa
- Mammee Apple
- Maple
- Mushroom
- Nelumbo
- Palmyra Palm
- Papaw
- Prickly Pear
- Reindeer Moss
- Sago
- Tamarind
- Ti
- Walnut
- Water-Chestnut

II. Plants Used in Preparing Beverages:
- Beverage Plants
- Agave
- Assai

Ava
Buriti Palm
Carrageen
Elder
Maté
Palmyra Palm
Sloe
Woodruff

III. Plants Used as Condiment or in Confectionery:

Flavoring Plants
Anise
Caper
Cardamom
Cinnamon
Coriander
Ginger
Jujube
Juniper
Laurel
Licorice
Marjoram
Marsh-Mallow
Mint
Pepper
Tonka Bean
Vanilla

IV. Plants Used in Perfumery:

Boswellia
Lemon-Grass
Lignum Rhodium
Lily of the Valley
Musk Plant
Myrrh
Patchouli
Ylang Ylang

V. Plants Yielding Pigments:

Alkanet
Aloe
Brazil Wood
Buckthorn
Butea
Camwood
Chay Root
Fustic
Henna
Indigo
Logwood
Marking-Nut
Walnut
Weld
Yam
Zamia

VI. Plants Yielding Gums, Wax, Oils, etc.:

Butter Tree
Calophyllum
Canarium
Candleberry
Candle-Nut
Carnauba Palm
Cashew Nut
Dammar
Elæococca
Fir
Grass-Tree
Mastic
Mesquite Tree
Oil Palm
Pine
Tallow Tree

VII. Plants Yielding Fibre:

Agave
Aloe
Astrocaryum
Attalea
Bromelia
Broom
Butea
Carnauba Palm
Caryota
Chamærops
Corchorus
Crotalaria

Eriodendron
Giant Lily
Gomuti
Jute
Kapok
Ootrum
Piassaba
Yucca

VIII. Plants Used for Timber and Cabinet Wood:

Ash
Boxwood
Butternut
Calophyllum
Cedar
Cypress
Dacrydium
Dalbergia
Elm
Eucalyptus
Fir
Gmelina
Greenheart
Guaiacum
Hemlock Tree
Hornbeam
Ilex
Kauri Pine
Lignum Vitæ
Lime Tree
Mammee Apple
Maple
Oak
Palmetto
Palmyra Palm
Pine
Plane
Podocarpus
Spruce
Tamarind
Teak
Tulip Tree
Walnut

IX. Plants Used for Ornamental Cabinet Woods:

Aloes Wood
Ebony
Holly
Letterwood
Mahogany
Palmyra Wood
Rosewood
Sandalwood
Satinwood

X. Plants Supplying Various Primitive Needs:

Bottle Gourd
Bussu Palm
Calabash Tree
Daphne
Nipa
Palmyra Palm
Papyrus
Rattan

XI. Plants Used Directly in Industrial Arts:

Carludovica Palmata
Ice Plant
Ivory, Vegetable
Myrobalan
Oak
Quebracho
Rattan

XII. Medicinal Plants:

Aconite
Acorns
Adansonia
Agrimony
Akee
Allamanda
Aloe
Alum Root
Angelica
Angostura Bark
Aristolochia
Arnica

Asarabacca
Belladonna
Bittersweet
Broom
Butterfly-Weed
Cajeput
Calabar Bean
Carrageen
Cascarilla
Cassia
Centaury
Choke-Cherry
Cinchona
Cissampelos
Coca
Croton
Cubebs
Dill
Dock
Dogbane
Elder
Erigeron
Ergot
Eucalyptus
Feverwort
Gentian
Geum
Guaiacum
Horehound
Houseleek
Ipecacuanha
Jalap
Licorice
Mint
Myrrh
Poppy
Strychnos
Witch-Hazel
Zanthoxylum

XIII. Poisonous Plants

Poisonous Plants
Abrus
Amanita
Andromeda
Belladonna
Bittersweet
Bitterwood
Calabar Bean
Cherry-Laurel
Cocculus Indicus
Colchicum
Fungi, Edible and Poisonous
Hemlock
Henbane
Kalmia
Laburnum
Manchineel
Nightshade
Poison Oak
Stramonium
Sumach
Tanghin
Upas

XIV. Biographies of Eminent Botanists:

Chapter 26. Agriculture, etc.

THE systematic and artificial cultivation of plants for the purpose of supplying human necessities or luxuries constitutes the arts of Agriculture, Horticulture, and Forestry, or the cultivation of the field, the garden, and the forest. The distinctions between these three arts, however, are not so definite as one might suppose, and the apportionment among them of the articles dealing with plant culture will be more or less arbitrary. Thus Forestry and Horticulture meet in the arts of Arboriculture and Landscape Gardening. The products of Horticulture are, as a rule, luxuries rather than necessities; but the raising of vegetables for the table, although they are almost necessary articles of food, is generally treated under Horticulture rather than under Agriculture. The latter term is best confined to the cultivation on a large scale of products used extensively in human economy, and this distinction will be the basis for the following divisions of the whole subject.

A. Agriculture

Agriculture, as its name implies, is the cultivation of the field, mainly for the purpose of providing a regular supply of organic food, both plant and animal. This indicates the two main divisions of farming, namely, the raising of food plants and the raising of animals. The former is, perhaps, the more complex process, requiring a more elaborate equipment of tools and machinery. It involves the selection and preparation of the soil, the sowing of the seed, the care of the growing crop, the prevention and cure of crop diseases, and the harvesting, manipulation, and disposition of the crop when ripe. The raising of animals involves their selection and breeding, the feeding and care of the animals, attention to the numerous diseases to which they are subject, and the manipulation and disposition of animal products, including the art of dairying. In connection with both branches of agriculture, there is the general management of the farm and its equipment. For a history of the development of agriculture in the various countries, see the article, AGRICULTURE.

I. For the general articles on the farm and its equipment, see:

Farm Buildings
Implements, Agricultural
Farm Management
Dry Farming

II. The preparation of the soil requires, first, the selection of a soil suited for the crop, and often its artificial fertilization; and, second, its tillage and irrigation.

For the selection of soil, see:

Soil
Humus
Alkali Soils
Chernozem
Gumbo Soil
Fallow
Waste Lands
Rotation of Crops

For fertilization and fertilizers, see:

Chemistry, Agricultural

Fertilizers
Manures and Manuring
Green Manuring
Nitrification
Sewage Farming
Soil Amendments
Fish Manures
Bone Fertilizers
Guano
Marl
Compost
Gypsum
Poudrette
Lupine
Superphosphate
Thomas Slag

The processes of tillage are described under:

Tillage
Cultivator
Plow, Plowing

For the irrigation and drainage of the soil, see:

Irrigation
Drainage
Ditch
Mulch
Warping
Lysimeter

When the soil has been prepared and tilled, the seed is sown. See:

Seed Testing
Broadcasting
Drill
Harrow

When the crop is ripe, it is harvested and prepared for the market. See:

Harvest and Harvesting
Reapers, Reaping
Threshing
Hummeler
Fan, or Fanner

III. The principal crops which are the subjects of agriculture are, of course, the food plants, and of these the most important are the cereals. Other plants, however, aside from those which are the subjects of horticulture, are also regularly cultivated, such as forage plants (see under Stock-Raising below), and plants used for fibre and various other purposes.

For the principal cereals, see:

Cereals
Barley
Buckwheat
Maize
Millet
Oat
Rice
Rye
Wheat

Other food crops are:

Artichoke
Artichoke, Jerusalem
Bean
Beet
Cassava
Cowpea
Dolichos
Lentil
Pea
Potato
Pumpkin
Sago
Sorghum
Soy Bean
Sugar Beet
Sugar-Cane
Sweet Potato

(For vegetables and fruits, see under section on Horticulture.)

Plants cultivated for fibre are:

Bœhmeria
Cotton

Flax
Hemp
Hemp, Bowstring
Hemp, Manila
Hemp, Sisal
Hemp, Sunn
Henequen
Ramie

Tobacco is also an important agricultural crop. See article TOBACCO.

IV. The care of the growing crop is of sufficient importance to have separate treatment, and the study and treatment of plant diseases is a science by itself. The principal cause of plant diseases are bacteria and fungi, and almost every kind of crop has its specific insect pests. These are all described in separate articles following the articles on the crops, under such titles as COTTON INSECTS, RICE INSECTS, etc., and, therefore, need not be enumerated here. The general articles on plant diseases and their treatment, and on diseases common to several crops are:

Diseases of Plants
Fungicides
Insecticides
Insect Powder
Mildew
Blight
Botrytis
Canker
Chlorosis
Damping Off
Dry Rot
Ergot
Gummosis
Rust
Smuts

The special diseases which affect particular crops are treated in the articles on the separate crops, but a few are described in separate articles. See:

Bunt
Cornstalk Disease
Crown-Gall
Ear Cockles
Clubroot
Oidium

Some of the common weeds with which the farmer and gardener have to contend are described in the articles:

Weed
Burdock
Chickweed
Chufa
Cockle
Chenopodium
Dodder
Orache
Pigweed
Tare

V. The raising of live-stock is the second great department of agriculture, and involves the selection of the animals, their breeding and general care, a supply of the proper feed stuffs; attention to diseases, which constitutes the practice of veterinary medicine; and the preparation of the animal products for the market.

The most important animals raised as live-stock are described in the articles:

Horse
Cattle
Mule
Sheep
Goat
Hog
Poultry
Fowl
Duck
Goose

Turkey
Pigeon
Bee

For the breeding and general care of the animals, see:

Breeds and Breeding
Incubator
Horseshoeing
Hoof
Dehorning
Feeding Farm Animals
Soiling, Soiling Crops
Bee-Keeping

Feeding stuffs may be divided into two general classes, natural or growing forage plants and the more or less artificially prepared feeds. The forage plants may again be divided into grasses and those that are not grasses, the latter being largely leguminous plants. See:

Feeding Stuffs
Pasture
Meadow

For forage grasses, see:

Grasses
Agropyron
Andropogon
Bermuda Grass
Blue Grass
Brome Grass
Buffalo-Grass
Canary-Grass
Crab-Grass
Gama Grass
Manna-Grass
Meadow Grass
Millet
Oat Grass
Orchard Grass
Redtop Grass
Rye-Grass
Sorghum
Teosinte
Timothy Grass

The principal forage plants other than grasses are:

Alfalfa
Burnet
Chufa
Clover
Cowpea
Fescue
Lupine
Mangel-Wurzel
Medicago
Medick
Melilot
Rape
Sainfoin
Serradella
Soy Bean
Sulla
Trefoil
Vetch

For the most important prepared feeds, see:

Brewers' Grains
Gluten Meal
Cottonseed Meal
Hay
Linseed Meal
Malt Sprouts
Silage

Farm animals are subject to numerous serious diseases, and the investigation and treatment of these constitute the profession of veterinary medicine. A convenient subdivision of animal diseases is according to the kinds of animals which they affect, since, with a few exceptions, each disease is either peculiar to, or chiefly prevalent in, a particular species. Several of these given under cattle diseases, however,

may also affect horses or sheep, and vice versa.

(*a*) The general articles on the subject and those dealing with diseases common to several kinds of live-stock are:

Veterinary Medicine
Diseases of Animals
Abortion
Anthrax
Colic in Animals
Ring Worm
Mange
Tuberculosis (in animals)

(*b*) For diseases primarily affecting the horse, see:

Azoturia
Bighead
Canker
Curb
Fistula
Founder
Glanders
Heaves
Hoof
Influenza in Animals
Meningitis
Navicular Disease
Roaring
Strangles
Stringhalt
Spavin
Thrush

(*c*) For diseases of cattle, see:

Actinomycosis
Blackleg
Cattle Plague
Fardel-bound
Foot-and-Mouth Disease
Joint-Ill
Malignant Catarrh
Mammitis
Milk Fever
Red Water
Texas Fever

(*d*) For diseases of sheep, see:

Agalactia
Bloat
Braxy
Fardel-bound
Gid
Icterohæmaturia
Liver-Rot
Lung-Worms
Nodular Disease

(*e*) For a disease of hogs, see:

Hog Cholera

(*f*) For diseases of poultry and bees, see:

Blackhead
Gapes
Roup
Diarrhœa, White, of Chickens
Foul Brood

VI. In the preparation of animal products for the market, one of the most elaborate, as well as important, departments is that of Dairying. This industry involves the supply of milk and cream, and the manufacture of butter and cheese. For a general article on the subject and articles on the processes of manufacture, and the machinery and equipment of the dairy, see:

Dairying
Milking Machine
Aërator
Creamery
Separator
Butter-Making
Churn
Butter-Worker
Butter-Color
Cheese-Making

Cheese Factory
Rennet

For the principal dairy products, see:

Milk
Skim Milk
Casein
Cream
Butter
Cheese
Buttermilk
Milk Sugar (under Sugars)
Ghee
Kephir
Koumiss
Whey

VII. Other more or less direct products of agriculture and stock raising, and the methods of their disposal, are described under:

Market and Marketing
Flour
Farina
Semolina
Food
Bread
Sugar
Honey
Glucose
Meat
Pork
Leather
Wool

See also POULTRY and EGG and the articles there referred to.

VIII. Since the patriarchal stage, Agriculture has been regarded as the most important of human industries, and is the one which has especially received direct and official attention from the governments of civilized nations. There are also at present numerous educational institutions, and private or semi-public associations for the advancement of the industry. See:

Agriculture, U. S. Department of
Agricultural Experiment Station
Agricultural Education
Farmers' Institute
Agricultural Association
Grange

IX. For biographies of eminent agriculturists, see:

Atwater, W. O.
Brewer, W. H.
Goodell, H. H.
Harris, J.
Hellriegel, H.
Hilgard, E. W.
Holdefleiss, F. W.
Johnson, S. W.
Judd, O.
Lawes, J. B.
Maercker, M.
Morris, Daniel
Ruffin, E.
Thaer, A. D.
True, A. C.
Wallace, R.
Young, A.

B. Horticulture and Forestry

Horticulture is the art of producing plants which are valued for their agreeable properties rather than as necessities for human comfort. The horticultural methods of breeding, propagating, and cultivating plants differ essentially from the agricultural method in that great attention is paid to the individual plant, while in agriculture attention is given to the crop

as a whole, in which the individual is lost. The subjects and products of horticulture are flowers, ornamental shrubs and trees, fruit trees, plants used as condiments, vegetables for the table, when considered merely as accessories to the more substantial articles of food, and all other plants treated by horticultural methods.

Horticulture also concerns itself with the laying out of gardens, and in this field of its activity it merges into landscape gardening and forestry. The latter, however, is a purely economic art and is not a branch of horticulture. It is included in this section because it is not yet a highly complex art and is, therefore, treated in a few general articles. For the general articles on Horticulture and Forestry, see:

Horticulture
Floriculture
Landscape Gardening
Arboriculture
Forestry
Afforestation

I. The buildings and equipments used by the horticulturist are described in the articles:

Greenhouse
Hothouse
Conservatory
Frame
Espalier
Hoe

One of the principal aims of horticulture is to develop particularly desirable varieties of plants and to maintain them true to the stock. For this purpose, special methods of breeding and propagation are necessary. See:

Plant-Breeding
Nursery
Budding
Cutting
Grafting
Layering
Caprification

Special methods are also necessary in raising the young plants to maturity and securing the desired qualities in the matured product. See:

Forcing
Bottom Heat
Electro-culture of Plants
Pruning
Cordon
Blanching

For the most important plants cultivated in greenhouses, see:

Greenhouse Plants
Achimenes
Azalea
Banksia
Carnation
Chrysanthemum
Fuchsia
Gardenia
Gladiolus
Hyacinth
Lily, Lily of the Valley
Mignonette
Oleander
Passion-Flower
Pelargonium

II. The principal articles on gardens, ornamental shrubs, and garden plants are:

Lawn
Hedge
Ampelopsis
Azalea
Canna
Centaurea
Chrysanthemum

Convolvulus
Cosmos
Cotoneaster
Cowslip
Dahlia
Eschscholtzia
Heliotrope
Hibiscus
Hollyhock
Hyacinth
Hydrangea
Ivy
Jasmine
Jonquil
Laburnum
Larkspur
Laurustinus
Lavender
Libocedrus
Lilac
Lily
Lily of the Valley
Mignonette
Narcissus
Peony
Petunia
Phlox
Pink
Polyanthus
Poppy
Rose
Star of Bethlehem
Sunflower
Sweet Pea
Thrift
Tropæolum
Trumpet Flower
Tuberose
Tulip
Wallflower
Wistaria

III. For the principal articles on fruit trees and fruit culture, see:

Fruit, Cultivated
Orchard
Apple
Apricot
Banana
Blackberry
Butternut
Calville
Cherimoyer
Chestnut
Cranberry
Currant
Custard-Apple
Date
Dewberry
Earthnut
Fig
Gooseberry
Grape
Hazelnut
Huckleberry
Kumquat
Lemon
Lime
Litchi
Loquat
Mango
Melon
Mulberry
Muskmelon
Olive
Orange
Peach
Peanut
Pear
Persimmon
Pineapple
Plum
Pomegranate
Quince
Raspberry
Strawberry
Walnut
Watermelon

For table vegetables, see:

Vegetables
Herbs, Culinary
Salad Plants
Asparagus
Brussels Sprouts
Cabbage
Carrot
Cauliflower
Celery
Corn-Salad
Cress
Cucumber
Egg Plant
Endive
Garlic
Kale
Kohl-rabi
Leek
Lettuce
Mushroom
Onion
Parsley
Parsnip
Radish
Rhubarb
Salsify
Spinach
Squash
Tomato
Truffle
Turnip

V. For the principal plants cultivated for their flavoring qualities, see:

Flavoring Plants
Allspice
Almond
Capsicum
Caraway
Chicory
Chive
Cinnamon
Citron
Cloves
Fennel
Hop
Horseradish
Mace
Mustard
Nutmeg
Pepper
Pistacia
Thyme
Vanilla

VI. The section on horticulture should also include reference to the articles on the well known beverage plants, and on some of the more direct products of horticulture. See:

Coffee
Tea
Cacao
Wine
Cider
Prune
Raisins

VII. For biographies of eminent horticulturists and foresters, see:

Bailey, L. H.
Burbank, L.
Downing, A. J.
Downing, C.
Duhamel du Monceau

Manning, R.

See also HORTICULTURAL SOCIETIES.

Chapter 27. Zoology

EVERY topic of importance in Natural History, especially as represented in America, is contained in the pages of the *New International Encyclopædia*, which thus may justly be called a complete text-book of zoölogy. The outline of our knowledge of animal life thus furnished is supplemented, in respect to each part of it, by references to special books, museum collections, and other sources of knowledge where the student may find the minute details and investigations interesting and necessary to the specialist, but superfluous to a general reader. The material contained in the Encyclopædia is thus equally useful to the deep and to the superficial inquirer; for the specialist in one department of science needs to have at hand general information, at least, as to other departments.

Zoölogy has two aspects: (a) that of its observed facts; and (b) that of the principles involved: phenomena and deductions; condition and theory. The foremost or basic part is a knowledge of the facts of the animal world, namely: Form and Structure; Reproduction, Embryology and Growth; Habit; Instinct; Distribution, past and present; Relationship, of animals to one another, and to their environment. From these have been deduced the facts of the Classification and Evolution of forms.

STRUCTURE.

The reader who seeks to take the topics dealing with Form and Structure in order may read the following articles:

Biology
Morphology
Animal
Protoplasm
Cell
Amœba
Embryology
Anatomy
Bone
Skeleton; and the more particular accounts of its component parts, as SKULL, HAND, SHOULDER-JOINT, etc.
Muscular System
Circulatory System
Alimentary System
Excretory System
Respiratory System
Nervous System and Brain
Cephalization
Metamerism
Integument
Horn
Hoof
Nail
Teeth
Hair
Feather
Pterylosis
Scales
Pigment
Metachrosis
Chromatophore
Melanism
Touch
Taste
Smell
Eye
Ear

The structure of various animals, as characteristic of groups, is given in such general articles as:

Amblypoda

Ammonites
Amphibia
Annulata
Arachnida
Archæopteryx
Bat
Beetle
Bird
Bovidæ
Butterflies and Moths
Brachiopoda
Camelidæ
Canidæ
Carnivora
Cephalopoda
Cestoda
Chordata
Cœlenterata
Coral
Crinoidea
Crustacea
Deer
Dinosauria
Dipnoi
Echinodermata
Elasmobranchii
Electric Fish
Felidæ
Fish
Fly
Fringillidæ
Frog
Ganoidei
Gastropoda
Holothurian
Horse, Evolution of the (under Horse, Fossil)
Hydrozoa
Hymenoptera
Infusoria
Insect
Mammalia
Marsupialia
Medusa
Mollusca
Ophiuroidea
Prototheria
Protozoa
Pterodactyl
Pteropoda
Reptile
Rodentia
Sirenia
Snake
Turtle
Ungulata
Vertebrata

For the most part, the articles referred to contain, incidentally or cited in the appended Bibliography, the names of investigators identified with these particular subjects. In the great majority of cases the biography of each of these men is to be found in its alphabetical position in the Encyclopædia; and an earnest reader will turn to it, and so acquaint himself with the man by whose learning he is profiting.

Reproduction and Growth.

Animals continue to exist by reproducing their kind after various methods, and each individual passes through a more or less complicated series of changes from its beginning to its maturity, collectively known as its life-history, or autogeny. An orderly study of this essential phase of animal life may be conducted by reading the articles mentioned below, with the lesser ones indicated by cross-references:

Reproduction
Spontaneous Generation
Egg
Spermatozoön
Gemmule
Sex
Embryology

Fœtus
Epigenesis
Mitosis
Parthenogenesis
Alternation of Generations
Biogenesis
Cross-fertilization
Metamorphosis
Larva
Pupa
Metabolism
Growth
Regeneration
Heredity
Pangenesis
Prepotency
Telegony
Mendel's Law
Breeds and Breeding
Hybridity
Nidification

HABITS.

The habits of animals constitute the principal feature of what may be called Descriptive Zoology—that is, accounts of a species or a group of species placed under the vernacular name. This policy has been adopted, rather than that of putting descriptions under technical names, for greater convenience of reference, as well as to avoid that attitude of pedantry which made the earlier encyclopædias often ridiculous. The majority of readers would turn more naturally to HORSE than to "Equidæ" or to BLACKSNAKE than to "Zamenis." The technical characteristics of many of the larger groups, lacking any English appellative, are given under their term in classification, as PROTOZOA, BOVIDÆ, and the like, or sometimes under the name of the special science dealing with them, as ICHTHYOLOGY, ORNITHOLOGY. Habits of animals, then, may be learned from the descriptive articles generally, the principal of which are given below:

Agate Shell
Agouti
Albatross
Alewife
Alligator
Anaconda
Ani
Ant
Antelope
Ant-lion
Aoudad
Apteryx
Armadillo
Ass
Auk
Aurochs
Axolotl
Aye-aye
Baboon
Badger
Bandicoot
Bank swallow
Barn-owl
Barn-swallow
Bass
Bat
Bear
Beaver
Bedbug
Bee
Bighorn
Bird of Paradise
Bison
Bittern
Blackbird
Blacksnake
Bluebird
Bluefish
Boa

Bobolink
Bollworm
Bookworm
Bot
Bower-bird
Brant
Buffalo-bird
Bug
Bulbul
Bumblebee
Bunting
Bushmaster
Bustard

Mind in Animals.

The intelligence and mental processes of animals are subjects to which much attention has been paid recently, and facts bearing upon them are eagerly sought. Some of the conclusions of students will be found in the following:

Ant
Nervous System, Evolution of the
Habit
Instinct
Social Insects (under Insect)
Orientation

Distribution of Animals.

Everyone is aware that different parts of the earth's surface have different faunas, and that this condition apparently remains permanent, except when, by means of civilization or commerce, certain animals are enabled to spread beyond their natural habitat, and even become cosmopolitan, as have rats, house-mice, the European house-sparrow, and a large number of plant-feeding insects. Normally one fauna does not enlarge or diminish at the expense of another, and, for the most part, species of animals, as of plants, are restricted to a comparatively small range and set of climatic conditions. The local faunas, both on the land and in the sea, have been examined, and their boundaries well ascertained. It has been found, however, that groups of related faunas

exist side by side, which may be composed into large divisions called "subregions," and these into a few still larger ones called "regions." The natural barriers which are set to the dispersion of animals, and the finding of the actual boundaries of the faunal districts, form the outlines of the highly interesting study of the geographical distribution of animal life, past and present. To acquaint himself with this science, the reader should peruse the following co-related articles:

Distribution of Animals
Fauna
Ethiopian Region
Paleotropical Region
Holarctic Region
Nearctic Region
Oriental Region
Palearctic Region
Deep-sea Exploration
Pelagic Animals
Plankton

See also the names of the various subregions, as NEW ZEALAND SUBREGION, MALAGASY SUBREGION, etc.; the paragraphs on *Fauna* under the names of the various continents and countries, as AMERICA, AUSTRALIA, BRAZIL, and the like; and, for the distribution of animals in past ages, PALEONTOLOGY, EXTINCTION OF SPECIES and MIGRATION OF ANIMALS.

RELATIONSHIP.

The relationship of animals toward others, and to the environment of each individual, species, or group, forms a feature of far-reaching importance and of great interest in zoology, and the study of the facts involved has been set apart as a science under the name of BIONOMICS. Much relating to it will be found in the descriptive articles cited under Habits and elsewhere, but special consideration is given under the succeeding heads:

Bionomics
Cave Animals
Environment
Estivation
Flowers and Insects
Hibernation
Social Insects (under Insect)
Natural Selection
Orientation
Parasite
Symbiosis
Tropism

The relations between man and the lower animals are mainly those of warfare or service. Animals are in the way of his operations or dangerous to him, and must be got rid of, or supply him with flesh, or hide, or fur, or some other desirable thing, which can be obtained, in most cases, only by killing them; or they attract him to the chase and to such sports as angling and shooting. Hence, many are sought only to be killed, and some species have been entirely exterminated. On the other hand, his agricultural operations have encouraged the spread and development of some, as various insects, rats, etc., in a remarkable way. A third class has been utilized by domestication and turned to his service and benefit. Some articles of special moment in the Encyclopædia dealing with this sporting and economic aspect of natural history are these:

Acclimatization
Angling
Bee
Buffalo

Domestic Animals (and the various kinds, as Camel, Cat, Dog, Horse, Sheep, Fowl, etc.)
Extinct Animals
Falconry
Fish as Food
Fish Culture
Fisheries
Fishing
Fur and the Fur Trade
Game Laws
Game Preserve
Insects, Propagation of Disease by
Introduced Species (especially of injurious insects, such as those described under Bollworm, Cutworm, Chinch-bug, Pear Insects, etc.)
Mosquito
Oyster
Pearl
Prairie Dog
Rabbit
Seal
Silkworm
Taxidermy

METHODS OF STUDY.

The methods of study in natural history are described to some extent in the articles:

Deep-sea Exploration
Laboratory
Microscope
Morphology
Nature-Study
Psychological Apparatus
Zoölogical Garden
Zoölogical Station

CLASSIFICATION OF ANIMALS.

Turning now from the methods and facts of observation and experiment to the philosophical deductions,—the principles and theories drawn from these facts,—the reader will first need to attend to the subject of classification, which has been slowly developed through a long series of errors and limitations and gradually corrected in the brightening light of growing knowledge. The history of this search for the true, because natural, classification may be found in the articles ANATOMY, CLASSIFICATION OF ANIMALS, and ZOÖLOGY, with the names of the men who from time to time notably advanced taxonomy, and whose biographies may be read. No real success was achieved until the modern conviction was arrived at, that the key to the problem of classification was to be found in community of descent, and that any true classification must follow the perception of genetic relationship —descent from a common ancestor. This is the basis of modern classification, and what we have approaches perfection in just the degree that the phylogeny of each group is rightly apprehended. As a result of the constant increase of knowledge, the arrangement of this group and that is constantly being modified and presumably always improved. From time to time, these amendments are gathered up and critically combined into a general scheme. The latest such scheme of classification of the whole animal kingdom, which is authoritative and at the same time generally accessible, is that contained in Parker and Haskell's *Text-book of Zoölogy*, and this has been followed in respect to the general outline in this Encyclopædia, insuring uniformity. For further details, consult:

Classification of Animals
Phylogeny

Variation
Type
Zoology

For the classification of separate groups, see their titles, as CŒLENTERATA, CRUSTACEA, MOLLUSCA, ECHINODERMATA, etc.

ZOÖLOGY AND EVOLUTION.

The philosophical part of zoology has been developed since man began to observe the ways of nature, and has produced a vast body of "laws," doctrine, and speculation, the history of which is sketched in such general articles as ANATOMY, ZOÖLOGY, EVOLUTION, etc., and the biographies of the great thinkers cited should be read in connection with their themes. Science has constantly tended to separate itself from metaphysics, and to use its hypothesis merely as a means for further investigation of phenomena. The outcome has been the formulation and general acceptance of a theory of universal development from the simple to the complex, from the homogeneous to the specialized; and Organic Evolution or the Doctrine of Descent is the application of the general principle to the history and phenomena of living things. A reader who wishes to acquire a knowledge of these views of nature may do so by reading in consecutive order the articles named below:

Biology
Evolution
Ontogeny
Phylogeny
Natural Selection
Lamarckism
Growth
Heredity
Hybridity
Mendel's Law
Extinction of Species

Guided by these articles and the cross-references to be found in them, he may pursue the subject under other fruitful titles, such as:

Botany
Chromosomes
Cross-fertilization
Degeneration as a Factor in Evolution
Embryology
Environment
Flowers and Insects
Isolation
Kinetogenesis
Longevity
Mechanics of Development
Mimicry
Neo-Darwinism
Neo-Lamarckism
Otter Sheep
Pollination
Polymorphism
Protective Coloration
Recognition Marks
Regeneration
Reversion
Senescence
Sex
Sexual Selection
Use-Inheritance
Variation
Warning Coloration
Weismannism

BIOGRAPHY.

Only a name or two has been quoted in the preceding analysis of the science of zoology. The investigators in the field have been numerous, and the following list should be regarded as selected rather than complete. See:

Agassiz, L.

Audubon, J. J.
Baer, K. E.
Baird, S. F.

28. Manufactures and Engineering

THE development of manufacturing industries has resulted from more efficient economic organization, and from the perfection of technological processes involving the application of scientific discoveries and knowledge. Accordingly, the most profitable method of study is first to consider the development of manufactures in general from the economic standpoint, and especially of the Factory System, where concentration permits of manufacture in increased quantities at diminished expense. This will be found treated in the articles on FACTORIES and MACHINERY, ECONOMIC EFFECTS OF, in which is traced the growth of manufacturing in general. For specific industries, reference should be made to the separate articles, as the historical and statistical development of any given industry is best considered by itself, on account of the important relation that it bears to practical questions of material, processes, and the like. This brings us straightway to the leading question how things are made, which it is an important function of an encyclopædia to answer. In this is involved the gathering and preparation of the raw material, the manufacture, the finishing, and the distribution, or utilization, of the finished product. There are prepared below a number of lists of subjects, more or less cognate, dealing with manufacturing industries and their products, and, by carefully observing the cross-references, a complete idea of the more important processes may be gained.

A. Manufacturing Processes

FOOD AND MANUFACTURE OF FOOD STUFFS, ETC.

An important field of manufacturing operations is that concerned with the preparation of food stuffs, both in the factory and on a less extensive scale in the home. COOKERY; FOOD, PRESERVATION OF; SLAUGHTER HOUSES; and PACKING INDUSTRY are titles that suggest the wide range of subjects that may be grouped under such a head. The following list indicates appropriate titles:

Meat
Slaughter Houses
Packing Industry
Food, Preservation of
Digester
Extract of Meat
Ham
Lard
Tallow
Pemican
Jerked Beef
Cookery
Wheat
Flour
Baking
Bread
Biscuit
Baking Powder
Butter
Cheese
Guarana
Macaroni
Sugar
Sardine

Gelatin
Confectionery
Chocolate
Cocoa Butter
Chewing Gum
Macaroon
Condiments
Pickles
Chutnee
Curry Powder
Olive Oil

FERMENTED AND DISTILLED LIQUORS.

The manufacture of BEER, WINE, and LIQUORS involves many interesting processes in chemical technology. A convenient beginning may be made by considering the history of fermented and distilled liquors, and the extent to which they are manufactured and consumed. Then, taking up the general properties of beer, wine, and distilled liquors, a classification of these beverages can be made, and the essential features of their production learned. Further details appropriate to the manufacture are discussed under BREWING, STILL, BOTTLING AND BOTTLING MACHINERY, while questions involving the chemistry of the subject are treated under FERMENTATION, DISTILLATION, and ALCOHOL. The physiological effects of alcohol are not only interesting, but instructive, and are properly considered in connection with the manufacture of alcoholic beverages. For a comprehensive study of the whole subject, the following articles should be consulted:

Liquors, Fermented and Distilled, Statistics and History of
Alcohol
Alcoholometry
Hydrometer
Alcohol, Physiological and Poisonous Action of
Fermentation
Brewing
Beer
Wine
Currant Wine
Distilled Liquors, or Ardent Spirits
Distillation
Brandy
Apple Brandy
Rum
Whisky
Fusel Oil
Geneva
Gin
Liqueur
Absinthe
Benedictine
Chartreuse
Curaçoa
Kirsch
Kümmel
Maraschino
Ratafia
Noyau
Bishop
Cider
Berlin Spirit
Bottling and Bottling Machinery

FIBRES AND TEXTILES.

The subject of fibres and textiles is one of novel scope and, for its proper comprehension, requires first the consideration of the fibres themselves and how they are produced and prepared for manufacture. The chief vegetable fibres are;

Cotton
Flax
Hemp
Jute
Linen
Hemp, Manila

Ramie
Coir
Cotton, Artificial
Wood Pulp Yarns
Silk
Silk Worm
Floss Silk
Organzine
Wool
Wool and Worsted Manufactures
Sheep
Noils
Shoddy

It is next advisable to consider the processes by which the fibres are prepared for spinning and weaving. These processes are discussed in the following articles:

Cotton-Gin
Heckle
Carding
Spinning
Yarn

Textile manufacturing comprises industries of many diverse characters, which employ complicated machinery. As they have a certain amount of similarity, and bear some relation to each other, the processes of making the various fabrics may first be considered together. The first step is the designing of the fabric, in which the weaves, patterns, and designs are made on the LOOM. This naturally involves the discussion of WEAVING, which should explain the fundamental weaves and the methods by which patterns are produced. Therefore, in this connection, the following articles should be consulted:

Textile Manufacturing
Textile Designing
Weaving
Loom
Heddle
Bobbin

Crocheting and knitting differ essentially from weaving and, whether performed by hand or machine, are the means of producing garments and other useful articles. The following titles indicate the articles to be consulted on these subjects:

Crochet
Knitting
Hosiery

Either the yarn or the finished fabric may be dyed, or the latter may be printed, in order to impart colored designs to it. In either case, complex and interesting processes are involved, which are described in the list below:

Dyeing
Coal-Tar Colors
Vegetable Colors
Indigo
Turkey Red
Textile Printing
Beetling
Calendering
Bleaching
Bleaching-Powder
Embroidery

The finished textile fabrics are almost infinite in their variety. It is possible to select the more important and the representatives of the leading classes and study them in detail. Such a list arranged alphabetically is as follows:

Art Square
Bandana
Barege
Batiste
Blanket
Bobbinet

Bolting-Cloth
Bombazine
Brocade
Brocatel
Brussels Lace
Buckram
Bunting
Cambric
Camel's Hair
Camlet
Canvas
Carpet
Cassimere
Chenille
Chintz
Corduroy
Crape
Cretonne
Crinoline
Damask
Diaper
Dimity
Dornick
Drugget
Duck
Felt
Flannel
Floor-Cloth
Fustian
Galloon
Gauze
Gingham
Grass Cloth
Gunny
Haircloth
Huckaback
Kersey
Lace
Linen
Matting
Mercerized Cotton
Mohair
Moire
Moleskin
Muslin
Nankeen Cloth
Nets
Oilcloth
Piña Cloth
Plush
Poplin
Rugs
Satin
Silk
Taffeta
Tapestry
Tarlatan
Tweed
Velvet

Leather and Leather Manufactures.

The various processes for the manufacture of Leather are described under that title, and the finished products, such as boots, shoes, saddlery, etc., in which independent industries participate, are appropriately grouped by themselves. For leather and leather goods, the following list is recommended:

Leather
Bark
Tanning (under Leather)
Buckskin
Glove
Buff Leather
Cordovan
Shagreen
Chamois
Leather Cloth
Saddlery
Boot
Shoes
Blacking

Carriages and Other Vehicles.

From the primitive ox-cart to the

modern motor vehicle in its numerous forms for business and pleasure is a long step, and it includes the development of many vehicles that have wrought important economic and social changes, involving new and improved road construction. These are represented in the following list:

Cart
Chariot
Carriage
Coach
Driving
Coupé
Hansom Cab
Wagonette
Buckboard
Phaeton
Ambulance
Bicycle
Automobile
Motor Vehicle
Motor Cycle
Side Car

Ceramic Industries.

Clay affords the fundamental material for numerous products used in industry and also for works of art. From its geology to its decorative application many interesting processes are involved, and the reader will find the subject well covered in the New International Encyclopaedia. It is recommended that at the outset the article Clay be studied, followed by those on the accompanying list which discuss rather the industrial uses as somewhat distinct from the mere artistic, as contained in the next following section:

Clay
Kaolin
Kiln
Fire Brick
Fire Clay
Pipe Clay
Pottery
Tile
Terra Cotta
Fireproof Construction

Porcelain and Pottery.

There are few more interesting studies than that of porcelain and pottery, and, if the processes are traced from the production of the clay until the finished piece emerges from the kiln after the final firing, the reader will be well repaid. For this purpose the following articles are recommended:

Pottery
Porcelain
Biscuit
Kiln
Annealing
Ceramic
Enamel
Bow China
Burmese Ware
Vase
Cracklin
Stoneware (under Delft)
Delft Ware
Eggshell China
Faïence
Jasper Ware
Majolica
Terra Cotta
Tile
Pyrometer

Glass.

Few materials are more extensively employed in the arts than glass, and in scientific work and in decoration it also holds an important place. For the es-

sential features of its manufacture, the comprehensive and general article GLASS should be consulted, while the subordinate topics, as listed below, should be read in this connection:

Glass
Flint Glass
Crown Glass
Iridescent Glass
Water-Glass
Wire Glass (under Glass)
Bottle
Carboy
Prince Rupert's Drops
Bologna Vial
Lens
Mirror
Lorraine Glass
Stained Glass
Gems, Imitation

HOROLOGY.

The construction of various instruments for keeping time is a science of considerable antiquity, and its various departments may be studied with profit. A convenient arrangement of titles is given below:

Horology
Clock
Watch
Clepsydra
Dial
Hour-Glass
Balance
Escapement
Fusee
Pendulum
Isochronism
Chronoscope
Chronograph
Time, Standard
Time Signals

PRINTING, TYPOGRAPHY, ENGRAVING, PAPER, ETC.

The development of the art of printing has brought about many connected processes and industries. These are concerned with the impression on paper of letters or designs in one form or another, or the provision of the apparatus and machinery to do this, as well as the material to receive the impression. An arrangement of such subjects is as follows:

Printing
Case
Type Founding
Typesetting Machines
Electrotyping (under Electro-Chemistry, Industrial)
Bank Notes, Manufacture of
Engraving
Photo-Engraving
Three-Color Process
Lithography
Rotogravure
Ink
India Ink
Graphotype
Paper
Parchment
Parchment, Vegetable
Cardboard
Bristol Board
Cartridge-Paper
Calendering
Bookbinding
Envelope
Pen
Fountain Pen (under Pen)
Pencil
Typewriters
Copying Machines
Sealing-Wax
Ruling Machine

MISCELLANEOUS INDUSTRIES AND PRODUCTS.

Bead
Bell
Blacking
Bristles
Brush and Broom
Button
Candle
Celluloid
Coal-Tar
Coke
Comb
Cooperage
Cork
Corset
Cosmetics
Doll
Embossing
Excelsior
Fan
Flowers, Artificial
Gems, Imitation and Artificial
Gilding
Gimp
Glove
Glue
Gold Lace
Grease
Gutta-Percha
Ivory
Ivory, Vegetable
Japanning
Jewelry
Lac
Lacquer-Work
Lapidary Work
Laundry Machinery
Linoleum
Lumber Industry
Mangle

Petrolatum
Pin
Poppy-seed Oil
Pyrotechny
Rope
Rubber
Sawdust
Sewing Machine
Silkworm Gut
Straw Manufactures
Tableware, Silver-Plated
Tobacco Pipe
Vacuum Cleaners
Varnish
Voting Machine

MINING AND METALLURGY.

In addition to general articles on MINING and METALLURGY, there will be found, under the various metals, articles dealing not only with their occurrence and general properties, but also with their mining and metallurgy. Such articles are included in the following list:

Mining
Metallurgy
Iron and Steel
Copper
Gold
Silver
Nickel
Zinc
Platinum
Lead
Tin
Antimony
Manganese
Mercury
Aluminium

Cobalt
Molybdenum
Litanium
Tungsten
Uranium
Vanadium

Looking, however, at special methods of mining and metallurgy, there are general articles which have reference to the more common metals and the methods of producing and refining them. These articles are as follows:

Mining
Mines and Mining in Law
Blasting
Explosives
Mine Accidents
Assaying
Metallurgy
Metallography
Calcining
Crucible
Ore Dressing
Roasting
Chloridizing
Chlorination
Refining of Metals
Electro-Chemistry
Electric Furnace

Although considerable material on metal working is given under the metals themselves, there are certain processes which can be described in special articles. These include the following:

Founding
Forge, Forging
Anvil
Welding
Tempering Steel
Annealing
Dies and Die-Sinking
Damaskeening
Brazing
Rolling Mill
Grinding and Crushing Machinery
Mint
Draw-Plate
Electro-Plating
Metal-Working Machinery

For many purposes, alloys are more useful than simple metals. These are discussed under their own heads, as well as in a collective article, while other preparations of metal, as GALVANIZED IRON and STEEL WOOL are also treated. A list of such articles is as follows:

Alloy
Alloys Magnetic
Brass
Bronze
Babbitt Metal
Fusible Metal
Coinage
Pinchbeck
Solder
Flux
Galvanized Iron
Steel Wool

The ornamental working of metals into small objects is also to be considered, and there are a number of articles which treat the subject from the artistic as well as the practical side. These titles include:

Jewelry
Plate, Sheffield
Tableware, Silver-Plated
Gold-Beating
Gold-Beater's Skin
Repousée
Enamel
Embossing

B. Construction

BUILDING AND BUILDING MATERIALS.

The materials used in building embrace natural and artificial substances which are specially wrought for the purpose. Whether we start with the lumber from the forest or the stone of the quarry, we find that there are a number of processes which have to be gone through before the material is finally disposed of in its appointed place. Considering first the materials for building, together with their sources, the following list has been constructed:

Building-Stone
Quarry, Quarrying
Stone Cutting and Dressing
Stone, Artificial
Clay
Brick
Mortar
Kiln
Cement
Concrete
Terra Cotta
Tile
Gypsum
Lumber Industry
Factor of Safety
Strength of Materials

For a study of the process of BUILDING, the article under that title will furnish an adequate idea. The separate branches, however, require more extensive treatment, as the following topics will suggest:

Building
Carpentry
Cabinet Work
Foundation
Masonry
Brick Work
Fireproof Construction
Steel Skeleton Construction
Half Timber
Plaster, Lathing and Plastering
Heating and Ventilation
Plumbing
Elevator
Paper-Hangings
Painting
Illumination
Gas, Illuminating and Fuel
Electric Lighting

For certain forms of building, such as APARTMENT HOUSES and HOTELS, somewhat different equipment is required, and these are discussed under their own heads. For building operations in general, there are a number of minor topics that require a separate treatment. These may be included in the following list:

Centring
Chimney
Door
Window
Framing
Column
Girder
Beam
Brace
Roof
Gutter
Lightning, Protection from
Lock
Alarm
Fire-Escape
Calcimine
Heating and Ventilation

C. Engineering

The constantly broadening field of engineering endeavor has resulted in dividing the work, so that to-day an engineer adopts but a comparatively small field for his own activity. Under ENGINEER AND ENGINEERING will be found a description of the modern divisions of engineering work and the qualifications of the men that follow each branch. In civil engineering, first may be mentioned the surveyor.

SURVEYOR.

Surveying involves the measurement of distances and areas and the delineation of the territory examined. It is carried on in different ways, depending on the extent and character of the country under survey. The following shows the general division of topics:

Surveying
Coast and Geodetic Survey
Geological Survey
Geodesy
Triangulation
Isostasy
Deflection of the Plumb Line
Hydrography
Dredge
Sound, Sounding
Photographic Surveying
Altimetry
Hypsometry
Leveling
Offset
Map
Engineering Instruments
Theodolite
Plane-Table
Stadia
Telemeter
Vernier
Sextant
Compass, Solar
Planimeter
Range-Finder
Aneroid
Heliograph
Odometer

RAILWAYS.

After a general and comprehensive review of the subject of RAILWAYS in the article of that title, particular parts require somewhat fuller treatment, involving, as they do, engineering and other features of a unique character. For this purpose, the following list is supplied:

Railways
Street Railway
Urban Railways
Electric Railways
Ship Railway
Locomotive
Compressed-Air Locomotive
Tunnel
Bridge
Cantilever
Viaduct
Culvert
Gauge
Frog, Railway
Fish Plate
Block-Signal System
Air Brake
Buffer, Buffing Apparatus
Bumping Posts
Snow-Plow

RIVER AND HARBOR IMPROVEMENTS.

Various important works to aid maritime commerce consist in the erection of numerous harbor and river im-

provements. These are of a permanent character and require special engineering. Such works are described in the list below:

Lighthouse
Buoy
Jetty
Breakwater
Embankments
Cofferdam
Foundation
Dike
Harbor
Dredge
Levee
Dock
Pile
Excavating Machinery
Blasting
Caisson
Masonry
Retaining Walls
Quay

CANALS.

When canals are carried across an isthmus, as at Suez or Panama, they may involve also many of the essential characteristics of harbor improvements; yet such works show considerable variation, and, when ordinary inland canals or those in connection with an irrigation system are considered, the methods of construction are quite different. The following list suggests a line of topics that could with profit be consulted:

Canal
Irrigation
Panama Canal
Nicaragua Canal
Suez Canal
Corinth Canal
Erie Canal
New York State Barge Canal
Cape Cod Canal
Saint Mary's Canal
Welland Canal
Chicago Drainage Canal
Trans-Isthmian Canal
Ship Railway

WATERWORKS AND HYDRAULIC ENGINEERING.

The use of water practically involves a separate department of engineering, but one in contact at many points with civil, sanitary, mechanical, and electrical engineering. It is necessary first to consider WATER SUPPLY, or the sources of water, then its storage, transmission, purification, distribution, and final consumption, and also various devices that are employed in these different stages. The material on this subject in the *New International Encyclopædia* is represented in the following list:

Water Supply
Hydrography
Well-Sinking
Artesian Wells
Dams and Reservoirs
Hydrostatics
Hydrodynamics
Current-Meter
Weir
Irrigation
Pipe
Water Purification
Water-Works
Fire Protection
Pumps and Pumping Machinery
Valve
Water Power
Filter and Filtration
Accumulators
Hydraulic Ram
Water Wheel and Turbines

Hydraulic Press
Archimedes' Screw
Danaide
Hydraulic Pressure Engine
Water Meters
Hydraulic Elevator (under Elevator)

SANITARY SCIENCE.

Under this somewhat comprehensive title, may be included such schemes as tend to improve and safeguard the health of mankind. See:

Hygiene
Diet
Occupational Diseases
Schools, Medical Inspection of
Health, Boards of
Sanitary Commission
Sanitary Laws
Quarantine
Water Supply
Water-Works
Water Purification
Plumbing
Garbage and Refuse Disposal
Sewage Disposal
Sewerage
Disinfectants
Drainage
Catch-Drains
Heating and Ventilation
Bath-Houses, Municipal
Slaughter Houses
Burial
Cemetery
Cremation of the Dead
Health Association, American Public

MUNICIPAL ENGINEERING.

The various applications of engineering knowledge to a large city result in the solving of many problems, such as water supply, transportation, the provision of PARKS and PLAYGROUNDS for the masses, etc., and especially the fundamental ones involved in CITY PLANNING, which are now engrossing the attention of many American cities. These subjects, grouped from this point of view, will be found in the following list:

City Planning
Road
Street
Boulevard
Road and Street Machinery
Asphalt
Pavement
Subways
Electric Railways
Street Railways
Urban Transportation
Water-Works
Illumination
Electric Lighting
Parks and Playgrounds
Landscape Gardening
Recreation Piers
Bath-Houses, Municipal
Garbage and Refuse Disposal
Municipal Ownership
Public Utilities

See also preceding section on Sanitary Science.

FIRE PROTECTION.

The surest fire protection is FIREPROOF CONSTRUCTION for buildings, seen at its best in STEEL SKELETON CONSTRUCTION, where combustible material is reduced to a minimum. Then there are SAFES AND SAFE DEPOSIT VAULTS for valuables, and the use of INCOMBUSTIBLE FABRICS. When these safeguards are unavailing, however, recourse must be had to the various apparatus for fighting fire, such as the

FIRE-ENGINE, now seen in its self-propelled form, the motor fire-engine, the high pressure pumping service, the FIRE-EXTINGUISHER, etc. See:

Fireproof Construction
Safes and Safe Deposit Vaults
Fireproofing
Incombustible Fabrics
Fire-Alarm
Fire Protection, Municipal
Fire-Engine
Fire-Extinguisher

MECHANICAL ENGINEERING.

For raising and transporting materials, and for carrying on other important operations, many interesting mechanical devices are constructed. The CABLEWAY, TELPHERAGE, DERRICK, and TRAVELING SIDEWALK are typical of the former class, while GRINDING AND CRUSHING MACHINERY and AIR COMPRESSOR may be cited as divisions of the many branches of mechanical engineering. A list of such subjects as are not already cited under other heads includes:

Derrick
Crane
Cableway
Telpherage
Ropeway
Traveling Sidewalk
Elevator
Air Compressor
Blowing-Machines
Pneumatic Dispatch
Power, Transmission of
Dynamometer
Brake
Prony Brake
Air Brake
Lubricants
Wood-Working Machinery

MECHANICAL DEVICES.

In the construction of machinery there are certain elementary parts that enter into its design. These serve such purposes as changing the direction of a motion, increasing or reducing speed, or permitting its control in any desired way. See:

Mechanical Powers
Axle
Shafting
Wheel and Axle
Lever
Pulley
Crank
Cam
Eccentric
Winch
Windlass
Inclined Plane
Wedge
Toggle Joint
Screw
Endless Screw
Belt
Gear-Wheel
Gearing
Couple

PRIME MOVERS.

For the generation of power there are a number of sources to be considered. HEAT, STEAM, ELECTRICITY, WATER POWER, WIND, etc., are all treated in their proper places, but under this head may conveniently be included articles describing the means for transforming energy into mechanical power available for a thousand and one different purposes. See:

Hot-Air Engine
Compressed-Air Engine
Compressed-Air Locomotive
Gas-Engines

Internal-Combustive Engines
Motor Vehicle
Fireless Engine
Steam Engine
Steam Turbine
Water Wheel
Windmill
Hydraulic Ram
Hydraulic Press
Hydraulic-Pressure Engine
Dynamo-Electric Machinery
Mechanical Powers

STEAM AND STEAM ENGINE.

Commencing with a consideration of the properties of steam, any discussion soon reaches the STEAM ENGINE and its various parts and its applications. Such will be found in the classification given below:

Steam
Boiler
Economizers
Shaking Grates
Æolipile
Steam Engine
Locomotive
Steam Navigation
Steam Turbine
Pumps and Pumping Machinery
Eccentric
Crank
Fly-Wheel
Governor
Valve
Injector
Indicator
Safety Valve
Condenser
Horse-Power

ELECTRICAL ENGINEERING.

In Electrical Engineering, we may include the generation and distribution of electric current, also its use for light and power, and the methods by which it is transmitted to considerable distance. The subject is treated in the following articles:

Dynamo-Electric Machinery
Armature
Cable, Electric
Transformer
Synchronizer
Transmission of Power
Electric Lighting
Electric Furnace
Electric Heater
Electric Railways
Urban Transportation
Electro-Chemistry
Storage Battery
Electrolysis
Welding
Lightning-Arresters
Electric Fuze (under Fuze)

For a discussion of the phenomena of the electric current, see the comprehensive section on Electricity in the chapter on Physics.

TOOLS.

Many and varied tools have been and are used by the mechanic, which are discussed in the articles dealing with the various industries. Certain groups and individual tools, however, demand consideration. Thus, METAL and WOOD-WORKING MACHINERY include many important tools, the chief types of which it is desirable to understand. PNEUMATIC TOOLS have resulted in considerable saving of labor and are of increasing importance. Many tools, such as the file, hammer, and axe, still survive and are not yet

replaced by machinery. The list in alphabetical order is as follows:

Axe
Boring Machinery
Calipers
Cutlery
Drill
File
Hammer
Jack
Mandril
Marlinespike
Metal-Working Machinery
Micrometer
Plane
Pneumatic Tools
Sand Blast
Sandpaper
Saw
Sawmill
Screw
Wood-Working Machinery

TELEGRAPH AND TELEPHONE.

The transmission of intelligence is constantly being accomplished more effectively and by a greater variety of methods, specialization having its play here as in other branches of applied electricity. The following articles may be recommended as supplying a complete idea of the history and development of these important processes:

Telegraph
Signaling and Telegraphing, Military
Lightning-Arresters
Telautograph
Telegraphy, Submarine
Atlantic Telegraph
Wireless Telegraphy
Telephony
Coherer
Telephone

Chapter 29. Efficiency and Industrial Management

WHILE few terms have been more abused in recent years than the word "Efficiency," which may be interpreted all the way from implying some occult science for making two blades of grass grow where one or even less previously flourished, to some simple means for securing greater output of a factory or business, it may be understood, however, in its strictly technical sense, as the ratio of the actual to the possible, or output to input. In such studies are involved much that can result and be interpreted to the advantage of mankind, so that in mathematical language a condition will be realized where this ratio will approach nearer to unity. For true efficiency there must be a knowledge both of the actual and the possible, expressed exactly and quantitatively, and then the employment of various means to eliminate waste and lost motion, so that the enterprise shall be more productive and yield greater returns, both gross and net. To accomplish this there are various methods, differing as to their manner and as to the claims advanced for their merits and workability, yet essentially the same if examined as regards their psychological and philosophical fundamentals.

Accordingly, when one investigates the subject of SCIENTIFIC MANAGEMENT he must first learn its objects and then appreciate wherein it is scientific, and then determine the various methods and schools of thought that have developed to secure these objects. Therefore, the student in this field should consult the fundamental articles on EFFICIENCY and INDUSTRIAL MANAGEMENT, but he will find also that in addition he will be required to inform himself as regards BOOKKEEPING and ACCOUNTING, for all studies in this field must depend upon records and bear a relation to the final system of accounts and values that show the profit of the enterprise. Accordingly, one might suggest the following list of titles that develop this interesting field of modern thought:

Efficiency
Industrial Management
Scientific Management
Legislative Management
Premium Plant
Motion Study
Time Study
Task and Bonus
Unit System

The articles BOOKKEEPING and ACCOUNTING, previously mentioned, should be read and also that on RAILWAYS, where, in the case of American railways, there has been much dispute as to the degree of efficiency that is secured in their operation, the principles of scientific management being designed to find application here if anywhere.

30. Military and Naval Science

AS the purpose of an army or any military organization is to carry on, or at least be prepared to carry on, war, either of defense or of offense, as effectively as possible, a study of the topic WAR, to ascertain under what circumstances recourse is had to the court of arms and under what conditions the laws and usages of nations demand that war shall be waged, makes a fitting beginning for reading in this field. Then, coming to the actual operations of war, we find that they must be planned according to the principles of STRATEGY and executed along lines worked out in systems of TACTICS. Accordingly, then, a suitable grouping of allied subjects is as follows:

A. Armies

War
Strategy
Tactics, Military
Military Aeronautics
Attack
Assault
Fire
Battle
Engagement
Skirmish
Invasion
Blockade
Fortifications, Attack and Defense of
Siege
Sap
Bombardment
Coast Defense
Manœuvres
Evolutions, Military
Demonstration
Marching
Manual of Arms
À Cheval Position
Ambuscade
Ambush
Debouching
Échelon
Enfilade
Feint
Point d'Appui
Retreat
Base of Operations
Advance Guard
Cavalry Screen
Outposts
Picket
Patrol
Guard
Main Guard
Rear Guard
Flank
Reconnaissance
Prisoner
Contraband of War

ORGANIZATION.

To carry out, however, any scheme of strategy and tactics involves an army whose effectiveness depends upon its organization. In the organization of an army, the INFANTRY, CAVALRY, and ARTILLERY, or LINE, must be considered. These are its prime essentials, together with its ENGINEERS, MEDICAL DEPARTMENT, COMMISSARIAT, Department of the QUARTERMASTER, SIGNAL CORPS, Bureau of Military Justice, or Judge Advocate's Department, its Pay Corps, GENERAL STAFF, and the vari-

ous other bureaus and departments upon the efficiency of which the successful organization and operation of a military body depend.

Looking at military organization from the point of view of the units of which an army is made up, we may start with the CORPS, and gradually proceed from one command to an inferior one, learning the function of each and its relation to the common whole. RANK AND COMMAND is the keystone of military organization. Over each body of men there must be an appropriate officer, and to learn his duties it is but necessary to consult the article on this subject. In addition to officers, there may be certain subordinate individuals who have peculiar or individual functions to perform; these too are best described under their own heads. The accompanying lists suggest the relation of many of these topics. Dealing first with the division which may be headed Armies and Army Organization, we find large and adequate treatment, the historical side here as well as elsewhere in the Encyclopædia being considered. The first group deals with the divisions of military organization, the second, entitled RANK AND COMMAND, with the individuals of all ranks that form an army. See:

(*a*) *Armies and Army Organization:*

Army Organization
Armies
Corps
Division
Brigade
Regiment
Battalion
Squadron
Company
Battery
Platoon
Detachment
Artillery
Artillery Corps
Artillery Train
Cavalry

Cornet
Non-Commissioned Officer
Color-Sergeant
Drum Major
Sergeant
Corporal
Gunner
Artificer
Drummer
Orderly
Private
Bombardier
Sentinel

MILITARY ENGINEERING.

To the military engineer are assigned many problems connected with the existence and operation of an army. He has to provide for its protection in both peace and war, which involves the construction of suitable barracks, camps, and fortifications, both temporary and permanent, and is besides required to study and delineate the country in which the troops live or operate. Naturally, the chief division to be made in the topics relating to this subject is FORTIFICATION, involving the construction of more or less permanent works, and Field Engineering, dealing with those of a more temporary character. See:

Engineering, Military
Fortification
Military Architecture

FORTS OF THE UNITED STATES.

With a description of the principles of Fortification and Military Encampments, or posts, may properly be included a description of such military posts of the United States as are of importance for one reason or another. These are included in the following list, and the articles give information as to their location, garrison, general characteristics, etc.

Fort Adams
Fort Bliss
Fort Canby
Fort Caswell
Fort Clark
Fort D. A. Russell
Fort Douglas
Fort Du Pont
Fort Ethan Allen
Fort Flagler
Fort Grant
Fort Greble
Fort Hamilton
Fort Hancock
Fort Howard
Fort Jay
Fort Keogh
Fort Leavenworth
Fort Logan
Fort McHenry
Fort McPherson
Fort Meade
Fort Monroe
Fort Morgan
Fort Myer
Fort Porter
Port Preble
Fort Riley
Fort Robinson
Fort Sam Houston
Fort Schuyler
Fort Sheridan
Fort Snelling
Fort Stevens
Fort Strong
Fort Terry
Fort Thomas
Fort Totten
Fort Trumbull
Fort Wadsworth
Fort Warren
Fort Washington
Fort Wayne
Fort William H. Seward
Fort Yellowstone
Columbus Barracks
Jefferson Barracks
Madison Barracks
Plattsburg Barracks
San Diego Barracks
Vancouver Barracks
Washington Barracks

ORDNANCE AND GUNNERY.

To carry on warfare, many weapons and resources have been placed at the disposal of the soldier. Such titles as ARTILLERY, ORDNANCE, EXPLOSIVES, AËROPLANES, SUBMARINES, GUNPOWDER, PROJECTILES, SMALL ARMS, naturally suggest themselves as principal topics. With them may be grouped the underlying science as embodied in BALLISTICS and GUNNERY, together with the other topics contained in the following list:

(*a*) *Artillery:*

Coast Artillery
Field Artillery
Horse Artillery
Mountain Artillery

Siege Gun
Guns, Naval
Rapid-fire Guns
Machine Gun
Mitrailleuse
Gardner Gun
Mortar
Howitzer
Air Gun
Pneumatic Gun
Submarine Gun
Ordnance
Ordnance Establishments
Cannon
Jacket
Bore
Calibre
Artillery Carriages
Gun-Carriage
Limber
Caisson
Small Arms
Carbine
Chassepôt
Arquebus
Bayonet
Pistol
Revolver
Target and Target Practice
Sword

(*b*) *Projectiles:*

Ammunition
Grape-Shot
Case-Shot
Canister
Carcass
Grenade
Bomb
Shrapnel
Rocket
Cartridge
Torpedo

(*c*) *Explosives:*

Gunpowder
Smokeless Powder
Dynamite
Nitroglycerin
Atlas Powder
Cordite
Lyddite
Maximite
Picric Acid
Dualine
Fulminates
Fulminate of Mercury
Fulminate of Silver
Pyrotechny
Primer
Fuze
Greek Fire
Charge
Matches

(*d*) *Gunnery:*

Ballistics
Range
Range-Finder
Aim
Charge
Plongée
Ricochet
Target and Target Practice
Target Practice, Naval
Proving Ground
Loading-Tray

(*e*) *Historic Cannon:*

Coehoorn
Columbiad
Demi-Cannon
Demi-Culverin
Falcon
Jingal
Mitrailleuse

UNIFORM AND EQUIPMENT.

Closely connected with the soldier's

and sailor's weapons are his Uniform and Equipment, the various insignia often being matters of considerable interest and curiosity to the layman. With these subjects, we may include allied topics as follows:

Military Insignia
Uniforms, Military and Naval
Aiguillettes
Bandolier
Busby
Canteen
Cartouch
Chevrons
Epaulet
Facings
Good Conduct Badges
Haversack
Helmet
Képi
Khaki
Kit
Knapsack
Spur
Sword

Military Ceremonies.

As a witness of various military ceremonies or other formalities, the layman comes in contact with certain other aspects of army and navy life. The more important of these will be treated under their respective heads. See the following:

Salutes
Feu-de-Joie
Dress Ship
Escort
Review
Inspection
Parade
Muster

Flags.

Flags of one kind or another, by reason of their histories and tradition and their special uses at the present time, play an important part in military and naval affairs. Besides being the emblem of the nation, they may also pertain to various organizations or individuals, as the colors of a regiment or the flag of an admiral. These will be understood on reference to the following articles, many of which are illustrated by colored plates:

Flag
Ensign
Colors
Guidon
Standard
Pennant
Jack
Union Jack
Flag of Truce
Signaling and Telegraphing

Historic and Special Military Organizations.

Military organizations in the past, as well as in the present, have been formed either for special purposes or under special auspices, or as independent commands. Some of the more famous classes of soldiers and historic military organizations are those included in the following list:

Artillery Company, Ancient and Honorable
Artillery Company, Honorable
Bashi-Bazouks
Beefeater
Bersaglieri
Black Watch
Cameronians
Carbineers
Chasseurs
Cohort
Coldstream Guards

Colonial Corps
Cossacks
Cuirassier
Dragoons (under Cavalry)
Equestrian Order
Fencible
Foot Guards
Francs-Tireurs
Fusiliers
Green Mountain Boys
Grenadier
Grenadier Guards
Guard
Guerrillas
Guide
Gurkhas
Highlanders
Honvéd
Horse Guards
Household Troops
Hussars
Janizaries
Lancer
Landsturm
Landwehr
Legion
Life Guards
Mamelukes
Minute Men
Mobiles, Corps of
National Guard
Phalanx
Rangers, Mounted
Rifleman
Rough Riders Association
Scots Greys
Sepoy
Sikhs
Spahis
Streltsi
Trainbands
Voltigeurs
Yeomanry
Yeomen of the Guard
Zouaves

MILITARY LAW.

For the government of the army there are certain statutes and regulations. International law in many of its aspects touches on the acts of armies in the field. Accordingly, a grouping of certain topics allied, though not necessarily logically connected, may be made as follows:

Military Law
Acts of Hostility
Allegiance
Armistice
Articles of War
Belligerent
Blockade
Booty
Bounty
Capitulation
Cartel
Cashiering
Casus Belli
Conscription
Contraband of War
Council of War
Courts Military
Declaration of War
Desertion
Discharge
Judge-Advocate
Judge-Advocate-General
King's Regulations
Martial Law
Military Commissions
Military Government
Military Law
Military Police
Military Prison
Neutrality
Posse Comitatus
Prisoner
Privateering

Prize
Prize Courts
Provost-Marshal
Ransom
Spy
Truce
War

MILITARY AND NAVAL EDUCATION.

The professions of the soldier and sailor require from beginning to end continual training, and from Academy to War College there are many studies to be pursued. Grouping those topics referring to the education of the soldier and sailor, we have the following list:

Army Schools
Artillery Schools
Cadet, Military, Naval
Military Geography
Cavalry and Light Artillery School
Military Education
Military Academy, U. S.
General Service and Staff College
Staff Colleges and Schools
War College
Naval Academy, U. S.
Naval Schools of Instruction
Naval Institute, U. S.
Discipline
Drill
Drill Regulations

MISCELLANEOUS.

The food for the soldier and his animals is discussed under RATIONS and FORAGE, and its mode of preparation under FIELD COOKING. The principal BUGLE AND TRUMPET CALLS that summon him to his duties are given with the music notes, and the DRUM and FIFE, which supply the field music, are also treated. Methods of RECRUITMENT in various countries, and also RETIREMENT, should be studied, while the PAY AND ALLOWANCES of the soldier must be considered in order to understand army conditions at home and abroad. An essential of modern military operations is the maintenance of communication between every part of an army and its base, or capital. This is the function of the SIGNAL CORPS, whose operations and apparatus are treated under SIGNALING AND TELEGRAPHING, MILITARY. In the event of casualties, the SURGEON and the MEDICAL DEPARTMENT, with its HOSPITAL CORPS, are called into requisition, protected as they are by the terms of the GENEVA CONVENTION. It is advantageous to learn the present conditions of SURGERY, MILITARY, and the peculiar problems that the military surgeon has to face, as well as his methods of operation. In this connection, also, should be mentioned the work of the RED CROSS, and the part it plays in alleviating suffering on the battlefield. Of importance, as in a small way reproducing some of the conditions of warfare, the WAR GAME is worthy of consideration, as on its board may be worked out many interesting problems in strategy and tactics.

B. Ships and Navies

No clearer distinction can be drawn in discussing vessels for navigating the seas than to consider separately those for military purposes and those for commerce, but it is not always possible to make the separation complete,

and many subjects concerning nautical affairs cover or apply to both classes. Under NAVIES and SHIP AND SHIPPING (subhead *Ship, Armored*) are given historical accounts of the development of war craft, while the evolution of the merchant ship is traced under NAVIGATION, SHIPBUILDING, and SHIP AND SHIPPING (subhead *Power Navigation*). In the following lists the different kinds of warships, merchantmen, and boats which are separately described under their own titles are collected under the proper head:

(*a*) *Warships:*

Warship
Ship, Armored (subhead under Ship and Shipping)
Battleship
Cruiser
Fuel Ship
Gunboat
Torpedo Boat
Torpedo Boat, Submarine
Hospital Ship
Ram
Guard-Ship
Receiving Ship
Galley
Galliot
Trireme
Fire-Ship
Floating Battery
Frigate
Monitor
Mortar Vessel
Corvette

(*b*) *Merchantmen:*

Ship and Shipping and its various subheads
Power Navigation (subhead under Ship and Shipping)
Clipper
Bark
Brig
Schooner
Sloop
General Ship
Composite Ships
Lighter
Whaleback
Yacht
Lugger
Junk
Grab
Dhow
Corsair
Ketch
Pinnace
Pirogue
Pram
Great Eastern
Launch, Launching
Derelict
Wreck

(*c*) *Boats:*

Lifeboat
Life-Rafts
Balsa
Launch
Whaleboat
Long Boat
Jolly-Boat
Punt
Cutter
Catboat
Canoe
Catamaran
Banca
Ice-Breaking Steamer
Barca
Kayak
Ferry

NAVIES, NAVAL AFFAIRS, ETC.

There is included under this head, in the following lists, articles pertain-

ing not only to the navy proper, but to such government services as are connected with naval and nautical affairs, such as Coast Guard, Life-Saving Service, etc.:

(*a*) *Organization and General Subjects:*

Navies
Tactics, Naval
Marine Corps
Engineer, Naval
Medical Department, United States Navy
Hydrographic Office
Navy, Department of the
Naval Academy
Naval Schools of Instruction
Naval College of Canada
Revenue Cutter Service, United States
Life-Saving Service
Coast Guard
Naval Reserve
Crew
Company, Ship's
Complement
Watch
Division
Landing Force
Billet
Mess
Pay and Allowances
Naval Reserve

(*b*) *Officers and Men:*

Admiral
Commodore
Captain
Commander
Lieutenant-Commander
Lieutenant
Ensign
Midshipman
Clerk, Paymaster's
Commanding Officer
Commandant
Flag-Officer
Executive Officer, United States Navy
Surgeon, Military and Naval
Paymaster
Watch Officer
Naval Constructors
Chaplain
Provost-Marshal
Pilot
Warrant Officer
Gunner
Master
Master-at-Arms
Mate
Carpenter, Navy
Boatswain
Machinist, Naval
Petty Officer
Quartermaster
Coxswain
Naval Apprentice
Landsman
Boys, Ships'

(*c*) *Naval Ordnance, Gunnery, Torpedoes, etc.:*

Guns, Naval
Gunpowder
Smokeless Powder
Guncotton
Rapid-fire Guns
Machine Guns
Target Practice
Target
Torpedo
Torpedo Director
Torpedo Net
Rangefinder
Stadimeter
Projectile
Mine, Submarine

(*d*) *Merchant Marine and Allied Subjects:*

Navigation
Merchant Marine (of U. S.)
Ship and Shipping, subheads of:
  Sailing Ship
  Power Navigation
  Classification of Ships for Marine Insurance
  Tables showing tonnage of ships built and building in the merchant navies of the world
Great Eastern
Load-line Marks of Vessels
Measurement of Ships for Tonnage
Safety at Sea
Rules of the Road at Sea
Fog Signals
Coasting Trade
Trade, Board of
Trinity House
Crew
Master
Mate
Pilot

See also the titles grouped under Maritime Law and Navigation on subsequent pages.

SHIPBUILDING AND NAVAL ARCHITECTURE.

The enormous size and great speed of many modern vessels require study, experience, and scientific attainments of the highest class for their design and construction. Under the head of SHIPBUILDING will be found a historical sketch of the subject, a description of the theory of design, of the means and methods of hull construction, and of the design, development, and construction of propelling and other machinery. The principal titles under which shipbuilding information is to be found are:

Armor Plate
Ship and Shipping, and subheads
Shipbuilding, and subheads
Launch, Launching
Navigation
Load-line Marks of Vessels
Marine Engineering
Steam Engine
Steam Turbine
Boiler
Buoyancy
Stability
Metacentre
Resistance
Displacement
Tonnage
Measurement of Ships for Tonnage
Lloyds
A 1

The various parts of a vessel are almost infinite in number. The articles SHIPBUILDING and SHIP will tell of these various parts and describe how the skill of naval architect, marine engineer, and shipbuilder unites them into one congruous whole. Such parts, however, often possess distinct features and characteristics which need separate treatment, and these are included in the following list:

Beak
Bilge
Beam
Bottom
Bow
Bridge
Bulkhead
Bulwark
Cockpit
Cofferdam
Companion

Deck
Figurehead
Gangway
Hawse
Helm
Hold
Keel
Keelson
Paddle-Wheel
Poop
Screw Propeller
Smokepipe

To gain a good idea of the rigging of a ship and the names of masts, sails, etc., the best plan is to consult the plate accompanying the article SHIP, where all the various parts of the rigging of a full-rigged ship are indicated and specified. There are various topics connected with sails and rigging that are described and their functions shown in brief articles. Such a list includes the following:

Belay
Block
Boom
Bowsprit
Brace
Brail
Bridle
Burton
Clip Hooks
Cordage
Crow's-Nest
Davit
Gaff
Halliards
Jib
Jury
Knotting and Splicing
Lateen Sail
Lug-Sail
Mast
Purchase
Rigging
Sail
Spanker
Spinnaker
Sprit
Stay
Tackle

Connected with the ship, but not wholly falling in any of the above classes, are many essentials such as the ANCHOR, the BINNACLE, the DAVIT, etc. These adjuncts are specially designed for specific purposes, which the reader naturally desires to understand. The following list includes some of the more important subjects in such a grouping:

Anchor
Ballast
Batten
Bells
Binnacle
Block
Boiler
Boiler (under Shipbuilding)
Bridle
Buoy
Burton
Cable
Canvas
Capstan
Cat
Cofferdam
Compass
Controller
Cordage
Davit
Fender
Ground-Tackle
Mooring Swivel
Kedge
Knotting and Splicing

Lifeboat
Life Buoy
Life-Preservers
Life-Rafts
Life-Saving Guns and Rockets
Life-Saving Service
Lights
Marling Spike
Oakum
Purchase
Rope
Smokepipe
Stopper
Tackle
Wheel
Winch
Windlass

NAVIGATION.

Navigation involves the conducting of a vessel from one port to another by making use of charts, the position of various heavenly bodies as determined by the navigator, and such other data as he can obtain by observation and calculation. In general this is contained in the article NAVIGATION, but further details and explanations are given of incidental topics. The following list will be found by the reader sufficiently comprehensive:

Navigation
Latitude and Longitude
Sailings
Binnacle
Compass
Log
Reckoning
Dead Reckoning
Day's Work
Departure
Deviation
Fog Signals
Rules of the Road at Sea
Safety at Sea
Rhumb Line
Meridian
Map
Loxodrome
Chart
Hydrography
Meteorology, Marine
Sound, Sounding
Coast Pilot
Bowditch's Practical Navigator
Almanac
Nautical Almanac
Ephemeris
Pilot Chart
Protractor
Sextant
Quadrant
Vernier

SEAMANSHIP.

Seamanship may be distinguished from navigation as dealing with the actual practice, rather than the theory, involving the handling of vessels and the means taken to insure their safety. Thus, under this head, is discussed such important subjects as the RULES OF THE ROAD, the use of the LOG, TACKING, jibing, mooring, and the various manœuvres and operations carried on at sea and in port. These hardly fall in a logical order, but the more important are contained in the following list:

Tacking and Wearing
Jibe
Boxhauling
Lee
Leeway
Moor, Mooring
Log
Log-Book
Helm

Steering
Port
Larboard
Starboard
Bearing
Sound, Sounding

MARITIME LAW.

Vessels sailing on the high seas are governed by rules and usages which have given rise to a body of laws known as admiralty and maritime law. Furthermore, such vessels are required to observe the statutes of the countries whose flags they fly, and such formalities as are duly prescribed. Connected with such governmental regulations are those of marine underwriters and insurance principles, forming a large department of maritime law. Interests at sea are also considered by international law, and prizes and privateering are subjects which it must consider. A grouping of interesting topics in these more or less related branches is as follows:

International Law
Admiralty Law
Maritime Law
Navigation Laws
Navigation, Freedom of
Ship's Papers
Manifest
Bill of Lading
Clearance
Bill of Health
Charter-Party
Cargo
Freight
Demurrage
Admiralty, The
Bounty
Collisions of Vessels
Bottomry Bond
Respondentia
Salvage
Derelict
Wharfage
Jettison
Barratry
Quarantine
Marine Insurance
Lloyds
A 1
Measurement of Ships for Tonnage
Tonnage
Load-line Marks of Vessels
Privateering
Prize
Prize Courts
Desertion
Safety at Sea

As the sailor must make his base of operations on shore, it is proper to consider such subjects as NAVY YARDS, DOCKS, etc., where he may secure supplies and protection. The following list indicates certain articles that will be of assistance in this respect:

Navy Yard
Dockyards, Royal
Arsenal
Reef
Harbor
Breakwater
Dock
Wharf
Torpedo Station
Naval Academy

Chapter 31. The Great War

THE WAR IN EUROPE is treated in an article that has been written by some of the best experts obtainable, and is a complete history of it in all its phases. It is divided into the following subdivisions: I, Underlying Causes; II, Outbreak of the War; III, Military Operations; IV, Western Front; V, Eastern Front; VI, Italian Front; VII, Balkan Front; VIII, Rumanian Front; IX, Turkish Front including the Gallipoli and the Palestine Campaigns; X, Seizure of German Colonies; XI, Naval Operations; and XII, Aërial Operations. This chapter aims to supplement the cross-references in the article on the War printed in volume 25 with a list of related articles in the NEW INTERNATIONAL ENCYCLOPÆDIA.

On June 28, 1914, Archduke Francis Ferdinand, the Austrian heir apparent, was assassinated with his wife at Sarajevo, the capital of Bosnia. This was the match that touched off the conflagration which had been brewing in Europe for years. Austria-Hungary, accusing Servia of complicity in the affair and declaring that it was the Serb aim to secure the provinces of Bosnia and Herzegovina, sent an ultimatum to Servia on July 23. Servia's reply, delivered just before the expiration of the time limit, only partially complied with Austria-Hungary's demands. Despite the most strenuous efforts on the part of the larger countries of Europe, Austria-Hungary declared war on Servia on July 28. Russia, the champion of the Slav Balkan States, issued an order of mobilization and, upon the refusal to withdraw this order, Germany declared war on her. This turned all Europe into an armed camp. France and England came to the aid of Russia, and Germany stood by her ally, Austria-Hungary. Italy, claiming that her Alliance with Germany and Austria-Hungary was purely defensive and claiming further that Austria-Hungary's declaration of war on Servia was offensive, refused to join her partners in the Triple Alliance. Rumania joined the Entente in August, 1916, and, as a result of the unrestricted submarine warfare announced by Germany on January 31, 1917, the United States declared war against her on April 6, 1917. A list of additional belligerents is given in the section, OUTBREAK OF THE WAR.

I. Underlying Causes

The Underlying Causes of the Great War fall naturally under three heads, namely: (1) National Antagonisms, (2) Militarism, and (3) Economic Rivalry.

1. NATIONAL ANTAGONISM.

The problem of national antagonism was an outgrowth of the Congress of Vienna, which concluded the French Revolution and Napoleonic periods. At this Congress many of the diplomats hoped that the principles of the French Revolution would be recognized and that the ruling ideas would be the recognition of the growth of democracy and the realization of national liberty. Because of the opposition of the reactionaries, particularly Metternich, these

ideas were subjugated and the attempt was made to restore the *ancient régime.* Thus we find the problem of nationality cropping up continually in the nineteenth century. Two examples of this will suffice to show the truth of this statement. As a result of the FRANCO-GERMAN WAR, Germany annexed Alsace and Lorraine, French-speaking territories. At the CONGRESS OF BERLIN, Russia's hopes of making the Balkan peninsula a Slav sphere of influence were frustrated by the jealousy of the other European powers. The French consequently hoped for the day of restoration and the national awaking of Russia foreshadowed her expansion to the Mediterranean. If the principle of nationality had been strictly carried out under the Treaty of St. Germain, July, 1920, the dismemberment of the former Austro-Hungarian Empire would have been on a different basis. Consult in volumes 24 and 25 LEAGUE OF NATIONS, PEACE CONFERENCE AND TREATIES, and RACIAL MINORITIES TREATIES.

Consult the following list of articles for a history of the growth of national antagonisms since the beginning of the nineteenth century:

French Revolution
Napoleon I
Peninsula War
Tugenbund
Vienna, Congress of
Alexander I (Russia)
Charles XIV John (Sweden)
Stewart, Robert (Second Marquis of Londonderry, Castlereagh)
Wellington, A. W.
Hardenberg, K. A.
Humboldt, K. W.
Metternich, C. W. N. L.
Nesselrode, K. R.
Stein, H. F. K.
Talleyrand-Perigord, C. M.
Crimean War
Declaration of Paris
Paris, Treaties of
Seven Weeks' War
Schleswig-Holstein
Bismarck-Schönhausen, K. O. E. L.
William I (Germany)
William II (Germany)
Franco-German War

Napoleon III
Cavour
Mazzini
Garibaldi
Eastern Question
Russo-Turkish War
Berlin, Congress of
Pan Slavism
Pan-Germanism (under War in Europe)
Africa
Turco-Italian War
Balkan War

In order to learn the part played by individual countries during the nineteenth and early twentieth centuries, as well as to find important historical material bearing on national antagonisms, consult the historical sections of the following titles both in the ENCYCLOPÆDIA proper and in volumes 24 and 25 containing more recent supplementary material:

Albania
Austria-Hungary
Belgium
Bosnia
Bulgaria
Denmark

France
Germany
Greece
Herzegovina
Italy
Montenegro
Netherlands
Norway
Poland
Portugal
Rumania
Russia
Sardinia
Servia
Sicilies, Kingdom of the Two
Spain
Switzerland
Turkey
United Kingdom of Great Britain and Ireland

For the biographies of statesmen, soldiers, etc., prominent during the war see the treatment of the countries involved in Chapter I of the Reading Courses. Supplementary to the lists given there are the biographies of individuals mentioned in the War articles, which are given in volumes 24 and 25.

2. Militarism.

Militarism, as defined in the New International Encyclopædia, is "A term employed somewhat loosely to designate a tendency to subordinate civil to military considerations in the policy of the State." We find that all the powers of Europe illustrate this tendency to a greater or less degree. Each has watched any move by the other and attempted to meet any increase in armament by a similar increase. For example, when Germany increased her army in 1913, France passed a law changing the term of service to 3 years, because her slowly increasing population would not permit an outright increase. To appreciate the modern tendency, consult the sections on Armies and Navies in the articles on the more important countries in the Encyclopædia proper and in volumes 24 and 25, as well as the following general titles:

Militarism
Armies
Navies
Military Education
Imperialism
Industrialism
Peace Movement, International

3. Economic Rivalry.

For the economic causes of the war it is not necessary to go back further than the beginning of the nineteenth century. Then occurred the Industrial Revolution, which substituted the factory system of manufacture for the cottage sysem. It also introduced the problem of capital and labor. With the vast increase in production, it was only natural that European countries should look for a market for their goods commensurate with the output. England had a monopoly of manufactures for almost three quarters of a century. Then France, Germany, etc., felt the effects of the revolution and began to look for their "places in the sun." The chief form taken by this economic rivalry was colonization and preferential tariffs. Africa and Asia were partitioned, practically between France and England, thus leaving Germany with no desirable place of expansion. Germany maintained that the adoption of preferential tariffs by the British colonies were attempts to crip-

III. Naval Operations

The naval operations during the Great War took place on almost every known sea. Engagements between flects were comparatively scarce, until the great battle off Jutland. This engagement, with those off the coast of Chile and near the Falkland Islands, were the most important fleet activities. Outstanding features of the naval operations were the submarine warfare, the spectacular raids on merchantmen, the blockade of Germany and the transportation of large numbers of troops from one place to another by the Allies. This section of the article is divided into the following divisions:

Operations in the North Sea and the Waters about Great Britain
Operations in the Baltic
Operations in the Mediterranean
Operations in the Black Sea and Dardenelles
Cruiser Operations in the Atlantic, Pacific and Indian Oceans

Reference should be made to the following articles in volumes 24 and 25:

Navies of the World
Vessels, Naval
Navigation
Gunnery, Naval
Guns, Naval

For a complete list of the more important articles in the NEW INTERNATIONAL ENCYCLOPÆDIA dealing with naval science, see chapter 30 in this volume. See also section on *Navies* of the different countries:

Navies

IV. Aerial Operations

For the first time in history, aërial operations played an important rôle in warfare. The aërial section of the WAR IN EUROPE article tells the different use to which the different types of aircraft were put. Consult also articles AËRONAUTICS in volume 24, chapter 17 in this volume dealing with AËRONAUTICS in general, and see:

Aëronautics
Navigation, Aërial Law of
Military Aëronautics
Naval Aëronautics
Hangar
London
Paris
Saarbrücken
Sandringham
Treves
Trieste
Venice
Verona

V. Neutral Nations

As the war developed it became almost as difficult for a neutral to maintain an attitude of strict neutrality as it was to be a belligerent. The trade markets of the world were completely upset and all routes and methods of transportation changed entirely. Commerce carrying vessels of the bel-

ligerents were requisitioned for war purposes, and in many neutral countries also political, as well as economical, disturbances resulted. The destruction of neutral vessels, the seizure of neutral mails, etc., brought forth protests from many neutral nations. Besides the historical sections of the neutral nations, such as Switzerland, Norway, Sweden, the Netherlands, see:

International Law
Neutrality
Armed Neutrality
Blockade
Contraband of War
Declaration of Paris
London, Declaration of

VI. Financial and Economic Aspects

The problem of financing the Great War proved to be extremely difficult. With trade and industry all but at a standstill, the usual channels for borrowing money were closed. War taxes of all descriptions were levied and old taxes were greatly increased. Large loans were sought at home and abroad. A large joint loan floated in the United States by the Entente Allies was followed by various national loans secured by undoubted collateral, as well as by the resources of the respective governments. The following list includes the more important articles which deal with financing a war:

Tax
Moratorium
Credit
Rediscounting
Stock Exchange
Bonds
Stocks
Panic, Financial
Crisis, Economic
Money
Marine Insurance
Bank, Banking
Foreign Money

In addition to the foregoing there will be found in volumes 24 and 25 articles on FINANCE AND BANKING, REPARATIONS, and TAXATION IN THE UNITED STATES, in which are discussed not only the problems of war finances and economics, but also the developments which followed the Armistice and continued to be matters of vital interest. The War also involved elaborate measures of RELIEF ADMINISTRATION discussed under that head, as well as under BELGIUM, where will be described the activity of the Commission for Relief in Belgium.

Chapter 32. Medicine

THE dissemination of some medical knowledge among the laity is a matter of inestimable social importance. Popular ignorance on the subjects of hygiene, the prevention of disease, and the care of the sick, places many widespread evils sadly beyond the power of the medical profession. The average man's failure, moreover, to appreciate clearly the soundness of the principles and methods of medical science invites the appearance in the community of various mystical, or mystifying, quacks, claiming to know therapeutic methods of all but miraculous efficiency, and offering to sell medicines which, like the philosopher's stone once vainly sought by the alchemists, possess unlimited curative powers. Honest and valuable knowledge to-day has no secrets, and, notwithstanding, or rather because of, really considerable development, is professedly aware of its limitations. Perhaps, therefore, the clearest mark of the impostor or incompetent is the alleged possession of secrets or of methods of universal applicability. Nor will the cunning theories, widely advertised in support of such allegations, appear at all reasonable to the man who has familiarized himself with the main principles and facts of scientific—that is, rational—medicine.

The lists of articles presented in the following pages map out a complete course of systematic reading in medicine. A true understanding of the purely medical subjects, even in their elementary aspects, is possible only after the acquisition of some knowledge of the general biological sciences and of chemistry. Thus, human anatomy is best understood if studied in connection with comparative anatomy. Physiology is more or less obscure if studied without a preliminary knowledge of the general principles of chemistry and biology, and, again, human physiology should be studied in connection with the physiology of the lower animals. Even general botany presents a number of points of the highest interest to the student of human anatomy and physiology. Should the assiduous reader of the Encyclopædia desire to familiarize himself with these and cognate subjects, the present volume will readily afford the necessary guidance. We would especially call attention to the psychological articles on the special senses and faculties, without which the physiological functions of the brain and nervous system cannot be thoroughly understood. Further, a large number of chemico-physiological articles on special foods, and of articles on subjects of veterinary medicine, will be found listed in the chapter Agriculture, Horticulture, and Forestry, those articles having been prepared for the Encyclopædia by the food and veterinary experts of the United States Department of Agriculture.

The classification of the medical subjects proper, on which the lists below are based, and the order of sequence of the subjects in the lists themselves, are those adopted by the best medical authorities, with slight modifications to suit the distribution of subject-matter in the Encyclopædia. The only considerable deviations from general usage are in the case of anatomy and physiology, the two being somewhat closely interwoven in the Encyclopædia and therefore, here, too, arranged as one joint subject. The listed articles comprise a complete

treatment of essentials. The reader desiring more detailed information on particular bones, muscles, nerves, etc., will be guided to the special articles on such subjects by cross-references in the articles listed.

The only lists in which the order of sequence of the topics is not according to some recognized system are those under "Symptoms and Morbid Conditions" (division, Pathology and Therapeutics) and "Diseases of the Skin" (division, Diseases of the Nose and Throat, Ear, Eye, Skin, and the Genito-Urinary System). The former list comprises those symptoms and morbid conditions that are common to more than one class of diseases and that could not, therefore, be included in the somewhat rigidly classified lists preceding. On the other hand, the orders of sequence of skin diseases usually adopted in special medical works are practically useless. It was, therefore, deemed best in both cases to preserve the alphabetical order—for convenience of reference. The list of "Drugs" (division, Materia Medica) includes all the pharmacopœial preparations in frequent use. A number of rarer drugs may be found described in the articles on chemical subjects.

The biographies of famous medical men are arranged in the order of historical sequence and, together with the articles listed under "History," form a complete presentation of the history of medicine—a truly fascinating subject. Interesting historical detail will also be found in the articles on all medical topics of any importance. The inclusion of such historical articles as BATH, BARBER, EMPIRIC, DERIVATION, BLACK DEATH, PLAGUE, INOCULATION, etc., would have swelled the lists unnecessarily.

VI. Diseases of the Nose and Throat, Ear, Eye, Skin, and the Genito-Urinary System.

1. *Diseases of the Nose and Throat:*
Rhinitis
Epistaxis
Ozena
Polypus
Throat, Affections of the
Larynx, Diseases of the
Laryngitis

2. *Diseases of the Ear:*
Ear
Deafness
Cerumen
Otitis Media
Otorrhœa
Otalgia

3. *Diseases of the Eye:*
Eye, Diseases of the
Blindness
Ectropion
Entropion
Stye
Trichiasis
Conjunctivitis
Ophthalmia
Blepharitis
Cornea
Leucoma
Staphyloma
Iritis
Glaucoma
Cataract
Retinitis
Nyctalopia
Color-Blindness
Optic Neuritis
Sight, Defects of
Myopia
Hyperopia
Astigmatism
Heterophoria
Strabismus

4. *Diseases of the Skin:*
Acarus Folliculorum
Acne
Alopecia
Bromidrosis
Corn
Ecthyma
Eczema
Erythema
Favus
Hair
Ichthyosis
Impetigo
Itch
Leprosy
Lichen
Lupus
Nævus
Pemphigus
Pityriasis
Plica
Prurigo
Psoriasis
Ringworm
Rupia
Seborrhœa
Sycosis
Tinea
Vitiligo
Wart
Yaws

5. *Diseases of the Genito-Urinary System:*
Cystitis
Calculus, or Stone
Extravasation

Prostate Gland
Gonorrhœa
Stricture
Hydrocele
Varicocele
Syphilis
Circumcision

VII. Materia Medica.

1. *General Articles:*

Materia Medica
Pharmacopœia
Toxicology
Prescription

2. *Preparation of Drugs:*

Tincture
Pill
Liniment
Lotion
Plasters
Infusion
Extract
Percolation
Suppository
Unguent
Ointment
Elixir

3. *Classification of Drugs:*

Alterative
Tonic
Excitant
Narcotics
Sedatives
Hypnotics
Anæsthetic
Anodyne
Antipyretic
Febrifuge
Expectorant
Stimulants
Gargle
Emetics
Anti-Emetic
Bitters
Antacids
Carminatives
Cholagogue
Laxative
Purgatives
Cathartic
Hydragogues
Anthelmintic
Diuretics
Diaphoretics
Anhidrotics
Antispasmodic
Astringents
Demulcents
Diluents
Aphrodisiac
Anaphrodisiacs
Emmenagogues
Oxytocics
Irritant
Rubefacients
Refrigerants
Depilatories
Disinfectants
Poison
Antidote

4. *Drugs:*

Quinine
Mercury, Medicinal uses of
Iodine
Iodides
Bromides
Arsenic
Iron
Colchicum
Colchicine
Salicylic Acid
Salicylates, Medical Uses of the
Salicin
Sulphur, Medical Uses of
Fern, Male
Kamala
Santonin
Goa Powder

Chrysarobin
Phosphorus
Alcohol, Pharmacology, Toxicology, and Therapeutic Use
Absinthe
Hashish
Opium
Laudanum
Paregoric
Dover's Powder
Morphine
Chloral
Paraldehyde
Hypnal
Sulphonal
Trional
Urethane
Hemlock
Coniine
Curari
Chloroform
Ether, or Di-Ethyl-Ether
Nitrous Oxide
Cocaine
Digitalis
Nux Vomica
Strychnine
Strophanthus
Valerian
Sparteine
Aconite
Hellebore
Veratrine
Tobacco
Amyl Nitrite
Nitroglycerin
Belladonna
Atropine
Homatropine
Sal Ammoniac
Heroin
Guaiacol
Creosotol
Calumba
Sodium
Lime, or Calcium Oxide
Apomorphine
Asafœtida
Senna
Cascara Sagrada
Castor Oil
Blue Pill
Calomel
Rhubarb
Aloes
Seidlitz Powders
Rochelle Salt
Epsom Salt
Jalap
Colocynth
Elaterin
Bismuth
Lead
Lunar Caustic
Diuretin
Copaiba
Methylene Blue
Salol
Jaborandi
Iodoform
Carbolic Acid
Sulphurous Acid
Antipyrine
Phenacetine
Acetanilid
Matzoon
Cod-Liver Oil
Lanolin
Ichthyol
Salvarsan

VIII. HISTORY AND BIOGRAPHY.

1. *History:*

Medicine
Homœopathy
Eclectic School of Medicine
Anatomy
Histology

Physiology
Hygiene
Pathology
Disease, Germ Theory of
Therapeutics
Surgery
Surgery, Military
Obstetrics
Dentistry

2. *Biography:*

Chapter 33. Manners and Customs

Dress and Apparel

NOWHERE more than in the apparel of men and women does time wreak its changes and the spirit of an age stand out. The student of the manners and customs of a people or period often may apply himself with profit to a consideration of their garments, and conversely in a study of the garments reflex actions on the wearer may be observed. Indeed, clothes may be subject to the dictates of a fickle fashion or possess a spiritual and deep-lying significance, as in the case of ecclesiastical vestments, or changing from the decorative to the more serviceable, as in the case of the military or naval uniform.

Thus costume in itself may possess a significance more than merely for the interest of the votary of fashion. For such a student a series of articles might be recommended embraced in the following list:

Costume
Dress
Textiles
Dress Reform
Armor
Fashion
Embroidery
Corset
Crinoline
Girdle
Glove
Hosiery
Mantle
Shawl
Hair Dressing
Beard
Cosmetics
Rouge
Perfumery
Wig
Hat
Headdress
Shoes
Boots
Jewelry
Parasol
Uniforms, Military and Naval
Costume, Ecclesiastical
Degree (for Academic Costume)

Jewelry

Among the minor arts in none have there been more important developments than in the artistic design and fabrication of jewelry. In many fields there may be considered to have taken place within recent years a return to the artistic products of the early gold- and silver-smiths of Continental Europe, while in the cutting and setting of gems there has also been opportunity for the display of the skill of the lapidary and the jeweler, who have evolved new styles of cutting and forms of settings.

Under the broad heading of JEWELRY in this section can be considered the articles for personal adornment, involving the use of precious and semi-

precious stones and the careful working of such metals as gold and silver, and also the manufacture of objects of utility and ornament of a somewhat larger description, such as tableware and the artistically decorated porcelain and other objects of art.

The visitor to a museum of fine arts would often find grouped in a single department such articles as are embraced in the following list, which is submitted for the guidance of the reader:

Jewelry
Fan
Enamel
Embossing
Gems
Goldsmith Work
Inlaying
Lacquer Work
Lapidary Work
Japanese Art
Marquetry
Metal Work
Pearl
Plate
Porcelain
Pottery
Plated Ware
Repousée
Ring
Stained Glass
Table Ware
Tarsia Work
Fork
Cutlery

In connection with jewelry, it is desirable to refer also to the various gems which are used for personal adornment. The article GEMS, which discusses the general qualities of precious or beautiful stones, with particular reference to those cut or engraved for use as jewels or seals, describes the history of such ornaments from the earliest periods of Egypt. This is followed by an article on GEMS, IMITATION AND ARTIFICIAL, in which are discussed the various imitations ranging all the way from crude affairs of glass to modern triumphs of the chemist, involving the electric furnace as a means of producing the gems artificially or synthetically.

While precious stones used for gems may have considerable value, due to their rare occurrence in nature, it is the lapidary who, in his cutting, grinding and polishing the various crystals or other precious stones, adds to their value or even, in some cases, gives beauty and value to stones whose intrinsic value is but small. Accordingly, the article LAPIDARY WORK should be read in addition to that on gems, and then the reader can take up the series of articles on the precious stones themselves—naturally headed by the diamond. These arrange themselves into two groups—those of great rarity and value, as follows:

Diamond
Emerald
Ruby
Sapphire
Amethyst
Opal
Carnelian
Turquoise
Topaz

The second group comprises many, mostly crystalline minerals, that are also considered as precious, but whose rarity is not such as to put them in

the same class with the list just given. Such minor stones would be:

Corundum
Quartz
Beryl
Chrysoberyl
Aquamarine
Tourmaline
Alabaster
Chalcedony
Sardonyx
Argonite
Agate
Jasper
Chrysolite
Garnet
Rhodonite
Chrysocolla
Catlinite

Chapter 34. Games and Sports

ALL peoples indulge in exercises of strength, of skill, of bodily and mental agility, or of fortune, and often these mimic the more serious pursuits of life, or consist in these very pursuits indulged in for pleasurable purposes only.

1. The capture and slaying of animals has remained a source of pleasure long after it has ceased to be the chief business of life. See:

(*a*) Shooting
Archery
Trapping
Coursing
Battue
Tiger-hunting
Still-Hunting
Fox-hunting
Falconry
Game Laws
Game Preserves

(*b*) Angling
Bait-fishing
Salmon-fishing
Trolling
Trout-fishing
Fly-Casting

2. The mimicry of war is also found in contests between men or animals, or men and animals. See:

Pugilism
Boxing
Wrestling
Fencing
Cock-fighting
Bear-baiting
Bull-fight

3. Water, both in its common state and in the forms of ice and snow, furnishes many forms of sport to primitive and civilized man. See:

(*a*) Swimming
Rowing
Canoe and Canoeing
Yachting
Water Polo

(*b*) Skating
Ice Polo
Ice Yachting
Curling

(*c*) Snowshoeing
Skiing

4. Useful to man in labors, the horse is his great companion in numerous sports. See:

Horsemanship
Coaching
Driving
Trotting
Pacing
Horse-racing
Stud-book
Derby Day
Steeple chasing
Polo
Hippodrome

5. Of the instruments entering into popular games, the ball, in various shapes, is by far the most common and the most widespread. See:

Bowls
Baseball
Indoor Baseball
Cricket
Golf
Croquet
Hockey
La Crosse
Polo
Football

Basketball
Handball
Pelota
Racquets
Tennis
Lawn Tennis
Court Tennis
Ping-Pong
Billiards
Bagatelle

6. In games of chance, the card and the die in varying forms are universally found. In the case of cards, however, chance often plays the minor part and the game assumes a highly intellectual character. See:

(*a*) Cards
Whist
Bridge
Pinochle
Skat
Ecarté
Piquet
Bezique
Cribbage
Euchre
Solitaire
Poker
Baccarat
Rouge et Noir
Fan-tan

(*b*) Dice
Hazard
Craps

(*c*) Roulette

7. For the great intellectual games par excellence, see:

Chess
Checkers

and for cognate games:

Backgammon
Dominoes

8. Miscellaneous sports and games:

Cycling
Mountain Climbing
Coasting
Toboggan
Shuffleboard
Quoits

9. The general subject is treated under:

Athletics
Gymnastics
Physical Culture
Amateur
Handicapping
Sports, Book of
Games, Ancient
Gymkhana
Olympic Games
Pythian Games
Nemea
Gladiator
Circus
Acrobat
